# ANNOUNCEMENT.

THE JUNIOR ENCYCLOPEDIA BRITANNICA is intended to be to the masses what the greatest reference library in the world, the *Encyclopædia Britannica*, is to the scholar.

It is published with several objects in view, as explained by the Editor in his Preface, and he has performed his work successfully. The JUNIOR ENCYCLOPEDIA BRITANNICA is not published as a rival to any reference books, nor is it our purpose to detract from their value or abate one particle from the meed of praise awarded them.

That typical American citizen, Horace Greeley, once said: "I want just three books constantly at my elbow while writing—an atlas, a dictionary, and an encyclopedia of not more than four volumes—three would be better; and these books should have every article abridged as much as possible." He said also that a lengthy dissertation on any subject in a book of reference would be misplaced.

If such a set of books was needed in the busy life of so great a citizen, how much more is it needed to refresh the memory of the student, to enlighten those who have not been fortunate enough to reach the higher seats of learning, or to aid the pupils of the public schools, whose needs we have had constantly in view.

#### THE PUBLISHERS.

514623

### PREFACE.

In the beginning we fully acknowledge the value of the greatest reference library in the English language, the *Encyclopædia Britannica*. To those who desire a complete series of elaborate treatises covering the whole field of knowledge we would recommend the above work. It is invaluable to the scholar, and no library is complete without it.

In the JUNIOR ENCYCLOPEDIA BRITANNICA we have endeavored to reproduce the quality of the larger work and at the same time reduce and simplify the quantity, so as to furnish a set of reliable and handy reference books, which would be not only within the intellectual reach of all, but also easily accessible to the great masses of the people who are striving for a higher intellectual development.

We have followed the general line of treatment of the ninth edition of the *Britannica* (A. & C. Black, Edinburgh), in that we have given a connected view of the more important subjects under a single heading, instead of breaking them up into a number of shorter articles. The articles have been so arranged that the various parts may be easily discerned. In the articles on the Sciences we have presented the latest developments in method and in classification, but we have persistently avoided any technical treatment.

We realize that information concerning living men is most difficult to secure. Instead of writing the biographies of a great number of men of the past, who, though they may have been prominent in their own times, have left no traces in the history of civilization, we have substituted the prominent men of our own time. We have given only those men of the past, whose names are inseparably connected with the world's history. In fact, if our biographies were arranged chronologically, they would present a complete history of human activity in the field of art, literature, and science. The JUNIOR ENCYCLOPEDIA BRITANNICA is essentially an American work. In the industrial world, in particular, things American are given precedence over foreign things. Yet the work is not so emphatically American that the treatment of foreign countries is narrow or insufficient for ordinary reference. The newer countries — those recently opened to civilization — have been dealt with at considerable length. For example, there are fifteen pages on the Empire of Japan and only eleven pages on England.

The process of making the common objects of every-day use is as interesting as it is mysterious. We present the manufacturing process of over two hundred of the principal articles of commerce, and show the process from the time the raw material goes into the mill, factory, or workshop, until it comes out a finished product.

The articles on the states of the American Union have been compiled from information received from the various states and from matter obtained from the National Bureau of Statistics. Towns in the United States, of five thousand inhabitants or over, are given, with railroad connections of same.

We desire to acknowledge the valuable assistance rendered by those who have been engaged in the compilation of the work. Their signed and unsigned articles appear throughout the volumes.

While the reading-matter on a great many subjects has been very much abridged, we have made up for the deficiency in a most admirable way, in that there are over one thousand engravings in the books, ten per cent. of which are full-page engravings.

If diligent research and almost constant reference to a comprehensive library embracing works on art, science, law, and history, can avail anything, the accuracy of the work is not to be doubted.

> L. BRENT VAUGHAN, *Editor*.

Chicago, September, 1897.

#### Aalborg

A, the first letter in almost all alphabets. Most modern languages, as French, Italian, German, have only one sound for a, namely, the sound which is heard in *father* pronounced short or long; in English this letter is made to represent seven sounds, as in the words *father*, *mat*, *mate*, *mare*, *many*, *ball*, *what*, besides being used in such digraphs as *ea* in *heat*, *oa* in *boat*. A, in music, is the sixth note in the diatonic scale of C, and stands when in perfect tune to the latter note in the ratio of § to 1. The second string of the violin is tuned to this note.

A 1, a symbol attached to vessels of the highest class in Lloyd's register of shipping, A referring to the hull of the vessel, while 1 intimates the sufficiency of the rigging and whole equipment. Iron vessels are classed A 1 with a numeral prefixed, as 100 A 1, 90 A 1, the numeral denoting that they are built respectively according to certain specifications.

**Aalborg** (eel-town), a seaport of Denmark, with considerable trade, shipbuilding, fishing, etc. It is the capital of a province of the same name. Pop. 20,000.

Aali Pasha (1815-1871), a distinguished Turkish states man, b. at Constantinople. At the early age of fifteen he became a clerk in the foreign office, and rose steadily from one diplomatic post to another, at home, Vienna, and elsewhere, till in 1844 he became ambassador at London. This varied experience left on his acute mind a profound impression of the absolute necessity of extensive reforms in the government of the Ottoman Empire; and with these reforms, under the sultans Abdul Medjid and Abdul Aziz, the name of Aali Pasha is identified. He presided at the Commission which passed the famous reforming decree of 1856, the Hatti-Humayun. At the Congress of Paris he represented the porte, and maintained its cause with zeal and skill. He was grand-vizier more than once; and from 1861 till his death, held alternately with the likeminded Fuad Pasha the most influential posts in the Turkish service. He was active in suppressing the Cretan rebellion in 1867-68, and in repressing Egyptian efforts to shake off the supremacy of the porte.

Aard-vark (Duich "earth hog") (or Cape Ant-eater), one of the Edentata, and the only ant-eater with teeth. It has seven molars on each side above, and six on each side below; with neither incisors nor canine teeth. It is a stout animal, with long, pig-like snout, tubular mouth, the usual termite-catching tongue, large ears, fieshy tail, and short, bristly hair. The limbs are short and very muscular; on the fore feet are four, on the hind five powerful claws, used in burrowing and in excavating the hills of the white ants on which it feeds. It is nocturnal in its habits, and is very inoffensive and timid. When pursued, it can

#### Abbotsford

burrow itself out of sight in a few minutes, working inward with such rapidity as to make it almost impossible to dig it out. Its total length is about five feet, of which the tail is 1 ft. 9 in. Its dwelling is a burrow at a little distance from the surface, and thence it may be observed creeping at dusk. Three species are known—one in South Africa, another in Senegal, and a third in South Nubia. The flesh is considered a delicacy.

Aard-wolf ("earth-wolf") (Proteles Lalandii), a South African carnivore, belonging to a sub-family of Hyænidæ. It is fox-like in size and habit, but has longer ears and a less bushy tail. It resembles a hyena in its sloping back, in its color, markings, and dorsal mane, but has five toes on the fore feet, and the head is much more pointed and civet-like. The back teeth are small and simple, and there is no carnassial or special cutting-tooth. The strong, blunt claws are, as usual, non-retractile. It feeds on carrion, white ants, larva, etc., but not on living vertebrates. It is timid and nocturnal in its habits, social but quarrelsome in its life, and tolerably swift in its pace, though usually trusting rather to burrowing than to flight. Like the hyenas, the aardwolves habitually fight among themselves.

**Abancay**, a town of Peru, in the department of Cuzco. Sugar, hemp, and silver mining are the principal industries. Pop. 21,000.

Abattoir (slaughterhouse), in general use since the establishment of the celebrated abattoirs of Paris, instituted by Napoleon in 1807, and brought to completion in 1818. The immense packing houses of Chicago, Cincinnati, Kansas City, St. Joseph, and other American cities, represent the largest and best equipped abattoirs in the world. See Packing.

Abbey, CLEVELAND (1838-1896), American astronomer and meteorologist; educated in New York and at Ann Arbor; served four years on the U. S. coast survey, studied in Russia, was made director of the Cincinnati Observatory, and in 1871 organized the present weather bureau. The general accuracy of his meteorological predictions obtained for him the familiar name of "Old Probabilities."

Abbot, EZRA (1819–1884), studied at Phillips Exeter academy, graduated at Bowdoin 1840, and in 1850 became assistant librarian at Harvard. He was LL.D. (Yale, 1869). He left his main library of 5,000 volumes to Harvard, the remainder to the Divinity School of the University. His works include New Discussions of the Trinity, Literature of the Doctrine of a Future Life, and The Authorship of the Fourth Gospel.

**Ab' botsford**, the former country seat of Sir Walter Scott, on the south bank of the Tweed, in Roxburghshire, Scotland, in the midst of picturesque scenery, forming an extensive and irregular pile in the Scottish baronial style of architecture.

Ab'bott, JACOB (1803-1879), a popular and prolific American writer, especially of entertaining and instructive books for the young; was teacher and subsequently clergyman.

Abbott, JOHN S. C. (1805-1877), author, was a Congregational minister in Massachusetts. Among the historical works written by him are The History of Napoleon Bonaparte, Napoleon at St. Helena, The History of Napoleon III, and a History of the Civil War in America. He was a brother of the above.

Abbott, LYMAN (1835-), clergyman, born in Massachusetts, son of Jacob Abbott, graduated at the university of New York in 1853, and was admitted to the bar in 1856. He took up theology and was ordained in the Congregational Church in 1860. For five years he preached in Terre Haute, Ind. He became pastor of the New England church in New York City, but resigned in 1869. He edited the "Literary Record" of *Harper's Magazine*, and the *Illus*trated Christian Weekly. He was associated with the Rev. Henry Ward Beecher on the Christian Union, and afterward became the editor in chief. Mr. Abbott has written a Life of Henry Ward Beecher (1883), and has edited Beecher's sermons. In 1889 he became pastor of Plymouth church. Brooklyn, so many years identified with Mr. Beecher's labors.

Abd-el-Ka-der (1807-1883), a famous Arab chief, of a lofty, intrepid, and tenacious char-He distinguished himself by his deteracter. mined resistance to the French arms in N. Africa. The Turkish power being broken by the French conquest of Algiers (1829), the Arab tribes of Oran made A. their emir, and he was soon at the head of 10,000 cavalry. Two battles, 1833 and 1834, obliged General Desmichels to conclude a treaty with him, and his power was acknowledged in Oran and Titeri. In 1835 he was strong enough to inflict a signal defeat on Gen. Tretzel. But the French gradually obtained the mastery, and in December, 1847, he had himself to surrender. Abd-el-Kader was sent to Toulon, and was liberated by Louis Napoleon in 1852.

Abdica'tion, properly the voluntary, but sometimes also the involuntary resignation of an office or dignity, and more especially that of sovereign power. The more important ab-dications of the present century are: --

Charles Emmanuel IV of So	rdini	a, June 4, 1802.
Charles IV of Spain,		March 19, 1808.
Joseph Bonaparte of Naple	s	June 6, 1808.
Gustavus IV of Sweden, .	•	March 29, 1809.
Louis Bonaparte of Holland	d	July 2, 1810.
Nanoloon of Franco		( Apřil 14, 1814,
Napoleon of France	•	i June 22, 1815.
Victor Emmanuel of Sardir	nia.	March 13, 1821.
Charles X of France,		August 2, 1830.
William I of Holland, .		October 7, 1840.
Louis Philippe of France		<ul> <li>February 24, 1848.</li> </ul>
Ferdinand of Austria.		December 2, 1848.
Charles Albert of Sardinia.		March 23, 1849.
Isabella II of Spain.		June 25, 1870.
Amadeus I of Spain.		February 11, 1873.
Abdul Aziz of Turkey.		May 30, 1876.

Abdo'men, in man, the belly, or lower cavity of the trunk, separated from the upper cavity or thorax by the diaphragm and bounded below by the bones of the pelvis. It contains the viscera belonging to the digestive and urinary systems. See Anatomy.

Ab'dul-Az'iz, thirty-second Sultan of Turkey, brother to Abdul-Medjid, whom he succeeded in June, 1861. He concluded treaties of commerce with France and England, both of which countries he visited in 1867. Deposed in May, 1876, he committed suicide, or more probably was assassinated, in June, the same year. He was succeeded by his son Murad V.

Ab'dul-Ham'id, thirty-fourth Sultan of Turkey, younger son of Abdul-Medjid, born in 1842, succeeded his brother Murad V, who was deposed on proof of his insanity in 1876. He was a Turk, a Mussulman of the old school, and opposed to European interference. His reign was marked by massacres of Christians in Armenia, and by many internal disturbances

Ab'dul-Medj'id, thirty-first Sultan of Turkey (1822-1861). He succeeded his father, Mahmud II in 1839. Abdul-Medjid was desirous of carrying out reforms, but most of them remained inoperative, or caused bloody insurrections where attempts were made to carry them out. His reign was marked by the Crimean war, and his resolute conduct in refusing to surrender the refugee Kossuth.

à Becket, THOMAS, born in London 1117 or 1119, assassinated in Canterbury Cathedral Dec. 29, 1170. He was educated at Oxford and Paris and studied civil law at Bologna in Italy, and on his return made Archdeacon of Canterbury and Provost of Beverly. In 1158 Henry II appointed him high-chancellor and preceptor to his son, Prince Henry. At this period he was a complete courtier, conforming in every respect to the humor of the king. He was the king's prime companion, and courted popular applause. In 1162 he was consecrated archbishop, and appeared as a zealous champion of the church against the aggressions of the king, whose policy was to have the clergy in subordination to the civil power. He was forced to assent to the "Constitutions of Clarendon," but a series of bitter conflicts with the king followed, ending in a Becket's flight to France, when he appealed to the pope by whom he was supported. A reconciliation took place in 1170, and Becket returned to England, resumed his office, and renewed his defiance of the royal authority. A rash hint from the king induced four barons, Reginald Fitz-Urse, William de Tracy, Hugh de Morville, and Richard Breto, to go to Canterbury and murder the archbishop while at vespers in the cathedral. He was canonized in 1172, and the splendid shrine erected at Canterbury for his remains was a

favorite place of pilgrimage. Abel, KARL FRIEDRICH (1726-1787), a noted German musician, famous also as a performer on the viola de gamba.

Abel, NIELS HENRIK (1802-1829), a famous

Norwegian mathematician. Abelard, PIERRE (1079-1142), an illustrious French scholastic philosopher and theologian. He went to Paris at the age of twenty, and

became first a disciple and soon after a rival of Guillaume de Champeaux. A. next established himself as a philosophical lecturer in 1113, at Paris, where he obtained the chair of his former master. At this moment his reputation was immense. From Rome, England, and Germany, students hastened to listen to his eloquent logic. Poet and musician, as well as philosopher, he wrote songs in French for his students. He secretly married Heloïse, the beautiful niece of Fulbert, canon of Notre Dame, who in revenge put an end to their union. A council held at Soissons in 1121 condemned his opinions on the Trinity as heretical, and soon after he withdrew to Nogent-on-the-Seine, where he built an oratory, and named it the Paraclete, or Comforter. In 1140 the pope condemned him as a heretic to perpetual silence. Two years after (1142)  $\Lambda$ . died in the abbey of St. Marcel, near Chal-A. had a great respect for ons-sur-Marne. the human intellect. He was a superb dialectician, and the most brilliant orator of the schools in his own age.

Abencerrages (ab-en-ser'a-jez), a distinguished Moorish family of Granada, the chief members of which, thirty-six in number, are said to have been massacred in the Alhambra by the king Abu-Hassan (latter half of the fifteenth century) on account of the attachment of his sister to one of them.

Ab'en Ezra (1000-1168), a celebrated Jewish rabbi. He particularly distinguished himself as a commentator on Scripture.

Abercromble, JAMES (1706-1781), British soldier. He commanded the British forces in America in 1758, and was defeated at Ticonderoga and superseded the next year. His son James was killed at Bunker Hill.

**Aberdare** (dar'), a town of South Wales, in Glamorganshire, with extensive coal and iron mines in the vicinity. Pop. 38,513.

Aberdeen', a royal burgh of Scotland, in the county of the same name. It is one of the oldest towns in Scotland. The shipping trade is extensive. Among the industries are woolen, cotton, jute, and linen factories; large comb works, soap and candle works, provision-curing works, chemical-works, papership-building yards, and establishworks. ments for preparing granite for all sorts of useful and ornamental work. Pop. 126,000. The county of Aberdeen forms the northeastern portion of Scotland. Area, 1,251,451 acres. It is generally hilly, there being in the southwest some of the highest mountains in Scot-land, as Ben Macdhui (4,205 feet), Cairntoul (4,245). Cairngorm (4,090), Lochnagar, etc. Its most valuable mineral is granite, large quantities of which are exported. Cereals (except wheat) and other crops succeed well. On the banks of the upper Dee is situated Balmoral, a favorite residence of Queen Victoria. Pop. 281.331. The University of Aberdeen was formed by the union and incorporation, in 1860, by Act of Parliament, of the University and King's College of Aberdeen, founded in Old Aberdeen, in 1494, by William Elphinstone, Bishop of Aberdeen, under the authority of a Papal bull obtained by James IV, and of the Marischal College and University of Aberdeen, founded in New Aberdeen, in 1593, by George Keith, Earl Marischal, by a charter ratified by Act of Parliament. The library numbers over 80,000 volumes.

Aberdeen, Earls of, a noble family of Scotland, notable for two of its members: (1) George Hamilton Gordon, 4th earl (1784-1860), "the traveled thane, Athenian Aberdeen" of Robert Burns's eulogy. His management of the Crimean war provoked much dissatisfaction. (2) John Campbell Hamilton Gordon, 7th earl. b. 1847. In 1876 he forsook the conservative party and cast his lot with W. E. Gladstone. who, in 1886, appointed him Lord Lieutenant of Ireland. In May, 1893, he was appointed governor-general of Canada, where he is now very popular. His wife, Lady Aberdeen, took a prominent part at the World's Columbian Exposition in Chicago.

**Aberdeen**, Brown co., S. Dak., 300 mi. w. of Minneapolis. Railroads, C. M. & St. P.; C. & N. W., and Great Northern. Industries, large flouring-mill. Surrounding country agricultural. The town was first settled in 1880, and became a city in 1882. Pop. estimated, 1897, 4,500.

Abernethy, JOHN (1764-1831). He was an eminent English surgeon, a pupil of the celebrated John Hunter. In 1787 he became assistant surgeon to St. Bartholomew's hospital, and lecturer on anatomy and surgery. In 1815 he was elected principal surgeon. He published several medical works.

Aberra'tion, in astronomy, the difference between the true and the observed position of a heavenly body, the result of the combined effect of the motion of light and the motion of the eye of the observer caused by the annual or diurnal motion of the earth; or of the motion of light and that of the body from which the light proceeds. It was discovered by Dr. Bradley.

Aberystwith (ab-er-ist'with), a seaport and fashionable watering-place of Wales, county of Cardigan.

Abigail, the beautiful wife of Nabal, the rich churl of Carmel (I Samuel 25), and afterward wife of David. From her speech to David the name, in modern days, has been applied generally to a female servant.

Abilene, Dickenson co., Kan., near Smoky Hill River, 163 miles from Kansas City. Railroads, U. P., C. R. I. & P., and A. T. & S. F. Industries, two cotton-mills, three flouringmills, cigar factory, carriage shops, etc. Surrounding country agricultural and large dairy interests. The town was first settled in 1860, became a city in 1880. From 1867 to 1873 it was the northern end of the Texas cattle trail. Pop. estimated, 1897, 3,600.

Abingdon, Va., noted as a tobacco market and as the scene of important operations in the Civil War. Pop. 3,500.

Abington, a town of Massachusetts, 20 miles s. e. of Boston. It has manufactures of boots, shoes, and nails. Pop. 4,500.

Abiogenesis (a-bi-o-jen'e-sis), the doctrine

#### Abkasia

or hypothesis that living matter may be produced from non-living; spontaneous generation.

Abka'sia, a Russian district, at the western extremity and south of the Caucasus, between the mountains and the Black Sea. The Abkasians form a race distinguished from their neighbors in various respects. At one time they were Christians, but latterly adopted Mohammedanism. Pop. about 200,000.

**Abo** (ö'bö), a port in Russian Finland, the capital of Finland till 1819, when it was supplanted by Helsingfors. Pop. 23,000.

Abolitionists, a name given to the people who opposed slavery previous to the Civil War.

**Abo'mey**, the capital of the kingdom of Dahomey, in West Africa, in a fertile plain, near the coast of Guinea. Pop. 30,000.

**Aboukir** (à-bö-kēr') (ancient *Canopus*), a small village on the Egyptian coast, 10 miles east of Alexandria. In Aboukir Bay took place the naval battle in which Nelson annihilated a French fleet in 1798, thus totally destroying the naval power of France in the Mediterranean. Near this place on July 25, 1799, Napoleon defeated the Turks under Mustapha.

**About** (å-bö), EDMOND FRANÇOIS VALENTIN (1828-1885), a French novelist. He wrote in a bright, humorous, and interesting style, and his novels have been very popular.

Abracadabra, a meaningless word once supposed to have a magical efficacy as an antidote against agues and fevers.

A'braham, originally Abram, the greatest of the Hebrew patriarchs, was born at Ur in Chaldea in 2153 B.C. according to Hales, in 1996 B.C. according to Ussher, while Bunsen says he lived 2850 B.C. His two sons, Isaac and Ishmael, were the progenitors of the Hebrews and Arabs respectively.

**Abran'tes**, a fortified town of Portugal, 73 miles n. e. of Lisbon, with which it carries on an active trade. Pop. 6,076.

Abruzzi, a division of Italy comprising three provinces. The interior is rugged and mountainous, being traversed throughout by the Apennines. The lower parts consist of fertile plains and valleys, yielding corn, wine. oil, almonds. saffron, etc.; area, 6,677 sq. mi.; pop. 1,386,817.

**Absalom**, the third son of David, king of Israel. His rebellion, death, and David's touching lamentation for his son, are to be found in 2 Samuel.

Ab'sinth, French absinthe, a liquor consisting of an alcoholic solution strongly flavored with an extract of several sorts of wormwood, oil of anise, etc. When taken habitually, or in excess, its effects are very pernicious. It is a favorite drink of the Parisians.

Absolution, remission of a penitent's sins in the name of God. The passages of Scripture on which the Roman Catholic Church founds in laying down its doctrine of absolution are such as Matt. 16:19; 18:18; John 20:23.

Absorb'ents, the system of minute vessels by which the nutritive elements of food and

#### Abyssinia

other matters are carried into the circulation of vertebrate animals. The vessels consist of two different sets, called respectively *lacteals* and *lymphatics*.

**Absorp'tion**, in physiology, one of the vital functions by which the materials of nutrition and growth are absorbed and conveyed to the organs of plants and animals.

**Abu-Bekr**, or FATHER OF THE VIRGIN, the father-in-law and first successor of Mohammed. His right to the succession was unsuccessfully contested by Ali, Mohammed's son-in-law, and a schism took place, which divided the Mohammedans into the two great sects of Sunnites and Shiites.

**Abu Klea**, a group of wells, surrounded by mountains, about 120 miles from Khartoum, in the Soudan.

**Abu'tilon**, a troublesome weed in the Middle U. S.; has been recommended for cultivation. and is called American jute, and sometimes Indian mallows.

Aby'dos, (1) an ancient city of Asia Minor. on the Hellespont, at the narrowest part of the strait, opposite Sestos. Leander, say ancient writers, swam nightly from Abydos to Sestos to see his loved Hero — a feat in swimming accomplished also by Lord Byron. (2) an ancient city of Upper Egypt, about 6 miles west of the Nile, now represented only by ruins of temples, tombs, etc. It was celebrated as the burying-place of the god Osiris. Here, in 1818, was discovered the famous Abydos Tablet, containing a list of the predecessors of Rameses the Great.

**Abyssin'ia**, a country of Eastern Africa; area, about 120,000 sq. mi.; chief divisions Tigré, Amhara, and Shoa: principal towns, Gondar and Debra Tabor. The more marked

Abyssinian – Galla boy.

physical features are a vast series of tablelands, and numerous ranges of mountains. These rise to 12,000 and 13,000 feet, while some of the peaks are always covered with snow. The principal rivers belong to the Nile basin. According to elevation there are several zones of vegetation. Within the lowest belt, which reaches an elevation of 4,800 feet, cotton, wild indigo, acacias, ebony, baobabs, sugar-canes,

coffee-trees, date-palms, etc., flourish, while the larger animals are lions, panthers, elephants, rhinoceroses, hippopotamuses, jackals, hyenas, bears, numerous antelopes, monkeys, and crocodiles. The middle zone, rising to 9,000 feet, produces the grains, grasses, and fruits of southern Europe, the orange, vine, peach, apricot, the bamboo, sycamore-tree, etc. The principal grains are millet, barley, wheat, maize, and teff, the latter a small seed, a favorite bread-stuff of the Abyssinians. Two, and in some places three, crops are obtained in one year. All the domestic animals of Europe, except swine, are known. The highest zone, reaching to 14,000 feet, has but little wood, and generally scanty vegetation, the hardier corn-plants only being grown; but oxen, goats and long-wooled sheep find abundant pasture. The climate is as various as the surface; but as a whole is temperate and agreeable. The chief mineral products are sulphur, iron, copper, coal, and salt, the latter serving to some extent as money. There has been a great intermixture of races in Abyssinia. What may be considered the Abyssinians proper, seem to have a blood-relationship with the Bedouin Arabs. They belong to the Semitic race. The complexion varies from very dark through different shades of brown and copper to olive. The figure is usually symmetrical. Other races are the black Gallas from the south; the Falashas, who claim descent from Abraham, and retain many Jewish characteristics : the Agows, Gongas, etc. The great majority of the people profess Christianity, but their religion consists chiefly in the performance of empty ceremonies, and gross superstition as well as ignorance prevails. The chief spoken language is the Amharic. Mohammedanism appears to be gaining ground in Abyssinia, and in respect of morality the Moslems stand higher than the Christians. A corrupt form of Judaism is professed by the Falashas. The bulk of the people are devoted to agriculture and cattle-breeding. The trade and manufac-tures are of small importance. The Abyssinians were converted to Christianity in the fourth century, by some missionaries from Alexandria. Ethiopia, as the country was then called, saw its golden age in the sixth century. Since that period it has been har-assed by Arab invasions and disturbed by internal revolutions. An attempt to revive the power of the ancient kingdom was commenced about the middle of the present cen-tury by King Theodore. He introduced European artisans, but his tyranny counteracted his politic measures. In consequence of the imprisonment of Consul Cameron and a number of other British subjects, in 1863, an army of nearly 12,000 men was despatched from Bombay in 1867. The force came within sight of the hill-fortress of Magdala in April, After being defeated in a battle Theo-1868. dore delivered up the captives and shut himself up in Magdala, which was taken by storm on April 13, Theodore being found among the slain. Then internal dissensions

#### Academy

ended in the accession of Johannes, who was succeeded by Menelik, king of Shoa, who claims descent from Solomon and the Queen of Sheba. Egyptian encroachments and Italian attempts at colonization engaged his troops. In 1885 the Italians occupied Massowah and in 1889 established a protectorate over Abyssinia. The warlike inhabitants kept the invaders on the coast until 1806 when on the inception of an Italian policy of conquest the Abyssinians inflicted some severe defeats on their opponents. Pop. 5,000,000.

Acacla, a genus of plants, consisting of trees or shrubs with compound pinnate leaves

and small leaflets, growing in Africa, Arabia, the East Indies, Australia, etc. The flowers are arranged in spikes or globular heads at the axils of the leaves near the extremity of the branches. The corolla is bell-shaped; stamens are numerous; the fruit is a dry unjointed pod. Several of the species yield gum-arabic and other gums; some have astringent barks and pods, used in tanning. An Indian species yields the valuable astringent called catechu; the wattle-tree of Australia, from 15 to 30 feet in height, is the most beautiful and useful of the species found there. Its bark contains a large percentage of tannin, and is hence exported. Some species yield valuable timber; some are cultivated for the beauty of their flowers.

Acad'emy, an association for the promotion of literature, science, or art : established sometimes by government, sometimes by the voluntary union of private individuals. The name Academy was first applied to the philosophical school of Plato, from the place where he used to teach, a grove or garden at Athens which was said to have belonged originally to the hero Acadõmus. The American Philosophical Society, the oldest scientific institution in America, was organized in 1744, in Philadelphia. The Academy of Natural Sciences of Philadelphia was organized in 1812. The American Academy of Arts and Sciences, incorporated in 1780, is located at Boston, as also the Society of Natural History. The Connecticut Academy of Arts and Sciences was organized at New Haven in 1709. The New York Academy of Sciences was incorporated as the Lyceum of Natural History in 1818. The Peabody Academy of Sciences, Salem, Mass., was endowed by George Peabody in 1867. The Smithsonian Institu-tion, Washington, D. C., was founded by James Smithson, an English scientist, incorporated by Congress in 1846. Its publications have given it prominent standing among scientists. In the great West there are active Academies in Cincinnati, St. Louis, Chicago, Davenport, San Francisco, Cal., and New Orleans, The most celebrated institutions bearing the name of academies, and designed for the encouragement of science, antiquities, and language respectively, are the French Académie des Sciences (founded by Colbert in 1666), Académie des Inscriptions (founded by Colbert in 1663), and Académie Française (founded by Richelieu in 1635), all of which are now merged in the National Institute. The oldest of the academies instituted for the improvement of language is the Italian Accademia della Crusca (now the Florentine Academy), formed in 1582, and celebrated for the compilation of a dictionary of the Italian language, and for the publication of several editions of ancient Italian poets. In Britain the name of academy is confined almost exclusively to institutions for the promotion of the fine arts, such as the Royal Academy of Arts and the Royal Scottish Academy.

Ac'adia, the name formerly given to Nova Scotia. It received its first colonists from France in 1604, being then a possession of that country, but it passed to Britain, by the Peace of Utrecht, in 1713. In 1756, 18,000 of the French inhabitants were forcibly removed from their homes by the British, an incident on which is based Longfellow's Evangeline.

Acan'thus, a genus of plants or shrubs, mostly tropical, two species of which are characterized by large white flowers and

Acanthus natural.

Acanthus of Corinthian Capital.

They are deeply indented shining leaves. favorite ornamental plants in gardens. In architecture the name is given to a kind of foliage decoration, and much employed in Roman and later styles.

Acapul'co, a seaport of Mexico, on the Pacific, with a capacious, well-sheltered harbor; a coaling station for steamers, but with no great trade. Pop. 5,000.

Acarna'nia, the most westerly portion of Northern Greece, pop. 138.444. The Acarnanians of ancient times were behind the other Greeks in civilization, living by robbery and piracy.

Acclimatiza'tion, the process of accustoming plants or animals to live and propagate in a climate different from that to which they are indigenous, or the change which the constitution of an animal or plant undergoes under new climatic conditions, in the direction of adaptation to those conditions. The systematic study of acclimatization has only been entered upon in very recent times, and the little progress that has been made in it has been more in the direction of formulating anticipative, if not arbitrary hypotheses, than of actual discovery and acquisition of facts. The term is sometimes applied to the case of animals or plants taking readily to a new country with a climate and other circumstances similar to what they have left, such as European animals and plants in America and New Zealand: but this is more properly naturalization than acclimatization.

Accor'dion, a keyed musical wind-instru-ment similar to the concertina; being in the form of a small box, containing a number of metallio reeds fixed at one of their extremities, the sides of the box forming a folding apparatus which acts as a bellows to supply the wind, and thus set the reeds in vibration, and produce the notes both of melody and harmony.

Ac'crah, a British settlement in Africa, on the Gold Coast, about 75 miles east of Cape Coast Castle. Exports gold-dust, ivory, gums, palm-oil; imports cottons, cutlery, firearms, etc.

Ac'crington, a town of England, Lancashire, 5 miles east of Blackburn, with large cotton factories, print-works, and bleach-fields, and coal-mines adjacent. Pop. 38,603.

Accu'mulator, a name applied to a kind of electric battery by means of which electric energy can be stored and rendered portable. In the usual form each battery forms a cylindrical leaden vessel, containing alternate sheets of metallic lead and minium wrapped in felt and rolled into a spiral wetted with acidulated water. On being charged with electricity the energy may be preserved till required for use. See *Electricity*.

Acetates, salts of acetic acid. The acetates of most commercial or manufacturing importance are those of aluminium and iron, which are used in calico-printing; of copper, which as verdigris is used as a color; and of lead, best known as sugar of lead. The acetates of potassium, sodium, and ammonium, of iron, zinc, and lead, and the acetate of morphia, are employed in medicine.

Acet'ic Acid, an acid produced by the oxidation of common alcohol, and of many other organic substances. Pure acetic acid has a very sour taste and pungent smell, burns the skin, and is poisonous. From freezing at ordinary temperatures  $(58^\circ \text{ or } 59^\circ)$  it is known as glacial acetic acid. Vinegar is simply dilute acetic acid, and is prepared by subjecting wine or weak spirits to the action of the air; also from malt which has undergone vinous fermentation. Acetic acid, both concentrated and dilute, is largely used in the arts, in medicine, and for domestic purposes. See Vinegar.

Acetylene, a pure hydro-carbon gas. It is clear, colorless, and heavy; has a distinct odor; burns with a flame of intense brilliancy. It is present in ordinary illuminating gas only to the extent of from 1/2 to 11/2 per cent. The

gas is poisonous to the same extent as ordinary gas, but its characteristic odor gives warning if there is any leak. There is no odor from the gas while burning, the flame being clear, white, and steady, without smoke, and with little heat. Acetylene gas is produced, com-mercially, by the action of water on *calcic* carbide, and the calcic carbide is the result of electrical fusion of coal dust and lime in the proportion of 1,130 pounds of coal dust to 1,750 pounds of lime. The resultant is 2,000 pounds of calcic carbide. The coal dust and lime, ground together, and intimately but mechanically associated, is placed in an electric furnace. The intense heat fuses the materials, and produces a dark, gray, cinder-like sub-stance called *calcium curbide*, or calcic car-bide. The calcic carbide can be exposed to the most intense heat of a blast furnace without perceptible effect. The atmosphere does not act upon the calcic carbide to any appreciable extent, although exposure to the air, particularly if the air is moist, reduces the gas-producing power. The instant water is brought in contact with the carbide, acetylene gas is produced. A double decomposition takes place. The oxygen of water unites with the calcium of the calcic carbide, forming oxide of calcium, which falls to the bottom of the generator. The hydrogen of the water unites with the carbon of the calcic carbide, forming the acetylene, which rises and is used.

For many years acetylene gas was known as a laboratory product too expensive for any-thing but experimental use. A possible method of producing this gas on a commercial basis was developed in the electric furnaces of the Willson Aluminium Company, Spray, N. C., by T. L. Willson while experimenting with the production of *aluminium*, and the smelting of refractory substances under the direction of Major J. T. Morehead, president of the company, and a geologist of national reputation. In the course of the experiments, coke and lime were fused together in the electric furnace, and the resulting products were thrown in a bucket of water. The violent bubbling, caused by the gas, directed attention to it; a match was struck, and the gas burst into a clear flame. The development of the experiments resulted in large electric furnaces being built at Niagara Falls, and calcio or calcium carbide is now a commercial product. Portable generators for house use are made, and the carbide is sold directly to consumers, who thus make their own illuminating gas.

Achievans (à-kê'anz), one of the four main divisions of the ancient Greeks. They migrated from Thessaly to the Peloponnesus, which they ruled in the heroic period. From very early times a confederacy existed among the twelve towns of this region. After the death of Alexander the Great it was broken up, but was revived again, B. c. 280, and from this time grew in power till it spread over the whole Peloponnesus. It was finally dissolved by the Romans, B. c. 147, and after this the whole of Greece, except Thessaly, was called Achaia or Achæa. Achaia with Elis now forms a monarchy of the kingdom of Greece. Pop. 181,632.

Achard (åk'årt), FRANZ KARL (1753-1821), a German chemist, principally known by his invention (1789-1800) of a process for manufacturing sugar from beet-root.

Achates (a-kā'tēz), a companion of Æneas in his wanderings subsequent to his flight from Troy. He is always distinguished in Vergil's Æneid by the epithet fidus, "faithful," and has become typical of a faithful friend and companion.

Acheen, or Atchin (å-chēn'), a native state of Sumatra, with capital of same name, in the n. w. extremity of the island, now nominally under Dutch administration. Though largely mountainous, it has also undulating tracts and low fertile plains. By treaty with Britain the Dutch were prevented from extending their territory in Sumatra by conquest; but this obstacle being removed, in 1871 they proceeded to occupy Acheen. It was not till 1879, however, that they obtained a general recogni-tion of their authority. They were forced to evacuate part of the Acheenese territory in 1885. In the seventeenth century Acheen was a powerful state, and carried on hostilities successfully against the Portuguese, but its influence decreased with the increase of the Dutch power. The principal exports are rice and pepper. Area 19,000 sq. mi.; pop. 600,000.

Achelous (ak-e-lo'-us), now Aspropotomo, the largest river of Greece, rising on Mount Pindus, separating Ætolia and Acarnania, and falling into the Ionian Sea. Achelous was the rivergod of Greece.

Acheron (ak' e-ron), the ancient name of several rivers in Greece and Italy, all of which were connected by legend with the lower world.

Achill (ak' il), or Eagle Island, the largest island on the Irish coast. Area, 51,521 acres, mostly bog. The chief occupation of the 5,000 inhabitants is fishing.

Achilles (a-kil' ēz), a Greek legendary hero, the chief character in Homer's Iliad. He was the son of Peleus, and of the Nereid Thetis, was instructed in eloquence and the arts of war by Phoenix, and in medicine by the centaur Cheiron. He led the Myrmidons to Troy in fifty ships, and was there the great bulwark of the Greeks. Being deprived by Agamemnon of Brisels, he ceased to take further part in the war, and the fortunes of the Greeks became desperate. He reconciled himself to Agamemnon, attacked the Trojans, and slew their bravest warrior, Hector. A legend represents his mother as having dipped him in the Styx to render him invulnerable, in which she succeeded with the exception of the ankles, by which she held him.

Achilles' Tendon, Tendon of Achilles, the strong tendon which connects the muscles of the calf with the heel, and may be easily felt with the hand. The origin of name is from the myth of Achilles' immersion in the river Styx.

Acid (Latin, acidus, sour), a name popularly

applied to a number of compounds. solid, liquid, and gaseous, having more or less the qualities of vinegar (itself a diluted form of acetic acid), the general properties assigned to them being a tart, sour taste, the power of changing vegetable blues into reds, of decomposing chalk and marble with effervescence, and of being in various degrees neutralized by alkalies. An acid has been defined as a substance containing hydrogen, which hydrogen is in whole or in part replaceable by a metal when the metal is presented in the form of a hydrate; being monobasic, diebasic, or tribasic, according to the number of hydrogen atoms replaced.

Acierage ( $\tilde{a}'$  se-  $\tilde{e}r$ - $\tilde{a}j$ ), a process by which an engraved copper-plate or an electrotype from an engraved plate of steel or copper has a film of iron deposited over its surface by electricity in order to protect the engraving from wear in printing. By this means an electrotype of a fine engraving, which, if printed directly from the copper, would not yield 500 good impressions, can be made to yield 3,000 or more; and when the film of iron becomes so worn as to reveal any part of the copper, it may be removed and a fresh coating deposited so that 20,000 good impressions may be got.

Aci Reale ( $\ddot{a}$ 'che-rā- $\ddot{a}$ 'lā), a seaport of Sicily, with a trade in corn, wine, fruit, etc. Pop. 24,100.

Aclin'ic Line, the magnetic equator, an irregular curve in the neighborhood of the terrestrial equator, where the magnetic needle balances itself horizontally, having no dip.

Aconcagua (à-kon-kä'gwà), a province, a river, and a mountain of Chile. The peak of Aconcagua, rising to the height of 22,860 feet, is one of the highest summits of the western hemisphere. Area of prov., 6,224 sq. mi. Pop. 133,830. Capital, San Felipe.

Ac'onite, a genus of hardy herbaceous

repreplants, sented by the well-known wolf's-bane or monk's-hood. and remarkable for their poisonous properties and medicinal qualities, being used internally as well as externally in rheumatism, gout, neuralgia. Aconitine is an alkaloid extracted from aconite, a virulent poison.

Aconquija (å-kon-kë'hà), a range of mountains in the Argentine Republic; the name also of a single peak, 17,000 feet

high. Acotyle'dons, plants not furnished with cotyledons or seed-lobes. They include ferns, mosses, sea-weeds, etc., and are also called flowerless plants.

Acoustics (a-kou'stiks), the science of sound. It teaches the cause, nature, and phenomena of such vibrations of elastic bodies as affect the organ of hearing; the manner in which sound is produced, its transmission through air and other media, the doctrine of reflected sound or echoes, the properties and effects of different sounds, including musical sounds or notes, and the structure and action of the organ of hearing, etc. The propagation of sound is analogous to that of light, both being due to vibrations which produce successive waves, and Newton was the first to show that its propagation through any medium depended upon the elasticity of that medium. Regarding the intensity, reflection, and refraction of sound, much the same rules apply as in light. In ordinary cases of hearing, the vibrating medium is air, but all substances capable of vibrating may be employed to propagate and convey sound. When a bell is struck its vibrations are communicated to the particles of air surrounding it, and from these to particles outside them, until they reach the ear of the listener. The intensity of sound varies inversely as the square of the distance of the body sounding from the

ear. Sound travels through the air at the rate of about 1.090 feet per second; through water at the rate of about 4,700 feet. Sounds may be musical or non-musical. A musical sound is caused by a regular series of exactly similar pulses succeeding each other at precisely equal intervals of time. If these conditions are not fulfilled the sound is a noise. Musical sounds are comparatively simple, and are combined to give pleasing sensations according to easy numerical relations. The loudness of a note depends upon the *degree* to which it affects the ear; the *pitch* of a note depends on the *number* of vibrations to the second which produce the note; the timbre, quality, or character of a note depends on the body or bodies whose vibrations produce the sound, and is due to the form of the paths of vibrating particles. The gamut is a series of eight notes, which are called by the names Do, Re, Mi, Fa, Sol, La, Si, Do. The properties of sound were mathematically investigated by Bacon and Galileo, but it remained for Newton, Lagrange, Euler, Laplace, Helmholtz, etc., to bring the science to its present state.

Acre, a standard measure of land, used in the U.S. and England. The acre consists of 4,840 square yards, divided into 4 roods.

**Acre** ( $\mathbf{\hat{a}}'$  ker), a seaport of Syria, in northern Palestine, on the Bay of Acre, early a place of

great strength and importance. Taken from the Saracens under Saladin in 1191 by Richard I of England and Philip of France; bravely defended by the Turks assisted by Sir Sidney Smith in 1799 against Napoleon; in 1832, taken by Ibrahim Pasha; in 1840, bombarded by a British, Austrian, and Turkish fleet, and restored to the sultan of Turkey. Pop. 10,000.

**Ácrop'olis**, the citadel or chief place of a Grecian city, usually on an eminence commanding the town. That of Athens contained some of the finest buildings in the world, such as the Parthenon, Erechthěum, etc.

Acros'tic, a poem of which the first or last, or certain other letters of the line, taken in order, form some name, motto, or sentence. A poem of which both first and last letters are thus arranged is called a double acrostic. In Hebrew poetry, the term is given to a poem, of which the initial letters of the lines or stanzas were made to run over the letters of the alphabet in their order, as in Psalm 119. Acrostics have been much used in complimentary verses, the initial letters giving the name of the person eulogized.

Acte on, in Greek mythology, a great hunter, turned into a stag by Artemis (Diana) for looking on her when she was bathing, and torn to pieces by his own dogs.

Ac'tinism, the property of those rays of light which produce chemical changes, as in photography, in contradistinction to the light rays and heat rays. The actinic property or force begins among the green rays, is strongest in the violet rays, and extends a long way beyond the visible spectrum.

Actinozo'a, a class of animals including seaanemones, corals, etc., all having rayed tentacles round the mouth.

Action, the mode of seeking redress at law for any wrong, injury, or deprivation. Actions are divided into civil and criminal, the former again being divided into real, personal, and mixed.

Ac'tium, a promontory on the western coast of Northern Greece, memorable on account of the naval victory gained here by Octavianus (afterward the Emperor Augustus) over Antony and Cleopatra, Sept. 2, B. c. 31. Cleopatra fled with sixty Egyptian ships, and Antony fled with her to Egypt. The deserted fleet was overcome after a brave resistance. Antony's land forces went over to the enemy.

Acts of the Apostles, one of the books of the New Testament, written in Greek by St. Luke. probably in A. D. 63 or 64. It embraces a period of about thirty years, beginning immediately after the Resurrection, and extending to the second year of the imprisonment of St. Paul in Rome.

Acupress'ure, a means of arresting bleeding from a cut artery introduced by Sir James Simpson in 1859, and consisting in compressing the artery above the orifice, that is, on the side nearest the heart, with the middle of a needle introduced through the tissues.

Acupunc'ture, a surgical operation, consisting in the insertion of needles into certain parts of the body for alleviating pain, or for the cure of different species of rheumatism, neuralgia, eye diseases, etc. It is easily performed, gives little pain, causes neither bleeding nor inflammation, and seems at times of surprising efficacy.

Adal', a country in Africa, east of Abyssinia, inhabited by a dark-brown race of same name, of nomadic habits, Mohammedans in religion; towns Aussa and Tajurrah. Part of the coast here is held by the French.

Ad'albert of Prague (955-997), called "the apostle of the Prussians," son of a Bohemian nobleman, appointed bishop of Prague in 983, labored in vain among the heathenish Bohemians, resolved to convert the pagans of Prussia, but was murdered in the attempt.

Adam, ROBERT (1728-1792), an eminent Scottish architect. He was employed by the English nobility and gentry in constructing modern and embellishing ancient mansions. Among his works are the Register House and the University buildings, Edinburgh, the royal Infirmary, Glasgow, and the Adelphi Buildings, London. He was buried in Westminster Abbey.

Adam and Eve, the names given in Scripture to our first parents, an account of whom and their immediate descendants is given in the early chapters of Genesis.

Adam de la Hale (1240-1287), French writer and musician. His *Jeu de Robin et de Marion* may be regarded as the first comic opera ever written.

Adama'wa, a region of Central Africa, also called *Fumbina*. Much of the surface is hilly or mountainous. A great part of the country is covered with thick forests. The inhabitants are industrious and intelligent. Slaves and ivory are the chief articles of trade. Chief town, Yola.

Chief town, Yola. Adams, Berks co., Mass., a prosperous manufacturing village 20 miles from Pittsfield. Pop. 9,206.

Ad'ams, CHARLES FRANCIS (1807-1886), American author and statesman, son of John Quincy Adams. His youthful years were spent in Europe, partly in England, but he finished his education at Harvard, and afterward studied law. After serving some years in the Massachusetts legislature was elected to Congress in 1858. In 1861 he was sent to England as American minister, and here he remained for seven years, performing the arduous duties of his office with the utmost tact and ability. He has edited a complete edition of his grandfather's works in ten volumes, with a life. He was one of the arbitrators on the Alabama claims.

Adams, CHARLES FRANCIS, Jr., second son of the above, born in Boston, 1835, graduated at Harvard, 1856, and admitted to the bar, 1858. He served in the Union army 1861–1865. He was appointed on the board of railroad commissioners for Massachusetts, 1869, and in 1884 president of the Union Pacific railway. He published *Chapters of Erie and other Essans*.

Adams, Charles Kendall, b. 1835 at Derby,

Vt. He graduated at the University of Michigan in 1861. He was made assistant professor there in 1863 and full professor in 1868. He became non-resident professor of history at ('ornell University in 1881, and in 1885 succeeded Andrew D. White as president. He is the author of *Democracy and Monarchy in France* (1874), and of *A Manual of Historical Literature* (N. Y. 1882). He became president of the University of Wisconsin in 1892.

Adams, GEORGE EVERETT, b. 1840 at Keene, N. H., graduated at Harvard, 1860. He moved to Chicago and practised law; elected state senator in 1880; elected to Congress from the fourth district in 1882 and re-elected three times. He is a Republican.

Adams, HENRY, b. 1838. was professor of history at Harvard 1870–1877. He has written several historical works. The youngest son of Charles Francis Adams.

Adams, JOHN (1735-1826), second president of the U. S., was born at Braintree (now Quincy), Massachusetts. He was educated at Harvard University, and adopted the law as a profession. His attention was directed to politics by the question as to the right of the English Parliament to tax the colonies, and in 1765 he published some essays strongly opposed to the claims of the mother country. As a member of the new American Congress in 1774, 1775, and 1776, he was strenuous in his opposition to the home government, and in organizing the various departments of the colonial government. On 13th May, 1776, he seconded the motion for a declaration of independence proposed by Lee of Virginia, and was appointed a member of committee to draw it up. The declaration was actually drawn up by Jefferson, but it was Adams who carried it through Congress. In 1778 he went to France on a special mission, but soon came back and again returned, and for nine years resided abroad as representative of his country in France, Holland, and England. After taking part in the peace negotiations he was appointed, in 1785, the first ambassador of the U.S. to the court of St. James. He was recalled in 1788, and in the same year elected vice-president of the republic under Washington. In 1792 he was re-elected vicepresident, and at the following election in 1796 was chosen president in succession to Washington. The commonwealth was then divided into two parties, the federalists, who favored aristocratic, and were suspected of monarchic views, and the republicans or democrats. Adams adhered to the former party, with which his views of government had always been in accordance, but the real leader of the party was Hamilton, with whom Adams did not agree, and who tried to prevent his election. His term of office proved a stormy one, which broke up and dissolved the federalist party. His re-election in 1800 was again opposed by the efforts of Hamilton, which ended in effecting the return of the democratic candidate Jefferson. Thus Adams retired from office into the obscurity of private life.

.

He had the consolation of living to see his son president. He died 4th July, 1826, the fiftieth anniversary of the declaration of independence, and on the same day as Jefferson. His works have been ably edited by his grandson Charles Francis Adams.

Adams, JOHN COUCH (1819–1892), an English astronomer. His investigations into the irregularities in the motion of the planet Uranus led him to the conclusion that they must be caused by another more distant planet. The French astronomer, Leverrier, had come to substantially the same results, which, being published in 1846, led to the actual discovery of the planet Neptune by Galle of Berlin. In 1858 Adams was professor of astronomy and geometry at Cambridge.

Adams, JOHN QUINCY (1767-1848), sixth president of the U. S., son of John Adams, second president. He accompanied his father to Europe and was educated there in part, but graduated at Harvard in 1788. He was ad-mitted to the bar in 1791. He began to take an active interest in politics, and some letters that he wrote having attracted general attention, in 1794 Washington appointed him minister to the Hague. He afterward was sent to Portugal, and by his father to Berlin. In 1798 he received a commission to negotiate a treaty of commerce with Sweden. On the accession of Jefferson to the presidency in 1801 he was recalled. The federalist party (that of his father), which was now declining, had sufficient influence in Massachusetts to elect him to the senate in 1803. In 1809 he went as ambassador to Russia. He assisted in nego-tiating the peace of 1814 with England, and was afterward appointed resident minister at London. Under Monroe as president he was secretary of state, and at the expiration of Monroe's double term of office he succeeded him in the presidency (1825). He was not very successful as president, and at the end of his term (1829) he was not re-elected. In 1831 he was returned to Congress by Massachusetts, and continued to represent this state till his death, his efforts being now chiefly on behalf of the abolitionist party.

Adams, JOHN QUINCY, b. 1833, was a member of the Massachusetts legislature, and contested the gubernatorial chair in 1867 and 1871. The oldest son of Charles Francis Adams.

Adams, SAMTEL (1722-1803), an American statesman, second cousin of President John Adams. He early devoted himself to politics, and in connection with the dispute between America and the mother country he showed himself one of the most unwearied, efficient, and disinterested assertors of American freedom and independence. He was one of the signers of the declaration of 1776, which he labored most indefatigably to bring forward. He sat in Congress eight years, in 1789-94 was lieutenant-governor of Massachusetts, in 1704-97 governor, when he retired from public life.

Adams, WILLIAM T. (1822-1897), born in Medway, Mass., better known by his pseudonym "Oliver Optic." a popular writer of

books for boys, was of the same family as the two presidents. Of his 36 volumes over half a million copies have been sold.

Adam's Bridge, a chain of reefs, sandbanks, and islands stretching between India and Ceylon; so called because the Mohammedans believe that when Adam was driven from paradise he had to pass by this way to Ceylon (where is also Adam's Peak).

Adam's Peak, one of the highest mountains in Ceylon 45 mi. e. s. e. of Colombo, conical, isolated, and 7,420 feet high. On the top, a rocky area of 64 ft. by 45, is a hollow in the rock 5 feet long bearing a rude resemblance to a human foot, which the Brahmans believe to be the footprint of Siva, the Buddhists that of Buddha, the Mohammedans that of Adam. Devotees of all creeds here meet and present their offerings (chiefly rhododendron flowers) to the sacred footprint. The ascent is very steep, and toward the summit is assisted by steps cut and iron chains riveted in the rock.

Ad'dax, a species of antelope of the size of a large ass with much of its make. The horns of the male are about 4 feet long, beautifully twisted into a wide sweeping spiral of two turns and a half, with the points directed outward. It has tufts of hair on the forehead and throat, and large broad hoofs. It inhabits the sandy regions of Nubia and Kordofan, and is also found in Caffraria.

Add'ison, JOSEPH (1672-1719), the most exquisite of English essayists, the founder of periodical literature, and poet, was the son of Rev. L. Addison, Dean of Lichfield, and was born at Milston, in Wiltshire. As a boy he made the acquaintance of Steele, afterward his coadjutor on the Tattler and Spectator. He graduated from Oxford M. A. in 1693. He traveled in Italy for two years, returning to England in 1703. While in Italy he penned his poetical Letter to Lord Halifax. In 1704 he wrote The Campaign, a poem addressed to the Duke of Marlborough, became member of Parliament in 1708, and in 1717 he was appointed secretary of state. He died at Holland House. A. commenced to write for the Tattler in 1709, and for its successor, the Spectator, in 1711. His tragedy of Cato, produced in 1713, met with unbounded success. Of his poetry one or two sacred pieces will endure as long as the language; but success. it is as an essayist that he is best known. For humor and poetic grace; for satire and for moral influence the essays of the Spectator remain unsurpassed.

Address, Forms of. The following are the principal modes of formally addressing titled personages or persons holding official rank in Great Britain and the U.S.:-

The King or Queen. - Address in writing : To the King's (Queen's) most excellent Majesty.

Say: Sire or Madam, Your Majesty. *The Royal Family.*— His Royal Highness (H. R. H.) the Prince of Wales, His Royal Highness the Duke of C—, His Royal Highness Prince A-

Duke and Ducal Family.-His Grace the Duke of ----; My Lord Duke, Your Grace. The duke's eldest son takes a secondary title

of his father, and is addressed as if he held it by right. A younger son is addressed, The Right Honorable Lord J-B-.

Marquis.— The Most Honorable the Marquis of ——, My Lord Marquis, My Lord. Earl.— The Right Honorable Earl of ——; My Lord, Your Lordship. The Right Honor-able the Countess of ——; Madam, Your Ladyship

Viscount.- The Right Honorable Lord Viscount ——; My Lord, Your Lordship. The Right Honorable the Viscountess ——; Madam,

Your Ladyship. Baron.— The Right Honorable Lord —; My Lord, Your Lordship.

Knight.—Sir C— D –, Kt., or K. G., K. C. B., G. C. B., etc., according to rank. The wives R. G. Č. B., etc., according to rank. of baronets and knights are styled Lady

Archbishop .- His Grace the Lord Archbishop of -

—; My Lord Archbishop; Your Grace. Bishop.— The Right Rev. the Lord Bishop of -; My Lord. Dean.-The Very Reverend; Sir; Mr. Dean.

Members of the Privy Council, the Speaker of the House of Commons, the Lord Chancel-

lor, Lord Advocate, are called Right Honorable ; members of Parliament, Honorable.

The Lord Mayors of London, York, and Dublin are styled Right Honorable.

In the U.S. persons holding official rank are similarly addressed; thus the President is styled His Excellency, as are also governors of states and foreign ministers; the vice-president, lieutenant-governors, senators, representatives, judges, and mayors are styled Honorable.

Adelaide (ad'e-lād), the capital of South Australia, founded in 1837, and named after the queen of William IV. The public buildings comprise the government house, court houses, the houses of legislature, the University, South Australian Institute, etc. Adelaide is connected by railway with Melbourne, and is the terminus of the overland telegraph to Port Darwin. Pop. 46,550.

Adelung (ad'e-lung), JOHANN CHRISTOPH (1732-1806), a German philologist. In 1759 he was appointed professor in the Protestant academy at Erfurt, and two years after removed to Leipzig, where he applied himself to his German dictionary (Leipzig, 1774-86), and his Mithridates, a work on general philology. In 1787 he was appointed librarian of the public library in Dresden.— FRIEDRICH VON ADELUNG (1768-1843), nephew of the above, also distinguished himself as a philologist. He became president of the Academy of Sciences at St. Petersburg.

A'den, a seaport town and territory on the southwest coast of Arabia. Occupying an important military position, Aden is strongly fortified and permanently garrisoned. Pop. 35,165.

Adenanthe'ra, a genus of trees and shrubs, natives of the East Indies and Ceylon. It includes one of the largest and handsomest trees of India, which yields hard solid timber called red sandal-wood. The bright scarlet seeds,

#### Adhesion

from their equality in weight (each-4 grains), are used by goldsmiths in the East as weights,

Adhesion, the tendency of two bodies to stick together when put in close contact, or the mutual attraction of their surfaces; distinguished from cohesion, which denotes the mutual attraction between the particles of a homogeneous body. Adhesion may exist between two solids, between a solid and a fluid, or between two fluids. A plate of glass or of polished metal laid on the surface of water and attached to one arm of a balance will support much more than its own weight in the opposite scale from the force of adhesion between the water and the plate. From the same force arises the tendency of most liquids, when gently poured from a jar, to run down the exterior of a vessel or along any other surface they meet.

Adige (ä'dē-jā), (German, Etsch), a river of Northern Italy, which rises in the Rhætian Alps, and after a south and east course of about 180 miles, during which it passes Verona and Legnago, falls into the Adriatic, forming a delta connected with that of the Po.

Adiron'dack flountains, a group belonging to the Appalachian chain, extending from the n. e. corner of the state of New York to near its center. The scenery is wild and grand, diversified by numerous beautiful lakes, and the whole region is a favorite resort of sportsmen and tourists. The district has been preserved in its natural beauty by state legislation constituting it a public park.

Adjutant-bird, a large wading bird of the stork family, native of the warmer parts of India. It stands about five feet high, has an enormous bill, and a pouch hanging from the

under part of the neck. It is one of the most voracious carnivorous birds known, and in India, from its devouring all sorts of carrion a n d noxious animals, is protected by law. From underneath the wings obtained a r e those light downy feathers known as marabou feathers. from the name of an allied species of bird Western in Africa, and also producing them.

Adjutant-bird.

Adler, FELIX, b. 1851, in Germany. He graduated at Columbia college in 1870, and studied at Berlin and Heidelberg. He was Professor of Hebrew and Oriental literature at Cornell 1874-76, and is at the head of the Society of Ethical Culture, New York City.

Adme'tus, in Greek mythology, king of Pheræ, in Thessaly, and husband of Alcestis, who gave signal proof of her attachment by consenting to die in order to prolong her husband's life.

Admiralty Charts. These useful aids to navigation are issued by the U. S. Coast Survey, as well as by the English, Russian, and French governments. The superintendent of the U. S. Coast Survey issues an annual report, showing the progress of the survey, and containing much valuable information.

Admiralty Island, an island belonging to the U. S. off the n. w. coast of N. A., 80 or 90 miles long and about 20 broad, covered with fine timber and inhabited by Sitka Indians.

Admiralty Islands, a cluster of islands, north of New Guinea, belonging to Germany. The largest is about 60 miles in length. They possess dense groves of cocoa-nut trees. The islanders are of a tawny color, have no metal (except what is imported), but use tools of stone and shell.

Adobe (å-dö'bā), the Spanish name for a brick made of loamy earth, containing about two thirds fine sand and one third clay dust, sun dried; in common use for building in Mexico, Texas, and Central America.

Ado'ni, a town and district in Madras, India; population of former 22,732, of latter 179,-448. Well known for excellent silk and cotton fabrics.

Ado'nis, a mythological personage, originally a deity of the Phænicians, but borrowed into Greek mythology. See Mythology.

into Greek mythology. See Mythology. Ado'nis, a genus of plants. In the cornadonis or pheasant's eye the petals are bright scarlet like the blood of Adonis, from which the plant is fabled to have sprung.

Adour (å-dör), a river of France, rising in the Pyrenees, and falling into the sea a little below Bayonne; length about 200 miles; partly navigable.

Ado'wa, a town of Abyssinia in Tigrć, at an elevation of 6,270 feet; the chief commercial depôt on the caravan route from Massowa to Gondar. Pop. about 6,000.

Adra (ä' dra), a seaport of southern Spain, in Andalusia, near the mouth of the Adra, on the Mediterranean; with marble quarries and lead works. Pop. 11,320.

Adrar', a district in the western Sahara of Africa, peopled by Berbers possessing camels, sheep, and oxen, and cul-

Berber Woman.

tivating dates, wheat, barley, and melons. Chief towns, Wadan, and Shingit, which has inexhaustible beds of rocksalt.

Adria (ä'dri-å), a cathedral city of northern Italy, province of Rovigo, between the Po and the Adige, on the site of the ancient town of same name, whence the Adriatic derives its appellation. Owing to alluvial deposits, the sea is now 17 miles distant. Pop. 11,554.

Adrian, the name of six popes of Rome. The first ruled from 772-795; a contemporary and friend of Charlemagne.-ADRIAN II was elected pope in 867, at the age of seventy-five years. He died in 872, in the midst of con-flicts with the Greek Church.—Adrian III, elected 884, was pope for one year and four months only.—ADRIAN IV, originally named Nicolas Breakspear, the only Englishman that ever occupied the papal chair, was born about 1100, and died 1159. He studied in France, and became abbot of St. Rufus in Provence. He became pope in 1154. He issued the famous bull (1158) granting the sovereignty of Ireland, on condition of the payment of Peter's pence, to Henry II.—ADRIAN V, settled the dispute between King Henry III, of England and his nobles, in favor of the former; but died a month after his election to the papal chair (1276).—ADRIAN VI, born at Utrecht, in 1459, was elected to the papal chair, 1522. He opposed the zeal of Luther with reproaches and threats, and even attempted to excite Erasmus and Zwinglius against him. Died 1523.

A'drian, Lenawee co., Mich., 70 miles w. s. w. of Detroit. Its extensive water-power is employed in works of various kinds. Pop. 10,000.

Adriano'ple, an important city of Turkey, about 135 miles w. n. w. from Constantinople. It has a great mosque, a palace, now in a state of decay, a grand aqueduct, and a splendid bazar: manufacturers of silk, woolen, and cotton stuffs, otto of roses, leather, etc., and an important trade. Adrianople was the residence of the Turkish sovereigns till the conquest of Constantinople in 1453. In 1829 it was taken by the Russians. The Russians occupied it also in 1878. Pop. 60,000.

Adriat'ic Sea, or GULF OF VENICE, an arm of the Mediterranean, stretching in a northwesterly direction from the Straits of Otranto, between Italy and the Turkish and Austrian dominions. Length. about 480 miles; average breadth. about 100; area, about 60,000 \$4. mi.

Adul'lam, CAVE OF, a cave to which David fled when persecuted by Saul. 1 Sam. 22:1, 2.

Adultera'tion, a term not only applied in its proper sense to the fraudulent mixture of articles of commerce, food, drink, drugs, seeds, etc., with noxious or inferior ingredients, but also by magistrates and analysts to accidental impurity, and even in some cases to actual substitution. The chief objects of adulteration are to increase the weight or volume of the article, to give a color which either makes a good article more pleasing to the eye or else disguises

an inferior one, to substitute a cheaper form of the article, or the same substance from which the strength has been extracted, or to give it a false strength. Among the adulterations which are practised for the purpose of fraudulently increasing the weight or volume of an article are the following:-Bread is adulterated with alum or sulphate of copper which gives solidity to the gluten of inferior flour; with chalk or carbonate of soda to correct the acidity of such flour; and with boiled rice or potatoes, which enables the bread to carry more water, and thus to produce a larger number of loaves from a given quantity of flour. Milk is usually adul-terated with water. The adulterations generally present in butter consist of an undue proportion of salt and water, lard, tallow, and other fats. Genuine butter should not con-tain less than 80 per cent. of butter-fat. Tea is adulterated (chiefly in China) with sand, iron-filings, chalk, gypsum, China clay, exhausted tea leaves, and the leaves of the sycamore, while color and weight are added by black-lead, indigo, Prussian-blue, gum, turmeric, soapstone, and other substances. Coffee is mingled with chicory, roasted wheat, roasted beans, acorns, rye-flour, and colored with burned sugar, and other materials. Chicory is adulterated with different flours, as rye, wheat, beans, etc., and colored with burned sugar, Venetian red, etc.

Tobacco is mixed with sugar and treacle, aloes, liquorice, oil, alum, etc., and such leaves as rhubarb, chicory, cabbage, burdock, besides excess of salt and water. Confections are adulterated with flour and sulphate of lime. Pepper is adulterated with linseed-meal, flour, mustard husks, etc. Color is given to pickles by salts of copper, acetate of copper, etc. Brandy is diluted with water, and burned sugar is added to improve the color. Gin is mixed with excess of water, and flavoring matters are added. For champagne, gooseberry and other inferior wines are often substituted. Medicines, such as jalap, opium, rhubarb, aloes, sarsaparilla, squills, etc., are mixed with various foreign substances. Castor-oil has been adulterated with other oils; and inferior oils are often mixed with codliver oil. The adulteration of seeds is largely practised. Thus turnip-seed is mixed with rape, wild mustard, or charlock. Clover is also much mixed with plantain and mere weeds. Laws against adulteration have been passed in various countries and at various times.

**Ægean Sea** ( $\tilde{e}$ - $j\tilde{e}$ 'an), that part of the Mediterranean which washes the eastern shores of Greece, the southern coast of Turkey, and the western coast of Asia Minor.

**Aggina** (e-ji'na), a Greek island; area about 32 sq. mi.; pop. 7,000. Except in the west, where the surface is more level, the island is mountainous and unproductive. The inhabitants are chiefly engaged in trade, seafaring, and agriculture, the chief crops being almonds, olives, and grain. In 456 B.c. the island fell under the power of the Athenians, and in

ς.

431 the Æginetans were expelled to make room for Athenian settlers, but were afterward restored. On a hill are the remains of a splendid temple of Athena (Minerva). Here were found in 1811 a number of marble statues (the Æginetan marbles), which are now at Munich.

Ægis (ë' jis), the shield of Zeus, according to Homer. In a figurative sense the word is used to denote some shielding or protecting power.

to denote some shielding or protecting power. **Ægospot'ami** ("goat-river"), a place on the Hellespont, of some note in Greek history, the Athenian fleet being here completely defeated in 405 B. c. by the Spartan Lysander, thus ending the Peloponnesian war.

Æne'as, the hero of Vergil's Ænëid, a Trojan, who, according to Homer, was, next to Hector, the bravest of the warriors of Troy. See Vergil.

**Abolian Harp**, a musical instrument, generally consisting of a box of thin fibrous wood, to which are attached from eight to fifteen fine catgut strings or wires, stretched on low bridges at each end, and tuned in unison. Its length is made to correspond with the size of the window or other aperture in which it is intended to be placed. When the wind blows athwart the strings, it produces very beautiful sounds, sweetly mingling all the harmonic tones, and swelling or diminishing according to the strength or weakness of the blast. It is said to have been invented by the German Jesuit, Athanasius Kerches (1602-1680).

**Æ'olus**, in Greek mythology the god of the winds, which he kept confined in a cave in the Æolian Islands, releasing them when he wished or was commanded by the superior gods.

Æpyor'nis, a genus of gigantic birds whose remains have been found in Madagascar, where it is supposed to have lived perhaps not longer than 200 years ago. It had three toes, and is classed with the ostrich, etc. Its eggs measured 14 inches in length, being about six times the bulk of those of the ostrich.

the bulk of those of the ostrich. A'erated Bread. — The raising of bread in baking is accomplished in two distinct ways. By the fermentation process carbonic acid gas is generated in the dough by induced alcoholic fermentation, but when the carbonic acid is developed from a foreign substance or introduced from without, acrated or unfermented bread is the result. The principal method of bread is the result. manufacturing A. B. is by a process patented by the late Dr. Danglish. It consists in making dough with water charged with carbonic acid under high pressure, which renders the mass uniformly spongiform throughout. The water for mixing is charged with carbonic acid in the same manner plain Aërated Water is prepared, and the mixing is accomplished in a strong cast-iron cylinder, in which a series of arms revolves by steam-power. The dough is expelled from the lower end of the cylinder into a box which is gauged to hold a two-pound loaf, and from the box it is removed into pans for firing without any portion of the material ever being handled.

A'erated Waters, waters impregnated with

carbonic acid gas, and forming effervescing beverages. Some mineral waters are naturally aërated, as Vichy, Apollinaris, Rosbach, etc.; others, especially such as are used for medicinal purposes, are frequently aërated to render them more palatable and exhilarating. Water simply aërated, or aërated and flavored with lemonade or fruit syrups, is largely used, especially in summer, as a refreshing beverage.

A'erolite, a meteoric stone, meteorite, or shooting-star. See Meteor.

Aeronau'tics, the art of sailing in or navi-gating the air. The first form in which the idea of aërial locomotion naturally suggested itself was that of providing men with wings by which they should be enabled to fly. It is now, however, the general opinion of scientific men that it is impossible for man by his muscular strength alone to give motion to wings of sufficient extent to keep him sus-pended in the air. But although the muscles of man may be of insufficient strength to enable him to use such wings, there yet remains the possibility of making a flying car, elevated and propelled by machinery, or a boat to float in the air. The navigation of the air by means of the balloon dates only from nearly the close of the eighteenth century. In 1766 Henry Cavendish showed that hydrogen gas was at least seven times lighter than ordinary air, and it at once occurred to Dr. Black of Edinburgh that a thin bag filled with this gas would rise in the air, but his experiments were for some reason unsuccessful. Some years afterward Tiberius Cavallo found that a bladder was too heavy and paper too porous, but in 1782 he succeeded in elevating soapbubbles by inflating them with hydrogen gas. In this and the following year two French-men, the brothers Stephen and Joseph Montgolfier, acting on the observation of the suspension of clouds in the atmosphere and the ascent of smoke, were able to cause several bags to ascend by rarefying the air within them by means of a fire below. These experiments roused much attention at Paris; and soon after a balloon was constructed under the superintendence of Professor Charles, which being inflated with hydrogen gas rose over 3,000 feet in two minutes, disappeared in the clouds, and fell after three quarters of an hour about 15 miles from Paris. These Montgolfier and Charles balloons already represented the two distinct principles in respect to the source of elevating power, the one being inflated with common air rarefied by heat, requiring a fire to keep up the rarefaction, the other being filled with gas lighter at a common temperature than air, and thus rendered permanently buoyant. Both forms were used for a considerable time, but the greater safety and convenience of the gaseous inflation finally prevailed. After the use of coal-gas had been introduced it superseded hydrogen gas, as being much less expensive, though having a far less elevating power. The first person who made an ascent in a balloon was Pilâtre de Rozier, who ascended 50 feet at Paris in 1783 in one of Montgolfler's.

A short time afterward M. Charles and M. Robert ascended in a balloon inflated with hydrogen gas, and traveled a distance of 27 miles from the Tuileries; M. Charles by himself also ascended to a height of about 2 miles. Blanchard with the American Dr. Jeffries, first crossed the Channel from Dover to Calais, in 1785; Garnerin, who first descended by a parachute from a balloon in October, 1797; and Gay-Lussac, who reached the height of 23,000 feet in September, 1804. In 1836 a balloon carrying Messrs. Green, Holland, and Mason traversed the 500 miles between London and Weilburg in Nassau in eighteen hours. In 1859 Mr. J. Wise, the chief of American aëronauts, accompanied by several others, rose from New York, and landed, after a flight of 1.150 miles, in twenty hours. In September, 1862, the renowned acronaut, Mr. Glaisher, accompanied by Mr. Coxwell, made an ascent from Wolverhampton, and reached the elevation of 37,000 feet, or 7 miles, which far exceeds the height hitherto attained by any other aërial voyagers. But the daring excursionists were for a time in great peril, Mr. Glaisher having been insensible for seven minutes, and Mr. Coxwell having his hands so severely frozen that he was unable to pull the valve for descent with them, and was compelled to use his teeth.-All the features of the balloon as now used are more or less due to Professor Charles, already mentioned. The balloon is a large pear-shaped bag, made of pliable silk cloth, covered with a varnish of caoutchouc dissolved in oil of turpentine to render it air-tight. The ordinary size of the bag ranges from 20 to 30 feet in equatorial diameter, with a proportionate height, but a balloon of 100 feet in diameter and 130 feet in height has been constructed. A car, generally of wicker-work, supported by a network which extends over the balloon, contains the aëronaut, and a valve, usually placed at the top, to which is attached a string reaching the car, gives him the power of allowing the gas to escape, whereby the balloon is lowered at pleasure. The problem of how to steer or propel a balloon in a desired horizontal direction can scarcely be said to have been satis-factorily solved. Balloons of a fish or cigar shape, floated by gas, propelled by a screw driven by a dynamo-electric machine, and steered by a large rudder, made several ascents in Paris in 1884 and 1885, and it is claimed for them that they have settled the question of the practicability of aerial navigation. Balloons have been used for taking both meteorological and military observations with considerable success. During the siege of Paris in 1870-71 over sixty persons (including Gambetta) and innumerable letters left the city in balloons. Recent experiments have been directed to flying machines by Maxim, Chanut, and others, and to dirigible kites by Lieut. Wise of the U.S. army.

Acrostatic Press, a simple contrivance for rendering the pressure of the atmosphere available for extracting the coloring matter from dye-woods, and similar purposes. A horizontal partition divides the machine into two parts. The lower part is connected with an air-pump, by means of which the air can be withdrawn from it. The matter from which the substance is to be extracted is laid upon the partition, which is perforated, and a perforated cover is placed over it. Upon this the liquid intended to form the extract is poured, and, the pump being worked, the air is extracted from the lower vessel, and by the pressure of the atmosphere the liquid is forced through the intervening mass, carrying the color or other soluble matter with it.

color or other soluble matter with it. **Æschines** (ës'ki-nëz), (390-314 B. c.) a celebrated Athenian orator, the rival and opponent of Demosthenes. He headed the Macedonian party in Greece, or those in favor of an alliance with Philip, while Demosthenes took the opposite side. Having failed in B. c. 330 in a prosecution against Ctesiphon for proposing to bestow a crown of gold upon Demosthenes for his services to the state (whence the oration of Demosthenes On the Croacn) he withdrew from Athens. Latterly he established a school of eloquence at Rhodes.

Æschylus (524-456 B. C.), the earliest of the three great writers of Greek tragedy.— He was of noble family, and probably a de-scendant of Codrus, the last king of Athens. His father was probably connected with the worship of Ceres, and Æschylus himself was early familiar with the Eleusinian Mysteries, strange religious rites into which he was after-Æschylus's life was active, ward initiated. not only in the field of dramatic poetry, but on the battle-field in defence of Athens against the invaders. For distinguished valor at Marathon (490) he, with his two brothers, Exclusion (100) in the area of the area of the first of t gained the prize for a trilogy. In the latter part of his life he was defeated by Simonides in the contest for a prize offered for the best elegy on those who fell at Marathon. Æschylus spent most, and perhaps all, of his remaining years in Sicily, where he was well received, and died there. - Of Æschylus's 70 dramas but seven are preserved, in addition to a few Of these the Prometheus is fragments. perhaps the best known to English readers through Mrs. Browning's poetical version. Æschylus has given an original portrayal to the story, making Prometheus's awful fate appear as the just result of his wilful self-assertion. In the Agamemnon is beautifully told the story of Clytemnestra's crime. He caused the first stage to be erected, and was the first to provide appropriate scenery and costumes. In style, the tragedies of Æschylus are grand and somber, and in their intensity they sometimes surpass even Shakes-Like this poet Æschylus drew his peare. material largely from myths and legends. Some are historical in character. The Persæ tells of the defeat of Xerxes and his host.

**Ascula plus**, the god of medicine among the Greeks and latterly adopted by the Romans, usually said to have been a son of Apollo.

He is often represented with a large beard, holding a knotty staff, round which is entwined a serpent, the serpent being specially his symbol.

Æ'sop, the Greek fabulist, is said to have been a contemporary of Crœsus and Solon, and thus probably lived about the middle of the sixth century B. C. He visited the court of Crœsus, and is also said to have visited Pisistratus at Athens. Finally he was sent by Crœsus to Delphi to distribute a sum of money to each of the citizens. For some reason he refused to distribute the money, whereupon the Delphians, enraged, threw him from a precipice, and killed him. In modern times several collections purporting to be Æsop's fables have been published.

Æsthet'ics, the philosophy of the beautiful; the name given to the branch of philosophy or of science which is concerned with that class of emotions, or with those attributes, real or apparent, of objects generally comprehended under the term beauty, and other related expressions. Baumgarten (1714-1762), a German philosopher, was the first modern writer to treat systematically on the subject. Socrates, according to Xenophon, regarded the beautiful as coincident with the good, and both as resolvable into the useful. Plato, in accordance with his idealistic theory, held the existence of an absolute beauty, which is the ground of beauty in all things. He also asserted the intimate union of the good, the beautiful, and the true. In his treatises on Poetry and Rhetoric Aristotle lays down a theory of art, and establishes principles of beauty. His philosophical views were in many respects opposed to those of Plato. He does not admit an abso-lute conception of the beautiful; but he distinguishes beauty from the good, the useful, the fit, and the necessary. A distinction of beauty, according to him, is the absence of lust or desire in the pleasure it excites. Beauty has no utilitarian or ethical object; the aim of art is merely to give immediate pleasure; its essence is imitation. Plotinus agrees with Plato, and disagrees with Aristotle, in holding that beauty may subsist in single and simple objects, and consequently in restoring the ab-solute conception of beauty. He differs from Plato and Aristotle in raising art above nature. Baumgarten's treatment of æsthetics is essentially Platonic. He made the division of philosophy into logic, ethics, and æsthetics; the first dealing with knowledge, the second with action (will and desire), the third with beauty. He limits asthetics to the conceptions derived from the senses, and makes them consist in confused or obscured conceptions, in contradistinction to logical knowledge, which con-sists in clear conceptions. Kant defines beauty in reference to his four categories-quantity, quality, relation, and modality. In accordance with the subjective character of his system, he denies an absolute conception of beauty, but his detailed treatment of the subject is incon-sistent with the denial. Thus he attributes a beauty to single colors and tones, not on any plea of complexity, but on the ground of purity. He holds also that the highest meaning of beauty is to symbolize moral good, and arbitrarily attaches moral character to the seven primary colors. The value of art is mediate, and the beauty of art is inferior to that of nature. The treatment of beauty in the systems of Schelling and Hegel could with difficulty be made comprehensible without a detailed reference to the principles of these remarkable speculations. English writers on beauty are numerous, but they rarely ascend to the heights of German speculation. Shaftesbury adopted the notion that beauty is perceived by a special internal sense; in which he was followed by Hutcheson, who held that beauty existed only in the perceiving mind, and not in the Numerous English writers, among object. whom the principal are Alison and Jeffrey, have supported the theory that the source of beauty is to be found in association - a theory analogous to that which places morality in sympathy. Dugald Stewart attempted to show that there is no common quality in the beautiful beyond that of producing a certain refined pleasure; and Bain agrees with this criticism, but endeavors to restrict the beautiful within a group of emotions chiefly excited by association or combination of simpler elementary Herbert Spencer has a theory of feelings. beauty which is subservient to the theory of evolution. He makes beauty consist in the play of the higher powers of perception and emotion, defined as an activity not directly subservient to any processes conducive to life, but being gratifications sought for themselves alone. He classifies æsthetic pleasures according to the complexity of the emotions excited, or the number of powers duly exercised; and he attributes the depth and apparent vagueness of musical emotions to associations with vocal tones built up during vast ages. Among numerous writers who have made valuable contributions to the scientific discussion of esthetics may be mentioned Winckelmann, Lessing, Richter, the Schlegels, Gervinus, Helmholtz, and Ruskin.

Ætna, (or Etna) Mount, the greatest volcano in Europe, in the province of Catania in Sicily; height, 10,874 feet. It rises immediately from the sea, has a circumference of more than 100 miles, and dominates the whole northeast part of Sicily, having a number of towns on its lower slopes. The top is covered with perpetual snow; midway down is the woody or forest region; at the foot is a region of orchards, vineyards, olive groves, etc. Ætna thus presents the variety of climates common to high mountains in lower latitudes, oranges and lemons and other fruits growing at the foot, the vine rather higher up, then oaks, chestnuts, beeches, and pines, while on the loftiest or desert region vegetation is of quite a stunted character. A more or less distinct margin of cliff separates the mountain proper from the surrounding plain; and the whole mass seems formed of a series of superimposed mountains, the terminal volcano being surrounded by a number of cones, all of volcanic origin, and nearly 100 of which are of consid-

The different aspects of the erable size. mountain present an astonishing variety of features - woods, forests, pastures, cultivated fields, bare rocky precipices, streams of lava, masses of ashes and scorize, as also picturesque towns and villages. From the summit the view presents a splendid panorama, embracing the whole of Sicily, the Lipari Islands, Malta, and Calabria. The eruptions of Ætna have been numerous, and many of them destructive. That of 1169 overwhelmed Catania and buried 15,000 persons in the ruins. In 1669 the lava spread over the country for forty days, and 10,000 persons are estimated to have perished. In 1693 there was an earthquake during the eruption, when over 60,000 lives were lost. One eruption was in 1755, the year of the Lisbon earthquake. Among more recent eruptions are those of 1832, 1865. 1874, 1879. An eruption is ordinarily preceded by premonitory symptoms of longer or shorter duration. The population of the dis-trict of Ætna is about 300,000.

**Æto'lia**, a western division of northern Greece. The inhabitants are little heard of in Greek history till the Peloponnesian war, at which time they were notorious among the Greeks for the rudeness of their manners.

Affida'vit, a written statement of facts upon oath or affirmation. Affidavits are generally made use of when evidence is to be laid before a judge or a court, while evidence brought before a jury is delivered orally. The person making the affidavit signs his name at the bottom of it, and swears that the statements contained in it are true. The affidavit may be sworn to in open court, or before a magistrate or other duly qualified person.

Affin'ity, in chemistry, the force by which unlike kinds of matter combine so intimately that the properties of the constituents are lost, and a compound with new properties is The usual effect of increase of produced. temperature is to diminish affinity and ultimately to cause the separation of a compound Where two elements into its constituents. combine to form a compound, heat is almost always evolved, and the amount evolved serves as a measure of the affinity. In order that chemical affinity may come into play it is necessary that the substances should be in contact, and usually one of them at least is a fluid or a gas. Color, taste, and smell are changed, destroyed, or created ; harmless constituents produce strong poisons; strong poisons produce harmless compounds.

Affin'ity, the relationship, imputed by reason of marriage, between the husband or wife and the kindred by blood of the other. Thus the wife's kindred bear the same relation by affinity to the husband that they bear to her by consanguinity. Affinity also exists between the husband and one who is connected by marriage with the blood relations of the wife, as in the case of two men who were married to sisters. It constitutes a disqualification of judges or jurors equally with consanguinity. In England, under the statute 32 Henry VIII, it was held that affinity was an impediment to marriage to the same extent as consanguinity; and hence arose the rule of the English law that a man may not marry his deceased wife's sister.

Afghanistan (äf-gän'i-stän), a country in Asia. In part the boundaries are not well defined, but recently that from the Oxus to the Persian frontier has been surveyed and marked by boundary stones by a joint Russian and British commission. The area may be set down at about 280,000 sq. mi. 'The population is estimated at between 5,000,000 and 6,000,-000. Afghanistan consists chiefly of lofty, bare, uninhabited tablelands, sandy, barren plains, ranges of snow-covered mountains, offsets of the Hindu Kush or the Himalayas, and deep ravines and valleys. Many of the last are well watered and very fertile, but about four fifths of the whole surface is rocky, mountain-ous, and unproductive. The surface on the northeast is covered with lofty ranges belonging to the Hindu Kush, whose heights are often 18,000 and sometimes reach perhaps 25,-000 feet. The northeastern portion of the country has a general elevation of over 6,000 feet; but toward the southwest, the gen-eral elevation declines to about 1,600 feet. The interior mountains reach the height of 15,000 feet. Great part of the frontier toward India consists of the Suleiman range, 12,000 feet high. There are numerous avenues of communication between Afghanistan and India, such as the Khyber Pass, the Gomul Pass, and the Bolan Pass, The largest river is the Helmund, 400 miles long. The climate is extremely cold in the higher, and intensely hot in the lower regions. The most common trees are pines, oaks, birch, and walnut. In the valleys fruits in the greatest variety and abun-dance, grow wild. The principal crops are wheat, barley, rice, maize, tobacco, sugar-cane, and cotton. The chief domestic animals are the dromedary, the horse, ass, and mule, the ox, sheep, and goat; of wild animals, there are the tiger, bears, leopards, wolves, jackal, hyena, foxes, etc. The chief towns are Cabul (the capital), Kandahar, Ghuzni, and Herat. The Afghans proper form the great mass of the people. They are allied in blood to the Persians, and are divided into a number of tribes, among which the Duranis and Ghiljis are the most important. The Afghans are bold, hardy, and warlike, of a restless, turbulent temper, and much given to plunder. Tribal dissensions are constantly in existence. Their language is distinct from the Persian, though it contains a great number of Persian words, and is written with the Arabic char-In religion they are Mohammedans acters. of the Sunnite sect.

The history of Afghanistan belongs almost to modern times. In 1738 the country was conquered by the Persians. About 1825 Dost Mohammed, the ruler of Cabul, acquired a preponderating influence in the country. In 1839, a British army entered Afghanistan, occupied Cabul, and placed Shah Shuja, a former ruler, on the throne. The Afghans organized a widespread insurrection in 1841, when a number of British officers, women, and children were murdered. In January, 1842, the British left Cabul. In a few months Gen. Pollock, with a fresh army from India, retook Cabul and soon finished the war. Shah Shuja having been assassinated, Dost Mohammed again obtained the throne of Cabul, and acquired extensive power in Afghanistan. He died in 1863, having nominated his son Shere Ali his successor. Shere Ali entered into friendly relations with the British, but in 1878 war was declared against him, and the British troops entered Afghanistan. The ameer fied to Turkestan, where he soon after died: and his son Yakeob Khan, having succeeded him, concluded a treaty with the British in 1879, in which extension of the British frontier, the control by Britain of the foreign policy, and the residence of a British envoy in Cabul, were the chief stipulations. In 1880 Abdur-Rahman, a grandson of Dost Mohammed, was recognized by Britain as emir of the country, and has since been on friendly terms with the British, by whom he is subsidized. Recent encroachments by the Russians on territory claimed by Afghanistan almost brought about a rupture between Britain and Russia in 1885, and has led to the delimitation of the frontier of Afghanistan on the side next the territory now occupied by Russia.

Af'rica, the second in size of the great divisions of the globe, lies in the eastern hemisphere. Its greatest length is about 5,000 miles, its greatest breadth 4,700, its area is 11,525,810 sq. mi., and its coast-line 15,000 miles. A. is shaped like an irregular triangle, having its vertex to the south, and is bounded n. by the Mediterranean, e. by the Red Sea and Indian Ocean, and w. by the Atlantic Ocean. It is joined to Asia by a narrow neck of land, which, however, has been cut through by the Suez Canal. There are few large gulfs and bays; the most important are the gulfs of Sidra and Kabes (the greater and lesser Syrtes) on the n.; Suez, Aden, and Delagoa Bay on the e.; Algoa Bay on the s.; and the Gulf of Guinea on the w. The principal capes are Bon on the n.; Guardafui on the e.; Good Hope on the s.; and Verd on the w. The islands belonging to Africa are not numerous, and except Madagascar, none of them are large. They include Madeira, the Canaries, large. They include Madeira, the Canaries, Cape Verd Islands, Fernando Po, Prince's Island, St. Thomas, Ascension, St. Helena, Mauritius, Bourbon, the Comoros, Socotra, etc.

Political Divisions.— The African continent has undergone considerable modification politically, during the last decade, due to wars and exploration and colonization. The principal political divisions of Africa are—Egypt, Algeria, Morocco, Tunis and Tripoli, Abyssinia, Congo Free State, Liberia, Sierra Leone. Cape of Good Hope, Natal, South African Republic (Transvaal), Orange Free State, Senegal, Rivieres du Sud, French Soudan, Algolia, Mossandes, Benguela, St. Paul de Loanda, Portuguese Congo, State of East Africa, Fritrea. Togoland, Kamarun, Rio de Oro, Ifni, Kordofan, Darfoor, Madagascar, Mauritius. About one fourth of Africa is under the direct or indirect control of seven European states — Great Britain, France, Portugal, Spain, Germany, Italy, and Turkey. The remainder of the continent consists of independent empires and kingdoms, republics and tribal states. Great Britain holds Gambia and Sierra Leone, a part of the Gumea coast, a part of the Lower Niger and Benue, the colonies of Cape and Natal, with Griqualand West, and has protectorates over Basutoland, Kafirland, Pondoland, part of Zululand, Bechuanaland, part of the territory between Mount Kilima Njoro and the Dana River, and Socotra; and also has military occupation of Egypt. France holds Algeria, Tunis, Senegal, the

France holds Algeria, Tunis, Senegal, the Gaboon and Ogoway basins, Obok and Grand Bassand.

Portugal holds Angolia and Benguela, with a small tract just north of the Congo mouth, Mozambique.

Spain holds Cuta, opposite Gibraltar, Ifni, and the District of Muni and Naya Rivers.

Germany has acquired the coast lands between Cape Frio and the Orange River, the Cameroons at the head of the Gulf of Guinea, and some territory in the region of Victoria Nyanza.

Italy occupies the Red Sea coast from Massowa to Assab.

Turkey continues her suzerainty over Egypt and retains the pashalik of Tripolitana with Fezzan.

Belgium, through King Leopold II, has the sovereignty of Congo Free State, which was founded by the International Conference of Berlin in 1885.

The most important native states are Morocco, the Abyssinian Empire, Waddai, Fulah, including the empire of Sococa and the kingdoms of Gando and Moasina on the Niger; Dahomey, Zanzibar, U-Ganda, U-Rua, U-Lunda, Matabele, the two Boer states of Transvaal (South African Republic), and Orange Free State. Liberia a native republic founded prior to the abolition of slavery in the U. S., as a home for emancipated slaves. Population, about 20,000 descendants of American negroes and about one million natives. Surface, Rivers, and Lakes.— The most strik-

ing feature of northern Africa is the immense tract known as the Sahara, or Great Desert, which is inclosed on the north by the Atlas Mountains (greatest height, 12,000 to 13,000 feet), the plateau of Barbary and that of Barca, on the east by the mountains along the west coast of the Red Sea, on the west by the Atlantic Ocean, and on the south by the Sou-The Sahara is by no means the sea of dan. sand it has sometimes been represented: it contains elevated plateaux and even mountains radiating in all directions, with habit-able valleys between. A considerable nomadic population is scattered over the habitable parts, and in the more favored regions there are settled communities. The Soudan, which lies to the south of the Sahara, and separates it from the more elevated plateau of Southern Africa, forms a belt of pastoral country across

Africa, and includes the countries on the Niger, around Lake Tchad (or Chad), and eastward to the elevated region of Abyssinia. Southern Africa as a whole is much more fertile and well watered than Northern Africa, though it also has a desert tract of considerable extent (the Kalahari Desert). The mountains which inclose Southern Africa are mostly much higher on the east than on the west, the most northerly of the former being those of Abyssinia, with heights of 10,000 to 14,000 or 16,000 feet, while the eastern edge of the Abyssinian plateau presents a steep un-broken line of 7,000 feet in height for many hundred miles. Farther south, and between the great lakes and the Indian Ocean, we find Mounts Kenia and Kilimanjaro (19,500 feet), the loftiest in Africa, covered with perpetual snow. Of the continuation of this mountain boundary we shall only mention the Drakenberg Mountains, which stretch to the southern extremity of the continent, reaching in Cathkin Peak, Natal, the height of over 10,000 feet. Of the mountains that form the western border the highest are the Cameroon Mountains, which rise to a height of 13,000 feet, at the inner angle of the Gulf of Guinea. The average elevation of the southern plateau is probably from 3,000 to 4,000 feet.

In respect to the river systems of Africa there is a certain symmetry. The two great southern basins of the Congo and Zambezi balance those of the Nile and Niger on the north, and the Orange and Limpopo in the extreme south correspond with the Senegal and Draa of the northwest. The Zambezi, Limpopo, Rovuma, Juba, and a few other coast streams flow into the Indian Ocean. The Congo, Nile, Niger, Orange, Cuncne, Koamza, Ogo-way, Volta, Cambaia, Tensife, Muluya, and Majerdah flow into the Atlantic directly or through the Mediterranean. Nearly all of these rivers have falls or rapids such as the Victoria Falls in the Zambezi, the Yellala and Isangulla and Stanley Falls on the Congo, the so-called six cataracts, the Ripon, the Mer-chison and others on the Nile, the Hundred Falls on the Middle Orange. The principal lakes of Africa are Nyassa, Tanganyika, Alex-andria Nyanza, Victoria Nyanza, Mwutan Nzige, Albert Nyanza, Victoria (next to Lake Superior the largest fresh water basin on the globe). In the equatorial lake region are Lake Psad, Ngani, Tana.

Geology.—In its geological constitution, Africa gives the appearance of great stability and antiquity. The seaboard is subject to scarcely any movements of upheaval or subsidence, except on the n. e. coast between the Nile delta and the Gulf of Sidra, and parts of the Moroccan and Red Sea coasts. Earthquakes are confined mainly to the Atlas, and igneous disturbances are restricted on the west side to the Bight of Biafra. On the east side, the volcanic system is much more highly developed, stretching from the Comoro Islands through Masai Land (Kilima-Njaro, Kenia, Elgon, etc.), northward to the Danákil country, and the volcanic islets in the Red Sea.

•

The lava-fields of the Masai plateau present The old plutonic signs of recent activity. and recent eruptive rocks appear to be generally intermingled and largely associated with semi-crystalline and metamorphic forms, such as the schists, gneisses, graywackes, and hornblendes, about Kilima-Njaro and many other places. Shales and flaggy sandstones form the geological basis of the East African carboniferous series, which extends in a narrow strip from near the equator continuously to the Cape. Hard granite forms the bed of the Orange River, and asbestos, soapstone, coal, iron, and copper were among the speci-mens collected by Farini in the Kalahari steppe. Metamorphic rocks, again, prevail in the Congo basin, where iron and copper ores also abound. Syenite, and other granites, with old sandstones, are the characteristic features of Upper Egypt and the Nubian steppe, while Abyssinia has also a granite base underlying dolerites, trachytes, and crystalline slates. A great diluvial plain stretches from this region through Senaar southward to the crystalline slates, associated with magnetic iron ores of the Baginze slopes, about the source of the Welle. The Sahara is characterized by the absence of late sedimentary rocks and marine fossils, and by the prevalence of old sandstones, quartz, and carboniferous limestones. It also abounds in rich saline deposits, forming a chief article of trade with the neighboring Soudan, which is distinguished by the almost total absence of salt, the prevailing formations here being crystalline rocks, granites, diorites, slates, gneiss, again associated with sandstones in the higher ranges. In the Kong uplands, the sandstones overlie the granites, which in the Teggele group (Kordofan) pass over to porphyrics and syenites, with gneiss interspersed with extensive diorite and auriferous quartz veins. Gold, mined by the ancient Egyptians at Mount Elba, Red Sea coast, occurs also in many other places, as in Upper Guinea, the Lower Zambezi, and Transvaal; and gold dust has at all times formed a chief article of export. But iron and copper are the characteristic metals, iron ores abounding almost everywhere, and copper in Namaqualand, the Congo basin, Dar-Fertit, and many other places. The basin of the Vaal is one of the richest diamontiferous regions on the globe. In this southern region granites and crystalline slates form the substratum of a great series of fossiliferous rocks.

Climate. — The climate of Africa is mainly influenced by the fact that it lies almost entirely within the tropics. In the equatorial belt, both north and south, rain is abundant and vegetation very luxuriant, dense tropical forests prevailing for about  $10^{\circ}$  on either side of the line. To the north and south of the equatorial belt the rainfall diminishes, and the forest region is succeeded by an open pastoral and agricultural country. This is followed by the rainless regions of the Sahara on the north and the Kalahari Desert on the south, extending beyond the tropics, and bordering on the

agricultural and pastoral countries of the north and south coasts, which lie entirely in the temperate zone. The low coast regions of Africa are almost everywhere unhealthy, the Atlantic coast within the tropics being the most fatal region to Europeans.

Vegetation. - About 41 per cent. of the surface of Africa is either desert, or under scrub, or otherwise absolutely waste, and 35 per cent. steppe, or nearly treeless grass-grown savannah, leaving only 24 per cent. for forest and arable lands. The continuous forest growths are confined mainly to the vast equatorial region between the Upper Zambezi and Soudan, and to some isolated tracts about the Abyssinian plateau, in the Moroccan Atlas, all along the Guinea coast, about the Middle Limpopo and Zambezi, and in parts of Masai Land and the Upper Nile basin. From Sierra Leone to the river Ogoway, along the coast, the one prevailing landscape is that of endless forest. This is, in fact, part of the forest region-the forest belt, which has a distinctive fauna and flora, and which extends eastward, near the equator, more than half way across Africa to Lake Victoria Nyanza and the western shores of Tanganyika. In the extreme north of Africa are found the olive, date, several kinds of oak, eucalyptus, halfa (exported for paper making) papyrus, lotus, and there have recently been introduced cereals, cotton and tobacco. In the Soudan and Guinea are the forest regions containing a magnificent baobab, the banana, butter-tree, ebony, oil palm, musanga, mangrove, ground nut, dragon tree, acacias, mimosas. In the cape region the vegetation consists mostly of shrubs, grasses, ferns, heathers.

Zoology.-Africa is the home of the largest members of the animal kingdom, and owing to the absence of great central mountain barriers they may be found in all regions without special modification of type. Among the carniverous animals, the lion, the panther, hyena, leopard, fox, and jackal. The herbivorous animals are the elephant, rhinoceros, buffalo, giraffe, ostrich, hippopotamus, and crocodile. Several species of antelopes are also found. The monkey family is spread over the whole continent represented by numerous types such as the Babbaray variety, the dog-faced baboon, the Gallago lemur, the colobus, and the anthropoid chimpanzee and gorilla. Animals resembling the horse are the zebra, quagma, the pigmy Mauritanian ass, and the camel. Of the mammals there are about 500 species peculiar to this continent, of which about 50 are the antelope family. The birds found in Africa are the ostrich, secretary, ibis, guinea fowl, weaver bird, roller bird, love bird, wax bill. whydah, sun bird, parrot, quail, and others. The reptiles and insects are the huge python, many poisonous snakes, termites, locusts, the destructive Tsetse fly, and the donderobo.

Population.—The population of A. is estimated at about 200,000.000. N. of the Soudan, the Berber race prevails from the Atlas Mountains to Libya; the Nubians are partly of Arab and partly of Negro origin, while the Copts of Egypt belong probably to the Semitic family, but the frequent conquests and colonizations of the n. African seaboard both in early and later times have complicated the question of race. Turks are numerous in Tunis, Tripoli, and Egypt. The middle of A. is peopled almost entirely by the Ethiopian or Negro family, and the s. is occupied by the Hottentots and Kaffirs-members probably of the same great family. There are about 1,110,000 Europeans (immigrants or descendants of immigrants): 448,000 in northern Africa, 640,000 in southern Africa, and 22,000 within the Tropics. Nearly one-half of the population of Africa are Mohammedans. Christianity is found among the Europeans, and, in a corrupt form, in Abyssinia. It embraces about 9,000,-000 people. There are about 1,000,000 Jews. The remaining portions are heathen, following varieties of fetichism, etc.

Commerce.—The trade of A. is in a great measure carried on by barter. The internal trade is in the hands of the Arabs, and (in Soudan) the Mandingoes and Fulahs. It is conducted by caravans crossing the interior, especially the deserts of the n. The coast trade is chiefly in the hands of Europeans. The coast The principal exports are coffee, sugar, rice, dates, palm-oil, gum, cotton, ivory, spices, musk, wax, and gold-dust. The traffic in slaves has been a great blot on African commerce, the slaves being brought from the interior to the coasts. In 1873 Great Britain made a treaty with the Sultan of Zanzibar, by which he agreed to abolish slavery in his dominions; and Sir Samuel Baker returned in the same year from a successful expedition up the Nile, organized by the Khedive of Egypt, ostensibly for the purpose of putting down the slave traffic. Until the slave trade is extinct, the legitimate commerce of A. cannot be fully developed. The total trade of Africa is estimated at 47 millions sterling worth of imports, and the same of exports. Of these imports, 19 millions are classed as British, and 14 millions as French; while 18 millions and 12 millions are the values of the British and French exports.

In nearly all of the important states railway systems are being built from the coast cities inland. Already Egypt has a railway system operating 1,200 miles of railway, and a railway is under construction on the left bank of the Lower Congo by the Belgian Government, and in Cape Colony a railway connects Grahamstown with Port Elizabeth. Since 1888 the South African railways have been developed along the lines of the common continental system. This system already extends to Pretoria, capital of the South African Republic, and Johannesburg in the same state, and it is intended to extend the system to Zambezi, and thence on to Buluwayo and Salisbury. Cape Colony has about 8,000 miles of roads, and government railways of 2,300 miles in total length. Many railways have been projected which are only on paper or just begun. One of the principal roads under consideration is a line about 650 miles

long from the coast at Mombasa to Lake Victoria Nyanza. Mombasa is connected with the coast by telegraph lines, and with Zanzibar by submarine cable.

History .- The Phœnicians are known to have formed establishments on the northern coast of A., probably not less than 3,000 years ago; and the conquest of Egypt by Cambyses dates as far back as the year B. c. 525. The coasts of Egypt, of the Red Sea, and of the Mediterranean, were well known to the ancient Asiatics, who were constantly passing the narrow isthmus which divided their country from Africa. But whether they were acquainted with the western coast, and the eastern coast washed by the Indian Ocean, has not yet been satisfactorily answered. Egypt, under the Ptolemies, possessing the advantage of the only great river which falls from the continent into the Mediterranean, made no progress beyond its ancient boundaries. The Romans, who subsequently possessed Egypt, extended their discoveries no further than Fezzan and the region of the Upper Nile. The Arabs, by means of the camel, were able to penetrate across the great desert to the very center of the continent, and along the two coasts as far as the Senegal and the Gambia on the west, and to Sofala on the east. On this latter coast they planted colonies at Sofala, Mombasa, Melinda, and at various other places.

The 15th century produced a new era in maritime discovery. The voyages of the Portuguese were the first to give anything like an accurate outline of the coasts, and to complete the circumnavigation of Africa.

With Mungo Park, strictly speaking, commences the era of unceasing endeavors to explore the interior. He proceeded in 1795 from the river Gambia on the west coast, to the Niger, traced this river as far as the town of Silla, determined the southern confines of the Sahara, and returned in 1797. In 1805 he embarked on a second journey in the same regions, which cost him his life. In 1798 Dr. Lacerda, a scientific Portuguese traveler, made the first great journey in southeastern Africa, inland from Mozambique, and reached the capital of the African king, known as the Cazembe, in whose country he died. In 1849 James Richardson, an experienced African traveler, commanded an expedition which started from Tripoli, penetrated to Mourzouk, then passed over the Sahara. This party gave to the world its first accurate knowledge of the Soudan. From 1862 onward, many French travelers and soldiers have done much to solve the geographical problems of northwestern Africa, and in 1880 two Frenchmen, MM. Moustier and Ziveifel, discovered the source of the Niger.

Between 1847 and 1852 Doctors Krapf and Rebman traveled 100 leagues inland from the eastern coast, and discovered Kilima-Njaro and Mount Kenia, and heard of great lakes lying beyond. The London Geographical Society sent an expedition in that direction, under the command of Captains Burton and Speke. The result of their expedition was the discovery of Lake Tanganyka and the Victoria Nyanza.

The news of these discoveries awakened great interest throughout Europe, and African travel was thenceforth undertaken with ardor. In every direction travelers pierced the continent. Between 1869 and 1873 Sir Samuel Baker, under the auspices of the khedive, made a second expedition up the Nile for the purpose of suppressing the slave traffic. On this expedition he completed the survey of Albert Nyanza.

David Livingstone's explorations began substantially in 1840, when he first went out to south Africa as a missionary; but it was not until 1849 that he crossed the great southern plateau, and discovered Lake N'gami. Between 1851 and 1854 he ascended the Zambezi River for several hundred miles, and crossing the interior westward, reached Loanda on the Atlantic coast. On this journey he dis-covered Victoria Falls. Returning to the Cape he made preparations for his last journey. He reached the Chambezi River, south of Tanganyka, in 1868. Livingstone traced this river through three lakes, and it was his belief that it was the true source of the Nile. We know it now to be the head waters of the Congo. In 1871 Henry M. Stanley, then a re-porter on the New York *Herald*, was sent by his employer, James Gordon Bennett, to flud Livingstone. He reached Zanzibar in January, 1871, organized a caravan, and started for Lake Tanganyka. In the following November he reached his destination and delivered supplies to Livingstone. Stanley remained with Livingstone four months, discovering the River Rusizi flowing into the north end of the lake. Stanley returned home, and Livingstone continued his explorations until May, 1873, when he died. In 1873 the Geographical Society of London resolved to continue Livingstone's explorations, and sent out Lieut. Cameron. His orders were to find Livingstone, if living, and place himself under his command. At Zanzibar he organized an expedition, marched westward, and reached Tabora, or Kazeh, where he heard of Livingstone's death. He found Livingstone's last journals and papers, and sent them home. In his further explorations he came to the conclusion, which subsequently was proved to be correct, that Tanganyka and the Lualaba did not belong to the Nile system, but to the Congo. In 1874 Henry M. Stanley was sent, at the expense of the New York Herald and the London Telegraph, to continue Livingstone's explorations. Organizing at Zanzibar, Stanley visited the mountains that separate the basin of the Indian Ocean from Tanganyka and the Nile. He discovered the most southern source of the Nile, and ex-plored the rivers Livumba and Shimiyu. In the spring of 1875 he completely circum-navigated Victoria Nyanza, and surveyed its shores. Going south he discovered another large lake, the Muta Nzige, now known as Albert Edward Nyanza, and arrived at Ujiji on Lake Tanganyka. The river swept to the north, but following the stream, he descended

to the Atlantic, thus proving the Lualaba and the Congo to be Identical. His travels had lasted three years. In 1879 Stanley was again sent out to Africa under the auspices of the International Association, at the head of which was the King of Belgium, for the purpose of founding the Congo Free State. Stations were established along the Congo River. Roads were built, and many of the affluents of the river were explored. The whole country is now being rapidly opened to trade. De Brazza, a French naval officer, made several expeditions in the equatorial region and on the Congo between 1878 and 1880. A Portuguese explorer, Maj. Serpa Pinto, crossed the continent from Benguela to the Zambezi in 1877 and 1878. In 1880 Joseph Thompson explored the region between Nyassa and Tanganyka, and in 1884 made a journey from Mombasa, by Kilima-Njaro and Mount Kenia, across Masai Land to Victoria Nyanza. In 1881-82 De Pogge and Lieut. Wissmann crossed the continent from west to east in twenty-three months. Other travelers in the various quarters of the Congo region were Dr. Junker, Mr. Grenfell, Capello and Ivens, and Dr. Oscar Wolf.

The reports of the wonderful fertility and resources of the great lake region of the Upper Nile stimulated the Khedive of Egypt to add all those provinces to his own. Gen. Gordon was appointed to rule over them. After the death of Gordon the Mahdists began to threaten Emin Bey, governor of Equatoria, or Emin Pasha, as he was then known, and he fell back from Lado south to Wadelai on the branch of the Nile which issues from Albert Nyanza. For months and months he heard nothing from Egypt, though he knew the Soudan was in rebellion, and that his own safety was threatened. In December, 1886, a relief expedition was organized, and the command of the expedition given to Henry M. Recruiting a force at Zanzibar, Stanley. Stanley carried it by steamer around the Cape to the Congo, and thence up that river to its junction with the Aruwimi, and then up the Aruwimi to Yambuya, 1,300 miles from the sea. This point was reached June 15, 1887. Divid-ing his command, he left the rear guard, under the command of Maj. Edmund Barttelot, and on June 28, with 389 men, plunged into the great African forest. The objective point was Kavalli, a village at the southern extremity of Albert Nyanza, distant 330 geographical miles from Yambuya, estimated at 550 English miles. For 160 days Stanley marched forward with his men through jungle and bush and forest. From two to ten miles a day was the rate of travel, so difficult was it to make a road through the jungle. They passed through many villages of hostile tribes and had many skirmishes with them. In this great forest dwell the Pygmies, or Wambutti dwarfs. De-cember 5, they came out upon a beautiful grassy plain over which roamed buffaloes, antelopes, and other varieties of wild animals. Two miles to the east of where they emerged, a tall peak arose 4,600 feet above the sea,

named by Stanley, Mount Pisgah. A range of mountains lay farther eastward, at the foot of which rolled the Albert Nyanza, the objective point of the expedition. The natives were hostile, and several battles took place. On December 14 he reached Kavalli, but he could learn no word of Emin, who was still a twenty-five days' march off. On April 18, 1888, Stanley received a letter from Emin. On April 29 they met. After delivering a portion of supplies to Emin, Stanley turned back into the forest in quest of his rear guard. He found the remains of the rear guard at Yambuya in a terrible plight. Major Barttelot had been murdered, and all the European officers except Mr. Bonny, were gone. More than half of the force had deserted or were dead. Stanley led the remainder through the forest to Albert This great African forest stretches Nyanza. in unbroken density north and south 621 miles, with an average breadth of 517 miles. Innumerable insects swarm everywhere. Birds of many varieties inhabit the trees, while wild animals, all manner of reptiles, lemurs, chimpanzees, and baboons make their homes in its dark recesses. Added to these are the various tribes of the forest, among them the dwarfs.

In January, 1880, he succeeded in bringing his forces, or what remained of them, to Kavalli. Three months more were occupied in making preparations to escort Emin Pasha and his people to the sea-coast at Zanzibar. April 10 the caravan started from Albert Nyanza and, December 4 following, safely reached Bagamonya. This expedition of Stanley's leaves little to be discovered in Africa that is now absolutely unknown. All that remains to be done is detail, in the way of accurate measurements and observations. The origin and meaning of the name of this continent has been a fertile subject for conjecture. By the Greeks it was called Libya, and by the Romans, Africa. With respect to the word Africa, Suidas tells us that it was the proper name of that great city which the Romans called Carthago. It was subsequently extended with their increasing knowledge, till it came at last to include the whole continent.

Agamem'non, son of Atreus, king of Mycenæ and Argos, brother of Menelaus, and commander of the allied Greeks at the siege of Troy. Returning home after the fall of Troy, he was treacherously assassinated by his wife, Clytemnestra, and her paramour. Ægisthus. He was the father of Orestes, Iphigenia, and Electra.

Aganippe (nip'ē), a fountain on Mount Helicon, in Greece, sacred to the Muses, which had the property of inspiring with poetic fire whoever drank of it.

Agar'ic, a large and important genus of fungi. Over a thousand species are known, and are arranged in five sections according as the color of their spores is white. pink, brown, purple, or black. Many of the species are edible, like the common musbroom, and supply a delicious article of food, while others are poisonous.

Agaric Mineral, or Mountain-Meal, one of the purest of the carbonates of lime, found

3

### Agasias

chiefly in the clefts of rocks and at the bottom of some lakes in a loose or semi-indurated form resembling a fungus. The name is also applied to a stone of loose consistence found in Tuscany, of which bricks may be made so light as to float in water, and of which the ancients are supposed to have made their floating bricks. It is a hydrated silicate of magnesium, mixed with lime, alumina, and a small quantity of iron.

Aga'sias, a Greek sculptor of Ephesus, about 400 B. c., whose celebrated statue, known as the Borghese Gladiator, representing a soldier contending with a horsemañ, is now in the Louvre, Paris.

Agassiz (ag'as-ē), Alexander (1835son of Louis Agassiz, was born in Neuchâtel, Switzerland. He came to the U.S. in 1849, and graduated at Harvard in 1855. He He was on the California Coast Survey, and was with his father in the museum of zoology at Cambridge, Mass. From 1866 to 1869, he was superintendent of the Calumet and Hecla copper mines, Lake Superior, and amassed a great fortune, of which he gave liberally to Harvard. He was curator of the museum in Cambridge from 1874 to 1885. Professor Agassiz is a member of the National Academy of Sciences and other scientific societies in this country and Europe. He is one of the great authorities on marine zoology.

Agassiz, Louis John Rudolph (1807-1873), an eminent naturalist, son of a Swiss Protestant clergyman. He completed his education at Lausanne, and early developed a love of the natural sciences. He studied medicine at Zürich, Heidelberg, and Munich. His attention was first specially directed to ichthyology by being called on to describe the Brazilian fishes brought to Europe from Brazil by Martius and Spix. Directing his attention to fossil ichthyology, five volumes of his appeared between 1834 and 1844. His researches led him to propose a new classification of fishes which he divided into four classes, distinguished by the characters of the skin. His system has not been generally adopted, but the names of his classes have been used. In 1836 he began the study of glaciers. From 1838 he had been professor of natural history at Neuchâtel, when in 1846 pressing solicitations and attractive offers induced him to settle in America, where he was connected as a teacher first with Harvard University, Cambridge, and latterly with Cornell University as well as Harvard. After his arrival in America he engaged in various investigations and explorations, and published numerous works. In 1865-66 he made zoological excursions and investigations in Brazil, which were productive of most valuable results. Agassiz held views on many important points in science different from those which prevailed among the scientific men of the day, and in particular he strongly opposed the theory of evolution.

Agassiz, Mount, an extinct volcano in Arizona, 10,000 feet in height; a place of summer resort, near the Great Cañon of the Colorado.

Ag'ate, a siliceous, seml-pellucid compound mineral, consisting of bands or layers of various colors blended together: the base generally being chalcedony, and this mixed with variable proportions of jasper, amethyst, quartz, opal, heliotrope, and carnelian. The varying manner in which these materials are arranged causes the agate when polished to assume some characteristic appearances, and thus certain varieties are distinguished, as the ribbon agate, the fortification agate, the zone agate, the star agate, the moss agate, the clouded agate, etc. In Scotland they are cut and polished under the name of Scottish pebbles. Agates are found at Agate Bay, Lake Superior, and in Colorado. In Apache co., Ariz., is a wonderful petrified forest where the ground is covered with immense tree trunks turned to agate and jasper. Agatized wood is found also in Utah, New Mexico, and California.

**Agathar'chus**, a Greek painter, native of Samos, the first to apply the rules of perspective to theatrical scene-painting; flourished about 480 B. C.

Agathocles (361?-289, B. C.), Tyrant of Syracuse. He was the son of a Sicilian potter. After working a while at his father's trade he became a leader of banditti. He afterward became a soldier under Damas, and on the latter's death married his widow, thus acquiring immense wealth and laying the foundation of his political fortunes. He became autocrat of Syracuse in 317 B. c. He declared all debts canceled, confiscated the property of the rich and divided it among the poor. His next plan was to drive the Carthaginians out of Sicily and bring the whole island under the government of Syracuse. He was defeated by Hamilcar, the Carthaginian governor. In 310 Agathocles attacked the Carthaginian possessions and was at first successful, but in 307 a decisive battle was fought with the Cartha-

ginians, who utterly defeated the invaders. Agathocles returned to Sicily, having made terms with the Carthaginians. He next made an attack on a people of southern Italy, made the Lipari Islands tributary, and seized the power in Crotona on the mainland. Soon afterward he died. During the despotism of Agathocles the naval power of Syracuse was raised to a place of considerable importance.

Agave (a-gā' vē). a genus of plants, popularly known

Agave.

as American aloes. They are generally large. and have a massive tuft of fleshy leaves with a spiny apex. They live for many years - ten to seventy according to treatment—before flowering. When this takes place the tall flowering stem springs from the center of the tuft of leaves, and grows very rapidly until it reaches a height of 15, 20, or even 40 feet, bearing toward the end a large number of flowers. The best known species is the common American aloe now extensively grown in the warmer parts of Europe and Asia. The sap when fermented yields a beverage resembling cider, called by the Mexicans "pulque." The leaves are used for feeding cattle; the fibers of the leaves are formed into thread, cord, and ropes; an extract from the leaves is used as a substitute for soap; slices of the withered flowerstem are used as razor-strops.

Age, a period of time representing the whole or a part of the duration of any individual thing or being, but used more specifically in a variety of senses. In law age is applied to the periods of life when men and women are enabled to do that which before, for want of years and consequently of judgment, they could not legally do. Full age in male or female is twenty-one years, which age is completed on the day preceding the anniversary of a person's birth, who till that time is an infant in law.

The term is also applied to designate the successive epochs or stages of civilization in history or mythology. Hesiod speaks of five distinct ages: I. The Golden or Saturnian Age, a patriarchal and peaceful age. 2. The Süter Age, licentious and wicked. 3. The Brazen Age, violent, savage, and warlike. 4. The Heroic Age, which seemed an approximation to a better state of things. 5. The Iron Age, when justice and honor had left the earth. The term is also used in such expressions as the Dark Ages, the Middle Ages, the Elizabethan Age, etc.

Age, etc. The Archaological Ages or Periods are three the Stone Age, the Bronze Age, and the Iron Age, these names being given in accordance with the materials chiefly employed for weapons, implements, etc., during the particular period. The Stone Age of Europe has been subdivided into two — the Palæolithic or earlier, and the Neolithic or later. The word age in this sense has no reference to the lapse of time, but simply denotes the stage at which a people has arrived in its progress toward civilization. See Archaology.

Agent, in law, a person employed to act for another, called the principal, the relation between them being called agency. With reference to the authority conferred upon him, an agent may be general or special, and may be appointed expressly or by implication. No particular form of appointment is required, with a few qualifications, as that an instrument under seal is necessary to confer authority to do an act in the name of the principal under seal. Attorneys, auctioneers, brokers, factors, and shipmasters are among the ordinary classes of agents. The agent may

bind his principal by acts within the scope of his authority. He is personally liable to third persons on contracts made as the agent of an undisclosed principal, but not on those in behalf of a disclosed principal, unless he exceed his authority. Public agents are not usually themselves liable upon contracts made in their official capacity. As to torts the general rule is that the principal is liable to third persons for the tortious acts of the agent committed when acting within the scope of his agency; but this does not relieve the agent of personal liability himself. As against the principal, an agent is entitled to compensation for his services, and reimbursement for the expenses of his agency, and for personal loss or damage in properly transacting the business thereof. As a means of enforcing these rights, the law gives him a lien upon the property of the principal in his hands.

Agesila'us (442-300 B. C.), a king of Sparta. He acquired renown by his exploits against the Persians, Thebans, and Athenians. Though a vigorous ruler, and almost adored by his soldiers, he was of small stature and lame from his birth. He died in Egypt. Xenophon, Plutarch, and Cornelius Nepos are among his biographers.

among his biographers. Agglu'tinate Languages, languages in which the modifying suffixes are, as it were. glued on to the root, both it and the suffixes retaining a kind of distinctive independence and individuality, as in the Turkish and other Turanian languages, and the Basque language.

Agincourt (a-zhan-kör), a village of northern France, department Pas de Calais, famous for the battle of Oct. 25, 1415, between the French and English.

Agis ( $\ddot{u}'jis$ ), the name of four Spartan kings. the most important of whom was Agis IV, who succeeded to the throne in B. c. 244, and reigned four years. He was entrapped and executed by his rival, Leonidas.

Agnesi (à-nyā'sē), MARIA GAETANA (1718-1799), a learned Italian lady, born at Milan. In her ninth year she was able to speak Latin, in her eleventh Greek; was a University professor.

Agnew, D. HAYES, American surgeon (1818-1892). He was a specialist on diseases of the eye and of women. He was a profound anatomist, and had wonderful skill and ease in operating. Sympathetic and gentle, he was an ideal physician and consultant. He was emeritus professor of surgery, and honorary professor of clinical surgery, at University of Pennsylvania. He became widely known through his treatment of President Garfield's wound. Doctor Agnew has written Practical Anatomy (1856), and The Principles and Practises of Surgery (1878-83).

Agnostics (ag-nos'tiks), a modern term applied to those who disclaim any knowledge of God or of the origin of the universe, holding that the mind of man is limited to a knowledge of phenomena and of what is relative, and that, therefore, the infinite, the absolute. and the unconditioned, being beyond all experience, are consequently beyond its range.

Agnus Del (dē'ī), a term applied to Christ in John 1:29, and in the Catholic liturgy a prayer beginning with the words "Agnus Dei," generally sung before the communion. The term is also commonly given to a medal, or more frequently a cake of wax, consecrated by the pope, stamped with the figure of a lamb supporting the banner of the cross.

Agouti (a-gö'ti), the name of several rodent mammals, forming a family by themselves. There are eight or nine species, all belonging to S. America and the W. Indies. The com-

Agouti.

mon agouti, or yellow-rumped cavy, is of the size of a rabbit. It burrows in the ground or in hollow trees, lives on vegetables, doing much injury to the sugar-cane, is as voracious as a pig, and makes a similar grunting noise. Its flesh is white and agreeable.

Agra (ä'gra), a city of India, in the n. w. Provinces, 841 miles from Calcutta. It has interesting structures, among which are the imperial palace, the Motí Masjid, or Pearl Mosque: the mosque called the Jama Masjid (a cenotaph of white marble); and the Taj Mahal, a mausoleum of the seventeenth century, built by the emperor Shah Jehan to his favorite queen. Agra has a trade in grain, sugar, etc., and manufactures, including inlaid mosaics. It was founded in 1566 by the emperor Akbar, and was a residence of the emperors for over a century. Pop. 160,203. The Agra division has an area of 10,151 sq. mi., and a population of 4,834,064.

Agram (og'rom), or Zagrab, a city in the Austrian Empire, capital of Croatia and Slavonia, contains the government buildings, cathedral, university, theater, etc.; carries on an active trade, and manufactures tobacco, leather, and linens. Pop. 28,360.

Agra'phia. See *Aphusia*. Agrarian Laws, laws enacted in ancient Rome for the division of the public lands. The right to the use of the public land belonged originally only to the ruling class; but latterly the claims of the plebeians on it were also admitted, though they were often un-fairly treated in the sharing of it. Hence arose much discontent among the plebeians, and various remedial laws were passed with more or less success.

Agric'ola, CNEIUS JULIUS (A. D. 37-93), a Roman consul under the emperor Vespasian. reduced the greater part of Britain to the

dominion of Rome; distinguished as a statesman and general. His life, written by his son-in-law, Tacitus, gives the best extant account of Britain in the early part of the period of the Roman rule. He was the twelfth Roman general who had been in Britain, but was the only one who effectually subdued the southern portion of it and reconciled the Britons to the Roman yoke. He constructed the chain of forts between the Forth and the Clyde, and sailed round the island, discovering the Orkneys.

Ag'riculture is the art of cultivating the ground, more especially with the plow and in large areas or fields, in order to raise grain and other crops for man and beast; including the art of preparing the soil, sowing and planting seeds, removing the crops, and also the raising and feeding of cattle or other live stock. This art is the basis of all other arts, and in all countries coeval with the first dawn of civilization. At how remote a period it must have been successfully practised in Egypt, Mesopotamia, and China we have no means of knowing. Egypt was renowned as a corn country in the time of the Jewish patriarchs. Among the ancient Greeks the implements of agriculture were very few and simple. Hesiod, in the eighth century B. C., mentions a plow consisting of three parts, the sharebeam, the draught-pole, and the plow-tail. The ground received three plowings, one in autumn, another in spring, and a third immediately before sowing the seed. Manures were applied, and the advantage of mixing soils, as sand with clay, or clay with sand, was understood. Seed was sown by hand, and covered with a rake. Grain was reaped with a sickle, bound in sheaves, thrashed, then winnowed by wind, laid in chests, bins, or granaries, and taken out as wanted by the family, to be ground. Agriculture was highly esteemed among the ancient Romans. Cato, the censor, derived his highest honors from having written a voluminous work on agriculture. In his Georgics Vergil has thought the subject of agriculture worthy of being treated in the most graceful and harmonious verse. The Romans used a great many different imple-

ments of agriculture. The plow is repre-sented by Cato as of two kinds, one for strong, the other for Varro light soils. mentions one with two mold-boards. Pliny mentions a plow

with one mold-board, and others with a coulter. Fallowing was a practise rarely deviated from by the Romans. Manure was collected from nearly or quite as many sources as have been resorted to by the moderns. Irrigation on a large scale was applied both to arable and grass lands.

The Romans introduced their agricultural knowledge among the Britons, and during the most flourishing period of the Roman occupation large quantities of corn were exported

#### Agriculture

from Briton to the Continent. Swine formed a most important portion of the live stock. The feudal system introduced by the Normans operated powerfully against progress in agricultural improvements. War and the chase formed the most prominent occupations of the Norman princes and nobles. Thriving villages and smiling fields were converted into deer

forests, vexatious imposts were laid on the farmers, and the serfs had no interest in the cultivation of the soil. But the monks of every monastery retained such lands as they could take charge of, and these they cultivated with great care under their own inspection, and frequently with their own hands.

The first English treatise on husbandry was published in 1534. It is entitled the Book of Husbandry, and contains directions for drain-

ing, clearing, and enclosing a farm. for enriching the soil, and rendering it fit for tillage. Lime, marl, and fallowing are strongly recom-mended. The subject of agriculture attained some prominence during the reign of Eliza-sowing - Ancient Egyptian.

Tusser's Fire Hundred Points of Good beth. Husbandry (published in 1580) conveys much useful instruction in meter, but few works of this time contain much that is valuable. About 1645 the field cultivation of red clover was introduced into England. The Dutch had devoted much attention to the improvement of winter roots, and also to the cultivation of clover and other artificial grasses, and the farmers and proprietors of England soon saw the advantages to be derived from their

Winnowing.

introduction. Potatoes had been introduced during the latter part of the sixteenth century, but were not for long in general cultivation. Robert Bakewell and others in the eighteenth century effected some important improvements in the breeds of cattle, sheep, and swine. By the end of the century

it was a common practise to alternate green crops with grain crops, instead of exhausting the land with a number of successive crops of corn. During the wars caused by the French revolution (1795-1814) the high price of agricultural produce led to an extraor-dinary improvement in agriculture. In Europe at large the principal cereals are wheat,

# Agriculture

oats, barley, and rye; wheat being mostly grown in the middle and southern regions, such as France, Spain, part of Germany, Austria, Hungary, Italy, and southern Russia, the others in the more northern portion. while maize is grown in the warmest parts. Turnips are comparatively little grown out of Britain, beet-root in some sense taking

their place; potatoes, however, are largely cultivated, except in the south. In Canada large quantities of wheat are grown (chiefly in Ontario, now also in Manitoba); much is also now produced in the Australian colonies.

The vast territory of the U.S. presents every variety of soil and climate. Its agriculture embraces all the products of European cultivation, together with some of the warmer countries, as cotton, sugar, and indigo. The U. S. exceeds all other nations in their wonder-

ful adaptation of machinery for all purposes of cultiva-tion and harvesting The disof crops. position of the American to experiment, to test alleged improvements, and adopt

Egyptians Reaping.

labor-saving expedients, gives a great impulse to the genius of inventors. This mental activity of the American farmer is owing in great part to his superior intelligence.

The American reaper was invented by Mc-Cormick in 1834; by many improvements it has secured the European as well as the home market. In 1855 the first American agricultural college was established. In 1862 the passage of the *Homestead* law served to accelerate the occupation of the public lands. In the same year Congress granted to each state 30,-000 acres for each Senator and Representative in Congress in order to promote the liberal and practical education of the industrial classes. In 1867 the organization of the "Patrons of Husbandry," commonly called Grangers, was

effected, to look after the interests of farmers, to reduce the profits of middlemen, and to insist on fair treatment from the railroads. The dairy system, based on the principle of as-

Threshing by the Norey.

sociation, has advanced rapidly. Agricultural societies, both state and county, are established in all parts of the U.S. The objects of these societies are such as the following: To encourage the introduction of improvements in agriculture; to encourage the improvement of agricultural implements and farm buildings; the application of chemistry to agriculture; the destruction of insects injurious to vegetation; to promote the discovery and adoption of new varieties of grain, or other useful vegetables; to collect information re-

#### Agriculture

garding the management of woods, plantations, and fences; to improve the education of those supported by the cultivation of the soil; to improve the veterinary art; to improve the breeds of live stock, etc. Fairs are held, at which prizes are distributed for live stock, implements, and farm produce.

Through the efforts of the above-mentioned and other societies, the investigations of scientific men, and the general diffusion of knowledge among all classes, over two hundred periodicals being devoted to its interests, agriculture has made great progress during the

present century. Among the chief improvements we may mention deep plowing and thorough draining. By the introduction of new

Syrian Comdrag.

or improved implements the labor necessary to the carrying out of agricultural operations has been greatly diminished. Science, too, has been called in to act as the handmaid of art, and it is by the investigations of the chemist that agriculture has been put on a really scientific basis. The organization of plants, the primary elements of which they are composed, the food on which they live, and the constituents of soils, have all been investigated, and most important results obtained, particularly in regard to manures and rotations. Artificial manures in great variety, to supply the elements wanted for plant growth, have come into common use, not only increasing the produce of lands previously cultivated, but extending the limits of cul-tivation itself. An improvement in all kinds of stock is becoming more and more general, feeding is conducted on more scientific principles, and improved varieties of plants used as field crops have been introduced. One of the valuable innovations in the U.S. is the introduction of the system of ensilage for preserving fodder in a green state, which gives valuable results. As a result of the new conditions, to be a thoroughly trained

Modern Syrian Plow.

and competent agriculturist requires a special education, partly theoretical, partly practical. In particular, no scientific cultivator can now be ignorant of agricultural chemistry, which teaches the constituents of the various plants grown as crops, their relation to the various soils, the nature and function of different manures, etc. Nearly all the states have colleges, or departments of colleges, devoted to the teaching of agriculture, and large allot

11

#### Aguilar

ments of public land have been made for their support. In Germany such institutions are numerous and highly efficient. For teaching agriculture practically model farms are commonly established. In many countries, too, there is a ministry of agriculture as one of the chief departments of government. In the U. S. the Department of Agriculture was organized in 1862, the secretary of which is now a cabinet officer. The chief crop in value grown in the U. S. is Indian corn, next to which comes wheat. Oats and potatoes are also important crops. The grass crop exceeds in value any other, except wheat and corn. The other principal crops are, barley, rye, buckwheat, beets, turnips, carrots, parsnips, and sorghum. Tobacco is a favorite crop in the southern states. In cotton the virtual monopoly of the southern states has ceased; but the crop increases steadily in amount each year.

It is only in very recent times that much progress has been made in perfecting implements and machinery for cultivating the soil, sowing seed, drilling, rolling, hoeing, reaping, digging, etc. The first application of steam to plowing dates from 1770, when Richard L. Edgeworth took out a patent for a steam plowing machine, but it was 1852 before such application proved of any economic value.

Agrigentum (-jen'tum), an ancient Greek city of Sicily, founded about 580 B. C., and long one of the most important places on the island. Extensive ruins of temples and public buildings yet attest its ancient magnificence.

ings yet attest its ancient magnificence. **Ågrip'pa**, CORNELIUS HENRY (1486-1535), born at Cologne, was a man of talents, learning, and eccentricity. In his youth he was secretary to the Emperor Maximilian I; he subsequently served seven years in Italy, and was knighted. On quitting the army he devoted himself to science, and became famous as a magician and alchemist, and was involved in disputes with the churchmen.

**Ágrippa,** MARCUS VIPSANIUS (B. C. 63-12), a Roman statesman and general, the son-inlaw of Augustus. He commanded the fleet of Augustus in the battle of Actium. To him Rome is indebted for three of her principal aqueducts, the Pantheon, and other works of public use and ornament.

**Agua** (àg'wà), an active volcano of Guatemala, rising to the height of 15,000 feet. It has twice destroyed the old city of Guatemala, in its immediate vicinity.

Aguardiente (à-gwär-dē-en'te), a popular spirituous beverage of Spain and Portugal, a kind of coarse brandy, made from red wine, from the refuse of the grapes left in the winepress, etc., generally flavored with anise; also a Mexican alcoholic drink distilled from the fermented juice of the agave. Aguas Calientes (àg'wäs kà-lē-en'tās) (lit.

Aguas Calientes (àg'wàs kà-lē-en'tās) (lit. "warm waters"), a town 270 miles n. w. of Mexico, capital of the state of its own name, named from the thermal springs near it; has manufactures of cottons and a considerable trade. Pop. 25,000.

**Aguilar** (a-gi-lär'), GRACE (1816–1847), an English writer. Of Jewish parentage, she at

# Agulhas

first devoted herself to Jewish subjects, but her fame rests on her novels, *Home Influence*, *A Mother's Recompense*, *Home Scenes and Heart Studies*, etc., most of which were published posthumously under the editorship of her mother.

Aguihas (ä-gul'yås), CAPE, a promontory, forming the most southern extremity of Africa, about 90 miles s. e. of the Cape of Good Hope, rising to 455 feet above the sea, with a lighthouse.

A'hab, the seventh king of Israel, succeeded his father Omri 928 B. C., and reigned twenty years. At the instigation of his wife Jezebel he erected a temple to Baal, and became a cruel persecutor of the true prophets. He was killed by an arrow at the siege of Ramoth-Gilead.

Ahasue'rus, in scripture history, a king of Persia, probably the same as Xerxes, the husband of Esther, to whom the Scriptures ascribe a singular deliverance of the Jews from extirpation. AHASUERUS is also a Scripture name for Cambyses, the son of Cyrus (Ezra 4: 6), and for Astyages, king of the Medes (Dan. 9:1).

A'haz, the twelfth king of Judah, succeeded his father Jotham, 742 B. c. Forsaking the true religion he gave himself up to idolatry, and plundered the temple to obtain presents for Tiglath-pileser, king of Assyria.

Ahazi'ah.—1. Son of Ahab and Jezebel, and eighth king of Israel, died from a fall through a lattice in his palace at Samaria after reigning two years (B. c. 896, 895).—2. Fifth king of Judah, and nephew of the above. He reigned but one year and was slain (B. c. 884) by Jehu.

Ahmedabad (or Ahmadabad) (ä-mad-a-bäd), a town of India, presidency of Bombay, in district of its own name, 310 miles north of Bombay. It was founded in 1412 by Ahmed Shah. It came into the hands of the British in 1818. It manufactures silk and cotton fabrics, cloths of gold and silver, pottery, paper, enamel, mother-of-pearl, etc. Pop. 127,621. Area of district 3,821 sq. mi.; pop. 856,324. Ahmednag'ar, a town of India, presidency

Ahmednag'ar, a town of India, presidency of Bombay, in district of its own name, with manufactures of cotton and silk cloths. Near the city is the fort, built of stone and 1<sup>1</sup>/<sub>4</sub> miles around. Pop. 32,841; including military, 37,492. Area of dist. 6.666 so. mi.: pop. 751.228.

Area of dist. 6,666 sq. mi.; pop. 751,228. Aidin (à-i-dên') (or Guzel Hissar), a town in Asiatic Turkey, about 60 miles southeast of Smyrna, with which it is connected by rail; has fine mosques and bazaars, is the residence of a pasha, and has an extensive trade in cotton, leather, figs, grapes, etc. Pop. 35,000.

Ailan'to (Ailanthus), a large and handsome tree, with leaves one or two feet long, a native of China, but has been introduced into Europe and North America, where it is in favor for its elegant foliage. A species of silk-worm, the ailanthus silk-worm, feeds on its leaves, and the material produced, though wanting the fineness and gloss of mulberry silk, is produced at less cost, and is more durable. The wood is hard, heavy, glossy, and is susceptible of a fine polish. Ailsa Craig, a rocky islet in the Firth of Clyde, 10 miles from the coast of Ayr, Scotland, of a conical form, 1,097 feet high, and about 2 miles in circumference, precipitous on all sides except the northeast, where alone it is accessible, frequented by innumerable seafowl, including solan-geese, and covered with grass. On it is a lighthouse.

Aimard (ā-mär), GUSTAVE (1818-1883), French novelist. He lived for ten years among the Indians of North America, and wrote a number of stories dealing with Indian life, which have been popular in English translations.

Ain (an), a southeastern frontier department of France, mountainous in the east (ridges of the Jura), flat or undulating in the west, divided into two nearly equal parts by the river Ain, a tributary of the Rhone. Area, 239 so mi Capital Bourg Pon 364 408

2,239 sq. mi, Capital, Bourg. Pop. 364,408. Ainmiller (In'mil-er), Max Emanuel (1807– 1870), a German artist who may be regarded as the restorer of the art of glass-painting. As inspector of the state institute of glass-painting at Munich he raised this art to a high degree of perfection by the new or improved processes introduced by him. Under his supervision this establishment produced a vast number of painted windows for ecclesiastical and other buildings, among the principal being a eries of forty windows, containing 100 historical and Scriptural pictures in Glasgow Cathedral. His son Heinrich, born 1837, followed in his father's footsteps.

Ainos (I'noz), the native name of an uncivilized race of people inhabiting the Japanese island of Yesso, as also Saghalien and the Kurile Islands, and believed by some to be the aboriginal inhabitants of Japan. They do not average over 5 feet in height, but are strong and active. They have matted beards 5 or 6 inches in length, and black hair which they allow to grow till it falls over their shoulders. Their whole body is covered with thick hair. They are the hairiest and also the filthiest people on the globe. Their complexion is dark brown, approaching to black. They worship the sun and moon, and pay reverence to the They support themselves by hunting bear. and fishing.

Ainsworth, WILLIAM HARRISON (1805-1882), an English novelist. He wrote Rookwood, Jack Sheppard, and about forty other novels, including Guy Faukes, Tower of London, Windsor Castle, Lancashire Witches, Flütch of Bacon, etc.

Ain-Tab (à-in-täb'), a town of northern Syria, 60 miles north of Aleppo: with manufactures of cottons, woolens, leather, etc., and an extensive trade. There is here an American Protestant mission. Pop. 20,000.

Air, the gaseous substance of which our atmosphere consists, being a mechanical mixture of 79.19 per cent. by measure of nitrogen and 20.81 per cent. of oxygen. The latter is absolutely essential to animal life, while the purpose chiefly served by the nitrogen appears to be to dilute the oxygen. Oxygen is more soluble in water than nitrogen, and hence the air dissolved in water contains about 10 per cent. more oxygen than atmospheric air. The oxygen therefore available for those animals which breathe by gills is somewhat less diluted with nitrogen, but it is very much diluted with water. For the various properties and phenomena connected with air, see such articles as Atmosphere, Aeronautics, Air-pump, Barometer, Combustion, Respiration.

Air-cells, cavities in the cellular tissue of the stems and leaves of plants which contain air only, the juices of the plants being contained in separate vessels. They are largest and most numerous in aquatic plants, as in the lily, the gigantic leaves of which are buoyed up on the surface of the water by their means.—The minute cells in the lungs of animals are also called air-cells. There are also air-cells in the bodies of birds. They are connected with the respiratory system, and are situated in the cavity of the thorax and abdomen, and sometimes extend into the bones. They are most fully developed in birds of powerful and rapid flight, such as the albatross.

Air-engine, an engine in which air heated, and so expanded, or compressed air, is used as the motive power. A great many engines of the former kind have been invented, some of which have been found to work pretty well where no great power is required. They map be said to be essentially similar in construction to the steam-engine, though of course the expansibility of air by heat is small compared with the expansion that takes place when water is converted into steam. Engines working by compressed air have been found very useful in mining, tunneling, etc., and the compressed air may be conveyed to its destination by means of pipes. In such cases the waste air serves for ventilation and for reducing the oppressive heat.

Air-gun, an instrument for the projection of bullets by means of condensed air, generally either in the form of an ordinary gun, or of a stout walking-stick and about the same length. A quantity of air being compressed into the air-chamber by means of a condensing syringe, the bullet is put in its place in front of this chamber, and is propelled by the expansive force of a certain quantity of the compressed air, which is liberated on pressing the trigger.

Air-plants (or Epiphytes), are plants that grow upon other plants or trees, apparently without receiving any nutriment otherwise than from the air. The name is restricted to flowering plants (mosses or licheus being excluded) and is suitably applied to many species of orchids. The conditions necessary to the growth of such plants are excessive heat and moisture, and hence their chief localities are the damp and shady tropical forests of Africa, Asia, and America. They are particularly abundant in Java and tropical America.

**Air-pump**, an apparatus by means of which air or other gas may be removed from an enclosed space; or for compressing air within an enclosed space. An ordinary suction-pump for water is on the same principle as the airpump; indeed, before water reaches the top

of the pipe the air has been pumped out by the same machinery which pumps the water. An ordinary suction-pump consists essentially of a cylinder, or barrel, having a valve opening from the pipe through which water is to rise and a valve opening into the outlet pipe, and a piston fitted to work in the cylinder (the outlet valve may be in the piston). See Pump. The arrangement of parts in an air-pump is quite similar. The barrel of an air-pump fills with the air which expands from the receiver (that is, the vessel from which the air is being pumped), and consequently the quantity of air expelled at each stroke is less as the exhaustion proceeds, the air getting more and more rarefied. Many interesting experiments may be made with the air-pump. If an animal is placed beneath the receiver, and the air exhausted, it dies almost immediately; a lighted candle under the exhausted receiver immediately goes out. Air is thus shown to be necessary to animal life and to combustion. A bell, suspended from a silken thread beneath the exhausted receiver, on being struck cannot be heard. If the bell be in one receiver from which the air is not exhausted, but which is within an exhausted receiver, it still cannot be heard. Air is therefore necessary to the production and to the transmission of sound. A shriveled apple placed beneath an exhausted receiver becomes as plump as if quite fresh, being thus shown to be full of elastic air. The air-pump was invented by Otto von Guericke, burgomaster of Magdeburg, about the year 1654.

**Airy**, SIR GEORGE BIDDELL, a distinguished English astronomer, b. 1801. At Cambridge he was professor of mathematics, and subsequently professor of astronomy and experimental philosophy, in the latter capacity having charge of the observatory. In 1835 he was appointed superintendent of the observatory at Greenwich. He has made numerous valuable investigations on subjects connected with astronomy, physics, and mathematics.

Aisne (ān), a department of France; area, 2,838 sq. mi. It contains the important towns of St. Quentin, Laon (the capital), Soissons, and Château Thierry. Pop. 555,925.

Aix ( $\hat{a}$ ks), a town of southern France, department Bouches-du-Rhône. Aix was founded in 123 B. c. by the Roman consul Caius Sextius Calvinus, and from its mineral springs was called Aquæ Sextive (Sextian Waters). Between this town and Arles, Marius gained his great victory over the Teutons, 102 B. c. In the Middle Ages the counts of Provence held their court here, to which the troubadours used to resort. Pop. 19,686.

Aix-la-Chapelle (āks-lā-shā-pel), a city of Rhenish Prussia, 38 miles west by south of Cologne. The most important building is the cathedral, the oldest portion of which, often called the nave, was erected in the time of Charles the Great (Charlemagne) as the palace chapel, about 796. It consists of an octagon surmounted by a cupola, in the middle being the tomb of Charlemagne. There are a number of warm sulphur springs.

here, and several chalybeate springs, with ample accommodation for strangers. It was the favorite residence of Charles the Great, who died here in 814. Thirty-seven German emperors and eleven empresses have been crowned in it, and the imperial insignia were preserved here till 1795, when they were carried to Vienna. Pop. 95.725.—Congress of Aix-la-Chapelle, a congress held in 1818, by which the army of the allies in France was withdrawn after France had paid the contribution imposed at the peace of 1815, and independence restored to France.-A treaty of peace concluded at this city, May 2, 1668, as a result of the Triple Alliance, put an end to the war carried on against Spain by Louis XIV in 1667, after the death of his father-in-law, Philip IV.—The second peace of Aix-la-Chapelle, Oct. 18, 1748, terminated the Austrian war of succession.

Ajaccio ( $\dot{a}$ -y $\dot{a}$ ch' $\ddot{o}$ ), the capital of Corsica, the birthplace of Napoleon, and the seat of a bishop, with coral and sardine fisheries, and a considerable trade. Pop. 15,351.

a considerable trade. Pop. 15,351. A'jax, the name of two Grecian chiefs who fought against Troy, the one being son of Olleus, the other, son of Telamon. The latter was from Salamis, and sailed with twelve ships to Troy, where he is represented by Homer as the boldest of the Greeks, after Achilles. On the death of Achilles, when his arms, which Ajax claimed, were awarded to Ulysses, he became insane and killed himself. This is the subject of Sophocles's tragedy Ajax.

Ajmeer' (Ajmir or Ajmer), a British commissionership in India, Rajputána, divided into the two districts of Ajmeer and Mairwara. Area 2,711 sq. mi: pop. 460,722. — Ajmeer, the capital, a favorite residence of the Mogul emperors, is 279 miles s. w. of Delhi. It is surrounded by a wall, and possesses a government college, as also Mayo College for Rajpoot nobles, a Scottish mission, a mosque that forms one of the finest specimens of early Mohammedan architecture extant, and an old palace of Akbar, now the treasury; trade in cotton, sugar, salt, etc. Pop. 34,763. Ak'bar (1542-1605), a Mogul emperor, the

Ak'bar (1542-1605), a Mogul emperor, the greatest Asiatic prince of modern times. He was born at Amerkote, in Sind, succeeded his father, Humayun, at the age of thirteen, and governed first under the guardianship of his minister, Beyram, but took the chief power into his own hands in 1560. His mausoleum at Secundra, near Agra, is a fine example of Mohammedan architecture.

A Kempis, THOMAS, See Thomas à Kempis. Akermann', a seaport of southern Russia, in Bessarabia. The vicinity produces quantities of salt and also fine grapes, from which excellent wine is made. A treaty was signed here, Oct. 6, 1826, between Russia and the Porte, by which Moldavia, Wallachia, and Servia were released from all but nominal dependence on Turkey. Pop. 29.609.

Turkey. Pop. 29,609. Akmollinsk', a Russian province in Central Asia, largely consisting of steppes and wastes. Area 210,000 sq. mi.; pop. 463,347. — Akmollinsk, the capital, is a place of some importance for its caravan trade. Pop. 3,130.

Akron, Summit co., O., 35 miles s. e. of Cleveland. Railroads, Erie; B. & O.; C. A. & C.; A. & C. Junction; P. & W.; C. T. & V.; and Northern Ohio. Industries, rubber works, five cereal mills, iron foundry, sewer pipe, linoleum, boiler, farm implements, and other factories, printing works, and potteries. Surrounding country agricultural, bituminous coal in vicinity. The town was first settled in 1810 and became a city in 1836. Pop. est. 1897, 40,000.

Alabama, one of the southern states of the the U. S. Its length is 330 miles, average breadth 154, and area 50,722 sq. mi. The Alleghany range stretches into the northern portion of the state, but the elevation is nowhere great. The Alabama is the chief river of the state. It is formed by the junction of the Coosa and the Tallapoosa, which unite about 10 miles above the city of Montgomery. Fortyfive miles above Mobile the Alabama is joined by the Tombigbee, and from that point is known as the Mobile River. It is navigable from Mobile to Wetumpka, on the Coosa, some 460 miles. The Tombigbee is navigable to Columbus, and the Black Warrior, one of its chief tributaries, to Tuscaloosa. The Tennessee flows through the northern portion of the state, and the Chattahoochee forms part of its eastern boundary.

Soil.-The southern portion of the state has an alluvial formation, and a light but productive soil well adapted to raising fruits. Cotton and corn are produced, and there are extensive forests of pine in this region. North of this tract is a division known as the cotton belt, mostly prairie land, largely devoted to the culture of cotton. The great mineral region is in the eastern and northeastern part of the state. Gold has been found here in paying quantities for many years. There is also bituminous coal mined in this region as well as other valuable minerals. West of this is a manufacturing district well supplied with water power. In the northern part of the state are rich grazing lands which yield large crops of cereals and fruits.

Vegetation. — In Alabama vegetable products of the temperate and semi-tropical regions thrive. The principal forest trees are oak, hickory, chestnut, cedar, elm, and pine. There are also some dense cane-brakes, which have now for the most part been cleared away, leaving a most fertile soil.

In the southern parts of the state are forests of cyprus, yellow pine, and magnolia. Also the fig and pomegranate, olive, apricot, and orange trees. Grasses, the cereals, and corn, and in the valleys, cotton, are raised in the northern part of the state. In the southwestern part of the state is grown sugar, rice, and some indigo; tobacco is grown to some extent. *Climate.*—The climate of Alabama varies

Climate. — The climate of Alabama varies with the latitude and elevation. The northern counties have a delightful temperate climate, the thermometer in winter seldom falling below 32° Fahrenheit, while the eleva-

# Alabama

tion prevents intense heat in the summer. Some of the river valleys are very unhealthful, and on the other hand there are several resorts for invalids in the state. In the southern part of the state there is a great tendency to malaria and fevers. But for the gulf breezes the heat would be almost unbearable. The water supply is from artesian wells in the southern part of the state, while the northern part is supplied with springs and good wells.

supplied with springs and good wells. Manufactures.— Within the last twenty-five years Alabama has made rapid strides in the establishment of manufacturing industries. There are a number of large saw-mills, grist-mills and leather-dressing establishments, boot and shoe factories, turpentine distilleries, carriage and wagon factories, in operation, employing thousands of men. The manufacture of pig-iron, which can be produced here as cheaply as any place in the U. S., machinery, and cotton goods, has been carried on with remarkable success and several large factories have been established.

Education.— There are four normal schools in the state located at Marion, Florence, Huntsville, and Tuskegee. The State University of Alabama is located at Tuscaloosa. The Agricultural and Mechanical College and the Southern University are located at Auburn and Greensboro respectively. At Mobile there is a blind asylum, and an institute for the deaf, dumb, and blind at Talladega, also an insane asylum at Tuscaloosa. There are about 200 newspapers in the state, 16 of them being dailies. The public school system of Alabama has not developed with the increase in population.

History.— The first settlement in Alabama was made on the Mobile River in 1702 by the French. The city of Mobile was founded in 1712. Alabama was made a state of the Union in 1819 and was one of the seceding states in 1861. The population in 1890 was 1,513,017. The chief towns are Montgomery, the capital, Mobile, and Birmingham.

Mobile, and Birmingham. Governors. — William W. Bibb, 1819-20; Thomas Bibb, 1820-21; Israel Pickens, 1821-25; John Murphy, 1825-29; Gabriel Moore, 1829-31; John Gayle, 1831-35; Clement C. Clay, 1835-37; Arthur P. Bagby, 1837-41; Benjamin Fitzpatrick, 1841-45; Joshua L. Martin, 1845-47; Reuben Chapman, 1847-49; Henry W. Collier, 1849-53; John A. Winston, 1853-57; Andrew B. Moore, 1857-61; John G. Shorter, 1861-63; Thomas H. Watts, 1863-65; Lewis E. Parsons, 1865; Robert M. Patton, 1865-68; William H. Smith, 1868-70; Robert B. Lindsay, 1872; David P. Lewis, 1872-74; George S. Houston, 1874-79; Rufus W. Cobb, 1870-81; Edward A. O'Neal, 1882-84-86; T. Seay, 1886-88-90; T. G. Jones, 1890-94; W. C. Oates, 1894-96; J. F. Johnston, 1896.

Alabama, a river of Alabama, formed by the junction of the Coosa and the Tallapoosa. After a course of 300 miles, it joins the Tombigbee and assumes the name of the Mobile.

Alabama, a vessel built at Birkenhead, Eng land, in 1862, by Messrs. Laird & Sons, for the Confederate Government. She was a

piratical craft, and it is certain that she was forced to deal with her captures precisely as a pirate does, against whom every port is closed; i. e., she first plundered and then burnt them. Her devastations gave rise to the Alabama question, and ultimately cost Great Britain over \$16,000,000. The cruiser was a wooden ship of 1,040 tons' register, barquerigged, with two engines of 350 horse-power each, pierced for 12 guns, besides being able to carry two heavy pivot-guns amidships, and cost in all nearly \$260,000. At Terceira, one of the Azores, she received guns, stores, and coals from another vessel. Captain Semmes then stepped on board, and Aug. 24, 1862, produced his commission, named the vessel the A., hoisted the Confederate flag, and prepared for work. Before September 16 she had destroyed more than her own cost, and for nearly two years after she was the terror of Union merchantmen in every sea. In all, she captured sixty-five vessels, and destroyed property estimated at \$4,000,000. Swift-sailing cruisers scoured the seas in search of the pirate, who, was at length forced, partly from want of stores, to take refuge in the port of Cherbourg, on the coast of Normandy, June 11, 1864. A few days later, the U.S. steamer Kearsarge, commanded by Captain Winslow, also arrived at Cherbourg. June 19 a fight took place outside the port and in less than an hour the A. was sunk. Semmes and others were picked up by an English yacht, the Deerhound.

Not many months after the A. had commenced her destructive career, Mr. Seward, in his capacity of secretary of state, informed the British Government that the U.S. held themselves entitled to damages for the injuries done to American commerce by a vessel fitted out for war in a British port, and would claim them in due time. The idea took claim them in due time. strong hold of the American mind, and at length Great Britain was induced to submit to arbitration the question of her culpability in regard to the escape of the A. A congress met at Geneva Dec. 17, 1871, consisting of rep-resentatives of Great Britain and the U. S., and of three members appointed by the king of Italy, the president of the Swiss Confederation, and the emperor of Brazil. The

decision was given Sept. 15, 1872. It was a dverse to Great Britain, which was ordered to pay to the U. S. the sum of \$16,-145,833. After all awards were made to private claimants about \$8,000,-000 still remained unclaimed.

Alabas'ter, a name applied to a granular variety of

granular variety of finate of lime. It was much used by the ancients for the manufact-

### Alagoas

ure of ointment and perfume boxes, vases, and the like. It has a fine granular texture, is usually of a pure white color, and is so soft that it can be scratched with the nail. It is found in many parts of Europe; in great abundance and of peculiarly excellent quality in Tuscany. From the finer and more compact kinds, vases, clock-stands, statuettes, and other ornamental articles are made, and from inferior kinds the cement known as plaster of Paris. A variety of carbonate of lime, closely resembling alabaster in appearance, is used for similar purposes under the name of Oriental alabaster. It is usually stalagmitic or stalactitic in origin, and is often of a yellowish color. It may be distinguished from true alabaster by being too hard to be scratched with the nail.

Alago'as, a maritime province of Brazil. Area 11,640 sq. mi.; pop. about 400,000. — Algoas, the former capital of the province is about 20 mi. distant from Maceio, to which the seat of government was transferred in 1839. Pop. about 4.000.

Alajuela (à-là-hu-a'là), a town of Central America, capital of the state of Costa Rica. Pop. 12,000.

**Alameda**, Alameda co., Cal., a favorite suburban residence for San Francisco business men. It is situated on the Bay of San Francisco about 8 mi. from the city, with which it is connected by a steam ferry. It is celebrated for its orchards and gardens. Pop. 11,165.

Alamo, Bexar co., Tex., celebrated for the resistance which 145 men under Col. Travis made against Gen. Santa Anna and 5,000 Mexican soldiers, from February 23 to March 6, 1836, in the war of Texan independence. The Alamo was built originally for a mission, but

The Alamo.

was strong euough for a place of defense. except against artillery. It had a surrounding wall of masonry over two and a half feet thick, and eight feet high. The main square was 154 yards long by 54 wide. On the southeast of it was the church, with walls of stone 4 feet thick and about 23 feet high. It was never completed and had no roof. From the northeast corner of the chapel, a wall extended northward 186 feet, thence westward, at right angles to the convent, enclosing the convent yard. The convent was a two-story adobe

building, 191 by 18 feet. It was used as an armory and barracks. The prison was one-story, 115 by 17 feet, and from its southeast corner a diagonal ditch, over which was a strong stockade with an entrance in the center, extended to the church. The whole area enclosed was about three acres, this was supplied with water from two aqueducts. Upon the walls of the Alamo were mounted fourteen guns, three of which were planted upon the walls of the church. The stockade was protected by two pieces, and two more overlooked the gateway and prison; others were placed at various points on the walls. Col. Travis was forced to take refuge in this place, on the above mentioned date, on account of the approach of the Mexican forces under Santa Anna. He had barely time to get a few bushels of corn and about twenty-five head of beeves within the enclosure. He had a very small supply of ammunition. Santa Anna appeared before the walls of the Mission and demanded an unconditional surrender, which was answered with a cannon shot. Within was answered with a cannon shot. the improvised fortress were such men as James Bowie, David Crockett, and J. B. Bonham. They determined not to surrender under any circumstances, nor would they retreat. Santa Anna continued to draw his forces around the walls, and a constant bombardment was kept up, and although nearly 200 shells fell inside the works, not a Texan was killed during the first eight days. The walls withstood the cannonade with little or no harm. The Texans in the meantime utilized their small supply of ammunition by picking off whatever of the Mexican forces fell within the range of their rifles. Santa Anna considered several times the advisability of storming the fortress, but it was not undertaken until the arrival of 1,200 more men and some heavy guns. On March 5, Santa Anna gave the order for the attack, and in four columns they proceeded to the fortress, provided with ladders, crow-bars, and axes. The attacking forces numbered 2,500 men, aided by the cavalry, which was stationed at several points to cut off escape. Early in the morning of the 6th, the attacking forces were ready for the onset. The besieged were also prepared, and at the first assault, made a terrible slaughter with the artillery and rifles, while they re-mained practically unharmed. At first the Mexicans were unable to scale the outer walls, and were repulsed several times, always with terrible loss. Again the stormers returned to the attack, and it was only on account of superior numbers that they at length gained an entrance to the wall. Col. Travis was killed, and the small amount of ammunition made it impossible to keep up the artillery firing. The outer walls were abandoned and the defenders retired to the long barracks and the church. They kept up the firing as well as they could through the windows and loopholes, but the Mexicans, having now gotten control of the Alamo artillery, made short work of destroy-ing the retreats of the defenders. Then followed a sharp hand-to-hand conflict, as the

defenders retired from one room to another. At length crowded into the church, the few remaining men, among whom were David Crockett, made a determined stand and turned the gun which was mounted on the church, against the Mexicans. Their superior numbers, however, soon overcame the remainder of the defenders, and the last of the Texan heroes was slain. In less than an hour after the bugle call to the assault, the Alamo was in the possession of the Mexicans. Six of those who were besieged in the Alamo were spared, three of whom were women, two children, and Col. Travis's negro servant-boy. The Texans were denied the right of burial. Their bodies were piled in layers between wood and dry brush, and set on fire. The loss to the Mexican forces is estimated at 1,600 men. In consequence of the heroic resistance made at this place, the Alamo is known as the "Thermopylae of America." Throughout the struggle for Texan independ-ence, the battle cry was, "Remember the Alamo."

Al'amo, a town of Mexico, state of Sonora, well built, the capital of a mining district. Pop. 12,000.

Aland (o'land) Islands, a numerous group of islands and islets, belonging to Russia, situated in the Baltic Sea, near the mouth of the Gulf of Finland. Area 468 sq. mi. The fortress of Bomarsund was destroyed by an Anglo-French force in August, 1854. The islands were ceded by Sweden to Russia in 1809. Pop. 18,000.

by Sweden to Russia in 1809. Pop. 18,000. Alarcon' Y Mendo'za, Don JUAN RUIZ DE, one of the most distinguished dramatic poets of Spain, born in Mexico about the beginning of the seventeenth century. He came to Europe about 1622, and in 1628 he published a volume containing eight comedies, and in 1634 another containing twelve. One of them called La Verdad Sospechosa (The Truth Suspected), furnished Corneille with the groundwork and greater part of the substance of his Menteur. His Tejador de Segoria (Weaver of Segoria) and Las Paredes Oyen (Walls have Ears) are still performed on the Spanish stage. He died in 1639.

Al'aric 1 (376-410), a famous Visigothic warrior. In 394 Theodosius gave him the command of his Gothic auxiliaries. In 396 he in-vaded and pillaged Greece, from which, when pressed by Stilicho (397), he made a masterly retreat to Illyria. In 400 he invaded Italy, but sustained a defeat from Stilicho at Pollentia (403). A. made a second invasion of Italy, memorable for three sieges of Rome. The first (408) was bought off, but the second (409) resulted in the surrender of the city, and the substitution of Attalus for Honorius. The incapacity of Attalus induced A. to restore Honorius. Rome was besieged for the third time, 410, and sacked for six days. A. intended to invade Sicily and Africa, but dying at Cosenza, he was buried in the bed of the Busento. A. was naturally generous, and it was owing to him that the splendid edifices of Greece and Rome suffered so little damage during his invasions. The most lasting effect

of his inroads on the Western Empire was the establishment of the Visigothic Empire in Spain by the warriors whom he left behind him.

Al'aric II, eighth king of the Visigoths, succeeded his father in A. D. 484. He preferred peace to war, and, though an Arian, granted privileges to the Catholics. In a battle at Vouillé, near Poitiers, the army of A. was defeated, and himself slain (507).

Alaska, formerly Russian America, a territory of the U. S., is a vast tract of country forming the northwest portion of North America. Alaska comprises the whole of North America from 141<sup>o</sup> w. long. to Behring Strait, and also numerous islands along the coast, notably Prince of Wales Island, King George III Archipelago, the Kodiak Islands, and the Aleutian Islands, which stretch seaward from the extremity of the peninsula. From north to south the extreme length of Alaska is about 1,100 miles, and the greatest breadth from east to west is 800 miles. The area of the whole territory is estimated at 514,700 sq. mi.

The numerous islands, creeks, and inlets of Alaska lengthen out its coast line to 7,860 miles, an extent greater than that of the eastern coast line of the U.S. The principal river of Alaska is the Yukon. At a distance of 600 miles from the sea this magnificent river has a width of more than a mile, and has many large tributaries. Its volume is so great that 10 miles out from its principal mouth the water is fresh. A great mountain range ex-tends from British Columbia, in a northwest direction, along the coast of Alaska, the summit being covered with snow and glaciers. The Muir Glacier, the largest in the world, is situated here. Professor John Muir, after whom the glacier is named, was the first to describe it. It is as large as all the Alpine glaciers in one, being 1,200 sq. mi. in area. Where it discharges into the sea, it presents a wall of blue ice exceeding 500 feet in thickness. This river of ice, with its numerous branches. is 150 mi. in length, and varying from one to a dozen miles in width. It is continuously discharging icebergs, small and large, some containing hundreds of tons of ice, the fall of which into the sea casts up spray for hundreds of feet into the air. The Muir Glacier is esti-mated to discharge 77 billion cubic feet of ice in icebergs, and 175 billion cubic feet of water by melting every year. In the interior and to the north the country is mountainous, with great intervening plains.

The northwest coast of this part of America was discovered and explored by a Russian expedition under Behring in 1741; and at subsequent periods settlements were made by the Russians at various places, chiefly for the prosecution of the fur trade. In 1799 the territory was granted to a Russo-American fur company by the Emperor Paul VIII, and in 1839 the charter of the company was renewed. New Archangel was the principal settlement, but the company had about forty stations. They exported annually 25,000 skins of the seal, sea-otter, beaver, etc., besides about 20,000 sea-horse teeth. The privileges of the company expired in 1863; and in 1867 the whole Russian possessions in America were ceded to the U. S. for a money payment of \$7,200,000. The treaty was signed March 30, and ratified June 20, 1867; and on October 9, following, the possession of the country was formally made over to a military force of the U. S. at New Archangel.

The climate on the southwestern coast of Alaska is tolerably mild considering its high latitude. The great warm current of the Pacific, sweeping in a northeasterly circuit from the East India Islands, and corresponding very much in character and effects to the Gulf Stream of the Atlantic, washes its shores; and while it modifies the temperature, also causes an excessive rainfall. At Sitka the mean temperature is 42.9°, and the average rainfall about 80 inches. Alaska will never have any great agricultural value. From the great amount of rain and the want of heat, cereals grow, but will not ripen, and vegetables do not thrive. Native grasses and berries grow plentifully, but the chief wealth of the country is in its vast forests, in its gold and coal mines, in the furs of its wild animals, and in the fish with which its rivers and seas abound. The forests, rising from the coast and covering the mountains to a height of 2,000 feet, consist of a very durable yellow cedar, spruce, larch, and fir of great size, and also cypress and hemlock. The wild animals include the elk, the deer, and various species of bear, and also many fur-bearing animals, such as the wolf and fox, the beaver, ermine, marten, otter, and squirrel. Near the coast and islands there are innumerable furbearing seals, which are caught in great numbers by the settlers; but from the rigor of the climate and the arduous nature of the work, the trapping of the animals of the interior is left to the Indians. The salmon abounds in the rivers, and there are great banks along the shores, the favorite haunt of cod and other fish. About eighty whalers prosecute their fishing off the coast of Alaska. Coal, iron, and gold are the most important minerals, the deposits of which are proving to be very extensive.

The population is very limited, consisting of 8,000 whites, and 15,000 Indians, with some Esquimaux on the northern coast. Sitka is the headquarters of the U. S. authorities. It contains about 1,500 inhabitants, is the residence of a Greek bishop, and has fortifications, magazines, and a magnetic observatory.

A'lava, a hilly province in the north of Spain, one of the three Basque provinces; area 1,207 sq. mi.; covered by branches of the Pyranees, the mountains being clothed with oak, chestnut, and other timber, and the valleys yielding grain, vegetables, and abundance of fruits. There are iron and copper mines, and inexhaustible salt springs. Capital, Vittoria. Pop. 93,538.

Alba, the name of several towns in ancient Italy, the most celebrated of which was Alba Longa, a city of Latium, according to tradition built by Ascanius, the son of Æneas, 300 years before the foundation of Rome, at one time the most powerful city of Latium. In later times its site became covered with villas of wealthy Romans.

Albacete (àl-bà-thã' tã), a town in southern Spain, capital of the province of the same name, 106 mi. n. n. w. of Cartagena, with a considerable trade, both direct and transit, and manufactures of knives, daggers, etc. Pop. 17,-694.—The province has an area of 6,170 sq. mi. and a population of 219,058.

Alban, St., the traditionary proto-martyr of Britain, who flourished in the third century, was, it is said, converted from paganism by a confessor whom he had saved from his persecutors, and refusing to sacrifice to the gods, was executed outside of the city of Verulamium (St. Albans) in 285 or 305.

Albani (àl-bā' nē), FRANCESCO (1578-1660), a famous Italian painter. Among the best known of his compositions are the Sleeping Venus, Diana in the Bath, Danae Reclining, Galatea on the Sea, Europa on the Bull.

Albani, MME. (MARIE EMMA LAJEUNESSE), born in Montreal, Canada, in 1851. She sang in Albany, N. Y., in the Catholic cathedral, and funds were procured to send her to Europe to complete her musical education. She sang in 1870 at Messina, Sicily, and adopted the name of Albina in remembrance of the city of Albany. Mme. Albani has sung in opera in London, Florence, St. Petersburg, and all the principal cities of this country. In 1880, she took part in the historic operatic season at the Chicago Auditorium.

Alba'nia, an extensive region in the s. w. of Turkey in Europe, stretching along the coast of the Adriatic for about 290 mi., and having a breadth varying from about 90 to about 50 mi. Albania has many species of oak, the poplar, hazel, plane, chestnut, cypress, and laurel. The vine flourishes, together with the orange, almond, fig, mulberry, and citron; maize, wheat and barley are cultivated. Its fauna comprises bears, wolves, and chamois; sheep, goats, horses, asses, and mules are plentiful. The chief exports are live stock. wool, hides, timber, oil, salt-fish, cheese, and tobacco. The chief ports are Prevesa, Avlona, and Durazzo. The population, about 1,400,-000, consists chiefly of Albanians, or, as they call themselves, mountaineers, with a certain number of Greeks and Turks. They are only half civilized, are divided into a number of clans, and bloody feuds are still common among them. They belong partly to the Greek, partly to the Roman Catholic Church, but the great majority are Mohammedans. Though their country became a province of the Turkish dominions in the fifteenth century, they still maintain a certain degree of independence, which the Porte has never found it possible to overcome.

'Alba'no, a city and lake in Italy, the former about 15 mi. s. e. of Rome, and on the west border of the lake, amid beautiful scenery, with remarkable remains of ancient structures. Pop. 6,493.—The lake, situated immediately beneath the Alban Hill, is of an oval form, 6 mi. in circumference, surrounded by steep

### Albany

banks of volcanic tufa, 300 or 400 feet high, and discharges its superfluous waters by an artificial tunnel at least 2,000 years old.

Al'bany, the original Celtic name probably at first applied to the whole of Britain, but latterly restricted to the Highlands of Scotland. It gave the title of duke formerly to a prince of the blood-royal of Scotland. Latterly the title has belonged to members of the British royal family.

Al'bany, capital of the state of New York, 145 miles north of New York City. The Erie Canal and the numerous railway lines centering here from all directions greatly contribute to the growth and prosperity of the city, which carries on an extensive trade. It is a great mart for timber, and has foundries, breweries, tanneries, etc. Albany was settled by the Dutch in 1610-14, and the older houses are in the Dutch style, with the gable ends to the streets. There is a university, an observatory, and a state library with 90,000 volumes. The principal public edifices are the capitol, or state-house, the state-hall for the public offices, a state arsenal, and numerous religious edifices. Pop. 120,000.

Al'batross, a large marine swimming bird of several species, of which the wandering albatross is the best known. The bill is straight and strong, the upper mandible hooked at the point and the lower one truncated; there are three webbed toes on each foot. The upper part of the body is of a grayish brown, and the

Wandering Albatross.

belly white. It is the largest sea-bird known, some measuring 17<sup>4</sup> feet from tip to tip of their expanded wings. They abound at the Cape of Good Hope and in other parts of the southern seas, and in Behring's Straits, and have been known to accompany ships for whole days without ever resting on the waves. The albatross is met with at great distances from the land, settling down on the waves at night to sleep. It is exceedingly voracious whenever food is abundant, gorging to such a degree as to be unable to fly or swim. It feeds on fish, carrion, fish-spawn, oceanic mollusca, and other small marine animals. Its voice is a harsh, disagreeable cry. Its eggs are larger than those of a goose. It lays but one egg. on the ground, where it makes a kind of nest by scraping the earth around it. The young is entirely white, and covered with a woolly down, which is very beautiful.

Albay (al-bi'), a province, town, bay, and volcano in the southeast part of the island of Luçon, one of the Phillippines. The province is mountainous but fertile; the town regularly built, with a population of 13,115; the bay capacious, secure, and almost landlocked; and the volcano, which is always in activity, forms a conspicuous landmark.

Albert, king of Saxony, b. 1828, succeeded to the throne 1873. He married Caroline, Princess Vasa, of Sweden in 1853. He supported Prussia in the war with France, 1870-71, and was made a field-marshal in the German Army.

Albert Edward. See Wales, Prince of.

Al'bert, FRANCIS-AUGUSTUS-CHARLES-EM-MANUEL, Prince of Saxe-Coburg-Gotha, late Consort of Queen Victoria, of England, was the second son of Ernest, Duke of Saxe-Coburg-Gotha, b. 1819. In 1840 he became the husband of the queen of England. The name of Prince A. will ever be remembered as that of a true friend of progress and the people. He was an earnest promoter of science and art, and was the first to suggest the International Exhibition of 1851. The manner in which he filled his somewhat anomalous position as the Queen's consort was marked by the greatest sagacity and tact. His death, Dec. 14, 1861, caused the most profound grief throughout the world. A collection of the speeches of Prince A. was published soon after his death.

Alber'ta, one of the districts of the Northwest Territories of Canada, having Assiniboia and Saskatchewan on the east, British Columbia on the west, the U. S. on the south, and Athabasca on the north. Area 106,500 sq. mi.; pop. 15,533. It is a fertile grassy region with trees in the river valleys; coal is abundant. Capital, Calgary.

Albert Nyan'za, a lake of Africa, one of the head-waters of the Nile. It abounds with fish, and its shores are infested with crocodiles and hippopotami. It receives the Victoria Nile from the Victoria Nyanza, and the White Nile issues from its northern extremity.

Albigenses (al-bi-jen'sēz), a sect which spread widely in the south of France and elsewhere about the twelfth century, and which differed in doctrine and practise from the Roman Catholic Church, by which they were subjected to severe persecution. They are said to have been so named from the district Albi, where, and about Toulouse, Narbonne, etc., they were numerous. A crusade was begun against them and Count Raymond VI of Toulouse, for tolerating them, in 1209, the army of the cross being called together by Pope Innocent III. Simon de Montfort, the military leader of the crusade, was severe toward other places in the territory of Raymond and his allies. When hundreds of thousands had fallen on both sides. a peace was made in 1229, by which Raymond was obliged to cede Narbonne with other territories to Louis IX, and make his son-in-law, a

brother of Louis, his heir. The heretics were now delivered up to the proselytizing Dominicans, and to the Inquisition, and they disappeared after the middle of the thirteenth century.

Albina, Multnomah co., Ore. Pop. 1890, 5,129.

Albinos (al-bi'noz), the name given to those persons from whose skin, hair, and eyes, in consequence of some defect in their organization, the dark coloring matter is absent. The skin of albinos, therefore, whether they belong to the white, Indian, or negro races, is of a uniform pale milky color, their hair is white, while the iris of their eyes is pale rose color, and the pupil intensely red, the absence of the dark pigment allowing the multitude of bloodvessels in these parts of the eye to be seen. For the same reason their eyes are not well suited to endure the bright light of day, and they see best in shade or by moonlight. peculiarity of albinism is always born with the individual, and is not confined to the human race, having been observed also in horses, rabbits. rats, mice, etc., birds (white crows or black-birds are not particularly uncommon), and fishes.

**Al'bion**, the earliest name by which the island of Great Britain was known, employed by Aristotle, and in poetry still used for Great Britain. The same word as *Albany*, *Albyn*.

Britain. The same word as Albany, Albyn. Albuera (àl-by-à'rà), a village of Spain, in Estremadura, 12 mi. s. s. e. of Badajoz. A battle was fought here, May 10, 1811, between the army of Marshal Beresford (30,000) and that of Marshal Soult (25,000), when the latter was obliged to retreat to Seville, leaving Badajoz to fall into the hands of the allies.

Albu'men (or Albumin), a substance, or rather, group of substances, so named from the Latin for the white of an egg, which is one of its most abundant known forms. It may be taken as the type of the protein compounds or the nitrogenous class of food stuffs. One variety enters largely into the composition of the animal fluids and solids, is coagulable by heat at and above 160°, and is composed of carbon, hydrogen, nitrogen, and oxygen, with a little sulphur. It abounds in the serum of the blood, the vitreous and crystalline hu-mors of the eye, the fluid of dropsy, the substance called coagulable lymph, in nutritive matters, the juice of flesh, etc. The blood contains about 7 per cent. of albumen. Another variety called vegetable albumen exists in most vegetable juices and many seeds, and has nearly the same composition and proper-ties as egg albumen. When albumen coagulates in any fluid it readily encloses any substances that may be suspended in the fluid. Hence it is used to clarify syrupy liq-In cookery white of eggs is employed uors. for clarifying, but in large operations like sugar-refining the serum of blood is used. From its being coagulable by various salts, and especially by corrosive sublimate, with which it forms an insoluble compound, white of egg is a convenient antidote in cases of poisoning by that substance. With lime it poisoning by that substance. forms a cement to mend broken ware.

In botany the name albumen is given to the farinaceous matter which surrounds the embryo, the term in this case having no reference to chemical composition. It constitutes the meat of the cocoanut, the flour or meal of cereals, the roasted part of coffee, etc.

Albuquerque (àl-bu-kerk'à), ALFONSO DE (1452-1515), an eminent Portuguese admiral. His career was extremely successful, he having extended the Portuguese power over Malabar, Ceylon, the Sunda Islands, and the Peninsula of Malacca, and made the Portuguese name respected by all the nations and princes of India.

Albuquerque, Bernalillo co., N. M., on Rio Grande River, 528 mi. s. of Denver. Railroads, Atlantic & Pacific and A. T. & S. F. Industries—two flouring mills, iron foundry, ice factory, stamp mill, and a wool-scouring plant, and railroad machine shops. Surrounding country, agricultural and mineral. The town was first settled in 1880 and became a city in 1892. Pop. est., 1897, 12,000.

**Albur' num,** the soft white substance which, in trees, is found between the liber or inner bark and the wood, and, in progress of time acquiring solidity, becomes itself the wood. A new layer of wood, or rather of alburnum, is added annually to the tree in every part just under the bark.

Alcæ'us, one of the greatest Grecian lyric poets, was born at Mitylene, in Lesbos, and flourished there at the close of the seventh and beginning of the sixth centuries B. C.; but of his life little is known. A strong manly enthusiasm for freedom and justice pervades his lyrics, of which only a few fragments are left. He wrote in the Æolic dialect, and was the inventor of a meter that bears his name, which Horace has employed in many of his odes.

Alcala' de Henares (en-ä'res), a beautiful city of Spain, 16 mi. e. n. e. of Madrid. It has an imposing appearance when seen from some distance, but on nearer inspection is found to be in a state of decay. There was formerly a university here, at one time attended by 10,000 students; but in 1830 it was removed with its library to Madrid. Cervantes was born here. Pop. 12,317.

Alces' tis, in Greek mythology, wife of Admetus, king of Thessaly. Her husband was ill, and, according to an oracle, would die unless some one made a vow to meet death in his stead. This was secretly done by Alcestis, and Admetus recovered. After her decease Hercules brought her back from the infernal regions. See *Mythology*.

Al'chemy (or Alchymy), the art which in former times occupied the place of, and paved the way for, the modern science of chemistry (as astrology did for astronomy), but whose aims were not scientific, being confined solely to the discovery of the means of indefinitely prolonging human life, and of transmuting the baser metals into gold and silver. Among the alchemists it was generally thought necessary to find a substance which, containing the original principle of all matter, should possess the

### Alcibiades

power of dissolving all substances into their elements. This general solvent, which at the same time was to possess the power of remov-ing all the seeds of disease out of the human body and renewing life, was called the philosopher's stone, and its pretended possessors were known as adepts. Alchemy flourished chiefly in the Middle Ages. Many of the monks de-voted themselves to alchemy, although they were latterly prohibited from studying it by the popes. But there was one even among these, John XXII, who was fond of alchemy. Raymond Lully, or Lullius, a famous alche-mist of the thirteenth and fourteenth centuries, is said to have changed for King Edward I a mass of 50,000 lbs. of quicksilver into gold, of which the first rose-nobles were coined. Among other alchemists may be mentioned Parcelsus and Basilius Valentinus. When more rational principles of chemistry and philosophy began to be diffused and to shed light on chemical phenomena, the rage for

alchemy gradually decreased. Alcibi ades (dez) (B. c. 450-404), an Athenian of high family and of great abilities, but of no principle, b. at Athens, being the son of Cleinias, and a relative of Pericles. In youth he was remarkable for the dissoluteness of his manners. He came under the influence of Socrates. After the death of Cleon he attained a political ascendency which left him no rival but Nicias. He played an important part in the Peloponnesian war. In 415 he advocated the expedition against Sicily, and was chosen one of the leaders, but before the expedition sailed he was charged with profaning and divulging the Eleusinian Mysteries. Rather than stand his trial he went over to Sparta, divulged the plans of the Athenians, and assisted the Spartans to defeat them. He soon left Sparta and took refuge with the Persian satrap Tissaphernes. He began to intrigue for his return to Athens, offering to bring Tissaphernes over to the Athenian al-liance, and latterly he was recalled and his banishment canceled. He, however, remained abroad in command of the Athenian forces. and took Chalcedon and Byzantium. In B. C. 407 he returned to Athens, but in 406, he was deprived of his command. He once more went over to the refuge of the satrap Pharnabazus of Phrygia, and here he was assassinated.

Al'cohol, the purely spirituous or intoxicating part of all liquids that have undergone vinous fermentation, extracted by distillation—a limpid colorless liquid, of an agreeable smell and a strong pungent taste. When brandy, whisky, and other spirituous liquors, themselves distilled from cruder materials, are again distilled, highly volatile alcohol is the first product to pass off. Charcoal and carbonate of soda put in the brandy or other liquor, partly retain the fusel-oil and acetic acid it contains. The product thus obtained by distillation is called *rectified spirits* or *spirits* of wine, and contains from 55 to 85 per cent. of alcohol, the rest being water. By distilling rectified spirits over carbonate of potassium,

powdered quicklime, or chloride of calcium, the greater part of the water is retained, and nearly pure alcohol passes over. It is only, however, by very prolonged digestion with desiccating agents and subsequent distillation that the last traces of water can be removed. The specific gravity of alcohol varies with its purity, decreasing as the quantity of water it contains decreases. By simple distillation the specific gravity of alcohol can scarcely be reduced below .825 at 60° Fahr.; by rectification over chloride of calcium it may be reduced to .794; as it usually occurs it is about .820. Alcohol is composed of carbon, hydrogen, and oxygen, in the proportions of 2 to 6 to 1 respectively. Under a barometric pressure of 29.5 inches it boils at 173° Fahr.; in the exhausted receiver of an air-pump it boils at ordinary temperatures. Its very low freezingpoint renders it valuable for use in thermometers for very low temperatures. Alcohol is extremely inflammable, and burns with a paleblue flame, scarcely visible in bright daylight. It occasions no carbonaceous deposit upon substances held over it, and the products of its combustion are carbonic acid and water. The steady and uniform heat which it gives during combustion makes it a valuable material for lamps. It dissolves the vegetable acids, the volatile oils, the resins, tan, and extractive matter, and many of the soaps; the greater number of the fixed oils are taken up by it insmall quantities only, but some are dissolved largely. When alcohol is submitted to distillation with certain acids a peculiar compound is formed, called ether. It is alcohol which gives all intoxicating liquors the property whence they are so called. Alcohol acts strongly on the nervous system, and though in small doses it is stimulating and exhilarating, in large doses it acts as a poison. In medicine it is often of great service.

The name alcohol is also applied in chemistry to a large group of compounds of carbon, hydrogen, and oxygen, whose chemical properties are analogous to that of common or ethylic alcohol.

Alco'ran. See Koran.

Alcott, AMOS BRONSON (1799-1888), born in Wolcott, Conn. In 1828 he went to Boston and organized a school on a novel plan. Later Mr. Alcott went to Concord, Mass., where he studied natural theology, reform in education and civil and social institutions, and began to lecture. In 1842 he went to England to confer with educational and social reformers. On his return to America he again settled in Concord. Among his publications are, Tablets (1868); Concord Days (1872); Table Talk (1877); and Sonnets and Canzonets (1877).

Alcott, LOUISA MAY (1832–1888), author, born in Germantown, Penn. She was the daughter of Amos Bronson Alcott. For a number of years she wrote for periodicals, while she was occupied as a school-teacher. In 1862 she went as a volunteer nurse in military hospitals. In 1866 Miss Alcott visited Europe, and on her return wrote *Little Women*, a book that at once established her popularity as a writer.

Some of her other publications have been almost equally popular. Alcuin (alk'win) (735-804), a learned Eng-

lishman, the confidant, instructor, and adviser of Charles the Great (Charlemagne). Charlemagne became acquainted with him at Parma, invited him in 782 to his court, and made use of his services in his endeavors to civilize his subjects. Charlemagne established at his court a school, called Schola Palatina, or the Palace School. Most of the schools in France were either founded or improved by him; thus he founded the school in the abbey of St. Martin of Tours, in 796. Alcuin left the court in 801, and retired to the abbey of St. Martin of Tours, but kept up a constant correspondence with Charles to his death. He left works on theology, philosophy, rhetoric, also poems and letters, all of which have been published.

Alden, JOHN, one of the Pilgrim Fathers landing in Massachusetts in 1620. The romantic incident of his courtship of Priscilla as the emissary of Miles Standish has been preserved in Longfellow's verse. He died 1687.

Alder (al'dér), a genus of plants, of the birch order, consisting of trees and shrubs inhabiting the temperate and colder regions of the globe. Common alder is a tree which grows in wet situations in the U.S., Europe, and Asia. Its wood, light and soft and of a

reddish color, is used for a variety of purposes, and is well adapted for work which is to be kept constantly in water. The roots and knots furnish a beautifully-veined wood, well suited for cabinet work. The charcoal made from the wood is used in manufacturing powder.. The bark is used in tanning and leather dressing, and by fishermen for staining their nets. This and the young twigs are sometimes employed in dyeing, and yield different shades of yellow and red. With the addition of copperas it yields a black dye.

Al derney, an island belonging to Britain off the coast of Normandy, 10 mi. due west of Cape La Hogue, and 60 from the nearest point of England, the most northerly of the Channel Islands, between 3 and 4 miles long, and about 14 broad. About a third of the island is occupied by grass lands; and the Alderney cows, a small-sized but handsome breed, are famous for the richness of their milk. Climate is mild and healthy. The *Race of Alderney*, the strait between the coast of France and this island. Pop. 2,039.

Aldershot (al'der), a town and military station in England. The *camp* was originated in 1854 by the purchase by government of a tract of moorland known as Aldershot Heath, on the confines of Surrey, Hampshire, and Berkshire. Pop. (including military) 25,595.

Al'dine Editions, the name given to the works which proceeded from the press of Aldus Manutius and his family at Venice (1400-1597). They have gained the respect of scholars and the attention of book-collectors. Many of them are the first printed editions of Greek and Latin classics. Others are texts of the modern Italian authors. These editions are of importance in the history of printing. Aldus had nine kinds of Greek type, and fourteen kinds of Latin type.

Aldrich, NELSON WILMARTH, b. in R. I., 1841; was a member of the assembly, 1875-76, in the latter year was a speaker in the House of Representatives. He was elected to Congress in 1878 and 1880. In 1881 he was elected to the U. S. Senate as a Republican to succeed General Burnside, and was again elected in 1886.

Aid'rich,  $T \Pi O M AS$  BAILEY, an American poet and writer of prose tales, mostly humorous, born in 1836, was a short time in a mercantile house, but soon adopted literature as a profession, and was for a time editor of the Atlantic Monthly. He has written in verse: The Bells; Ballad of Baby Bell; Pampinea and other Poems; Cloth of Gold and other Poems; Flower and Thorn; in prose, Daisy's Necklace; Story of a Bad Boy; Marjory Daw; Prudence Palfrey, etc.

Aldridge, IRA (1804-1867), a negro actor, born at Belair, Md., died in Lodez, Poland. He was educated for a preacher, but united with an amateur dramatic company of his race, where he showed marked ability. His dramatic aspirations were interrupted by friends, and he went to England to complete a ministerial education. But in London the youth made his début at the Royalty theater as Othello, the Moor of Venice, and met with success. Later he appeared at Belfast, Ireland. In 1833 Aldridge appeared at Covent Garden theater in London, and in 1848 at the Surrey theater. He played for three years in Germany, and in 1857 visited Sweden. He re ceived several honors in Europe.

Alecto, in Greek mythology, one of the Furies.

Alembert (à-làm-bār), JEAN DE ROND D' (1717-1783), a French mathematician and philosopher. He was the illegitimate son of Madame de Tencin. His parents never publicly acknowledged him, but his father settled upon him an income of 1,200 livres. He entered the College Mazarin at the age of twelve, and studied mathematics with success. Having left college he studied law and became an advo-

4

cate, but did not cease to occupy himself with mathematics. A pamphlet on the motion of solid bodies in a fluid, and another on the integral calculus, which he laid before the Academy of Sciences in 1739 and 1740, showed him in so favorable a light that the Academy received him in 1741 into the number of its members. He published his famous work on dynamics, Traité de Dynamique (1743); and that on fluids, Iraité des Fluides. He also took a part in the investigations which completed the discoveries of Newton respecting the motion of the heavenly bodies. He took part in the celebrated Encyclopédie for which he wrote the Discours Préliminaire, and almost all the mathematical articles. He received an invitation from the Russian empress Catherine II to go to St. Petersburg, and Frederick the Great invited him to Berlin, but in vain. From Frederick, however, he accepted a pension. There was an intimate friendship between him and Voltaire.

Alemtejo (å-län-tä'zhō), the largest province of Portugal, and the most southern except Algarve. Area 19,255 sq. mi.; pop. 367,169. The capital is Evora.

Alençon (à-làn-sôn), a town of France, capital of department Orue, on the right bank of the Sarthe, 105 mi. w. by s. of Paris; has a fine Gothic church (fifteenth century), and interesting remains of the old castle of the dukes of d'Alençon. Alençon was long famed for its point-lace, called "point d'Alençon." Fine rock-crystal, yielding the so-called "diamants d'Alençon," is found in the neighboring granite quarries. Pop. 17,237.—ALENÇON, a dukedom, became united with the crown in 1221. The first duke of the name lost his life at the battle of Agincourt in 1415; another, called Charles IV, married the celebrated Margaret of Valois, sister of Francis I.

Alep'po, a city of Asiatic Turkey, in north Syria, 195 mi. n. n. e. of Damascus. Previous to 1822 Aleppo contained about 100 mosques, but in that year an earthquake laid the greater part of them in ruins, and destroyed nearly the whole city. The aqueduct built by the Romans is the oldest monument of the town. It has a trade in wool, cotton, silk, wax, skins, soap, tobacco, etc. By the Greeks and Romans it was called *Beræa*. It was conquered by the Arabs in 638, and its original name *Chalybon* was then turned into *Haleb*, whence the Italian form *Aleppo*. Its population is now estimated at over 100,000, of whom perhaps 25,000 are Christians. The language generally spoken is Arabic.

Alessan' dria, a town and fortress in north Italy, capital of the province of the same name; was built in 1168 by the Cremonese and Milanese, and was named in honor of Pope Alexander III, who made it a bishop's see. It has a cathedral, important manufactures of linen, woolen, and silk goods, and an active trade. Pop. 30,761.

Aletsch-glacier, the greatest glacier in Switzerland, canton Vaud, a prolongation of the immense mass of glaciers connected with the Jungfrau, the Aletschhorn (14,000 ft.), and other peaks; about fifteen miles long.

Aleu'tian Islands, a chain of about eighty small islands belonging to the U.S. See Alaska.

Alexander the Great, king of Macedon (356-323 B. C.), the greatest character in history before the Christian era. In early youth Alexander gave evidence of invincible courage, wonderful strength and endurance, and boundless ambition. At the age of 13 he became a pupil of Aristotle. During the lifetime of his father, Philip of Macedon, he shared in the wars for the supremacy of Macedon over the neighboring states of Greece. On the assassination of his father (336), Alexander came to the throne, at the age of twenty. He put to death several of the murderers of his father, and the latter's second wife and her infant son. The conditions under which Alexander came to the throne were far from He at once began a series of favorable. conquests which filled his reign of a little more than twelve years. The first two years were occupied in subduing the revolting cities of Greece and hostile tribes beyond the northern frontier of Macedonia. It was reported that Alexander had been slain, and a considerable revolt against the Macedonian yoke was begun anew in Greece, with Athens and Thebes as its center. Alexander appeared be-fore the latter city. The allies of Thebes, including Athens, deserted her and the city was taken by storm. The famous city was totally destroyed, the house of the poet Pindar alone being spared. The remaining states of Greece were pardoned.

Alexander set out in the spring of 334 for the conquest of the Persian Empire. With an army of 35,00 he crossed the Hellespont, and at the Granicus he totally defeated a Persian force, thereby opening the gate to all Asia Minor. The next year (333) the invading force met a vast Persian army numbering 600,000 on the plain of Issus. The Persians were again routed. Alexander next turned his attention to Phœnicia. The whole of Syria and Phœnicia submitted to him excepting only the famous city of Tyre, which was taken after a siege of seven months (332). The population of 8,000 was ex-terminated. The capture of Tyre is considered the greatest of Alexander's military operations. The next conquest was that of Egypt. At one of the mouths of the Nile the conqueror founded the city of Alexandria, which became so important a factor in the commerce of the Mediterranean. He next proceeded to the famous temple of Zeus Ammon in the Libyan desert. Alexander now turned his army eastward, to complete his overthrow of the Persian Empire. At Arbela, he met the army of the Persians, numbering more than 1,000,000, and fought one of the decisive battles of the world (331). With his army of 47,000 Alexander routed the Persians, and King Darius III met his death. He entered Babylon and Susa, taking in the latter city the royal treasure of silver and gold. Alexander was now regarded by himself and by the Persians as the successor of Darius. The vio-

### Alexander

torious army was next led northward for the subjugation of various tribes about the Caspian Sea, and thence across the Hindu Kush into Bactria and Sogdiana (329-328). In 327 Alexander led his army to India, where all the na-tive princes submitted except Porus, a powerful king north of the Indus, who was defeated. Alexander rediscovered the sea-route from the Indus to the Euphrates via the Indian Ocean, an achievement of great importance for the commerce of India. He made Babylon the capital of his vast empire. By means of colonies and intermarriage the peoples of Europe and Asia were to be fused into a single great nation, having common laws, language, and ruler. He himself married a daughter of King Darius, and 10,000 of his soldiers took Asiatic wives. In the midst of his vast projects Alexander was seized by a fever and died at Babylon. Of the generals among whom his vast domain was divided, the most famous was Ptolemy, who founded in Egypt the line of rulers of that name.

Alexander's title to greatness lies in his military achievements. His insatiate vanity and unchecked excesses are a serious blemish. His uncontrolled passion led him to commit deeds, such as the murder of his dearest friend, Clitus, which he bitterly repented. He never asked his soldiers to do what he would not do himself. He was a man of fine tastes and a liberal patron of art, philosophy, and literature. The effects of his conquests were, to end the struggle between Greece and Persia, to spread Hellenic civilization over Egypt and western Asia, while to the Greeks came the wealth and the vices of the Orient.

The story of Alexander's life and conquests is told in many ancient annals, and in the romances and legends of many nations.

Alexander, the name of eight popes, the earliest of whom, Alexander I, is said to have reigned from 109 to 119. The most famous is ALEXANDER VI (Borgia), (1431-1503), who was born at Valencia, in Spain. When he was only twenty-five years of age his uncle, Pope Calixtus III, made him a cardinal, and shortly afterward appointed him to the dignified and lucrative office of vice-chancellor. By bribery he prepared his way to the papal throne, which he attained in 1492, after the death of Innocent VIII. Both the authority and revenues of the popes being at this time much impaired, he set himself to reduce the power of the Italian princes, and seized upon their possessions for the benefit of his own family. His policy was faithless and base. He sold indulgences, and set aside, in favor of himself, the wills of several cardinals. His excesses roused against him the powerful eloquence of Savonarola, who, by pen and pul-pit, urged his deposition, but had to meet his death at the stake in 1498. His son Cesare Borgia, and his daughter, Lucrezia, are equally notorious with himself.

Alexander, the name of three Scottish kings. ALEXANDER I, a son of Malcolm Canmore and Margaret of England. He was a great benefactor of the church and a firm vindicator of the national independence. ALEXANDER II (1198-1248) succeeded his father, William the Lion, in 1214. Alexander died at Kerrera, an island opposite Oban, when on an expedition in which he hoped to wrest the Hebrides from Norway. He was succeeded by his son, ALEX-ANDER III, a boy of eight, who, in 1251, married Margaret, eldest daughter of Henry III, of England. He brought the Hebrides under his sway in a few years after the defeat of the Norse King Haco at Largs, in 1263. Alexander was strenuous in asserting the independence both of the Scottish kingdom and the Scottish church against England. He died in 1285. Under him Scotland enjoyed greater prosperity than for generations afterward.

prosperity than for generations afterward. Alexander I (1777-1825), emperor of Russia, son of Paul I and Maria, daughter of Prince Eugene of Würtemberg. On the assassination of his father, in 1801, Alexander ascended the throne, and concluded peace with Great Britain, against which his predecessor had declared war. In 1803 he offered his services as mediator between England and France, and two years later a convention was entered into between Russia, England, Austria, and Sweden for the purpose of resisting the encroachments of France on the territories of independent states. He was present at the battle of Austerlitz (1805), when the combined armies of states. Russia and Austria were defeated by Napoleon. In the succeeding campaign the Russians were again beaten at Éylau and Friedland (1807), the result of which was the treaty at Tilsit. The Russian emperor identified himself with the Napoleonic schemes, and obtained possession The of Finland and territory on the Danube. French alliance was too oppressive, and his having separated himself from Napoleon led to the French invasion of 1812. In 1813 he published a manifesto which served as the basis of the coalition of the other European powers against France, which was followed by the capture of Paris (in 1814), the abdication of Napoleon and the restoration of the Bourbons, and the utter overthrow of Napoleon the following year. After Waterloo, Alexander, accompanied by the emperor of Austria and the king of Prussia, made his second entrance into Paris, where they concluded the treaty known as the Holy Alliance. The remaining part of his reign was chiefly taken up in measures of internal reform, including the gradual abolition of serfdom, and the promotion of education, agriculture, commerce, and manufactures, as well as literature and the fine arts.

Alexander II (1818–1881), emperor of Russia, succeeded his father Nicholas in 1855, before the end of the Crimean war. After peace was concluded the new emperor set about effecting the emancipation of the serfs in 1861, a measure which gave freedom, on certain conditions, to 22,000,000 human beings. Under him, too, representative assemblies were introduced, and he did much to improve education, and to reorganize the judicial system. During his reign the Russian dominions in Central Asia were extended, a piece of territory south of the Caucasus, formerly belong-

## Alexander

ing to Turkey, was acquired, and a part of Bessarabia, belonging since the Crimean war to Turkey in Europe, but previously to Russia, was restored to the latter power. The latter additions resulted from the Russo-Turkish war of 1877-78. He was killed by an explosive missile flung at him by a Nihilist in a street in St. Petersburg, March 13, 1881. He was succeeded by his second son, Alexander III (1845-1894), his eldest son having died in youth. His only daughter is the wife of the Duke of Edinburgh.

Alexander, ARCHIBALD (1772-1851), born in Virginia. He became a Presbyterian minister, and in 1812 head of the theological seminary at Princeton. He published several theological treatises.

Alexander, STEPHEN (1806-1883), astronomer, b. in Schenectady, N. Y.; d. at Princeton, N. J. From 1845 to 1878 he occupied the professorships of mathematics and of astronomy and mechanics at Princeton. In 1860 he conducted an expedition to Labrador for the purpose of observing a solar eclipse.

Alexander, WILLIAM (1726–1783), called "Lord Stirling," soldier, born in New York City. In 1757 he prosecuted his claim to the earldom of Stirling before the British House of Lords, but without success. He became surveyor-general and member of the provin-cial council. At the beginning of the Revolution he joined the colonial army, 1775, as colonel of the battalion of East Jersey, captured an armed British transport, for which exploit Congress appointed him brigadier-general. At the battle of Long Island, Aug. 26, 1776, he was taken prisoner. Within the same year he was exchanged, and in February, 1777, was promoted a major-general. When Gen. Charles Lee marched to Philadelphia, in December, 1776, Alexander remained in command at New York. At Trenton, N. J., he captured a Hessian regiment. On June 24, 1777, at Metuchen his division was defeated. He fought creditably at Brandywine, Germantown, and Monmouth. In 1779 he surprised a British force at Paulus Hook, N. J. In 1781 he was in command at Albany. Alexander was one of the founders of King's College (now Columbia), and became its first president.

Alexander Nevskoi (1219-1263), a Russian hero and saint, son of the Grand-duke Jaroslav. He fought against assaults of the Mongols, the Danes, Swedes, and knights of the Teutonic order. He gained a splendid victory, on the Neva, over the Swedes. His countrymen commemorated him in popular songs, and raised him to the dignity of a saint. Peter the Great built a splendid monastery at St. Petersburg in his honor, and in memory of him established the order of Alexander Nevskoi.

Alexander Seve'rus (A. D. 205-235), a Roman emperor. He was raised to the imperial dignity in 222 A. D. by the pratorian guards, after they had put his cousin, the emperor Heliogabalus, to death. He governed ably both in peace and war; and also occupied himself in poetry, philosophy, and literature.

# Alexandria

In 232 he defeated the Persians under Artaxerxes, who wished to drive the Romans from Asia. When on an expedition into Gaul to repress an incursion of the Germans, he was murdered with his mother in an insurrection of his troops, headed by the brutal Maximin, who succeeded him as emperor.

Alexan' dria, an ancient city and seaport in Egypt, at the northwest angle of the Nile delta, on a ridge of land between the sea and Lake Mareotis. Ancient Alexandria was founded by, and named in honor of, Alexander the Great, in B. C. 332, and was long a great and splendid city, the center of commerce between the East and West, as well as of Greek learning and civilization, with a population at one time of perhaps 1,000,000. It was especially celebrated for its great library, and also for its famous lighthouse, one of the wonders of the world, standing upon the little island of Pharos, which was connected with the city by a mole. Under Roman rule it was the second city of the empire, and when Constantinople became the capital of the East it still remained the chief center of trade; but it received a blow from which it never recovered when captured by Amru, general of Caliph Omar in 641, after a siege of fourteen months. Its ruin was finally completed by the discovery of the passage to India by the Cape of Good Hope, which opened up a new route for the Asiatic trade. See Alexandrian Library, Alexandrian School. Modern Alexandria stands partly on what was formerly the island of Pharos, partly on the peninsula which now connects it with the mainland and has been formed by the accumulation of soil, and partly on the mainland. The streets in the Turkish quarter are narrow, dirty, and irregular; in the foreign quarter they are regular and wide, and it is here the finest houses are situated, and where are the principal shops and hotels, banks, offices of companies, etc.; this part of the city being also supplied with gas, and with water brought by the Mahmudieh Canal from the western branch of the Nile. Alexandria is connected by railway with Cairo, Rosetta, and Suez. A little to the south of the city are the catacombs which now serve as a quarry. Another relic of antiquity is Pompey's Pillar, 98 ft. 9 in. high. Alexandria has two ports, on the east and west respectively of the isthmus of the Pharos peninsula, the latter having a breakwater over 3,000 yards in length, with fine quays and suitable railway and other accommodation. The trade of Alexandria is large and varied, the exports being cotton, beans, peas, rice, wheat, etc.; the imports chiefly manufac-tured goods. At the beginning of the century Alexandria was an insignificant place of 5,000 or 6,000 inhabitants. The origin of its more recent career of prosperity it owes to Moham-med Ali. In 1882 the insurrection of Arabi Pasha and the massacre of Europeans led to the intervention of the British, and the bombardment of the forts by the British fleet, in July. When the British entered the city they found the finest parts of it sacked and in

flames, but the damage is being repaired.

Pop. 227,064. Alexandria, a town and port of Virginia, on the right bank of the Potomac, 7 miles south of Washington, with straight and spacious streets: carries on a considerable trade, chiefly in flour. Pop. 15,230.

Alexandrian Library, the largest and most famous of all the ancient collections of books, founded by Ptolemy Soter, king of Egypt, and greatly enlarged by succeeding Ptolemies. At its most flourishing period it is said to have numbered 700,000 volumes, accommodated in two different buildings, one of them being the Serapeion, or temple of Jupiter Serapis. The other collection was burned during Julius Cæsar's seige of the city, but the Serapeion library existed to the time of the emperor Theodosius the Great, when, at the general destruction of the heathen temples, the splendid temple of Jupiter Serapis was gutted (A. D. 391) by a fanatical crowd of Christians, and its literary treasures destroyed or scattered. A library was again accumulated, but was burned by the Arabs when they captured the city under the Caliph Omar in 641. Amru, the captain of the caliph's army, would have been willing to spare the library, but Omar is said to have disposed of the matter in the famous words : "If these writings of the Greeks agree with the Koran they are useless, and need not be preserved; if they disagree they are perni-cious, and ought to be destroyed."

Alexandrian School (or Age), the school or period of Greek literature and learning that existed at Alexandria in Egypt during the three hundred years that the rule of the Ptolemies lasted (323-30 B. C.), and continued under the Roman supremacy. Ptolemy Soter founded the famous library of Alexandria and his son, Philadelphus, established a kind of academy of sciences and arts. Many scholars and men of genius were thus attracted to Alexandria, and a period of literary activity set in, which made Alexandria for long the focus and center of Greek culture and intellectual effort. Among the grammarians and critics, were Zenodotus, Eratosthenes, Aristophanes, Aristarchus, and Zoilus, proverbial as a captious critic. Their merit is to have collected, edited, and preserved the existing monuments of Greek literature. To the poets belong Apollonius, Lycophron, Aratus, Nicander, Euphorion, Callimachus, Theocritus, Philetas, etc. Among those who pursued mathematics, physics, and astronomy, was Euclid, the father of scientific geometry; Archimedes, great in physics and mechanics; Apollonius of Perga, whose work on conic sec-tions still exists; Nicomachus, the first scientific arithmetician; and (under the Romans) the astronomer and geographer Ptolemy. Alexandria also was distinguished in philosophical speculation, and it was here that the New Platonic school was established at the close of the second century after Christ by Ammonius of Alexandria (about 193 A. D.), whose disciples were Plotinus and Origen. Being for the most part Orientals, formed by

the study of Greek learning, the writings of the New Platonists are strikingly characterized -- for example, those of Ammonius Saccas, Plotinus, Iamblicus, Porphyrius — by a mixture of Asiatic and European elements. The principal Gnostic systems also had their origin in Alexandria.

Alexandrian Version, or Codex Alexandrinus, a manuscript in the British Museum, of great importance in Biblical criticism, written on parchment with uncial letters, and belonging probably to the latter half of the sixth century. It contains the whole Greek Bible (the Old Testament being according to the Septuagint), together with the letters of Bishop Clement of Rome, but it wants parts of Matthew, John, and Second Corinthians. The Patriarch of Constantinople, who in 1628 sent this manuscript as a present to Charles I, said he had received it from Egypt (whence its name).

Alex'is Michai'lovitch (son of Michael) (1629-1676), second Russian czar of the line of Romanoff (the present dynasty). He did much for the internal administration and for the enlargement of the empire; reconquered Little Russia from Poland, and carried his authority to the extreme east of Siberia. He was father of Peter the Great.

Alex'ius Comne'nus (1048-1118), Byzantine emperor. See Byzantine Empire.

Alfal'fa, a name given to a perennial forage plant, and one of the most valuable of the leguminous plants grown for the supply of green food to cattle. It is sometimes known as Lucerne. It is a native of the south of Europe, and has been cultivated there from an unknown antiquity. It is largely culti-vated in some parts of North and South America. It is especially adapted to the Southern states. It endures great droughts, its roots penetrating very deep into the ground. It is the best of all forage crops for a drought. It delights in a sight and concernent drought. It delights in a rich and calcareous soil, and never succeeds on damp soils or tenacious clays. It is a perennial, and if kept free from weeds affords good crops for six, seven, or more years. It is sown in rows, at 10 or 14 inches apart, and may be mown several times in a year, growing very quickly after being mown. The quantity of produce is very great -sometimes from twenty to thirty tons per annum—and few other forage plants are ready for use so early in spring. Alfalfa has a rather erect stem, leaves with three obovate-oblong toothed leaflets; purplish-blue or sometimes yellow flowers in many-flowered racemes, and pods twisted two or three times round.

Alfara'bi, an eminent Arabian scholar of the tenth century; died at Damascus in 950. wrote on the Aristotelian philosophy, and compiled a kind of encyclopedia.

Alfleri (al-fe-ā'rē), VITTORIO, COUNT (1749-1803), Italian poet. After extensive European travels he began to write, and his first play, Cleopatra (1775), being received with general applause, he determined to devote all his efforts to attaining a position among writers of dramatic

poetry. He died at Florence and was buried in the church of Santa Croce, between Macohiavelli and Michael Angelo, where a beautiful monument by Canova covers his remains. He wrote twenty-one tragedies and six comedles. He is considered the first tragic writer of Italy, and has served as a model for his successors. Alfieri composed also an epic, lyrics, satires, and poetical translations from the ancient classics. He left an interesting autobiography.

Alford, HENRY, D. D. (1810-1871), Dean of Canterbury, an English poet, scholar, and miscellaneous writer. He wrote an edition of the Greek Testament with commentary, which occupied him for twenty years. In 1857 he was appointed Dean of Canterbury. Among other things he wrote Chapters on the Poets of Ancient Greece, Sermons, Psalms and Hymns, Homilies on the Acts of the Apostles, Letters from Abroad, Poetical Works, Plea for the Queen's English.

Alfred the Great (849-901), king of the West Saxons. The youngest son of Ethel-wulf, who reigned 836-858, he came to the throne in 871, the intervening thirteen years having been occupied by the reigns of his three older brothers. In his youth Alfred was an eager student, and so remained through life. His entire reign of 30 years was occupied in repelling the attacks of invading Danes and Northmen, and in restoring his country from the effects of their ravages. On coming to the throne Alfred made a truce with the Danes, who turned their attention to the other provinces of Britain. It is to be noticed that Alfred was not king of all England, his dominions having extended hardly as far north as the mouth of the Severn. He fitted out a number of ships and with these resumed hostilities in 876. The following spring he is said to have met a force of 120 Danish ships and driven them on shore, where all on board perished in the wreck. The next winter the Danes invaded in large numbers, and Alfred with his followers fled to the hills and woods for safety. It is to this period that the familiar legend of the burning cakes be-longs. He was joined by a band of trusty followers, and made repeated sallies against the enemy's possessions. In May, 878, he prepared to attack the Danish army under Guthrum at Eddington. It is said that two or three days before the battle he entered the Danish camp disguised as a gleeman, and gained all the information desired respecting their strength and position. In the battle that followed, the Danes were utterly defeated. Guthrum and his followers accepted Christianity and were assigned territory north of Wessex. He afterward ceded to them the eastern portion of Mercia, which became known as the Danelagh. Alfred was now the ruler of nearly all England, though never recognized by title as such. During the period of peace which followed Alfred rebuilt the cities and fortresses and improved his fleet. Ships were stationed at intervals along the coast to guard against invasion. It is to this period that Alfred's most

Important government reforms and literary labors belong. He established a regular militia which should be able to protect the several parts of the kingdom without leaving any district defenseless. The last invasion during Alfred's reign was in 894 under the famous Hastings. After three years of hard fighting in nearly all parts of the kingdom, the invaders were driven out. Alfred's last years were passed in peace. He was succeeded by his son, Edward the Elder.

Of all the monarchs to whom the title of "Great" has been given, none deserves it, in point of character, as does Alfred. The selfish ambition and cruelty which have stained the characters of other great rulers are not recorded in his life. In the making and administration of laws, in his careful oversight of the courts of justice, in his promotion of the arts of peace, he had the welfare of his subjects ever in view. He was blessed with signal good judgment in choosing his advisers. Of his military genius, the record of obstacles patiently combated and victoriously overcome is sufficient witness. He was in belief and in practise a devout Christian; for many years he suffered uncomplainingly the ravages of a dread, mysterious disease. Alfred is conspicuous for the patronage he gave to letters, and his own learning and industrious scholarship are most remarkable. To bring knowledge within reach of his subjects he translated Bede's Ecclesiastical History of England, Gregory's Pastoral Care, Boëthius's Consolations of Philosophy, from Latin into Anglo-Saxon, adding much of his own composition. It was during his reign that the valuable Anglo-Saxon Chronicle assumed a systematic form. He represents all that is greatest and best in the modern Christian civilization of the West, and was the herald of centuries far removed from him in point of time.

Al'gæ (al'jē), an order of plants, found for the most part in the sea and fresh water, and comprising sea-weeds, etc. The higher forms have stems bearing leaf-like expansions, and they are often attached to the rocks by roots, which, however, do not derive nutriment from the rocks. A stem, however, is most frequently absent. The plants are nourished through their whole surface by the medium in which they live. They vary in size from the microscopic diatoms to forms whose stems resemble those of forest trees, and whose fronds rival the leaves of the palm. They are entirely composed of cellular tissue, and many are edible and nutritious, as carrageen or Irishmoss, dulse, etc. Kelp, iodine, and bromine are products of various species. The Algæ are also valuable as manure.

Algar'di, ALESSANDRO (1602-1654), one of the chief Italian sculptors of the seventeenth century. He lived and worked chiefly at Rome; executed the tomb of Leo XI in St. Peter's, and a marble relief with life-size figures over the altar of St. Leo there.

Algarve ( $\dot{a}$ ll- $g\dot{a}$ *i* ' $v\dot{a}$ ), a maritime province of Portugal occupying the southern portion of the kingdom; mountainous but with some

fertile tracts. Area 2,099 sq. mi.; pop. 200,-000.

Al'gebra, a kind of generalized arithmetic, in which numbers or quantities and operations, often also the results of operations, are represented by symbols. Thus the expression  $xy + cz + dy^{2}$  denotes that a number represented by z is to be multiplied by a number represented by y, a number c multiplied by a number z, a number d by a number ymultiplied by itself (or squared), and the sum taken of these three products. So the equation (as it is called)  $x^2 - 7x + 12 = 0$  expresses the fact that if a certain number x is multiplied by itself, and this result made less by seven times the number and greater by twelve, the result is 0. In this case x must either be 3 or 4 to produce the given result; but such an equation (or formula) as (a+b) $(a-b) = a^2 - b^2$  is always true whatever values may be assigned to a and b. Algebra is an invaluable instrument in intricate calculations of all kinds, and enables operations to be performed and results obtained that by arithmetic would be impossible, and its scope is still being extended.

The beginnings of algebraic method are to be found in Diophantus, a Greek of the fourth century of our era, but it was the Arabians that introduced algebra to Europe, and from them it received its name. The first Arabian treatise on algebra was published in the reign of the great Caliph Al Mamun (813–833) by Mohammed Ben Musa. In 1202 Leonardo Fibonacci of Pisa, who had traveled and studied in the East, published a work treating of algebra as then understood in the Arabian school. From this time to the discovery of printing considerable attention was given to algebra, and the work of Ben Musa and another Arabian treatise, called the Rule of Algebra, were translated into Italian. The first printed work treating on algebra (also on arithmetic, etc.) appeared at Venice in 1494, the author being a monk called Luca Pacioli da Bergo. Rapid progress now began to be made, and among the names of those to whom advances are to be attributed are Tartaglia and Cardan. About the middle of the sixteenth century the German Stifel introduced the signs  $+, -, \sqrt{}$ , and Recorde the sign =. Recorde wrote the first English work on algebra. François Vieta, a French mathematician (1540-1603), first adopted the method which has led to so great an extension of modern algebra, by being the first who used general symbols for known quantities as well as for unknown. It was he also who first made the application of algebra to geometry. Albert Girard extended the theory of equations by the supposition of imaginary quantities. The Englishman Harriot, early in the seventeenth century, discovered negative roots, and established the equality between the number of roots and the units in the degree of the equation. He also invented the signs < >, and Oughthred that of  $\times$ . Descartes, though not the first to apply algebra to geometry, has, by the extent and importance of his applications, commonly acquired the

credit of being so. The same discoveries have also been attributed to him as to Harriot, and their respective claims have caused much controversy. He obtained by means of algebra the definition and description of curves. Since his time algebra has been applied so widely in geometry and higher mathematics that we need only mention the names of Fermat, Wallis, Newton, Leibnitz, De Moivre, Mac Laurin, Taylor, Euler, D'Alembert, Lagrange, Laplace, Fourier, Poisson, Gauss, Horner, De Morgan, Sylvester, Cayley, Boole, Jevons, and others who applied the algebraic method not only to formal logic but to political economy.

Algeciras (àl-he-thē' ràs), à seaport of Spain, on the west side of the Bay of Gibraltar, a wellbuilt town carrying on a brisk coasting trade. It was the first conquest of the Arabs in Spain (711), and was held by them till 1344, when it was taken by Alphonso XI of Castile after a siege of twenty months. Near Algeciras, in July, 1801, the English admiral Saumarez defeated the combined French and Spanish fleets, after having failed in an attack a few days before. Pop. 14,230.

Alger, HORATIO, JR., an American author of books for young people, born in Massachusetts, 1834. His works are numerous and very popular.

Alger, RUSSELL A., an American soldier and statesman, b. in Medina co., O., 1836, in a log cabin. His parents died when he was twelve years old, leaving four children to fight the battles of life. When fourteen years of age he began to work as a common farm laborer at \$3 a month. He received a fair English education, but it was in the university of adversity. Shortly after his marriage the war broke out, and in August, 1861, he enlisted in the Second Michigan cavalry, and was commissioned as captain. He was several times wounded, and was obliged to resign from the army on Sept. 20, 1864. Returning from the field he settled in Detroit, and became interested in the lumber trade, so that to-day he is the largest lumber dealer in the world. In 1884 he was elected governor of the state of Michigan on the Republican ticket and in February, 1897, was selected by President McKinley as his secretary of war.

Alge'ria, a French colony in North Africa, area 122,878 sq. mi. The country is divided into three departments—Algiers, Oran, and Constantine. The country is traversed by the Atlas Mountains, two chains of which—the Great Atlas bordering on the Sahara, and the Little, or Maritime Atlas, between it and the sea—run parallel to the coast, the former attaining a height of 7,000 feet. The climate varies considerably according to elevation and local peculiarities. There are three seasons: winter from November to February, spring from March to June, and summer from July to October. The summer is very hot and dry. In many parts of the coast the temperature is moderate and the climate so healthy that Algeria is now a winter resort for invalids.

The chief products of cultivation are wheat, barley, and oats, tobacco, cotton, wine, silk,

and dates. Early vegetables, especially potatoes and peas, are exported to France and England. A fiber called *alfa*, a variety of espart, which grows wild on the high plateaux, is exported in large quantities. Cork is also exported. There are valuable forests, in which grow various sorts of pines and oaks, ash, cedar, myrtle, pistachio-nut, mastic, carob, etc. The Australian gum-tree has been successfully introduced. Agriculture often suffers much from the ravages of locusts. Among wild animals are the lion, panther, hyena, and jackal; the domestic quadrupeds include the horse, the mule, cattle, sheep, and pigs (introduced by the French). Algeria possesses valuable minerals, including iron, copper, lead, sulphur, zinc, antimony, marble (white and red), and lithographic stone.

The exports (besides those mentioned above) are olive-oil, rawhides, wood, wool, tobacco, oranges, etc.; the imports: manufactured goods, wines, spirits, coffee, etc. The manufacturing industries are unimportant, and include morocco leather, carpets, muslins, and silks. French money, weights, and measures are generally used, The chief towns are Algiers, Oran, Constantine, Bona, and Tlemcen. There are about 1,300 miles of railways opened; there is also a considerable network of telegraph lines.

The two principal native races inhabiting Algeria are Arabs and Berbers. The former are mostly nomads, dwelling in tents and wan-dering from place to place. The Berbers, here called Kabyles, are the original inhabitants of the territory and still form a considerable part of the population. They speak the Berber language, but use Arabic characters in writing. The Jews form a small but influential part of the population. Various other races also exist. Except the Jews all the native races are Mohammedans. There are over 260,000 colonists of French origin in Algeria, and over 200,000 colonists natives of other European countries (chiefly Spaniards and Italians). Algeria is governed by a governor-general, who is assisted by a council appointed by the French Government. The settled portion of the country, in the three departments of Algiers, Constantine, and Oran, is treated much as if it were a part of France, and each department sends two deputies and one senator to the French chambers. The rest of the territory is under military rule. The colony costs France a consid-erable sum every year. Population of civil ter. 3,324,475; of mil. ter. 492,990; total, 3,817,465.

The country now called Algeria was known to the Romans as Numidia. It flourished greatly under their rule. It was conquered by the Vandals in 430-431 A. D., and recovered by Belisarius for the Byzantine Empire in 533-534. About the middle of the seventh century it was overrun by the Saracens. The town of Algiers was founded about 935 by Yussef Ibn Zeiri, and the country was subsequently ruled by his successors and the dynasties of the Almoravides and Almohades. After the overthrow of the latter, about 1269, it broke up into a number of small independent terri-

The Moors and Jews who were driven tories. out of Spain by Ferdinand and Isabella at the end of the fifteenth century settled in Algeria. Various expeditions were made by Spain against Algeria, and by 1510 the greater part of the country was made tributary. A few years later the Algerians invited to their assistance the Turkish pirate Horush Barbarossa, who made himself Sultan of Algiers in 1516, but was not long in being taken by the Span-iards and beheaded. His brother and successor put Algiers under the protection of Turkey (about 1520), and organized the sys-tem of piracy which was long the terror of European commerce, and was never wholly suppressed till the French occupation. Henceforth the country belonged to the Turkish Empire, though from 1710 the connection was little more than nominal. The depredations of the Algerian pirates were a continual source of irritation to the powers, who sent a long series of expeditions against them. In 1815 a U. S. fleet defeated an Algerian one and forced the dey to agree to a peace in which he recognized the American flag as inviolable. In 1816 Lord Exmouth with an English fleet bombarded Algiers, and exacted a treaty by which all the Christian slaves were at once released, and the dey undertook for the future to treat all his prisoners of war as the European law of nations demanded. At last the French, 1830, sent a force of over 40,000 men against the country. Algiers was speedily occupied, the dey retired, and the country was without a government, but resistance was organized by Abd-el-Kader, an Arab\_chief whom the emergency had raised up. He began his warlike career of fifteen years by an attack on Oran in 1832, and after an obstinate struggle the French, in February, 1834, consented to a peace, acknowledging him as ruling over all the Arab tribes west of the Shelif by the title of Emir of Maskara. War was soon again renewed with varying fortune, and in 1837, in order to have their hands free in attacking Constantine, the French made peace with Abd-el-Kader, leaving to him the whole of western Algeria except some coast towns. Abd-el-Kader prepared for another conflict, and in 1838, broke into French territory with a strong force, and for a time the supremacy of the French was endangered. Gen. Bugeaud was appointed governer-general in February, 1841. In the autumn of 1841 Saida, the last fortress of Abd-el-Kader, fell into his hands. Abd-el-Kader found himself compelled to seek refuge in the adjoining empire. From Marocco he twice made a descent upon Algeria, on the second occasion defeating the French in two battles; and in 1844 he even succeeded in raising an army in Marocco to withstand the French. Bugeaud crossed the frontier, and inflicted a severe defeat on this army, while a French fleet bombarded the towns on the coast. The emperor of Marocco was at length compelled to agree to a treaty, in which he not only promised to refuse Abd-el-Kader his assistance, but even engaged to lend his assistance against him. Reduced to extremi-

ties Abd-el-Kader surrendered, 1847, and was taken to France a prisoner, but was released on his promise not to return to Algeria. Repeated risings have taken place, especially during the Franco-German war of 1871.

Algiers (al'jerz), a city and seaport on the Mediterranean, capital of Algeria, on the Bay of Algiers, partly on the slope of a hill facing the sea. The old town, which is the higher, is oriental in appearance, with narrow, crooked streets, and houses that are strong, prison-like edifices. The modern French town, which occupies the lower slope and spreads along the shore, is handsomely built, with broad streets, and elegant squares. There is a large shipping trade carried on. The climate of Algiers, though extremely variable, makes it a very desirable winter residence for invalids and others from colder regions. The winter months resemble a bright, sunny autumn, while the heat of summer is not so intense as that of Egypt. Pop. 74,792.

Algo'a Bay, a bay on the south coast of Cape Colony, 425 mi. from the Cape of Good Hope, the only place of shelter on this coast for vessels during the prevailing northwest gales. The usual anchorage is off Port Elizabeth, on its west coast, now a place of large and increasing trade.

**Aigo'ma**, a district of Canada, on the north side of Lake Superior, forming the northwest portion of Ontaria, rich in silver, copper, iron, etc.

Algon'kins, one of the two great families of North American Indians, formerly spread over a great extent of territory, and still forming a large proportion of the Indians of Canada. They consist of four groups; namely, I, the eastern group, comprising the Massachusetts, Narragansetts, Mohicans, Delawares, and other tribes; 2, the northeastern group, consisting of the Abenakis, etc.; 3, the western group, made up of the Shawnees, Miamis, Illinois, etc.; 4 the northwestern group, including the Chippewas, or Ojibbewas, the largest of all the tribes.

Alhama (à-là'mà) (that is, "the bath"), a town of southern Spain, province of Granada, 25 mi. s.w. of Granada, celebrated for its warm medicinal (sulphur) baths and drinking waters. It formed a Moorish fortress, the recovery of which in 1482 by the Spaniards led to the entire conquest of Granada. It was thrown into ruins by an earthquake in December, 1884. Pop. 8,000.

**Alham'bra** ("the red castle"), a famous group of buildings in Spain, forming the citadel of Granada when that city was one of the principal seats of the empire of the Moors in Spain, situated on a height, surrounded by a wall flanked by many towers, and having a circuit of 24 mi. Within the circuit of the walls are two churches, a number of mean houses and some straggling gardens, besides the palace of Charles V and the celebrated Moorish palace, which is often distinctively spoken of as the Alhambra. This building was the royal palace of the kings of Granada. The greater part of

the present building belongs to the first half of the fourteenth century. It consists mainly of buildings surrounding two oblong courts, the one called the Court of the Fish-pond (or of the Myrtles), 138 by 74 feet, lying north and south; the other called the Court of the Lions, from a fountain ornamented with twelve lions in marble, 115 feet by 66 feet, lying east and west, described as being, with the apartments that surround it, "the gem of Arabian art in• Spain, its most beautiful and most perfect example." Its design is elaborate, exhibiting a profusion of exquisite detail, gorgeous in coloring, but the smallness of its size deprives it of the element of majesty. The peristyle or portico on each side is supported by 128 pillars of white marble, 11 feet high, sometimes placed singly and sometimes in groups. Two pavilions project into the court at each end, the domed roof of one having been lately restored. Some of the finest chambers of the Alhambra open into this court, and near the entrance a museum of Moorish remains has been formed. The prevalence of stucco or plaster ornamentation is one of the features of theAlhambra, which becomes especially remarkable in the beautiful honey-comb-stalactical pendentives which the ceilings exhibit. Arabesques and geometrical designs with interwoven inscriptions are present in the richest profusion. The beauties of Alhambra have been glowingly described by Washington Irving.

All (a' lē) (A. D. 602-661), cousin and son-inlaw of Mohammed, the first of his converts, and the bravest and most faithful of his adherents.

Ali, Pasha of Yanina (1741-1822), generally called *Ali Pasha*, a bold and able, but ferocious and unscrupulous Albanian. He made himself master of a large part of Albania, including Yanina, which the Porte sanctioned his holding, with the title of pasha. In 1820 Sultan Mahmoud pronounced his deposition. He surrendered in 1822, and his treasures were seized by the Porte.

Alicante (à-lê-kản'tả), a fortified town and Mediterranean seaport in Spain, capital of the province of the same name, 80 mi. s. by w. of Valencia. The principal manufactures are cotton, linen, and cigars; one cigar manufactory employing above 3,000 women. The chief export is wine, which largely goes to England. In 718 it was taken by the Moors, from whom it was wrested about 1240. It was besieged and bombarded by the French in 1709 and in 1812, and by the people of Cartagena during the commotions of 1873. Pop. 35,470.—The province is very fruitful and well cultivated, producing wine. silk, fruits, etc. Area 2,098 sq.mi. Pop. 427,818.

Alicata (or Licata) (à-lè-kä'tà. lè-kä, 'tà), the most important commercial town on the s. coast of Sicily, 24 mi. e s.e. of Girgenti, with a considerable trade in sulphur, grain, wine, oil, nuts, almonds, and soda. It occupies the site of the town which the Tyrant Phintias of Acragas erected and named after himself, when Gela was destroyed in 280. Pop. 15,906.

A'lien, in relation to any country, a person born out of the jurisdiction of the country, and not having acquired the full rights of a citizen of it. The position of aliens depends upon the laws of the respective countries, but generally speaking, aliens owe a local allegiance, and are bound equally with natives to obey all general rules for the preservation of order which do not relate especially to citizens. In the U.S. the position of aliens as regards acquisition and holding of real property differs somewhat in the different states, though in recent times the disabilities of aliens have been removed in most of them. Personal property they can take, hold, and dispose of, like native citizens. Individual states have no jurisdiction on the subject of naturalization, though they may pass laws admitting aliens to any privilege short of citizenship. A naturalized citizen is not eligible to election as president or vice-president of the U.S., and cannot serve as senator until after nine years' citizenship, nor as a member of the House of Representatives until after seven years' citizenship. Five years' residence in the U.S. and one year's permanent residence in the particular state where the application is made are necessary for the attainment of citizenship. See Naturalization.

Alien and Sedition Laws.—French interference in the domestic politics of the U. 8. caused the passage by Congress, June 25, 1798, of the Alien law, giving the president power to order aliens whom he should adjudge dangerous, out of the country, and providing for the fine and imprisonment of those who refused to go. The Sedition law, passed July 14, 1798, to remain in force till March 3, 1801, imposed fine and imprisonment on conspirators to resist government measures, and on libelers and scandalizers of the government, Congress, or the president.

Aligarh (a-le-gar'), a fort and town in India, in the Northwest Provinces, on the East Indian railway, 84 mi. s.e. of Delhi. The town properly called Koel or Coel, is distant about 2 mi. from the fort. Pop. 61,730. The district has an area of 1,054 sq. mi., and a population of 1,021,187.

Al'iment, food, a term which includes everything, solid or liquid, serving as nutriment for the bodily system. Aliments are of the most diverse character, but all of them must contain nutritious matter of some kind, which, being extracted by the act of digestion, enters the blood, and effects by assimilation the repair of the body. Alimentary matter, therefore, must be similar to animal substance, or transmutable into such. All alimentary substances must, therefore, be composed in a greater or less degree of soluble parts, which easily lose their peculiar qualities in the process of digestion, and correspond to the elements of the body. The food of animals consists for the most part of substances containing little oxygen and exhibiting a high degree of chemical combination, in which respects they differ from most sub-

stances that serve as sustenance for plants. which are generally highly oxidized and exhibit little chemical combinations. According to the nature of their constituents most of the aliments of animals are divided into nitrogenous (consisting of carbon, hydrogen, and oxygen along with nitrogen, and also of sulphur and phosphorus) and non-nitrogenous (consisting of carbon, hydrogen, and oxygen without nitrogen). Water and salts are usually considered as forming a third group, and in the widest sense of the word aliment, oxygen alone, which enters the blood in the lungs, forms a fourth. The articles used as food by man do not consist entirely of nutritious substances, but with few exceptions are compounds of various nutritious with in-digestible and accordingly innutritious sub-stances. The only nitrogenous aliments are albuminous substances, and these are contained largely in animal food (flesh, eggs, milk, cheese). The principal non-nitrogenous substance obtained as food from animals is fat. Sugar is so obtained in smaller quantities (in milk). While some vegetable substances also contain much albumen, very many of them are rich in starch. Among vegetable substances the richest in albumen are the legumes (peas, beans, and lentils), and following them come the cereals (wheat, oats, etc.). Sugar, water, and salts may pass without any change into the circulatory system; but albuminous substances cannot do so without being first rendered soluble and capable of absorption (in the stomach and intestines); starch must be converted into sugar, and fat emulsified (chiefly by the action of the pancreatic juice). One of the objects of cooking is to make our food more susceptible of the operation of the digestive fluids.

The relative importance of the various nutritious substances that are taken into the system and enter the blood depends upon their chemical constitution. The **#buminous sub**stances are the most indispensable, inasmuch as they form the material by which the constant waste of the body is repaired, whence they are called by Liebig the substance-formers. But a part of the operation of albuminous nutriments may be performed equally well, and at less cost, by non-nitrogenous substances, that part being the maintenance of the temperature of the body. As is well known, the temperature of warm-blooded animals is considerably higher than the ordinary temperature of the surrounding air, in man about 98° F., and the uniformity of this temperature is maintained by the heat which is set free by the chemical processes (of oxidation) which go on within the body. Now these processes take place as well with nonnitrogenous as with nitrogenous substances. The former are even preferable to the latter for the keeping up of these processes; by oxidation they yield larger quantities of heat with less labor to the body, and they are hence called the heat-givers. The best heat-giver is

fat. Albuminous matters are not only the tissue-formers of the body; they also supply the vehicle for the oxygen, inasmuch as it is of such matters that the blood corpuscles are formed. The more red-blood corpuscles an animal possesses, the more oxygen can it take into its system, and the more easily and rapidly can it carry on the process of oxidation and develop heat. Now only a part of the heat so developed passes away into the environment of the animal; another part is transformed within the body (in the muscles) into mechanical work. Hence it follows that the non-nitrogenous articles of food produce not merely heat but also work, but only with the assistance of albuminous matters, which, on the one hand, compose the working machine, and, on the other hand, convey the oxygen necessary for oxidation.

The wholesome or unwholesome character of any aliment depends, in a great measure, on the state of the digestive organs in any given case, as also on the method in which it is cooked. Very often a simple aliment is made indigestible by artificial cookery. In any given case, the digestive power of the individual is to be considered in order to determine whether a particular aliment is whole-some or not. In general, therefore, we can only say that that aliment is healthy which is easily soluble, and is suited to the power of digestion of the individual. Man is fitted to derive nourishment both from animal and vegetable aliment, but can live exclusively on either. The nations of the North incline generally more to animal aliments; those of the South, and the Orientals, more to vegetable. The inhabitants of the most northern regions live almost entirely upon animal food, and very largely on fat on account of its heatgiving property. See Dietetics, Digestion, Adulteration, etc.

Alimentary Canal, a common name given to the cosophagus, stomach, and intestines of animals. See *Mnatomy*.

Al'imony, in law, the allowance to which a woman is entitled while a matrimonial suit is pending between her and her husband, or after a legal separation from her husband, not occasioned by adultery or elopement on her part.

Al' ison, ARCHTBALD (1792-1867), an English lawyer and writer of history. His chief work, *The History of Europe from 1789 to 1815*, was first issued in ten vols. in 1833-42, the narrative being subsequently brought down to 1852, the beginning of the second French Empire. This work displays industry and research, and is generally accurate, but not very readable. Its popularity, however, has been immense, and it has been translated into French, German, Arabic, Hindustani, etc.

Aliwal', a village of Hindustan in the Punjab, on the left bank of the Sutlej, celebrated from the battle fought in its vicinity, Jan. 28, 1846, between the Sikhs and a British army, resulting in the total defeat of the Sikhs.

Aliz'arine, a substance contained in the madder root, and largely used in dyeing reds

of various shades. Formerly madder root was largely employed as a dye-stuff, its capability of dyeing being chiefly due to the presence in it of alizarine; but the use of the root has been almost superseded by the employment of alizarine itself, prepared artificially from one of the constituents of coal-tar. It forms yellowish-red prismatic crystals, nearly insoluble in cold, but dissolved to a small extent by boiling water, and readily soluble in alcohol and ether. It possesses exceedingly strong tinctorial powers.

Al'kall, a term first used to designate the soluble part of the ashes of plants, especially sea-weed. Now the term is applied to various classes of bodies having the following properties in common: (1) solubility in water; (2) the power of neutralizing acids, and forming salts with them; (3) the property of corroding animal and vegetable substances; (4) the property of altering the tint of many coloring matters — thus, they turn litmus, reddened by an acid, into blue; turmeric, brown; and syrup of violets, an infusion of red cabbages, green. The alkalies are hydrates, or water in which half the hydrogen is replaced by a metal or compound radical. In its restricted and common sense the term is applied to four substances only: hydrate of potassium (potash), hydrate of sodium (soda), hydrate of lithium (lithia), and hydrate of ammonium (an aqueous solution of ammonia). In a more general sense it is applied to the hydrates of the so-called alkaling earths (baryta, strontia, and lime), and to a large number of organic substances, both natural and artificial, de-scribed under Alkaloid. Volatile alkali is a name for ammonia.

Al'kaloid, a term applied to a class of nitrogenized compounds having certain alkaline properties, found in living plants, and containing their active principles, usually in combination with organic acids. Their names generally end in ine, as morphine, quinine, aconitine, caffeine, etc. Most alkaloids occur in plants, but some are formed by decomposition. Their alkaline character depends on the nitrogen they contain. Most natural alkaloids contain carbon, hydrogen, nitrogen, and oxygen, but the greater number of artificial ones want the oxygen. The only property common to all alkaloids is that of combining with acids to form salts, and some exhibit an alkaline reaction with colors. Alkaloids form what is termed the organic bases of plants. Although formed originally within the plant, it has been found possible to prepare several of these alkaloids by purely artificial means.

Al'kanet, a dycing drug, the bark of the root of the Anchusa, or Alkanna tinctoria, a plant with downy and spear-shaped leaves, and clusters of small purple or reddish flowers. The plant is sometimes cultivated in Britain, but most of the alkanet of commerce is imported from the Levant or from southern France. It imparts a fine deep-red color and is used for coloring oils, plasters, lip-salve, confections, etc.; also in compositions for rubbing and giving color to mahogany furniture, and to color spurious port-wine.

Alkar'sin, an extremely poisonous liquid containing kakodyle, together with oxidation products of this substance, and formerly known as *Cadet's fuming liquor*, characterized by its insupportable smell and high degree of spontaneous combustibility when exposed to air.

Alkmaar (älk'mär), a town of the Netherlands, prov. of North Holland, 20 mi. n. n. w. of Amsterdam. It has manufactures of salt, sail-cloth, vinegar, leather, etc., and an extensive trade in cattle, corn, butter, and cheese. Pop. 13,304.

Al'lah, in Arabic, the name of God, a word of kindred origin with the Hebrew word *Elohim.* Allah Akbar (God is great) is a Mohammedan war-cry.

Allahabad ("City of Allah"), an ancient city of India, capital of the Northwest Provinces. Allahabad is one of the chief resorts of Hindu pilgrims, who have their sins washed away by bathing in the waters of the sacred rivers Ganges and Jumna at their junction; and is also the scene of a great fair in December and January. A large general and transit trade is carried on. The town is as old as the third century B. c. In the mutiny of 1857 it was the scene of a serious outbreak and massacre. Pop. 150,378.—The division of ALLAHABAD contains the districts of Cawnpur, Futlehpur, Hamirpur, Banda, Jaunpur, and Allahabad. Area 13,746 sq. mi.; pop. 5,754,855.—The DISTRICT contains an area of 2,833 sq. mi., about five sixths being under cultivation. Pop. 1,474,106.

Allan, DAVID (1744-1796), a Scottish painter. His illustrations of the *Gentle Shepherd*, the *Cotter's Saturday Night*, and other sketches of rustic life and manners in Scotland, obtained for him the name of the "Scottish Hogarth."

Alian, GEORGE WILLIAM, born 1822, in Toronto, Canada; graduated at Upper Canada College in 1839, and was admitted to the bar in 1846. In 1855 he was elected mayor of Toronto, and in 1858 sat in the Legislative Council for York division. In 1867 he was elected to the Senate, and in 1876 became chancellor of Trinity College.

Allan, Sin HUGH (1810-1882), born in Scotland. In 1824 he came to Canada, and established the Allan line of ocean steamers. He was a director of several banks, and was knighted in 1871.

Allan, SIR WILLIAM (1782-1850), a distinguished Scottish artist. In 1814 he exhibited his pictures, one of which, Circassian Captives, made his reputation. He now turned his attention to historical painting, and produced Knox Admonishing Mary Queen of Scots, Murder of Rizzio, Exiles on Their Way to Siberia, The Slave Market at Constantinople, etc.; latterly also battle scenes, as the Battle of Prestonpans, Nelson Boarding the Sun Nicolas, and two pictures of the Battle of Waterloo, the one from the British, the other from the French position, and delineating the actual scene and the incidents therein taking place at the moment chosen for the representation.

Alleghany (al-le-gā'ni), a river of Pennsylvania and New York, which unites with the Monongahela at Pittsburg to form the Ohio; navigable nearly 200 miles above Pittsburg.

Alleghany *l*iountains, a name sometimes used as synonymous with Appalachians, but also often restricted to the portion of those mountains that traverses the states of Virginia, Maryland, and Pennsylvania from southwest to northeast, and consists of a series of parallel ridges for the most part wooded to the summit, and with some fertile valleys between. Their mean elevation is about 2,500 feet; but in Virginia they rise to over 4,000.

Ailegheny (al-le-gen'i), a city of Pennsylvania, on the River Alleghany, opposite Pittsburg, of which it may be considered virtually to be a suburb, and with which it is connected by six bridges. The principal industries are connected with iron and machinery. Also called *Allegheny City.* Pop. 110.605.

ery. Also called Allegheng City. Pop. 110,605. Allen, ETHAN (1737-1789), soldier, born in Litchfield, Conn. About 1763 he settled near Bennington. In 1764, the king decided in favor of the claim of New York to jurisdiction over the Green Mountain territory against the settlers under the New Hampshire grants. Allen was chosen to plead the cause of the New Hampshire settlers at Albany, N. Y. The courts decided adversely. Allen was made colonel of the "Green Mountain Boys," who, with the New Hampshire grantees, expelled the New York settlers. Governor Tryon, of New York, offered \$750 reward for Allen. Allen retaliated by offering a reward for Tryon. In 1775, after the battle of Lexington, the condition of Fort Ticonderoga attracted the attention of the patriots. Allen and Benedict Arnold both were eager to effect its capture. Arnold was commissioned colonel by Massachusetts, but the "Green Mountain Boys," with Allen, reached Lake George before Arnold overtook them, and they would not receive a new commander. On May 10, when only eighty-four of his men had as yet crossed the lake, Allen rushed into the fort and ordered the commander to surrender "in the name of the Great Jehovah and the Continental Congress !" The fort contained a large amount of artillery and arms. Allen went to Philadelphia, where he received the thanks of Congress for his services. He was sent on a secret mission to Canada to learn the views of the Canadians as to rebellion. On his way to Gen. Montgomery's expedition he took part in a rash adventure at Montreal on September 25, and was captured and sent to England. He was returned to this country, where he was confined in prison-ships, but later allowed partial liberty. In 1779 Allen published a Narratics of his treatment while a British prisoner. It is a compound of local barbarisms, Scripture, physiology, and Oriental wildness. After Burgoyne's surrender at Saratoga, Congress secured Allen's release. Allen, on obtaining his freedom, was ap-

pointed major-general of the Vermont militia, and sent as an agent to Congress to secure the admission of Vermont to the Confederation. Congress hesitated, and the British commanders endeavored to persuade Allen to restore the authority of the crown. Vermont sent these letters to the president of Congress, and soon became a part of the Union, although not recognized as a state until 1791. After the Revolution Allen lived in retirement, writing a book on natural religion, 1784, entitled *Reason the Only Oracle of Man.* This is the first work opposed to Christianity published in America.

Allen, WILLIAM, D. D. (1784–1868), American clergyman and author. He was president of Bowdoin College 1820-1839; author of Ameriean Biographical and Historical Dictionary; a Supplement to Webster's Dictionary; Poems, etc.

**Allentown**, Lehigh co., Pa., on Lehigh River, 18 mi. above its junction with the Delaware. It has an important trade in coal and iron ore, with large blast-furnaces, rollingmills, etc. Pop. 25,228.

Al'lia, a small affluent of the Tiber, joining it about 12 miles from Rome, famous for the defeat sustained by the Roman army from Brennus and his Gauls, resulting in the capture and sack of Rome, about 390 B. C.

Alliance, Stark co., 0., 57 mi. s. e. of Cleveland, and 93 miles n. n. w. of Pittsburg; seat of Mt. Union College. Manufactures of bagging, white lead, and rolling mill. Pop. 7,856.

Al'libone, SAMUEL AUSTIN, LL. D. (1816-1889), an American author. He compiled a most useful Critical Dictionary of English Literature and British and American Authors.

Allier (àl-lē-ā), a central department of France. It has extensive beds of coal as well as other minerals, which are actively worked, there being several flourishing centers of mining and manufacturing enterprise; mineral waters at Vichy, Bourbon, L'Archambault, etc. Large numbers of sheep and cattle are bred. Area 2,822 sq. mi. Capital, Moulins. Pop. 424,532.

Alliga'tion, a rule of arithmetic, chiefly found in the older books, relating to the solution of questions concerning the compounding or mixing together of different ingredients, or ingredients of different qualities or values. Thus, if a quantity of sugar worth 4 cents a lb. and another quantity worth 7 cents are mixed, the question to be solved by alligation is, what is the value of the mixture by the pound?

Alligator, a genus of reptiles of the crocodile family, differing from the true crocodiles in having a shorter and flatter head, in having cavities or pits in the upper jaw, into which the long canine teeth of the under jaw flt, and in having the feet much less webbed. Their habits are less aquatic. They are confined to the warmer parts of America, where they frequent swamps and marshes, and may be seen basking on the dry ground during the day in the heat of the sun. They are most active during the night when they make a loud bellowing. The largest of these animals grow

to the length of 18 or 20 feet. They are covered by a dense armor of horny scales, impenetrable by a rifle-ball, and have a huge mouth, armed with strong conical teeth. They swim with wonderful celerity, impelled by their long, laterally-compressed, and powerful tails. On land their motions are proportionally slow and embarrassed because of the length and unwieldiness of their bodies and the short-ness of their limbs. They live on fish, and any small animals or carrion, and sometimes catch pigs on the shore, or dogs which are swim-ming. They even sometimes make man their ming. prey. In winter they burrow in the mud of swamps and marshes, lying torpid till the warm weather. The female lays a great number of eggs, which are deposited in the sand or mud, and left to be hatched by the heat of the sun, but the mother alligator is very attentive to her young. The most flerce and dangerous species is that found in the southern part of the U.S., having the snout a little turned up. slightly resembling that of the pike. The alligators of S. A. are there very often called Caymans. One species is known also as Spectacled Cayman, from the prominent bony rim surrounding the orbit of each eye. The flesh of the alligator is sometimes eaten.

Alligator-pear, an evergreen tree of the natural order Lauraceæ, with a fruit resembling a large pear, 1 to 2 lbs. in weight, with a firm marrow-like pulp of a delicate flavor; called also avocado-pear, or subaltern's butter. It is a native of tropical America and the West Indies.

Allison, WILLIAM B., b. in Wayne co. O., 1829, practised law in Ohio until 1857, when he removed to Dubuque, Ia. He served in Congress as a Republican 1863-1871. In 1873 he was elected to the U. S. Senate, and re-elected in 1878, 1884, and 1890.

Allitera'tion, the repetition of the same letter at the beginning of two or more words immediately succeeding each other, or at short intervals; as many men, many minds; death defles the doctor; "Apt alliteration's artful aid." "Puffs, powders. patches, bibles, billet-doux." In the ancient German and Scandinavian and in early English poetry alliteration took the place of terminal rhymes, the alliterative syllables being made to recur with a certain regularity in the same position in successive verses. So far has alliteration sometimes been carried that long compositions have been written every word of which commenced with the same letter.

Allo' dium, land held in one's own right, without any feudal obligation to a superior or lord. See *Feudal System*.

Allop' athy, the name applied by homeopathists to systems of medicine other than their own; Halınemann's principle being that "like cures like," he called his own system homeopathy, and other systems allopathy. See Homeopathy.

Al'ioway, a parish of Scotland, now included in Ayr parish. Here Robert Burns was born in 1759, and the "auld haunted kirk." near his birthplace, was the scene of the dance of witches in Tam O'Shanter.

Alloy,' a substance produced by melting together two or more metals, sometimes a definite chemical compound, but more generally merely a mechanical mixture. Most metals mix together in all proportions, but others unite only in definite proportions, and form true chemical compounds. Others again resist combination, and when fused together form not a homogeneous mixture but a conglomerate of distinct masses. The changes produced in their physicial properties by the combination of metals are very various. Their hardness is in general increased, their malleability and ductility impaired. The color of an alloy may be scarcely different from that of one of its components, or it may show traces of neither of the two. Its specific gravity is sometimes less than the mean of that of its component metals. Alloys are always more fusible than the metal most difficult to melt that enters into their composition, and generally even more so than the most easily melted one. Newton's fusible metal, composed of three parts of tin, two or five parts of lead, and five or eight parts of bismuth, melts at temperatures varying from 198° to 210° F. (and therefore in boiling water); its components fuse respectively at the tem-peratures 442°, 600°, and 478° F. Sometimes each metal retains its own fusing point. With a few exceptions metals are not used in a pure state. Printers' types are made from an alloy of lead and antimony; brass and a numerous list of other alloys are formed from copper and zinc; bronze from copper and tin. All Saints' Day, a festival of the Christian

All Saints' Day, a festival of the Christian Church, instituted in 835, and celebrated on November 1 in honor of the saints in general.

All Souls' Day, a festival of the Catholio Church, instituted in 998, and observed on November 2 for the relief of souls in purgatory.

Allspice (al'spis) (or Pimenta), is the dried berry of a West Indian species of myrtle, a beautiful tree with white and fragrant aromatic flowers and leaves of a deepshining green. Pimenta is thought to resemble in flavor a mixture of cinnamon, nutmegs, and cloves. whence the popular name of allspice; it is also called 🖉 Jamaica pepper. It is employed in cookery, also in medicine as an

agreeable aromatic, and forms the basis of a distilled water, a spirit, and an essential oil.

Aliston, WASHINGTON (1799-1843), an American painter, b. in South Carolina. He won much fame in England, and returning to America died. His Belshazzer's Feast is one of the masterpieces possessed by the Boston Athenæum. In style he imitated the Venetian School and has been called the "American Titian."

Allu'vium, deposits of soil, collected by the action of water, such as are found in valleys and plains, consisting of loam, clay, gravel, etc., washed down from the higher grounds. Great alterations are often produced by alluvium—deltas and whole islands being often formed by this cause. Much of the rich land along the banks of rivers is alluvial in its origin.

Alma, a small river of Russia, in the Crimea, celebrated from the victory gained by the allied British and French over the Russians, 1854.

Al'maden, Cal., about 60 mi. s.e. of San Francisco, with rich quicksilver mines, the product of which has been largely employed in gold and silver mining. It was so named after Almaden, in Spain, where much quick silver was mined.

Alma'gro, DIEGO DE (1475-1538), Spanish "Conquistador," a foundling. He took part with Pizarro in the conquest of Peru, and after frequent disputes with Pizarro about their respective shares in their conquests led an expedition against Chile, which he failed to conquer. On his return a struggle took place between him and Pizarro, in which Almagro was finally overcome, taken prisoner, strangled, and afterward beheaded. He was avenged by his son, who raised an insurrection in which Pizarro was assassinated in 1541. The younger Almagro was put to death in 1542 by De Castro, the new viceroy of Peru.

Al'manac, a calendar, in which are set down the rising and setting of the sun, the phases of the moon, the most remarkable positions and phenomena of the heavenly bodies, for every month and day of the year; also the several fasts and feasts to be observed in the church and state, etc., and often much mis-cellaneous information likely to be useful to the public. The term is of Arabic origin, but the Arabs were not the first to use almanacs. In England they are known from the four-teenth century, there being several English almanacs of that century existing in MS. They became generally used in Europe within a short time after the invention of printing. Their effects in France were found so mischievous, from the pretended prophecies which they published, that Henry III in 1579 forbade any predictions to be inserted in them relating to civil affairs, whether those of the state or of private persons. During the civil war of Charles I, and thence onward, English almanacs were conspicuous for the boldness of their astrological predictions, and their de-termined perpetuation of popular errors. The most famous English almanac was Poor Robin's Almanack, which was published from 1663 to 1775. In 1828 the Society for the Diffusion of Useful Knowledge, by publishing the British Almanac, took the lead in the production of an unexceptional almanac in Great Britain. The circulation of almanacs was cramped by the

### Alma-Tadema

very heavy duty of one shilling and three pence per copy till 1834, when this duty was abolished. About 200 new almanacs were started immediately on the repeal. Almanacs from their periodical character, are now more and more used as vehicles for conveying statistical and other useful information for the inhabitants of a particular country or district, or for a particular class or party. Some of the almanacs that are regularly published every year are almost indispensable to men engaged in official, mercantile, literary, or professional Official Directory of the United Kingdom, the British Almanac, Oliver and Boyd's Edinburgh Almanac, and Whitaker's Almanac. The first popular almanac in America is believed to have emanated from Bradford's press at Philadelphia, in 1687. Benjamin Franklin's Poor Richard's Almanac, first issued in 1732, had a popularity for a quarter of a century. Many leading newspapers, not a few religious denominations, and several trades and professions now issue excellent popular almanacs at inexpensive rates. The Almanach de Gotha, which has appeared at Gotha since 1764, contains information regarding the reigning families and governments, the finances, commerce, population, etc., of the different states through-out the world. It is published both in French and in German.

The Nautical Almanac, or the American Astronomical Ephemeris, is published by the U.S. Bureau of Navigation annually. It embraces all the elements necessary for determining at any time the absolute and relative places of the sun, moon, and seven principal planets and of many of the fixed stars, also several different series of phenomena for the determination of longitudes and latitudes, the distances of the moon from fixed stars and planets, eclipses, etc. To these are added rules and tables for practical use in nautical astronomy, land observations, and tables of tides. It is a text-book for the navigator and no sailor leaves the American shore without it. It informs him of his place on the ocean where there are no other guides than the sun and stars. The computations are made three years in advance and could be made still farther if necessary, but no cruise is made which lasts longer than that time and it is unneces-sary to keep farther in advance. Before the American Nautical Almanac was published we used an American edition of the British Nautical Almanac which is published annually by the British government two or three years in advance. This almanac was com-menced in 1767 by Dr. Maskelyne, astrono-mer royal. The French Connaissance des Tempes is published with the same views as the American and English almanacs. It was first issued in 1679. The German Government also publishes a nautical almanac.

Alma-Tad'ema, LAWRENCE, Dutch painter, born in 1836, resident since 1870 in England, where he is a naturalized subject. In 1876 he was elected an associate of the Royal Academy, in 1879, an academician; he is also

# Almond

a member of various foreign academies. He is especially celebrated for his pictures of ancient Roman, Greek, and Egyptian life, which are painted with great realism and archeological correctness.

Almeida (al-mā'i-da), one of the strongest fortresses in Portugal, in the province of Beira, near the Spanish border, on the Coa. Pop. 2,000. Taken by Massena from the English in 1810; retaken by Wellington in 1811.

Almeida (dål-mā'i-då), FRANCISCO DE (1450-1510), first Portuguese viceroy of India. He fought against the Moors, and being appointed governor of the new Portuguese settlements on the African and Indian coasts, he sailed for India in 1505. In Africa he took possession of Quiloa and Mombas, and in the East he conquered Cananor, Cochin, Calicut, etc., and established forts and factories. His son Lorenzo discovered the Maldives and Madagascar, but perished in an attack made on him by a fleet sent by the sultan of Egypt, with the aid of the Porte and the Republic of Venice. Hav-ing signally defeated the Mussulmans (1508), he sailed for Portugal, but was killed in a skirmish.

Almeria (àl-mà-rē'à), a fortified seaport of southern Spain, capital of province Almeria, with an important trade, exporting lead, esparto, barilla, etc. The province, which has an area of 3,300 sq. mi., is generally mountainous, and rich in minerals. Pop. of town

40,323; of province, 349,854. Almohades (ăl'mo-hădz), an Arabic or Moorish dynasty that ruled in Africa and Spain in the twelfth and thirteenth centuries. They overthrew the Almoravides in Spain, but themselves received a defeat in 1212 from which they did not recover, and in 1269 were overthrown in Africa.

Almond (a'mund), the fruit of the almond tree, a tree which grows usually to the height of 20 feet, and is akin to the peach, nectarine, It has beautiful pinkish flowers that etc. appear before the leaves, which are oval.

a.-flower. b.-fruit.

pointed, and delicately serrated. It is a native of Africa and Asia, naturalized in southern Europe, and cultivated in England for its beauty. The fruit is a drupe, ovoid, and with downy, outer surface; the fleshy covering is

#### Almoravides

tough and fibrous; it covers the compressed, wrinkled stone enclosing the seed or almond within it. There are two varieties, one sweet and the other bitter. The chief kinds of sweet almonds are the Valencian, Jordan, and Malaga. Bitter almonds come from Magador, and besides a fixed oil they contain a substance called emulsin, and also a bitter crystalline substance called amygdalin, which, acting on the emulsin, produces prussic acid, whence the aroma of bitter almonds when mixed with water. Almond-oil, a bland fixed oil, is expressed from the kernels of either sweet or bitter almonds, and is used by perfumers and in medicine. A poisonous essential oil is obtained from bitter almonds, which is used for flavoring by cooks and confectioners, also by perfumers and in medicine.

Almo'ravides (-vīdz), a Moorish dynasty which arose in northwestern Africa in the eleventh century, and having crossed the Straits of Gibraltar, gained possession of all Arabic Spain, but was overthrown by the Almohades in the following century.

Aloe (al' $\bar{o}$ ), the name of a number of plants belonging to the genus Aloe, some of which

are not more than a few inches, while others are 30 feet and upward in height; natives of Africa and other hot regions; leaves fleshy, thick, and more or less spinous at the edges or extremity; flowers with a tubular corolla. Some of the larger kinds are of great use, the fibrous parts of the leaves being made into cordage, fishing nets and lines, cloth, etc. The juice of several species

is used in medicine, under the name of abes, forming a bitter purgative. The principal drug-producing species are, the Socotrine aloe, the Barbadoes aloe, the Cape aloe, etc. A beautiful violet color is afforded by the leaves of the Socotrine aloe. The American aloe (see Agare) is a different plant altogether; as are also the aloes or lign-aloes of Scripture. Aloe fiber is obtained from species of Aloe, Agare, Yucca, etc., and is made into coarse fabrics, ropes, etc.

Aloes-wood, Eagle-wood, the inner portion of the trunk of forest trees, found in tropical Asia, and yielding a fragrant resinous substance, which, as well as the wood, is burned for its perfume. Another tree also produces aloes-wood. This wood is supposed to be the lign-aloes of the Bible.

A'lost (or Aalst) (ä'lost, älst), a town of Bel-

### Alphabet

gium, 15 mi. w. n. w. of Brussels. It has manufactures of lace, thread, linen, and cotton goods, etc., and a considerable trade. Pop. 21,631.

Alpac'a, a ruminant mammal of the camel tribe, a native of the Andes, especially of the

# Alpaca.

mountains of Chile and Peru, and so closely allied to the llama that by some it is regarded rather as a smaller variety than a distinct species. It has been domesticated, and remains also in a wild state. In form and size it approaches the sheep, but has a longer neck. It is valued chiefly for its long, soft, and silky wool, which is straighter than that of the sheep, and very strong, and is woven into fabrics of great beauty, used for shawls, clothing for warm climate, coat-linings, and umbrellas, and known by the same name. Its flesh is pleasant and wholesome.

Alpena, Alpena co., Mich., 130 mi. n. e. of Saginaw City. It is an important lumber center, has also two foundries and two banks. Pop. 12,276.

Alpes (àlp), the name of three departments in the s. e. of France, all more or less covered by the Alps or their offshoots. These are Basses ALPES: area 2,685 sq. mi.; capital, Digne; pop. 129,494. — HAUTES-ALPES ( $\overline{o}t$ - $\overline{a}lp$ ) (Upper Alps), area 2,158; capital, Gap; pop. 122,924. — ALPES-MARITIMES ( $\overline{a}lp$ - $\overline{m}a$ -ri-t $\overline{e}m$ ) (Maritime Alps). It produces in the south, cereals, vines, olives, oranges, citrons, and other fruits; and there are manufactories of perfumes, liquors, soap, etc., and valuable fisheries. It is a favorite resort for invalids. Area 1,482 sq. mi.; capital, Nice; pop. 238.-057.

Al'pha and O'mega, the first and last letters of the Greek alphabet, sometimes used to signify the beginning and the end, or the first and the last of anything; also as a symbol of the Divine Being. They were also formerly the symbol of Christianity, and engraved accordingly on the tombs of the ancient Christians.

Al'phabet (from Alpha and Beta, the first two letters of the Greek alphabet), the series of characters used in writing a language, and intended to represent the sounds of which it consists. The English alphabet, like most of those of modern Europe, is derived directly from the Latin, the Latin from the ancient

Greek, and that from the Phœnician, which again is believed to have had its origin in the Egyptian hieroglyphics, the Hebrew alphabet also having the same origin. The names of the letters in Phœnician and Hebrew must have been almost the same, for the Greek names, which, with the letters, were borrowed from the former, differ little from the Hebrew. By means of the names we may trace the process by which the Egyptian characters were transformed into letters by the Phœnicians. Some Egyptian character would, by its form, recall the idea of a house, for example, in Phœnician or Hebrew, beth. This character would subsequently come to be used wherever the sound b occurred. Its form might be afterward simplified, or even completely modified, but the name would still remain, as beth still continues the Hebrew name for b, and beta the Greek. Our letter m, which in Hebrew was called mim, water, has still a considerable resemblance to the zigzag, wavy line which had been chosen to represent water, as in the zodaical symbol for Aquarius. The letter o, of which the Hebrew name means eye, no doubt originally intended to represent that organ. While the ancient Greek alphabet gave rise to the ordinary Greek alphabet and the Latin, the Greek alphabet of later times furnished elements for the Coptic, the Gothic, and the old Slavic alphabets. The Latin characters are now employed by a great many nations, such as the Italian, the French, the Spanish, the Portuguese, the English, the Dutch, the German, the Hungarian, the Polish, etc., each nation having introduced such modifications or additions as are necessary to express the sound of the language peculiar to it. The sound of the language peculiar to it. The Greek alphabet originally possessed only six-teen letters, though the Phœnician had twentytwo. The original Latin alphabet, as it is found in the oldest inscriptions, consisted of The German alphabet twenty-one letters. consists of the same letters as the English, but the sounds of some of them are different. Anciently certain characters called Runic were made use of by the Teutonic nations, to which some would attribute an origin independent of the Greek and Latin alphabets. While the alphabets of the west-of Europe are derived from the Latin, the Russian, which is very complete, is based on the Greek, with some characters borrowed from the Armenian. The Sanskrit or Devanagari alphabet is one of the most remarkable alphabets of the world. As now used it has fourteen characters for the vowels and diphthongs, and thirty-three for the consonants, besides two other symbols. Our alphabet is a very imperfect instrument for what it has to perform, being both defective and redundant. An alphabet is not essential to the writing of a language, since ideograms or symbols may be used instead, as in Chinese.

There is a remarkable Indian alphabet which was invented by See-quah-yah, of the Cherokee tribe. This Indian was confined to his cabin by a swollen knee, and was set to thinking whether the mysterious power of the "talking leaf" was the gift of the Great Spirit to the white man or the discovery of the white man himself. His mind was directed to the mystery of speaking by letters, the name of which of course was not to be found in his language. From the cries of wild beasts, the sound of mocking-birds, the voices of his children and companions he observed that feelings and passions were conveyed by direct sound from one intelligent being to another. He immediately set about to ascertain all the sounds in the Cherokee language. In this labor he was aided by the more acute ears of his wife and children. At first he attempted to use pictorial signs, and images of birds and beasts to convey the different sounds in their language. He soon abandoned this method as difficult or impossible, and invented arbitrary signs without any regard to appearances, except such as might assist in recollecting them and distinguishing them from each other. His first alphabet consisted of about two hundred characters. This proved to be too cumbersome, and with the aid of his daughter, he reduced them at last to eighty-six, which number was used afterward. He perfected these characters in appearances, although he had no pen, making his characters on bark with a knife or nail. He sent to the Indian agent for paper and pen, made ink from the bark of the forest trees, and, after seeing the construction of the pen, he soon made a supply. His alphabet invented, he next proceeded to demonstrate to his people that he had made a discovery. His daughter, who was his only pupil, was sent out of hearing while he asked his friends to name a word or sentiment, which he put down. The girl was then called back and read what he had written. The father then retired, and the daughter wrote. This satisfied his companions of the discovery. Several of the brightest young men of the tribe were selected, to whom See-quah-yah communicated the mystery. This required some months, and at length they offered themselves for examination. The tribe watched for the results with anxiety. The youths were separated from their master and from each other and carefully watched. The uninitiated conducted the examination, which proved in every way successful. A great feast was ordered in honor of See-quahyah, who at once became philosopher and chief. He continued in his labors and discovered numbers. The U.S. Government had a font of type cut for his alphabet, and a newspaper called "The Cherokee Phœnix," printed, partly in the Cherokee language and partly in English, was established. Many of the Cherokees were able to read both languages.

Alphon'so, the name of a number of Portuguese and Spanish kings. The name is borne by the present ruler of Spain, Alphonso XIII, born May 17, 1886, nearly six months after the death of his father, Alphonso XII. He is a Bourbon, a descendant of Louis XIV of France.

**Alps**, the highest and most extensive mountain-chain in Europe, forming the water-shed between the river-systems of the Mediterra-

Digitized by Google

5

nean Sea and the Atlantic Ocean. It includes parts of five countries; viz.: portions of northern Italy, southeastern France, southern Germany, western Austria-Hungary, and most of Switzerland. The range is about 600 miles long, and from 90 to 180 miles wide. Its average height is about 7,700 feet; the highest peaks are Mont Blanc, 15,781 feet, on the Franco-Italian border, and Monte Rosa, 15,-217, in Switzerland. The system of ranges is now commonly grouped under Eastern, Western, and Central Alps. The general form of the Alps is that of a crescent; from the principal chains spurs extend to the Apennines, the Vosges, the Harz, the Balkans, and the Carpathians. The line of perpetual snow begins at a line about 8,000 to 9,000 feet above the sea-level, more than 400 peaks rising to this altitude. From these peaks there descend to the valleys below enormous masses of partially melted snow and pulverized ice, constantly augmented by the masses from behind, which acquire a moving force that nothing can resist. Finally they reach a point where the sun melts them and become the sources of mountain rivers. The largest glacier is the "Mer de Glace" on the northern slope of Mont Blanc, and is 15 miles long, 3 to 6 miles wide, and 80 to 120 feet thick. The Rhône Glacier is one of the most famous. The Helvetian Alps in Western Switzerland, on both sides of the Rhone, are the portion most visited and afford the most beautiful mountain scenery of Europe. Among their peaks are the Jungfrau and the Finsteraar-horn. The dangerous ascent of Mont Blanc was first made in 1786 by a Frenchman, Jacques Balmat. The atmospheric conditions of the Alps produce at certain points most interesting optical illusions, sometimes very beautiful. The Alps were formerly considered well-nigh impassable, and many perished in the attempt. Hannibal's famous passage was reckoned one of his greatest feats. There are now good roads over most of the passes, some of which, however, are exceedingly dangerous.  $\mathbf{T}he$ chief passes connect Switzerland with Italy. and occupy 8 to 15 hours in crossing. One of the first famous roads was that built by Napoleon, 1803-10, over Mt. Cenis, at a height of 6,773 feet. The Mont Cenis tunnel, connecting France and Italy, is 14 miles from this road. It was built 1861-70 and is 74 miles The celebrated St. Gothard Pass is long. 6,935 feet high, and has been crossed by a carriage road since 1823. The great tunnel of St. Gothard, connecting Luzerne and Milan, is the longest in the world, 91 miles. At its central point it is 3,786 feet high. This tunnel was built 1872-82, by the contributions of Italy, Switzerland, and Germany. Other famous passes are the Col de Balme, celebrated for its view of Mont Blanc, the little St. Bernard, one of the oldest and easiest, and the Great St. Bernard, famed for its inn and dogs. The geological structure of the Alps has been a subject of interesting investigation, which was greatly aided by the building of the tunnels. Owing to their great height, the vegetation of the Alps is remarkably varied. At 6,500 feet all the vegetation of the plains has disappeared, including maize, cereals, common fruit, and forest trees. Between 7,500 and 8,500 feet a very rich pasturage and the peculiar "Alpine flora" appear. Animal life in many forms is abundant. Peculiar to Alpine regions are the chamois and the mountain goat.

Alsace-Lorraine, an imperial territory of the German Empire, ceded by France in 1871 as a result of the Franco-German war; area 5,668 sq. mi.; pop. 1,603,506; capital, Strasburg. The provinces of Alsace and Lorraine have been "debatable ground" between France and Germany for many centuries. In the ninth century they formed part of the kingdom of Lothar, grandson of Charlemagne, and ever since the partition of his dominions between France and the German Empire (869) portions of their territory, including as it does the borders of the two countries, have been the recurring subject of dispute, belonging to whichever power happened to have the mastery. At the close of the Roman period, in the fifth century, Alsace was filled up by Germanic settlers, and the population has remained distinctly Germanic ever since. It took its name from the river Ill, the settlers being called Ill-Sassen. In 924 Henry the Fowler annexed Alsace to the German Empire. During the tenth century it was claimed as a French possession, but never regained, and after the extinction of the Carolingian line it remained as an undisputed possession for several centuries. It was at various times an Alemannian or Sualian duchy. During the Reformation period a violent outbreak of the Alsatian peasantry was quelled (1525) by Duke Anthony III. Giselbert, Duke of Lorraine, had been attached to Charles the Simple of France, but during the disorders which marked the reign of that king, he voluntarily attached himself to the emperor Henry (925), the latter became his father-in-law, and Lorraine was formally incorporated in the empire, where it remained until 1734. Otto the Great gave the province to his brother Brun, Bishop of Cologne (952), Duke Conrad having re-belled and been subdued. It was afterward divided into Lower and Upper Lorraine. The former subsequently became known as Brabant, and was a possession of the Dukes of Burgundy. Upper Lorraine retained its name and became the modern province. About the middle of the eleventh century the emperor Henry III conferred it upon Gérard of Alsace, the founder of a long line of dukes who ruled it, for the most part, down to the eighteenth century. During the decadence of the empire and the supremacy of France under Louis XIII, Louis XIV, and Louis XV, parts of northern Lorraine were seized, including principally the bishoprics of Metz. Toul, and Ver-dun. During the latter part of the thirty years' war France sought to secure the Rhinelands, and by the treaty of Westphalia (1648) these three bishoprics, together with most of Alsace. were confirmed to Louis XIV. During the war of the Palatinate (1089-97) Louis XIV seized

more of the Rhine provinces, but was compelled to give much of it back to the empire by the treaty of Ryswick (1697). He retained the city of Strassburg, taken 1681, and had now acquired entire Alsace. After the war of the Polish Succession, the king of Poland, Stanislas Leszczynski, received Lorraine, which was to be annexed to France at his death. This occurred in 1766, and Lorraine became a part of France. At the Congress of Vienna (1814-15) Prussia sought to recover Alsace and Lorraine for Germany, but obtained only a small portion on the Rhine. In the Franco-German war of 1870-71, there was a strong national feeling in Germany for the recovery of these provinces, to which she was historically entitled, and here was the principal battle-ground. By the treaty of Frankfort, Germany recovered Alsace and German Lorraine, in general the part between the Vosges Mountains and the Moselle, together with Metz and the adjacent district. Alsace-Lorraine became a possession of the whole empire and not of any particular state, and is under direct control of the imperial government, vested in a provincial committee of 58 members. It has 15 seats in the Reichstag. The prevailing language is German, except in portions of Lorraine. Both languages are commonly understood. The German educational system is now well est**a**blished. Seventy-eight per cent. of the population is Roman Catholic. The soil is very fertile, producing principally grain, wine, and tobacco. The manufactures and mines of coal and iron are important

Al'sen, an island of Prussia on the east coast of Schleswig-Holstein. Pop. 22,500.

Attai Mountains (al'ti), an important Asiatic system on the borders of Siberia and Mongolia, partly in Russian and partly in Chinese territory. The highest summit is Byeluka, height 11,000 feet. The Altai is exceedingly rich in minerals, including gold, silver, copper, and iron. The inhabitants are chiefly Russians and Kalmuks. The chief town is Barnaul,

Altamu'ra, a town of south Italy, province of Bari, at the foot of the Apennines, walled, well built, and containing a magnificent cathedral. Pop 20,013.

Al'tenburg, a town of Germany, capital of Saxe-Altenburg. 23 miles south of Leipsic. It has manufactures of cigars, woolen yarn, gloves, hats, musical instruments, glass, brushes, etc. Pop. 26,241.

Alteratives (al'), medicines, as mercury, iodine, etc., which, administered in small doses, gradually induce a change in the habit or constitution, and imperceptibly alter disordered secretions and actions, and restore healthy functions without producing any sensible evacuation by perspiration, purging, or vomiting.

Al'tiscope, an instrument consisting of an arrangement of mirrors in a vertical framework, by means of which a person is enabled to overlook an object (a parapet, for instance) intervening between himself and any view that he desires to see, the picture of the latter being reflected from a higher to a lower mirror, where it is seen by the observer.

Al'titude, in mathematics the perpendicular height of the vertex or apex of a plane figure or solid above the base. In astronomy it is the vertical height of any point or body above the horizon. It is measured or estimated by the angle subtended between the object and the plane of the horizon, and may be either *true* or *apparent*. The *apparent* altitude is that which is obtained immediately from observation; the *true* altitude, that which results from correcting the apparent altitude, by making allowance for parallax, refraction, etc.

Alton, Madison co., Ill., on Mississippi River, 15 mi. n.w. of St. Louis. Railroads: Chicago & Alton; C. C. C. & St. L. (Big 4); Burlington, Keokuk & Northwestern; C. B. & Q.; M. K. & T.; C. St. L. & St. P. (Bluff Line). Industries: glass, three flouring-mills, iron foundry, woolen-mill, plow company, two carriage factories, lime and cement works, firebrick, tile works, powder-mill, packing, and mining-tool works. Alton became a city in 1837. Pop. est. 1897, 15,000.

**Al'tona**, an important commercial city in the Prussian province of Schleswig-Holstein, adjoining Hamburg, with which it virtually forms one city. It is a free port, and its commerce, both inland and foreign, is large, being quite identified with that of Hamburg. Pop. 104,717.

Altoo'na, Blair co., Pa., at the eastern base of the Alleghanies, 244 mi. w. of Philadelphia, with large machine-shops and locomotive factories. Pop. 30,337.

Al'torf, a small town of Switzerland, capital of the canton of Uri, beautifully situated, near the Lake of Luzern, amid gardens and orchards, and memorable as the place where, according to legend, William Tell shot the apple from his son's head. A colossal statue of Tell now stands here. Pop. 2,900.

Alto-Rillevo (àl' tō-rē-lē-ā"vo) "high reiief," a term applied in regard to sculptured figures to express that they stand out boldly from the background, projecting more than half their thickness, without being entirely detached. In mezzo-rilievo, or middle relief, the projection is one half, and in basso-rilievo, or basrelief, less than one half. Alto-rilievo is further distinguished from mezzo-rilievo by some portion of the figures standing usually quite free from the surface on which they are carved, while in the latter the figures, though rounded, are not detached in any part.

Alum is a crystalline compound containing the metals aluminum and potassium, together with sulphuric acid and water. A. is prepared from a bituminous shale containing iron pyrites interspersed throughout its mass, found in the Lower Coal Measures, and technically called *alum ore*. In preparing A. from the ore, the latter is first roasted—that is, heated in contact with air. By this roasting the iron pyrites is oxidized to sulphate of iron, and sulphuric anhydride, which combines with the aluminum. The roasted mass is
treated with water to dissolve out the two sulphates, and the solution obtained by this means evaporated to a suitable consistency. and mixed with chloride of potassium. A. and chloride of iron result, the former of which, being less soluble than the latter, is readily separated by crystallization. A. is a colorless crystalline substance of very astringent acid taste. Its solution reddens litmus. It is largely employed by dyers as a mordant. It is also used In preparing pigments called lakes. A. is used in medicine, and has been employed as an an-tiseptic. It is sometimes used to adulterate flour intended for making bread, as it appears to give the bread a firm consistency and white color. Burnt A. is A. from which the water has been driven off by heat.

Alumbagh (*a*-lam-biig'), a palace and connected buildings in Hindustan, about 4 mi. s. of Lucknow, famous for its capture and defense by the British in the Indian mutiny.

Alu'mina, the single oxide of the metal aluminium. As found native it is called corundum; when crystallized, ruby or sapphire; when amorphous, emery. It is next to the diamond in hardness. In combination with silica it is one of the most widely distributed substances, as it enters in large quantity into the composition of granite, traps, slates, schists, clays, loams, and other rocks. The porcelain clays and kaolins contain about half their weight of this earth, to which they owe their most valuable properties. It has a strong affinity for coloring matters, which causes it to be employed in the preparation of the colors called *lakes* in dyeing and calico-printing. It combines with the acids and forms numerous salts, the most important of which are the sulphate and acetate, the latter of extensive use as a mordant.

Alumin' ium, a metal discovered in 1827, but nowhere found native, though as the base of adumina (which see) it is abundantly dis-tributed. The mineral cryolite—a fluoride of aduminium and sodium—which is brought from Greeuland, is one of the chief sources of aduminium. It is a shining white metal, of a color between silver and platinum, very light, weighing less than glass, and about one-fourth of silver (specific gravity, 2.56 cast, 2.67 hammered), not liable to tarnish or undergo oxidation in the air, very ductile and malleable, and remarkably sonorous. It forms several useful alloys with iron and copper; one of the latter (aluminium gold) much resembles gold, and is made into cheap trinkets. Another, known as aluminium bronze, possesses great hardness and tenacity.

The process of extracting aluminium from clay requires a very flerce heat or a powerful electric current. In some of the factories an electric current of 14,000 amperes and 30 volts is generated. This terrific current is run into the reduction machines by means of heavy copper wires. The reduction machine consists of a huge crucible made of carbon blocks so as to be infusible. In the bottom of the crucible is a small tap-hole where the melted aluminum may be drawn out. The electrode

is constructed of heavy carbon plates so as to form a prism. This is fastened by a chain to a derrick and can be lowered into the crucible or furnace as fast as its end burns off. Before the process begins, chunks of copper are thrown into the crucible to form the negative electrode, then the purest obtainable alumina or clay is shoveled into the holes. The moment the electrode is lowered the connection is made and the terrific heat thus produced causes the alumina to give up its aluminium, which may be drawn off through the tap-hole. The clay is fed into the crucible as fast as the reduction process goes on and until the electrode has been entirely consumed. An ordinary aluminium furnace will produce about four hundred-weight in twenty-four hours, and about fifteen horse-power is necessary for each pound of aluminium produced per hour. Aluminium factories produce immense volumes of poisonous gases and for that reason must be more or less isolated. The uses of aluminum are many and various. Aluminum was first used in making aluminum bronze; it is used also for medals and household utensils, jewelers' novelties, parts of bicycles, scientific and surgical instruments, chains for use in mining machinery (because acid water does not eat nor rust it), barbers' supplies, umbrella and cane sticks. The largest quantity of alu-minium is used in making steel. Manufacturers use it in making bath tubs, and shoe dealers build up the heels of shoes with the metal. Great war vessels are being finished in aluminium, and France has built an aluminium torpedo boat. It is used for the manufacture of cash registers, artificial limbs, horse shoes, ornaments for coffins, elevators, chafing-dishes, and dental plates. The two difficulties of using the metal extensively are those of soldering and tempering it.

Alum-root, the name given in America to two plants on account of the remarkable astringency of their roots, which are used for medical purposes.

Alum-slate, a slaty rock from which much alum is prepared; color, grayish, bluish, or iron-black; often possessed of a glossy or shining luster; chiefly composed of clay (silicate of alumina), with variable proportions of sulphide of iron, lime, bitumen, and magnesia.

Alum-stone, a mineral of a grayish or yellowish-white color, approaching to earthy in its composition, from which (in Italy) is obtained a very pure alum by simply subjecting it to roasting and lixiviation.

Al'va (or Al'ba), FERDINAND ALVAREZ, Duke of (1508-1582), Spanish statesman and general under Charles V and Philip II; fought in the wars of Charles V in France, Italy, Africa, Hungary, and Germany. He is remembered for his bloody and tyrannical government of the Netherlands (1567-73), which had revolted, and which he was commissioned by Philip II to reduce to entire subjection to Spain. Among his first proceedings was to establish the "Council of Blood," a tribunal which condemned all whose opinions were suspected, and whose riches were coveted. Many mer-

chants and mechanics emigrated to England. The counts Egmont and Horn, and other men of rank, were executed, and William and Louis of Orange had to save themselves in Germany. Resistance was quelled for a time, and the provinces of Holland and Zealand revolted against his tyranny. A fleet which was fitted out at his command was annihilated, and he was everywhere met with insuperable courage. He was recalled, and in 1573 heleft the country, in which, as he boasted, he had executed 18,000 men. He was received with distinction in Madrid. Before his death he reduced all Portugal to subjection to his sovereign. It is said that during sixty years of warfare he never lost a battle and was never taken by surprise.

Alvarado ( $\dot{a}l$ - $\dot{a}$ - $\ddot{a}$ ' $d\ddot{o}$ ), PEDRO DE, one of the Spanish "conquistadors," was born toward the end of the fifteenth century, and died in 1541. Having crossed the Atlantic he was associated (1519) with Cortez in his expedition to conquer Mexico; and was intrusted with important operations. In July, 1520, during the disastrous retreat from the capital after the death of Montezuma, the perilous command of the rear-guard was assigned to Alvarado. On his return to Spain he was received with honor by Charles V, who made him governor of Guatemala, which he had himself conquered. To this was subsequently added Honduras. He continued to add to the Spanish dominions in America till his death.

**Alwar** (al-war'), a state of northwestern Hindustan, in Rajputana. Area 3,024 sq. mi. This semi-independent state has as its ruler a rajah with a revenue of about \$1,000,000; military force, about 5,000 infantry and 2,000 cavalry. Pop. 682,928.—ALwAR, the capital, is situated 80 mi. s.s.w. of Delhi. Pop. 49,867.

Amade'us, Duke of Aosta, second son of Victor Emmanuel of Italy, and brother of the present king, was born in 1845, and was chosen by the Cortes king of Spain in 1870, Queen Isabella having had to leave the country in 1868. His position was far from comfortable, however, and perceiving that, as a member of a foreign dynasty, he had little hope of becoming acceptable to all parties in the state, he abdicated in 1873 and returned to Italy.

Amal'ekites, a Semitic race occupying the peninsula between Egypt and Palestine, named after a grandson of Esau. They were denounced by Moses for their hostility to the Israelites during their journey through the wilderness, and they seem to have been all but exterminated by Saul and David.

Amal'fi, a seaport in southern Italy, 23 mi. from Naples, formerly a place of great commercial importance, in the Middle Ages enjoying a republican constitution of its own. Here arose the Amalfan Code of maritime law. Pop. 7,737.

Amal gam, a name applied to the alloys of mercury with the other metals. One of them is the amalgam of mercury with tin, which is used to silver looking-glasses. Mercury unites very readily with gold and silver at ordinary temperatures, and advantage is taken of this to separate them from their ores, the process being called *amalgumation*. The mercury being properly applied dissolves and combines with the precious metal and separates it from the waste matters, and is itself easily driven off by heat.

Amarapura (a-ma-ra-pö'ra), a deserted city, once the capital of the Burmese Empire, on the left bank of the Irrawaddy, 10 mi. n.e. of Ava. In 1810 it was completely destroyed by fire, in 1839 it was visited by a destructive earthquake. In 1857 the seat of government was removed to Mandalay. The population in 1800 was 175,000.

Amaryllida 'Ceee, an order of plants, generally bulbous, with a highly colored flower, natives of Europe and most of the warmer parts of the world. The order includes the snowdrop, the snow-flake, the daffodil, the belladonna-lily, the so-called Guernsey-lily (probably a native of Japan), the Brunsvigias, the blood-flowers of the Cape of Good Hope, different species of Narcissus, Agave (American aloe), etc. Many are highly prized in gardens and hothouses; the bulbs of some are strongly poisonous.

Amasia (à-mà-sẽ'à), a town in the north of Asia Minor, on the Irmak, 60 miles from the Black Sea, surmounted by a rocky height in which is a ruined fortress; has numerous mosques, richly-endowed Mohammedan schools, and a trade in wine, silk, etc. Amasia was a residence of the ancient kings of Pontus. Pop. 25,000.

**Ámati** ( $\dot{a}$ -m $\ddot{a}'t\tilde{c}$ ), a family of Cremona who manufactured violins in the sixteenth and seventeenth centuries. Most of the violins made by them are of comparatively small size and flat model, and the tone produced by the fourth or G string is somewhat thin and sharp. Many of Niccolo Amati's violins are, however, of a larger size and have all the fulness and intensity of tone characteristic of those manufactured by Stradivario and Guarnerio.

Amatit'lan, a town in Central America, state of Guatemala, about 15 miles south of the city of Guatemala, a busy modern town, the inhabitants of which are actively engaged in the cochineal trade. There is a small lake of same name close to the town. Pop. 12,000.

Amauro'sis, a species of blindness, formerly called guttaserena (the "drop serene," as Milton, whose blindness was of this sort, called it), caused by disease of the nerves of vision. The most frequent causes are a long-continued direction of the eye on minute objects, long exposure to a bright light, to the fire of a forge. to snow, or irritating gases, overfulness of blood, disease of the brain, etc. If taken in time it may be cured or mitigated; but confirmed amaurosis is usually incurable.

Am'azon, a river of South America, the largest in the world, formed by a great number of sources which rise in the Andes; length, including windings, between 3,000 and 4,000 mi.; area of drainage basin 2,300,000 sq. mi. It enters the Atlantic under the equator by a mouth 200 miles wide. In

its upper course navigation is interrupted by rapids, but from its mouth upward for a distance of 3,300 mi. (mostly in Brazil) there is no obstruction. It receives the waters of about 200 tributaries, 100 of which are navigable, and seventeen of these 1,000 to 2,300 miles in length. The Amazonian water system affords some 50,000 miles of river suitable for navigation. The rapidity of the river is considerable, especially during the rainy season (January to June), when it is subject to floods; but there is no great fall in its course. The tides reach up as far as 400 miles from its mouth. The singular phenomenon of the bore, or as it is called on the Amazon the pororoca, occurs at the mouth of the river at spring-tides on a grand scale. The river swarms with alligators, turtles, and a great variety of fish. Steamers and other craft ply on the river, the chief center of trade being Para, at its mouth. The Amazon was discovered by Yanez Pincon in 1500, but the stream was not navigated by any European till 1540, when Francis Orellana descended it. Orellana stated that he found on its banks a nation of armed women, and this circumstance gave the name to the river.

**Amaz'onas,** the largest province of Brazil, traversed by the Amazon and its tributaries. Area 753,000 sq. mi.; pop. 80,000.

Area 753,000 sq. mi.; pop. 80,000. **Amazons**, according to an ancient Greek tradition, the name of a community of women, who permitted no man to reside among them, fought under the conduct of a queen, and long constituted a formidable state. They were said to burn off the right breast that it might not impede them in the use of the bow. Several nations of Amazons are mentioned, the most famous being those who dwelt in Pontus, who built Ephesus and other cities. Their queen, Hippolyta, was vanquished by Hercules. They attacked Attica in the time of Theseus. They came to the assistance of Troy under their queen, Penthesilëa, who was slain by Achilles.

Amazu'lu. See Zulus.

**Amba'ia** (Umball'a), a town of India, in the Punjab, with a flourishing trade in grain and other commodities. Total pop. 67,463.

Ambas' sador, a minister of the highest rank, employed by one prince or state at the court of another to manage the public concerns, or support the interests of his own prince or state, and representing the power and dignity of his sovereign or state. Ambassadors are ordinary when they reside permanently at a foreign court, or extraordinary when they are sent on a special occasion. When Ambassadors extraordinary have full powers, as of concluding peace, making treaties, and the like, they are called plenipotentiaries. Ambassadors are often called simply ministers. Enroys are ministers employed on special occasions, and are of less dignity than ambassadors. Until recently the U.S. sent no ambassadors to foreign countries, but were represented by ministers-plenipotentiary, ap-pointed by the president, with approval of the Senate. In 1896 the ministers to Germany,

France, England, and Italy were raised to the rank of ambassadors.

Amba'to, a town of Ecuador, on the side of Chimborazo, 70 mi. s. of Quito. Pop. 12,000.

Am ber, a semi-mineral substance of resinous composition, a sort of fossil resin, the produce of extinct Coniferæ. It is usually of yellow or reddish-brown color; brittle; yields easily to the knife; is translucent, and possessed of a resinous luster. It burns with a yellow flame, emitting a pungent, aromatic smoke, and leaving a light carbonaceous residue, which is employed as the basis of the finest black varnishes. By friction it becomes strongly electric. It is found in masses from the size of coarse sand to that of a man's head, and occurs in beds of bituminous wood situated upon the shores of the Baltic and Adriatic Seas; also in Poland, France, Italy, and Denmark. It is often washed up on the Prus-sian shores of the Baltic, and is also obtained by fishing for it with nets. Sometimes it is found on the east coast of Britain, in gravel pits round London, also in the U.S.

Working in Amber. - The amber blocks are sawed into small blocks by an extremely thin saw. With the amber rough-shaped the worker puts in his lathe a disk file, a circular steel plate with radiating file sections on its face, thus the amber is reduced to the desired size. In making the mouthpiece for a pipe, for instance, the blocks of amber, after being brought nearly to the finished shape, are put in the lathe to be bored out. As the hole must be drilled in the exact center, the amber must be truly centered in the lathe. The hole for the bone screw which joins the mouthpiece and the pipe stem is bored out, and a screw thread cut in with a toothed tool. A curious thing about amber is that it will crack if a hole is bored straight through from one end. After the hole is bored the amber is brought down to the right size for the particular pipe stem for which it is intended and is then polished. Some of the mouthpieces are curved and this is done after the amber is shaped and bored. The straight mouthpiece is put into hot oil until it loses its stiffness and is then bent as desired. Rubber and horn mouthpieces are worked much as amber, but the tools employed are stronger and heavier. Amber is sold by the pound, the price vary-ing from \$2 to \$75 per pound. There is no difference, so far as cost is concerned, between the clouded and the clear amber. Amberine is an imitation of amber as its name implies. It is tougher and stronger than amber.

Am bergris, a substance derived from the intestines of the sperm-whale, and found floating on or near the shore; yellowish or blackish white; very light; melts at  $140^{\circ}$ , and is entirely dissipated on red-hot coals; is soluble in ether, volatile oils, and partially in alcohol, and is chiefly composed of a peculiar fatty substance. Its odor is very agreeable, and hence it is used as a perfume.

**Ambleteuse** (an-bl-teuz), a small seaport of France, 6 mi. from Boulogne. Here James II landed on his flight from England in 1688;

TYPE OF AMERICAN INDIANS. I. Eskimo Woman (Labrador). 2. Mexican (Coast). 3. Mexican (Highl 9, 10. Apache (U. S. A.) II. Bellaccola or Bilchula. 12, 13. Pueblo (U. S. A.). 14, 15. Zapoteca (Mexico). 16, 17. Ca del Fuego. 23. Patagonian Woman.

and from its harbor Napoleon I prepared to despatch a flotilla of flat-bottomed boats for the invasion of Britain.

Amblyop'sis, a genus of blind fishes, containing only one species, found in the Mammoth Cave of Kentucky.

Amboy'na (Amboina, or Apon), one of the Molucca Islands in the Indian Archipelago, close to the large island of Ceram; area about 280 sq. mi. Here is the seat of government of the Dutch residency or province of Amboyna, which includes also Ceram, Booro, etc. It affords a variety of useful trees, including the cocoa-nut and sago palms. Cloves and nutmegs are the staple productions. The natives are mostly of Malayan race. The capital, also called Amboyna, is situated on the Bay of Amboyna, and is well built and defended by a citadel. The streets are planted on each side with rows of fruit-trees. It is a free port. Pop. 10,500. In 1607 Amboyna and the other Moluccas were taken by the Dutch from the Portuguese, and it was for some years the seat of government of the Dutch East Indies. Trade with the Moluccas was secured to the British by treaty in 1619, but the British establishment was destroyed and several persons massacred in 1023, an outrage for which no satisfaction was obtained till 1654 by Cromwell. Amboyna was taken by the British in 1796 and 1810, but each time restored to the Dutch. Pop. 30,000.

Amboyna Wood, a beautiful curled orange or brownish colored wood brought from the Moluccas.

Ambulance, a four or two wheeled wagon fitted up for the conveyance of injured persons. In the armies of the world the term is applied to movable field hospitals, especially those controlled by the Red Cross Society. Every principal city in America has its hospitals and police departments equipped with excellent ambulances in the charge of qualified surgeons. These vehicles having the right of way over other vehicles, respond to accident calls sent by the police, and render most efficient first aid to the injured as well as conveying them to hospitals or their homes. Ambulances are also provided for the conveyance of injured animals.

Amend ment, a proposal brought forward in a meeting of some public or other body, either in order to get an alteration introduced on some proposal already before the meeting, or entirely to overturn such proposal. When amendments are made in either house of Congress upon a bill which passed the other, the bill, as amended, must be sent back to the other house. The Senate may amend money bills passed by the House of Representatives, but cannot originate such bills. The Constitution of the U. S. contains a provision for its amendments, as follows :--

"The Congress, whenever two thirds of both houses shall deem it necessary, shall propose amendments to this constitution; or, on the application of the legislatures of two thirds of the several states, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes, as part of this constitution, when ratified by the legislatures of three fourths of the several states, or by conventions in three fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided, that no amendment which may be made prior to the year 1808 shall in any manner affect the first and fourth clauses in the ninth section of the first article; and that no state, without its consent, shall be deprived of its equal suffrage in the Senate."

Amer' ica, or the New World, the largest of the great divisions of the globe except Asia, is washed on the west by the Pacific, on the east by the Atlantic, on the north by the Arctic Ocean, on the south tapers to a point. On the northwest it approaches within about 50 mi. of Asia, while on the northeast the island of Greenland approaches within 370 mi. of Iceland. America as a whole forms the two triangular continents of North and South America, united by the narrow Isthmus of Panama, and having an entire length of about 10,000 miles: a maximum breadth (in North America) of 3,500 miles; a coast line of 44,000 miles; and a total area, including the islands, of nearly 16,000,000, of which North America contains about 9,000,000 sq. mi. South America ica is more compact in form than North America, in this respect resembling Africa, while N. America more resembles Europe. Between the two on the east side is the great basin which comprises the Gulf of Mexico, the Caribbean Sea, and the West India Islands. Like Europe also N. America possesses numerous islands, while those of S. America are less important and confined almost to the southern extremity.

NORTH AMERICA.—The political divisions of N. A. are, the U. S. (including Alaska), Mexico, Canada, Greenland, and the Bermuda Islands.

Surface, Rivers, and Lakes.—North America naturally divides itself into five physical regions: 1. The table-land of Mexico, with the strip of low country on its eastern and western shores; 2. The plateau lying between the Rocky Mountains and the Pacific Ocean, a country with a mild and humid atmosphere as far north as the 55th parallel, but inhospitable and barren beyond this boundary; 3. The great central valley of the Mississippi, rich and well wooded on the east side; bare but not unfertile in the middle; dry, sandy, and almost a desert on the west; 4. The eastern declivities of the Alleghany Mountains, a region of natural forests, and of mixed but rather poor soil; 5. The great northern plain beyond the 50th parallel, four fifths of which is a bleak and bare waste, overspread with innumerable lakes, and resembling Siberia both in the physical character of its surface and the rigor of its climate. The loftiest mountains in N. America are Wrangell in Alaska. 20,000 ft.; Mount St. Elias, 19,500 ft.; and Popocatepetl, 17,783 ft. The principal river systems are the Mississippi, the St. Lawrence, the Mackenzie, and the Rio del Norte. The

Mississippi River system is, next to the Amazon, the largest in the world. It receives as tributaries the Missouri, the Ohio, the Arkansas, and the Red River, draining a total territory of about one million and a half sq. mi. This river system is separated from the Mackenzie River system by a low plateau which stretches across the country near the Canadian lakes. The Mackenzie flows into the Arctic Ocean. A part of this territory north of the lakes is drained by numerous small rivers which empty into Hudson Bay. The third great river system is the St. Law-rence, which is the outlet of the five great lakes. It has a drainage area of about 400,000 sq. mi. The Rio del Norte flows into the Gulf of Mexico, draining an area of about 200,000 sq. mi. The principal rivers emptying into the Pacific Ocean are the Columbia, the Colorado, the Sacramento, and the Frazer. The Yukon, in Alaska, empties into Bering Sea. The principal indentations of the coast of North America are Hudson Bay, the Gulf of St. Lawrence, the Gulf of Mexico, Long Island Sound, the bays of Fundy, Cape Cod, Delaware, and Chesapeake, and the Gulf of California and San Francisco Bay and Puget Sound.

Geology.- If we run a line westward across the continent of North America at the latitude of Delaware Bay (38<sup>°</sup>), the geological formations present themselves in the follow-ing order: 1. Tertiary and Cretaceous strata on the shores of the Atlantic; 2. Gneiss underlying these strata, and presenting itself on the eastern slope of the Alleghany or Appalachian mountains, but covered in parts by new Red Sandstone: 3. Palæozoic rocks, consisting of Silurian, Devonian, and Carboniferous strata, curiously bent into parallel foldings, with synclinal and articlinal axes, the crests of the latter forming the ridges of the Alleghany Mountains, which in this region rise to the height of 2,500 feet. Upon these Palæozoic rocks rest three great coal-fields-the Appalachian, that of Illinois, and that of Michigan. covering a large portion of the space between the Alleghanies and the Mississippi, and embracing collectively an area equal to the surface of Great Britain. From the Mississippi westward to Utah the Palæozoic rocks occur in great folds, between which are extensive areas of Triassic, Oolitic, Cretaceous, and Tertiary beds. In California the rocks are chiefly metamorphosed secondary strata on which lie patches of Tertiary sediments. In British America there is an enormous development of the Laurentian and Huronian rocks, which are the oldest yet discovered, and occupy most of the country immediately north of the large lakes. Newfoundland and the neighboring British territories consist of Pre-Silurian, Silurian, Devonian, Carboniferous (which includes coal-fields of considerable extent), and Triassic rocks. The area north of about  $40^\circ$  n. is also covered and strewed with glacial drift and boulders.

The Ozark Mountains resemble the Alleghanies in their mineral structure, containing the

same rocks from the granite to the carboniferous, and probably upward to the chalk. The mineral products of N. A. are of une-qualed richness and variety. Gold is abundant in California, Nevada, and Montana. It is also found in British Columbia, Mexico, Alaska, and Canada, and sparingly in Virginia and South Carolina. Silver is obtained from Mexico, California, and Newfoundland. Great masses of almost pure copper are found in the Huronian rock strata, the north and east shores of Lake Superior being the richest of copper mining regions; while New York and Indiana possess a share of the same metal, and it is found in different countries from British Columbia to the isthmus. The iron ores of Pennsylvania, and those of Canada, including New Brunswick, are of the greatest importance; the former are rendered more available by their occurring close to the beds of bituminous coal, giving materials for the manufacturing industry of Pittsburg; while anthracite coal is obtained from the eastern districts of Pennsylvania. It is estimated that one third of the total area of this state is occupied by coal-fields, which can scarcely be exhausted. Lead is found in Wisconsin, Illinois, and Missouri, in New York, in Canada, in California; white zinc is got from Arkansas and New Jersey. Reverting to the subject of coal, as having an intimate economic connection with all metallic wealth, it should be observed that the united area of all the coalfields in the U.S. is estimated at 190,000 sq. mi., exceeding twenty-fold those of Europe. The chief of these coal-fields are, first, the Appalachian, extending from the Susque-hanna in Pennsylvania to the Tuscaloosa in Alabama, along the west side of the Alleghany Mountains; the area of this coal-field is 70,-000 sq. mi., and its greatest thickness 2,500 feet; secondly, the coal-field of Michigan, about the center of that state; thirdly, the extensive coal-field between the Ohio and the Mississippi, across the states of Indiana and Illinois: lastly, the lowa and Missouri coalfield. Coal is found also in Nova Scotia, in British Columbia, and Vancouver Island, and wherever the Upper Palæozoic strata prevail in the geological structure.

Climate.-The climate of N. A. varies from the tropical to the frigid. Mexico is hot. moist, and unhealthy on the low coast, but the greater part of its area, comprising all the populous district, is a table-land from 5,000 to 9,000 feet in height. In consequence of this, Mexico, though half of it is within the torrid zone, has a temperate and equable climate. The mean heat of the capital (7,400 feet above the sea) is  $62\frac{3}{2}$ . The difference between the warmest and the coldest month is only 12°. In the extensive region lying between the parallels of 30° and 50° n., which comprehends three fourths of the useful soil of N. A., we have three well-marked varieties of climate, that of the east coast, the west coast, and the basin of the Mississippi. On the east coast, from Georgia to Lower Canada, the range of the thermometer is very great, the summer

being hot and the winter cold. At Quebeo the temperature of the warmest month exceeds that of the coldest by no less than  $60_1^{\circ}$  F. The climate undergoes a more rapid change in America as we proceed from south to north, a degree of latitude in the middle of the temperate zone producing a decrease of annual temperature of 1°.57 F. At the mouth of Columbia River, in latitude  $46_1^{\circ}$  n., the mean heat of the warmest monthwas about  $62^{\circ}$  F., of the coldest about  $36^{\circ}$ , and of the whole year 51°. The place is under the same latitude with Quebec, where the snow lies five months, and the mean temperature during the three winter months is 18° below the freezing point. This single circumstance marks emphatically the contrast in the climate of the east and west coasts of N. A.

Vegetation.-North America is rich in forests of pine, oak, ash, hickory, beech, walnut, maple, cedar, cypress, juniper, hemlock, bass-wood, palmetto, dogwood, willow, elm, sycamore, magnolia, gum, locust, and other trees. Perhaps the most important plant is the maize or Indian corn. Corn is raised mostly in the central part of the U. S., and is the principal product of many of the prairie states. Wheat. barley, peas, oats, and rice are cultivated throughout the greater portion of the continent. Vanilla, pimento, jalap, cinchoua, to-bacco, sweet potatoes, and the cactus are grown in various parts, and are mostly indigenous. All kinds of vegetables and fruits are grown. The orange, lemon, apple, peach, and pear are grown very extensively. Coffee, sugar, and cotton are staple products. The potato is a native of both North and South America and is raised in great quantity.

Zoology.-The animals of N. A. include the polar, black, and grizzly bears in the Arctic regions and Rocky Mountains. Also the cougar, or panther, lynx, and wildcat. Formerly the buffalo, or bison, roamed over the prairies in great herds but it is now almost extinct. Other animals are the musk-ox, the moose, reindeer, antelope, wolves, dogs, and foxes. Among the smaller animals are beaver, otter, raccoon, badger, opossum, weasel, hare, muskrat, squirrel, porcupine, gopher. There are numerous species of reptiles, the rattlesnake being among the most dangerous. In the southern part of the U.S. and in Mexico are found the alligator, boa-constrictor, tortoise, sea-turtle, toad, frog, and lizard. There are a great many birds found which are peculiar to this continent. The wild turkey, one of the principal native birds, has now almost disappeared. Wild pigeons are still found in some localities. Other birds are the bald eagle, sparrow-hawk, swallow-tail hawk, falcon, vulture, turkey-buzzard, and owl. Among the smaller birds are turkeys, pheasants, grouse, and quails; also cranes, herons, fla-mingoes, spoonbills, rails, and gallinules. The mingoes, spoonbills, rails, and gallinules. principal water fowls are swans, wild geese, ducks, and pelicans, Some of the smaller birds are larks, orioles, buntings, magpies, jays, cedar birds, thrushes, shripes, mocking birds, robins, grossbeaks, bluebirds, parrots,

woodpeckers, humming - birds, klngfishers, whip-poor-wills. The principal varieties of fish are sturgeon, salmon-trout, shad, white fish, mackerel, herring, halibut, sheeps-head, salmon, bass, perch, pike, blue fish, suckers. The domestic animals are horses, cattle, sheep, and swine.

Population. - The inhabitants of N. A., when it was discovered by Europeans, were Indians of whom many are still in existence, though they are fast disappearing before the advance of civilization. Whence came the aborigines of America no one can say definitely, but the best authorities agree that they came from Asia. The Indians living in N. A. at the present time are, in the extreme northern parts, the Esquimaux; a few in the U.S., located in the Indian Territory, and some on small reservations in various states, and in Mexico. When the Europeans first came to this continent the various tribes of Indians were scattered over the whole continent. Some of the Indians had made great advances in a rude sort of civilization, dwelling in large and wellbuilt houses and having a settled form of government, practising agriculture and to some extent the mechanical arts. The white population of the continent is mainly of British origin though to considerable extent it consists of Germans, Scandinavians, and the de-scendants of such. There may also be found representatives of nearly every race and na-tion on the face of the globe. The African race constitutes an important part of the population especially in the southern part. It consists of freed slaves and the descendants of slaves.

History.— America was first made known to the world by the discovery of Christopher Columbus who set sail from Spain in August, 1492. The continent of North America was first discovered by John Cabot and his son Se-bastian, in 1497. The new world was named after Amerigo Vespucci who was the first to write a description of it. Various voyages were made from Europe, the principal ones being by Gaspar de Cortereal, a Portuguese sailor, who made two voyages to the coast of Labrador; Ponce de Leon, who discovered Florida in 1512; Verrazzano, a Florentine sailor, who explored more than 2,000 miles of the eastern coast; Jacques Cartier, who explored Newfoundland and descended the St. Lawrence; Cortez. who discovered and con-quered Mexico. The first English settlers in what is now the U. S. came in 1607, locat-ing in Jamestown, Va. From time to time From time to time colonies came from England, Holland, and France and made settlements along the eastern coast, from Florida to Quebec. At times expeditions were made inland, and in the course of 150 years settlements were made on the Great Lakes and in the Mississippi Valley. By 1776 the English owned most all of the settlements except those of Quebec and Florida. In that year the English colonies established an independent American Commonwealth. In 1821 Mexico became independent of Spain, forming a republic. The remainder of N. A.,

#### America

except the peninsula of Alaska, which belongs to the U. S., and Greenland, which is a Danish possession, belongs to Great Britain.

CENTRAL AMERICA extends from the Isthmus of Panama to the Isthmus of Tehuantepec. Its entire length is about 800 mi., with a breadth varying from 25 to 350 mi. Its area is about 190,000 sq. mi. The political divisions of Central America are Guatemala, Honduras, San Salvador, Nicaragua, Costa Rica, and British Honduras.

Surface, Rivers, and Lakes.-The surface of Central America is for the most part mountainous. North of Panama is the plateau of Veragua, the highest point of which is 8,000 The plateaus of Costa Rica and Cartago ft. lie north of this. There are several peaks of 10,000 ft. in height. These plateaus gradually slope down to the plain of Nicaragua, north of which rises the table-land of Honduras with an average height of 4,000 ft. South of this region are two rows of volcanoes. The plateaus of Honduras and Guatemala are connected by a single mountain. In the plateau of Guatemala are several volcanoes over 12,000 ft. in height. Among the rivers of Central America which are considerable in size though short, are the Usumasinta and the San Juan, the outlet of Lake Nicaragua. On the east coast is the Gulf of Honduras, and on the west the Bay of Panama, the Gulf of Dulce, Coronada Bay, Gulf of Nicoya, and the Gulf of Fonseca. The lakes are: Nicaragua, area 34,000 sq. mi., Managua in Nicaragua, Illopongo, Amatitlan, and the Yojoa.

Geology.—In the central part are the crystalline and volcanic rocks, on either side of which are strata of the Tertiary Age. Gold, silver, lead, and mercury are found in many places and especially in Costa Rica and Honduras. The only hindrance to the working of these mines is the unhealthy climate. Jasper and marble are also found in Honduras and large quantities of salt are produced on the western coast, and also from the numerous salt springs.

Climate.—There are only two seasons in Central America, the wet and the dry. During the wet season the skies are filled with clouds and falling rain and the sun is seldom seen. During the dry season the temperature does not rise so high, but hot and dry weather prevails, and the atmosphere is clear and healthy. The higher regions are more open and are comparatively healthy, but many contagious diseases prevail in the low marshes.

Vegetation.—Central America is rich in the growth of vegetables and tropical fruits, among which are sugar-cane, indigo. Indian corn, sweet potatoes, tobacco, cacao, the cactus, mandioca, and banana. There are large forests of mahogany, logwood, lignum-vitæ, pimento, sarsaparilla, vanilla, black balsam, etc. There are about one hundred different kinds of trees in the forests of Panama that are fatal to animal life.

Zoology.—There is very little difference between the zoology of C. A. and the other divisions of the continent. There are many

#### America

species of humming-birds and quezal. The birds are noted for their brilliant plumage. There are many large and dangerous serpents, also a brown and green species of locust. The rivers and lakes are rich in fish.

Population.—The inhabitants of C. A. are the descendants of the Spaniards who settled there centuries ago, and some Indians and creoles. There are also a few blacks. In general the people of these hot republics are quarrelsome.

*History.*—Columbus visited the east coast of C. A. in 1502, passing along the shores of Honduras and Costa Rica. In 1523 Cortez sent one of his lieutenants to conquer this region which he did in two years' time. The whole territory belonged to Spain from that time until 1823 when it became a republic. In 1833 this republic was dissolved and the five extant republics were formed. The only European possession is that of British Honduras owned by Great Britain.

SOUTH AMERICA is a vast peninsula of a roughly triangular form about 5,000 mi. long by 3,230 mi. broad, having an area of about 7,000,000 sq. mi. The political divisions of S. A. are Brazil, Venezuela, Columbia, Equador, Peru, Bolivia, Chili, the Argentine Republic, Paraguay, Uruguay, and British, Dutch, and French Guiana.

Surface, Rivers, and Lakes.—There are four great systems of mountains in S. A., the greatest of which are the Andes, on the Pacific coast, stretching in a continuous chain for over four thousand miles. Next to the Himalayas this is the highest mountain range in the world, the highest point being 25,000 feet. The second system is that of the highlands of Guiana which lie north of the Amazon valley. Here are several irregular groups of mountains about 2,000 feet high which separate the plains of the Orinoco from those of the Rio Negro and the Amazon. The third system is the coast chain of Venezuela, the bighest point of which is 8.600 feet. The highest point of which is 8,600 feet. The Brazilian highland, the fourth system, is very broad, and crossed by low ranges of mountains. Its average height is less than half that of the Andes. From the configuration of its surface, the continent may be divided into five phys-ical regions: 1. The low country skirting the shores of the Pacific Ocean, from 50 to 150 mi. in breadth, and 4,000 in length. The two extremities of this territory are fer-tile, the middle a sandy desert. 2. The basin of the Orinoco, a country consisting of extensive plains, or steppes, called Llanos, either destitute of wood or merely dotted with trees, but covered with a very tall herbage during a part of the year. During the dry season the heat is intense here, and the parched soil opens into long fissures, in which lizards and serpents lie in a state of torpor. 3. The basin of the Amazon, a vast plain, embracing a surface of more than two million square miles, possessing a rich soil and humid climate. It is covered almost everywhere with dense forests, which harbor innumerable tribes of wild animals, and are thinly inhabited by savages,

who live by hunting and fishing. 4. The great southern plain, watered by the Plata and the numerous streams descending from the eastern summits of the Cordilleras. Open steppes, which are here called Pampas, occupy the greater portion of this region, which is dry, and in some parts barren, but in general is covered with a strong growth of weeds and tall grass, which feeds prodigious herds of horses and cattle, and affords shelter to a few wild animals. 5. The country of Brazil, eastward of the Paraná and Uruguay, presenting alternate ridges and valleys, thickly covered with wood on the side next the Atlantic, and opening into steppes, or pastures, in the interior.

The three important river systems of S. A. are the Amazon, the Orinoco, and the La Plata, the Amazon being the largest river on the globe. All of these rivers flow into the Atlantic. The Amazon rises in the Andes, and is 4,000 mi. long. It is navigable for The Orinoco rises in the about 2,300 mi. Parine mountains and is 1,400 mi. long. The Orinoco and the Amazon systems are connected by a small river called the Cassiqui-are. The Plata is formed by the confluence of the Panana and Uruguay rivers and is 185 mi. long, and at its mouth about 125 mi. wide. The principal smaller rivers are the San Francisco, the Rio Negro, the Colorado and Essequibo. The largest lake is Titicaca in the Andes, covering an area of about 4,000 sq. mi. and is over 12,000 feet above the level of the sea. There are several small lakes in the mountain regions but none of any special importance.

Geology. - The mountain areas of S. A. are as a general rule, those which have received the thickest accumulations of sedimentary During the periods of the formation matter. of such deposits, these areas were areas of subsistence, and since those beds which once formed the sea bottoms now constitute the highest peaks, these areas must have been subjected to subsequent upheaval. Vertical movements of this kind have occurred again and again, indicating that these areas are specially liable to disturbance. The history of the mountain chains is almost co-extensive with that of the continent itself. In the sea the beds were deposited horizontally, or nearly so; and at certain intervals the beds were uplifted above the sea. The rocks were at one time faulted, folded, and metamorphosed, and at other times denuded. The land was uplifted in a broad band, the axis of which ran parallel to the shore of the sea in which the beds were formed. The principal ridges formed during the same period usually coincide in direction with the stratigraphical strike of the bed forming them. The oldest rocks form the outermost rim of the continent, of which the n.e. and s.e. corners have prob-ably been swept away. These corners now correspond with the mouths of the Orinoco, the Amazon, and the La Plata rivers. Within this basin are schists and quartzites, which are in all probability of Silurian Age. Within

this again are sandstones and limestones, usually referred to the Carboniferous period, which also form part of the transverse ridges. A band of rocks of secondary age follow, some of which are believed to be Triassic, while Tertiary others are identified as Cretaceous. beds, some of Miocene date, together with Post-Tertiary beds, cover the largest part of the areas of the great river basins and the hollows in the mountain range, and also occur on the seaward flanks of the principal chains. There are some twenty or more volcanic cones, of which about a dozen are active. Bolivia has one or two active vents, and Peru several: but it is in Ecuador, with its dozen ignivomous vents, that have occurred the grandest and most frequent displays. Colombia has four or five volcanoes. With the exception of the Moluccas, no country in the world has had so many and so destructive earth-quake shocks as S. A. But these are concentrated along the Andes, and more particularly their western slope. Comparatively few are felt in the plains to the east of them. Peru seems to be the principal focus of action; and next to it in importance as a seismic area comes Chile. Bolivia is comparatively free from them, as also are Brazil and the Argentine Republic, but they are more frequent in Ecuador, Colombia, Venezuela, and the three Guianas.

The mineral wealth of S. A. consists in gold, silver, copper. mercury, diamonds, and other valuable metals. The desert coast of Chile is rich in guano, niter. valuable iodine compounds, and borax. Chile is also rich in copper and silver and the coal mines are being developed rapidly and give promise of great wealth. There are celebrated silver mines in Bolivia and considerable supplies of gold in Venezuela and Guiana. Some rich gold mines have been discovered in the southern part of Argentine. Brazil has some coal mines, but its great mineral wealth consists in diamonds.

Climate.-In the western and warmest part of the parched steppes of Caraccas, the hottest known region in America, the temperature of the air during the day is only 98° in the shade. At Calabozo, farther east in the Llanos, the common temperature of the day is only from 88° to 90°; and at sunrise the thermometer The basin of the Amazon is sinks to 80°. shaded with lofty woods; and a cool breeze from the east, a minor branch of the tradewind, ascends the channel of the stream, following all its windings, almost to the foot of the Andes. Hence this region, though under the equator, and visited with almost constant rains, is neither excessively hot nor unhealthy. Brazil, and the vast country extending westward from it between the Plata and the Amazon, is an uneven table-land, blessed with an equable climate. At Rio Janeiro, which stands low, and is exposed to a heat comparatively great, the temperature in summer varies from  $68^\circ$  to  $82^\circ$  F., and the mean is only about 74°. Farther north, and in the interior, the Indians find it necessary to keep fires in their huts; and in the country

#### America

near the sources of the Paraguay, hoar-frost is seen on the hills during the colder months, and the mean temperature of the year falls below 65° or 67°. On the declivities of the Andes, and on the high plains of Upper Peru, the heats are so moderate that the plants of Italy, France, and Germany come to maturity. Lower Peru, though a sandy desert, enjoys a wonderful degree of coolness, owing to the fogs which intercept the solar rays. At Lima, which is 540 feet above the sea, the tempera-ture varies from  $53^{\circ}$  to  $82^{\circ}$ , but the mean for the whole year is only  $72^{\circ}$ . At Buenos Ayres, for instance, the mean annual heat is 68° F. As we advance southward, the diminishing breadth of the continent makes the climate approximate to that of an island, and the extremes approach each other. In the Strait of Magellan the temperature of the warmest month does not exceed 43° or 46°; and snow falls almost daily in the middle of winter. The climate of Patagonia is absolutely colder than that of places in the same latitude in Europe; but the difference lies chiefly in the very low temperature of the summer. This peculiarity no doubt results chiefly from the greater coolness of the sea in the southern hemisphere; for beyond the parallel of 48°, the difference of temperature in the north and south Atlantic amounts, according to Humboldt, to 10° or 12° of Fahrenheit's scale. The sum of the peculiar qualities which distinguish the climate of South America may be briefly stated. Near the equator the new continent is humid; and within the tropics generally, owing to its vast forests, the absence of sandy deserts, and the elevation of the soil, it is cooler. Beyond the tropics the heat is nearly the same in the south temperate zone of America and the northern one of the old continent, till we ascend to the latitude of Cape Horn, where we have cold summers and a very limited range of the thermometer.

Vegetation .- The vegetable kingdom in S. A. has a magnificent development, particularly in the vast tropical territory east of the Andes, the basins of the Amazon, the Orinoco, and their tributaries, where the genera and species are very abundant, the forests large, and the forms gigantic. Besides its palms, it has dyewoods of all sorts, cedar, mahogany, ebony, etc.; farther south are the araucarias of Chile, and the beech forests of Argentine. There are numerous kinds of fruit trees, the fruit of which is usually very large, and covered with an extremely thick shell. Among these may be mentioned the cannon-ball tree and the Brazil-nut tree. Ferns and water lilies are also numerously represented, and splendid specimens of both are found. The jungle, or undergrowth, in the forests, is impenetrable in many places. Cinchona is found on the higher ground within the tropics. A holly is grown, the leaves of which are soaked in water, and produce a beverage called "Paraguay Tea.

Zoology.—The zoology of S. A. is extensive and peculiar, embracing a fourth of all the

known mammals, among which, however, are almost none of the wild animals so abundant in Africa and Asia. The most powerful of the carnivora is the jaguar, which is indeed the only formidable beast of prey in the whole continent. Of the other animals may be mentioned the great tapir, peccaries, sloths, anteaters, armadilloes; the llama, the chinchilla, and the monkey. The armadillo is said to be the only wild animal that increases with the increase of population. It catches mice and poisonous snakes, kills them, cuts them up, and eats as much as it requires. Although often hunted for its succulent flesh, by means of trained dogs, this singular animal actually multiplies in number as the population of the district it inhabits increases. If versatility in habits or adaptiveness can be taken as a measure of intelligence, the armadillo is the superior of the large-brained cats and canines. Many of the species are peculiar to S. A., and are not found elsewhere. Among birds the most notable are various parrots, humming-birds, flamingoes, toucans, and aracaris. Chief among the reptiles are alligators, boas, turtles, and rattlesnakes.

Population.-The aborigines of S. A. are undoubtedly of the same race as those of N. A., as there exists a very striking general physical resemblance between the native races throughout the whole of the American continent, from Cape Horn to Bering's Strait. See America and Indians. They are almost all of a copper color, with long black hair, deep-set black eyes, aquiline nose, and often hand-some, slender form. In S. A. these red men are far more numerous than in N. A., and though many are half-civilized, a greater number are in a state of barbarism. A considerable portion of the population also consists of persons of Spanish and Portuguese blood, and along with these a far greater number of mixed Indian and European blood, civilized, and forming an important element in the various states of the continent. To these are now being added considerable numbers of Spanish and Italian immigrants.

History.-Columbus first touched the continent at the mouth of the Orinoco in 1498. The next navigator to explore this continent was Hojeda, a Spaniard, who touched the continent near the equator and passed up the coast of Venezuela. He was accompanied by Amerigo Vespucci. Vespucci was an experienced mariner, and In 1500, after his return. published an account of the voyage, and on account of this the new world was called America. Spain and Portugal had almost entire control of the continent until the beginning of the nineteenth century. The Spanish colonies declared their independence in 1810 and after a ten years' war established a num-ber of republics. In 1823 Brazil became independent of Portugal and retained a monarchical form of government which lasted until 1889, when the form of government was changed to a republic. The only foreign possessions on the continent at the present time are those of British, French and Dutch Guiana.

# Americanism

Between the first of these and Venezuela there is a boundary dispute which has been submitted to arbitration. The U. S. Government having requested this under the authority of the Monroe Doctrine.'

Americanism, a term applied to certain words and idioms of the English language peculiar to the U.S. Following are a few of the more common Americanisms:-

Around or round, about or near. To hang around is to loiter about a place.

Backwoods, the partially cleared forest regions in the western states.

Bee, an assemblage of persons to unite their labors for the benefit of an individual or family, or to carry out a joint scheme.

Bogus, false, counterfeit.

Boss, an employer or superintendent of laborers, a leader.

Bug, a coleopterous insect, or what in England is called a beetle.

Buggy, a four-wheeled vehicle.

Bulldose, to; to intimidate voters.

Bunkum or buncombe, a speech made solely to please a constituency; talk for talking's sake, and in an inflated style.

Bureau, a chest of drawers; a dressing-table surmounted by a mirror.

Calculate, to suppose, to believe, to think.

Camp-meeting, a meeting held in the fields or woods for religious purposes, and where the assemblage encamp and remain several days.

Canebrake, a thicket of canes.

Caucus, a private meeting of the leading politicians of a party to agree upon the plans to be pursued in an approaching election.

Chunk, a short, thick piece of wood or any other material.

Cleter, good-natured, obliging. Cocktail, a stimulating drink made of brandy or gin mixed with sugar, and a very little water, etc.

Corn-husking, or corn-shucking, an occasion on which a farmer invites his neighbors to assist him in stripping the husks from his Indian corn.

Cowhide, a whip made of twisted strips of rawhide.

Creek, a small river or brook; not, as in England, a small arm of the sea.

Cunning, small and pretty, nice; as, it was such a cunning baby.

Dander, to get one's dander raised, to have one's dander up, is to have been worked into a passion.

Dead-heads, people who have free admission to entertainments, or who have the use of pub-

lic conveyances, or the like, free of charge.

Dépôt, a railway station.

Down east, in or into the New England states. A down-easter is a New Englander.

Drummer, a commercial traveler.

Dry goods, a general term for such articles as are sold by linen-drapers, haberdashers, hosiers. etc.

Fix, to; to put in order, to prepare, to adjust. To fix the hair, the table, the fire, is to dress the hair, lay the table, make up the fire.

Fixings, arrangements, dress, embellish-

# Americanism

ments, luggage, furniture, garnishings of any kind.

Gerrymander, to arrange political divisions so that in an election one party may obtain an advantage over its opponent, even though the latter may possess a majority of votes in the state; from the deviser of such a scheme, named Gerry, governor of Massachusetts.

Given name, a Christian name.

Grü, courage, spirit, mettle.

Guess, to; to believe, to suppose, to think, to fancy; also used emphatically, as you liquor up?" "I guess I will." 'Joe, will

Gulch, a deep, abrupt ravine, caused by the action of water.

Happen in, to; to happen to come in, or call. *Help*, a servant.

Highfulutin, inflated speech, bombast.

Hoe-cake, a cake of Indian meal baked on a hoe or before the fire.

Johnny-cake, a cake made of Indian corn meal mixed with milk or water, and sometimes a little stewed pumpkin; the term is also applied to a New Englander.

Julep, a drink composed of brandy or whisky with sugar, pounded ice, and some sprigs of mint.

Loafer, a lounger, a vagabond.

Log-rolling, the assembly of several parties of wood-cutters to help one of them in rolling their logs to the river after they are felled and trimmed; also employed in politics to signify a like system of mutual co-operation.

Lot, a piece or division of land, an allotment.

Lumber, timber sawed for use; as beams, joists, planks.

Lynch law, an irregular species of justice executed by the populace or a mob, without legal authority or trial.

Mail letters, to; to post letters.

Mitten: 10 get the mitten is to meet with a refusal.

Muss, a state of confusion.

Notions, a term applied to every variety of small wares.

One-horse: a one-horse thing is a thing of no value or importance, a mean and trifling thing.

Pickaninny, a negro child.

Pile, a quantity of money.

Planks, in a political sense, are the several principles which appertain to a party; platform is the collection of such principles.

*Reckon*, to; to suppose, to think.

Rile, to; to irritate, to drive into a passion. *Rooster*, the common domestic cock.

Scalawag, a scamp, a scapegrace.

Shanty, a structure such as squatters erect; a temporary hut.

Skedaddle, to; to run away; a word introduced during the CivilWar.

Smart, often used in the sense of considerable, a good deal, as a smart chance.

Span of horses, two horses as nearly as possible alike, harnessed side by side.

Spread-eagle style, a compound of exaggeration, bombast, mixed metaphor, etc.

Spry, active.

Stampede, the sudden flight of a crowd or number.

#### Americus

Store, a shop, as a book store, a grocery store. Strike oil, to; to come upon petroleum; hence to make a lucky hit, especially financially.

Stump speech, a bombastic speech calculated to please the popular ear, such speeches in newly-settled districts being often delivered from stumps of trees.

Tall, great, fine (used by Shakespeare pretty much in the same sense); tall talk is extravagant talk.

*Ticket*: to vote the *straight ticket* is to vote for all the men or measures your party wishes.

Truck, the small produce of gardens; truck patch, a plot in which the smaller fruits and vegetables are raised,

Ugly, ill-tempered, vicious.

1

Vamose, to; to run off (from the Spanish ramos, let us go).

Will, to; to fade, to decay, to droop, to wither.

Americus, Sumter co., Ga.; has a female college, a large carriage factory, etc. Pop. 6,398.

Amerigo Vespucci (à-mer-è go vesput'chē) (1451-1512), a maritime discoverer, after whom America has been named. In 1499 he coasted along the continent of America for several hundred leagues, and the publication of his narrative, while the prior discovery of Columbus was yet comparatively a secret, led to the giving of his name to the new continent.

Amersfoort (ä'merz-fört), a town in Holland, province of Utrecht, manufactures woolen goods, tobacco, glass, and silk yarn. Pop. 14,863.

Ames, FISHER (1758–1808), a distinguished American statesman of the Revolutionary era, an orator of great power, famous for his eulogy on Washington.

Ames, OAKES (1804-1873), born in Easton, Mass. Congressman from 1862-1873 from the second Massachusetts district. He was interested in contracts for building the Union Pacific railroad, and his connection with the Credit Mobilier led to a congressional investigation and Mr. Ames was censured. He withdrew from political life. His son, Oliver, became governor of Massachusetts, 1880.

Amesbury, Essex co., Mass., on Merrimac River, 5 mi. n. of Newburyport. Railroads: Boston & Maine; Haverhill & Amesbury; Newburyport & Amesbury. Industries: woolen company, 45 carriage factories. shoe, hat, and bicycle factories. Surrounding country agricultural. Birthplace of Josiah Bartlett, signer of Declaration of Independence, and burial place of John G. Whittier. First frigate Alliance for Continental Congress built here. The town was first settled in 1630. Pop. est. 1897, 10,000.

Amherst, Hampshire co., Mass., 25 mi. s. of Springfield. Railroads, Boston & Maine, and Central Vermont. Industries, two large straw-hat factories. Surrounding country agricultural. Amherst College is located here, also Massachusetts Agricultural College. Amherst was first settled in 1731 by people from

#### Ammoniaphone

Hadley, and it is still a town Pop. est. 1897, 5,000.

Amherst (am'erst), a seaport of British Burmah, 31 mi. s. of Moulmein, a health resort of Europeans. Pop. 3,000. The district of Amherst has an area of 15,189 sq. mi. Pop. 301,086. It exports rice and teak.

Amherst, JEFFREY, Lord (1717-1796), a British general, who fought at Dettingen and Fontenoy, and commanded in America, where he took Louisburg. Ticonderoga, and Quebec, and restored the British prestige in Canada. He was raised to the peerage, became commander-in-chief, and ultimately field-marshal.

Amiens (à.m.e.an), a town of France, capital of the department of Somme. It has a citadel, wide and regular streets, and several large open areas; a cathedral, one of the largest and finest Gothic buildings in Europe, founded in 1220. It has a large trade and numerous important manufactures, especially cottons and woolens. It was taken by the Germans in 1870. Pop. 80,288. The Peace of Amiens, concluded between Great Britain, France, Spain, and the Batavian Republic, March 27, 1802, put au end for a time to the great war which had lasted since 1793.

Ammana'ti, BARTOLOMEO (1511-1589), an Italian sculptor and architect; executed the Leda at Florence, a gigantic Neptune for St. Mark's Place at Venice, a colossal Hercules at Padua, and built the celebrated Trinity Bridge at Florence.

Am'mon, an ancient Egyptian deity, identlfied by the Greeks with Zeus; represented as a human being with a ram's head, or simply with the horns of a ram. There was a celebrated temple of Ammon in the Oasis of Siwah in the Libyan desert.

Ammo'nia, an alkaline substance, which differs from the other alkalies by being gaseous, and is hence sometimes called the volatile alkali. It is a colorless, pungent gas, composed of nitrogen and hydrogen. It was first procured in that state by Priestley, who termed it alkaline air. He obtained it from sal-ammoniac by the action of lime, by which method it is yet generally prepared. It is used for many purposes, both in medicine and scientific chemistry; not, however, in the gaseous state, but frequently in solution in water, under the names of liquid ammonia, aqueous ammonia, or spirits of hartshorn. It may be procured naturally from putrescent animal substances; artificially it is chiefly got from the distillation of coal and of refuse animal substances, such as bones, clippings and shavings of horn, hoof, etc. It may also be obtained from vegetable matter when nitrogen is one of its elements. Sal-ammoniac is the chloride of ammonium.

Ammo' niaphone, an instrument. consisting of a metallic tube containing some substance saturated with ammonia, peroxide of hydrogen, and a few flavoring compounds. fitted with a mouthpiece to breathe through, which is said to render the voice strong, clear, rich, and ringing by the inhalation of the ammoniacal vapor. It was invented by Dr. Carter Moffat, and was suggested by the presence of

#### Ammonite

ammonia in some quantity in the atmosphere of Italy— the country of fine singers.

Am monite, a fossil Cephalopod, allied to the Nautilus, having a many-chambered shell, in shape like the curved horns on the ancient statues of Jupiter Ammon; characteristic of

Ammonites.

the Trias, Lias, and Oolite formations, and sometimes found in immense numbers and of great size.

Am'monites, a Semitic race frequently mentioned in Scripture, descended from Ben-Ammi, the son of Lot (Gen. 19:38), often spoken of in conjunction with the Moabites. A predatory and Bedouin race, they inhabited the desert country east of Gad, their chief city being Rabbath-Ammon (Philadelphia). Wars between the Israelites and the Ammonites were frequent; they were overcome by Jephthah, Saul, David, Uzziah, Jotham, etc. They appear to have existed as a distinct people in the time of Justin Martyr, but have subsequently become merged in the aggregate of nameless Arab tribes.

Ammo'nium, the name given to the hypothetical base of ammonia, analogous to a metal, as potassium. It has not been isolated, but it is believed to exist in an amalgam with mercury.

Ammuni'tion, military stores generally; in modern usage confined to the articles used in the discharge of firearms and ordnance of all kinds, as powder, balls, shells, various kinds of shot, etc. Which see.

Am' nesty, the releasing of a number of persons who have been guilty of political offenses from the consequence of these offenses.

Amol', a town of northern Persia. 76 mi. n.e. of Teheran. Extensive ruins tell of former greatness, the most prominent being the mausoleum of Seyed Quam-u-deen, who died in 1378. Population in winter estimated at about 40,000.

Amo'mum, a genus of plants of the ginger species, natives of warm climates, and remarkable for the pungency and aromatic properties of their seeds. Some of species yield cardamoms, others grains of paradise.

Amoo-Darlä, a Russian territory of Central Asia, on the east of the Amoo, and southeast of the Sea of Aral. Area 40,000 sq. mi; pop. 220,000.

Amoor' (or Amur'), one of the largest rivers of Eastern Asia, course 1,500 miles. It forms, for a large portion of its course, part of the boundary line between the Russian and the Chinese dominions, and is navigable through-

# Amphibia

out for four months in the year.—AMOOR TER-RITORY. In 1858 Russia acquired from China the territory on the left bank of the Upper and Middle Amoor, together with that on both banks of the Lower Amoor. The western portion of the territory was organized as a sep-

arate province, with the name of Amoor (area 173,559 sq. mi.; pop. 58,000). The eastern portion was joined to the Maritime Province of eastern Siberia.

A'mor, the god of love among the Romans, equivalent to the Greek Eros.

Am'orites, a powerful Canaanitish tribe at the time of the occupation of the country by the Israelites; occupied the whole of Gilead and Bashan, and formed two powerful

kingdoms—a northern, under Og, who is called king of Bashan; and a southern under Sihon, called king of the Amorites; first attacked and overthrown by Joshua; subsequently subdued, and made tributary or driven to mingle with the Philistines and other remnants of the Canaanitish nations.

A'mos, one of the minor prophets; flourished under the kings Uzziah of Judah and Jeroboam II of Israel (B. c. 810 to 784 by the common chronology). His book of prophecies has high literary merits. It contains denunciations of Israel and the surrounding nations, promises of the Messiah.

Amoy', an important Chinese trading port, on a small island off the s.e. coast opposite Formosa; has a safe and commodious harbor, and its merchants are among the wealthiest and most enterprising in China; one of the five ports opened to British commerce in 1843, now open to all countries. Pop. 95,600.

Ampère (an-par). ANDRE-MARIE (1775-1836), a celebrated French mathematician and philosopher, founder of the science of electrodynamics, professor of mathematical analysis at the Polytechnic School, Paris, and of physics at the College of France. What is known as *Ampere's Theory* is that magnetism consists in the existence of electric currents circulating round the particles of magnetic bodies, being in different directions round different particles when the bodies are unmagnetized, but all in the same direction when they are magnetized.

Amphib'ia, a class of vertebrate animals, which in their early life breathe by gills or branchiæ, and afterward partly or entirely by lungs. The Frog, breathing in its tadpole state by gills and afterward throwing off these organs and breathing entirely by lungs in its adult state, is an example of the latter phase of amphibian existence. The Proteus of the underground caves of Central Europe exemplifies forms in which the gills of early life are retained throughout life, and in which lungs are developed in addition to the gills. A second character of this group consists in the presence of two occipital "condyles," or processes by means of which the skull articulates with the spine or vertebral column, reptiles possessing one condyle only. The class is divided into four orders: the Ophiomorpha (or serpentiform), represented by the Blindworms, in which limbs are wanting and the body is snake-like; the Urodela or "Tailed" Amphibians, including the Newts, Proteus, Siren, etc.; the Anoura, or tailless Amphibia, represented by the Frogs and Toads; and the Labyrinthodontia, which includes the extinct forms known as Labyrinthodons.

Amphic'tyonic League (or council), in ancient Greece, a confederation of tribes for the protection of religious worship, but which also discussed questions of international law, and matters affecting their political union. The most important was that of the twelve northern tribes which met alternately at Delphi and Thermopylæ. The tribes sent two deputies each, who assembled with great solemnity; composed the public dissensions, and the quarrels of individual cities, by force or persuasion; punished civil and criminal offenses, and particularly transgressions of the law of nations, and violations of the temple of Delphi. Its calling on the states to punish the Phocians for plundering Delphi caused the Sacred Wars, 595-586, 448-447, 357-346 B. C.

Amphi'on, in Greek mythology, son of Zeus and Antiöpë, and husband of Niöbë; had miraculous skill in music, being taught by Mercury, or, according to others, by Apollo. In poetic legend he is said to have availed himself of his skill when building the walls of Thebes—the stones moving and arranging themselves in proper position at the sound of his lyre.

Amphithe'ater, an ancient Roman edifice of an oval form without a roof, having a central area (the *arena*) encompassed with rows of seats, rising higher as they receded

Amphitheater.

from the center, on which people used to sit to view the combats of gladiators and of wild beasts, and other sports. The Colosseum at Rome is the largest of all the ancient amphitheaters, being capable of containing from 50,000 to 80,000 persons. That at Verona is one of the best examples remaining. Its dimensions are 502 feet by 401, and 98 feet high. The name means "both-ways theater," or "theater all round," the theater forming only a semicircular edifice.

#### Amsterdam

Amphitri'te, in Greek mythology, daughter of Oceanus and Tethys, or of Nereus and Doris, and wife of Poseidon (or Neptune), represented as drawn in a chariot of shells by Tritons, with a trident in her hand.

Amphit'ryon, in Greek legend, king of Thebes, son of Alcæus, and husband of Alcmena. Plautus, and after him Molière, have made an amour of Zeus with Alcmena the subject of amusing comedies.

Ampudia, PEDRO DE, Mexican, was appointed general by Santa Anna in 1840; in 1842, he commanded the land forces in the siege of Campeachy, Yucatan. Later he was in command of Monterey, where, in 1846, he surrendered to General Taylor of the U. S.

Amputa'tion, in surgery, that operation by which a member is separated from the body according to the rules of the science. See Surgery.

Amra'oti, a town of British India in Berár; it is celebrated for its cotton, and is a place of good trade. Pop. 23,550. The district has an area of 2,767 sq. mi.; pop. 546,448.

Am'ritsir (or Amritsar) ("the pool of immortality"), a flourishing commercial town of Hindustan, capital of a district of the same name, in the Punjab, the principal place of the religious worship of the Sikhs. It has considerable manufactures of shawls and silks; and receives its name from the sacred pond constructed by Ram Das, the apostle of the Sikhs, in which the Sikhs and other Hindus immerse themselves that they may be purified from all sin. Pop. 151,896. The district of Amritsir has an area of 1,574 sq. mi. Pop. 893,266.

Am'ru, originally an opponent, and subsequently a zealous supporter of Mohammed, and one of the ablest of the Mohammedan warriors. He brought Egypt under the power of the Caliph Omar in 638, and governed it wisely till his death in 636. The burning of the famous Alexandrian Library has been generally attributed to him, though only on the authority of a writer who lived six centuries later.

Am'sterdam (that is, "the dam of the Amstel"), one of the chief commercial cities of Europe, capital of Holland. On account of the lowness of the site of the city the greater part of it is built on piles. It is divided by numerous canals into about 90 islands, which are connected by nearly 300 bridges. Among its numerous industries may be mentioned as a speciality the cutting and polishing of dia-monds. The harbor, formed by the Y river, lies along the whole of the north side of the city, and is surrounded by various docks and basins. The trade is very great, being much facilitated by the great ship-canal (15 mi. long, 22-26 feet deep, constructed 1865-76), which connects the Y directly with the North Sea. Another canal, the North Holland Canal (46 mi. long, 20 feet deep), connects Amsterdam with the Helder. During the seventeenth and eighteenth centuries Amsterdam was one of the wealthiest and most flourishing cities in the world. Its forced alliance with France

#### Amsterdam

ruined its trade, but since 1813 its commerce has revived. Pop. 417,539.

Amsterdam, Montgomery co., N. Y., on Mohawk River, 33 mi. w. of Albany. Railroads: N. Y. C. & H. R., and West Shore. Industries: carpet mills, linseed oil, broom, carriage springs, and knitted goods factories. Surrounding country agricultural. The town was first settled about 1776 and became a city in 1885. Pop. est. 1897, 20,000.

**Amuck** (Amuk), to run, a phrase applied to natives of the eastern Archipelago who are occasionally seen to rush out in a frantic state, making indiscriminate and murderous assaults on all that come in their way. The cause of such outbursts is not well known.

Amyl' ic Alcohol, another name for fusel oil.

Amyrida cese, a natural order of plants consisting of tropical trees or shrubs, the leaves, bark, and fruit of which abound in fragrant, resinous, and balsamic juices. Myrrh, frankincense, and the gum-elemi of commerce are among their products.

Anabap' tists, a name given to a Christian sect by their adversaries, because, as they objected to infant baptism, they rebaptized those who joined their body. The founder of the sect appears to have been Nicolas Storch, a disciple of Luther. He incited the peasantry of Suabia and Franconia to insurrection. This insurrection was quelled in 1525. In 1534 the town of Münster in Westphalia became their center of action. Bockhold became leader. assuming the name of John of Leyden, king of the New Jerusalem, and Münster became a theater of all the excesses of fanati-cism, lust, and cruelty. They rejected the practise of polygamy, community of goods, and intolerance toward those of different opinions which had prevailed in Münster. The application of the term Anabaptist to the general body of Baptists throughout the world is unwarranted. The Baptists repudiate the name Anabaptist.

Anab'asis ("a going up"), the Greek title of Xenophon's celebrated account of the expedition of Cyrus the Younger against his brother Artaxerxes, king of Persia. The title is also given to Arrian's work which records the campaigns of Alexander the Great.

Anach' ronism, an error of chronology by which things are represented as co-existing which did not co-exist; applied also to anything foreign to, or out of keeping with, a specified time. The anachronisms of authors and painters have furnished materials for many amusing magazine articles. In art, some of the most glaring instances have occurred in the works of the Dutch school, as for instance arming scriptural characters with guns or attiring them in the costume of the seventeenth century.

Anacon'da, the popular name of two of the largest species of the serpent tribe; viz., a Ceylonese species of the genus Python, said to have been met with, 33 feet long; and a native of tropical America, allied to the boa-constrictor, and the largest of the serpent tribe,

#### Anakim

attaining the length of 40 feet. See Boa-constrictor.

Anaconda, Deer Lodge co., Mon., the center of an active mining district. Population about 5,000.

Anac'reon, an amatory lyric Greek poet of the sixth century B. C., native of Teos, in Ionia. Only a few fragments of his works have come down to us; the collection of odes that usually passes under the name of Anacreon is mostly the production of a later time.

Anæsthet'ics, medical agents employed for the removal of pain, especially in surgical operations, by suspending sensibility either locally or generally. Various agents have been employed for both of these purposes, from the earliest times, but the scientific use of anæsthetics may be said to date from 1800, when Sir Humphrey Davy made experiments on the anæsthetic properties of nitrous oxide, and recommended its use in surgery. In 1818 Faraday established the anæsthetic properties of sulphuric ether, but this agent made no advance beyond the region of experiment, till 1844, when Dr. Wells, a dentist of Hartford, Conn., applied the inhalation of sulphuric ether in the extraction of teeth, but owing to some misadventure did not persevere with it. The example was followed in 1846 by Dr. Morton, a Boston dentist, who also extended the use of ether to other surgical operations. The practise was soon after introduced into England by Mr. Liston, and a London dentist, Mr. Robinson. A few weeks later Sir James Simpson made the first application of ether in a case of midwifery. This was early in 1847. Toward the end of the same year Simpson had his attention called to the anæsthetic efficacy of chloroform, and announced it as a superior agent to ether. This agent has since been the most extensively used anæsthetic, though the use of ether still largely prevails in the U.S. In their general effects ether and chloroform are very similar: but the latter tends to enfeeble the action of the heart more readily than the former. For this reason great caution has to be used in administering chloroform where there is weak heart action from disease. Local anæsthesia is produced by isolating the part of the body to be operated upon, and producing insensibility of the nerves in that locality. Dr. Richardson's method is to apply the spray of ether, which, by its rapid evaporation, chills and freezes the tissues and produces complete anæsthesia. This mode of treatment, besides its use in minor surgical operations, has recently begun to have important remedial applications. A valuable local anæsthetic now employed is cocaine. See Coca.

Anahuac (à-nà-wàk') ("near the water"), an old Mexican name applied to the plateau of the city of Mexico, from the lakes situated there, generally elevated from 6,000 to 9,000 feet above the sea.

An'akim, the posterity of Anak, the son of Arba, noted in sacred history for their flerceness and loftiness of stature. Their stronghold was Kirjath-arba, or Hebron, which was taken and destroyed by Caleb and the tribe of Judah.

Anal'ysis, the resolution of an object, whether of the senses or the intellect, into its component elements. In philosophy it is the mode of resolving a compound idea into its simple parts, in order to consider them more distinctly, and arrive at a more precise knowledge of the whole. It is opposed to synthesis, by which we combine and class our perceptions, and contrive expressions for our thoughts, so as to represent their several divisions, classes, and relations.

Analysis, in mathematics, is, in the widest sense, the expression and development of the functions of quantities by calculation; in a narrower sense the resolving of problems by algebraic equations. The analysis of the ancients was exhibited only in geometry, and made use only of geometrical assistance, whereby it is distinguished from the analysis of the moderns, which extends to all measurable objects, and expresses in equations the mutual dependence of magnitudes. Analysis is divided into lower and higher; the lower comprising, besides arithmetic and algebra, the doctrines of functions, of series, combinations, logarithms, and curves: the higher comprising the differential and integral calculus, and the calculus of variations.

In chemistry, analysis is the process of decomposing a compound substance with a view to determine either (a) what elements it contains (qualitative analysis), or (b) how much of each element is present (quantitative analysis). Thus by the first process we learn that water is a compound of hydrogen and oxygen, and by the second that it consists of one part of hydrogen by weight to eight parts of oxygen.

Anam', a country of Asia occupying the e. side of the Indo-Chinese Peninsula. It is composed of three parts: Tonquin in the n.; Co-chin-China in the s.; and the territory of the Lass tribes, s.w. of Tonquin. Area together, 170,000 sq. mi.; pop. 15,000,000 -9,000,000 in Tonquin. Tonquin is mountainous on the north, but in the east is nearly level, terminating toward the sea in an alluvial plain yielding good crops of rice, cotton, fruits, ginger, and spices, and a great variety of varnish-trees, palms, etc. The principal river is the Song-ka, which has numerous tributaries, many of them being joined together by canals, both for irrigation and commerce. Tonquin is rich in gold, silver, copper, and iron. Cochin-China is, generally speaking, unproduc-tive, but contains many fertile spots, in which grain, leguminous plants, sugar-cane, cinnamon, etc., are produced in great abundance. Agriculture is the chief occupation, but many of the inhabitants are engaged in the spinning and weaving of cotton and silk into coarse fabrics, the preparation of varnish, iron-smelting, and the construction of ships or junks. The inhabitants are said to be the ugliest of the Mongoloid races of the peninsula, being under the middle size and less robust than the surrounding peoples. Their language is monosyl-

#### **Anastatic Printing**

labic, and is connected with the Chinese. The religion of the majority is Buddhism, but the educated classes hold the doctrines of Con-The principal towns are Hanoi, the fucius. capital of Tonquin, and Huë, the capital of Cochin-China, and formerly of the whole empire. Anam was conquered by the Chinese in 214 B. C., but in 1428 A. D. it completely won its independence. The French began to interfere actively in its affairs in 1847 on the plea of protecting the native Christians. By the treaties of 1862 and 1867 they obtained the southern and most productive part of Cochin-China, subsequently known as French Cochin-China and in 1874 they obtained large powers over Tonquin, notwithstanding the protests of the Chi-nese. Finally in 1883 Tonquin was ceded to France, and next year Anam was declared a French protectorate. After a short period of hostilities with China the latter recognized the French claims, and Tonquin is now directly administered by France, while Anam is entirely under French direction.

Anani'as, a disciple at Jerusalem, who, having with his wife Sapphira, committed a fraud, was with her struck dead.

Anarajapoo'ra (or Anuradhapura), a ruined city, the ancient capital of Ceylon, built about 540 B. C., and said to have covered an area of 300 sq. mi., doubtless a great exaggeration. The great object of interest is the sacred Bo-tree planted over 2,000 years, and probably the oldest historical tree in the world, but shattered by a storm in 1887.

An'archists, a revolutionary sect or body setting forth as the social ideal the extreme form of individual freedom, and holding that all government is injurious and immoral, that the destruction of every social form now existing must be the first step to the creation of a new world. Their recognition as an independent sect may be dated from the secession of Bakunin and his followers from the Social Democrats at the congress of The Hague in 1872, since which they have maintained an active propaganda. Their principal journals have been La Révolle (Paris), the Freiheit (New York), Liberty (Boston), and the Anarchist (London). Akin to the Nihilists, of alien birth, the Anarchists in America, with the exception of a bomb outrage in Chicago, have accomplished little.

Anasta'slus I (491-518 A. D.), Emperor of the East, succeeded Zeno, at the age of sixty. He was a member of the imperial lifeguard, and owed his elevation to Ariadne, widow of Zeno, whom he married. He distinguished himself by suppressing the combats between men and wild beasts in the arena, abolishing the sale of offices, building the fortifications of Constantinople, etc.

Anastat'ic Printing, a mode of obtaining fac-simile impressions of any printed page or engraving by transferring it to a plate of zinc, which, on being subjected to the action of an acid, is etched or eaten away with the exception of the parts covered with the ink, which parts, being thus protected from the action of

the acid, are left in relief so that they can readily be printed from.

Anatomy is that branch of biological science, which treats of the structure of organized The words anatomy and dissection bodies. are synonymous etymologically; but custom, while retaining the original meaning of the latter word (literally, to cut apart) has broadened that of the former until it has come to include all the many sciences embraced within the one great science of organic form. Thus we speak of Human, Animal, and Vegetable Anatomy; of Embryology, or develop-mental anatomy; of Comparative Anatomy, which teaches the variations of corresponding structures in different animals; of Philosoph-ical Anatomy, which teaches Homology, or the fundamental identity of organs arising from the same parts of the embryos of different species; of Histology, or the study of the minute anatomy of the tissues; of Descriptive Anatomy, treating of the gross form and rela-tions of organs and structure; and finally of Systematic and Topographical (regional or surgical) Anatomy; the former treating of systems; e. g., digestive, genito-urinary, nervous, vascular, muscular systems; the latter treat-ing of regions made up of parts of several systems; e. g., neck, abdomen, arm, leg. We will consider here only Human Anatomy, and under this head only Systematic Anatomy. For other branches of the subject, see Histology and Embryology.

SYSTEMATIC ANATOMY.- In response to the tendency to specialization observed in many celled organisms, the cells of the human body group themselves into systems, each performing certain functions, although the law of the physiological division of labor imposes the closest interdependence between each system and its yoke-fellows. In every system we find one or more most highly specialized cell-groups to which we give the name of organs. Entering intimately into the composition of organs, as well as binding them together and keeping them in proper correlation with other organs, we find tissues. These latter are the ultimate results of cell-differentiation, and are considered under Histology. We recognize the following principal systems sufficiently isolated by function to require separate consideration: 1, Skeleton, Osseous System, the supporting framework of the body: 2, Articular System the system of joints: 3, Muscular System, a series of elastic and voluntarily contractile fibers, the ends of which are inserted into the extremities of the bones: 4, Vascular System, a series of tubes which supply the tissues with nourishment and carry away the effete pro-ducts of the body; 5, Respiratory System, through which oxygen enters the blood, and carbon-dioxide is thrown off; 6, Digestive System, through which soluble food is elaborated from insoluble diet; 7, Urinary System, effete products taken up by the blood are eliminated in part through this system; 8, Reproductive Organs; 9, Nervous System. All of these various systems are united anatomically by masses of connective tissue.

Osseous System, or Skeleton. Articular System, or Joints.— The skeleton is composed of 200 bones, of which 74 belong to the Azial skeleton (head, neck, and trunk), and 126 to the extremities, or Appendicular skeleton. This number does not include certain small bones developed in tendons as they pass across bony angles.

Axial Skeleton.-The vertebral column, or spine, is made up of 26 bones, of which 7, called cervical vertebræ, are located in the neck; 12, called dorsal or thoracic vertebræ, lie in the thoracic region, or chest, and sup-port 24 ribs and the sternum; 5 lie in the foin or lumbar region and are called lumbar vertebræ; the sacrum (made up during early life of five sacral vertebræ which fuse into one solid mass in the adult), in the sacral or pelvic region, forming a kind of keystone, by which the weight of the body is transmitted to the pelvic girdle and the lower extremities; and the coccyx (made up dur-ing early life of 4 rudimentary vertebræ), in the coccygeal region. Each vertebræ is composed of a body, or centrum, from which arise two arches, a neural arch, enclosing a segment of the spinal cord or marrow, lying in the neural or spinal canal, and a hæmal, or visceral arch enclosing more or less completely a segment of the great visceral cavity found in the neck, chest, and abdomen. The neural canal is complete except in the lower sacral and coccygeal regions. The visceral arches, however, are subject to many vicissitudes, and it is only in the upper thoracic region that we find them completely encircling the visceral cavity, each arch being completed by two ribs and a segment of the sternum or breast-bone. In the lower thoracic region the ribs do not completely encircle the cavity. Strength, combined with great elasticity and flexibility, is provided for the spinal column by anterior, posterior, and lateral ligaments, by pads of cartilage placed between the vertabræ, and by an alternation of anterior and posterior curves in the four principal regions. The ribs are tipped anteriorly with costal cartilages and the seven upper (true) ribs are joined to the sternum by their cartilages. Of the remaining five ribs (false), the upper three are fixed to the cartilages above, but not to the sternum, and the lower two are free or floating. In the sternum we recognize three pieces, united in the adult - manubrium or handle, gladiolus or body, and xiphoid or ensiform appendix.

The axial skeleton is completed by the skull and hyoid bone—23 bones, of which 8 (occipital, sphenoid, ethmoid, frontal, 2 parietals, 2 temporals) enter into the cranium or brain case, and 15 (vomer, 2 nasals, 2 lachrymals, 2 palates, 2 malar, 2 superior maxillaries, 2 maxillo or inferior turbineals, inferior maxillary, hyoid) form the bony framework of a series of arches (face and neck) surrounding the organs of special sense and the upper orifices of the respiratory and digestive organs. See *Embryology*. Springing upward from the axis is a series of arches composed of thin, flat bones enveloping the brain, and either

paired, or developed from paired ossific de-These arches bear a close resemblance posits. to the neural arches of the vertebrae, especially when we consider that the brain is merely the expanded end of the spinal cord. Thrown downward from the cranio-facial axis are other arches: (a) enclosing the nose and forming the roof of the mouth; (b) the lower jaw and the floor of the mouth. Certain bones are also formed in connection with the organs of special sense, these organs being pushed in above or between the arches: (a) malar and lachrymal bones in relation to the organ of vision, and above the palato-maxillary arch; (b) turbinal bones for the reception of the organ of smell, between the two maxillaries; (c) petrous and mastoid parts of the temporal bones, containing the organ of hearing, and lying between the occipital and sphenoid bones; (d) the organ of taste, supported below and behind by the hyoid bone, and pushed in between the maxillary and mandibular arches; (e) the organ of voice (larynx) suspended from the hyoid bone and surmounted by one or more very rudimentary cartilaginous arches. The cavity containing the eye-ball and its machinery is called the orbit; the passage leading from without into the petrous and mastoid part of the temporal bone is called the external auditory meatus; the parallel nasal passages leading from the nostrils to the throat are called *nares.* Opening into the nares are chambers or sinuses in the frontal, ethmoid, sphenoid, and maxillary bones, containing air and modifying the voice as by a sounding-A bony bar running from the outer board. margin of the orbit to just above the external auditory meatus is called the Zygoma. and partly encloses the great temporal and Zygomatic fossæ for the reception of the muscles of mastication. The upper and lower jaw are provided with alveolar processes containing sockets for the reception of teeth, of which there are 32 in the adult jaws (8 incisors, 4 canines, 8 biscuspids, 12 molars), and 20 (milk or temporary) teeth in the jaws of the infant. The mandible, or inferior maxillary, joins the skull by means of an articular condyle, fitting into the glenoid fossa of the temporal bone, and is the only movable bone of the skull, the others being immovably united by sutures. Separating the mouth from the nose is the hard palate, made up of horizontal plates from the maxillary and palate bones. The cranial cavity is smooth and unbroken above, but broken into fossæ below for the reception of the cerebrum and cerebellum. The spinal cord leaves the cranial cavity through the foramen magnum (foramen: a hole or opening) in the occiptal bone, on either side of which can be seen the occipital condyles for articulation with the atlas. Other openings give passage to nerves and vessels to and from the brain: through the optic foramen pass the optic nerve and ophthalmic artery; through the sphenoidal fissure between the wings of the sphenoid pass the nerves to the orbit; through the carotid foramen passes the artery of that name; through the jugular forumen pass the jugular vein and the ninth, tenth, and eleventh nerves; through the round and oval openings pass branches of the fifth nerve; through the internal auditory meatus pass the facial and auditory nerves; through the *anterior condylar foramen* passes the twelfth nerve. The hyoid bone lies between the tongue and the larynx and is joined to the skull (styloid process of temporal bone) by a stylo-hyoid ligament. The hyoidean arch is the last of the visceral arches of the human skull.

Appendicular Skeleton.—This skeleton com-prises the shoulder girdle with the upper extremities (64 bones), and the pelvic girdle with the lower extremities (62 bones). The shoulder girdle is made up of clavicle or collar-bone, and scapula or shoulder-blade, bound together at the outer extremities by ligaments, and joined to the trunk at one point only by a small gliding joint between the inner extremity of the clavicle and the upper piece of the sternum. By thus pivoting the upper ex-tremity on the trunk, there is secured great freedom of motion with little loss of power by joint friction. The clavicle is a slender bone shaped like the Roman S, lying between sternum and scapula. The scapula is a flat, irregularly triangular bone lying close to the side of the thorax, but separated and sus-The part applied pended from it by muscles. to the thorax is the sub-scapular fossa; the part looking backward and outward is divided into supra-and infra-spinous fossæ by a prominent spine, which projects upward and outward. At the outer angle of the scapula, between coracoid, clavicle, and acromion, is the glenoid fossa for the reception of the humeral head (ball and socket joint). The glenoid and humerus are held together in the shoulder joint by the action of the shoulder muscles, and by a loose sac called the capsular ligament, permitting a wide range of motion in almost every direction. The humerus, or arm bone, is a long bone, at the upper extremity of which are found a head, neck, and two tuberosities; below these is a long, rounded shaft, grooved behind by the musculo-spiral nerve, and supporting an irregularly flattened inferior extremity, presenting a trochlea (pulley surface) and capitellum (head) for articulation with the ulna and radius respectively. In the forearm (or antibrachium) are found the radius externally and the ulna internally. These bones are united to the humerus by a hinge-joint, permitting only antero-posterior motion, the head of the radius playing on the capitellum, and the ulna presenting a great sigmoid notch for the reception of the trochiea (or pulley) of the humerus. At their inferior extremities the forearm bones join the carpus, the radius directly, the ulna indirectly through the inter-vention of a small fibro-cartilage. The ulna is heaviest at the humeral end, the radius at the carpal end. The carpus or wrist (8 bones) is irregularly biconvex and made up of two rows of small bones united by ligaments and lying between forearm and palm. The metacarpus (paim) is made up of five metacarpal bones numbered from thumb to little

finger. The digits are provided with three phalanges each, except the thumb, which has only two. The thumb, however, has the advantage of moving freely on the carpus by means of a saddle-joint. The other carpal and metacarpal bones play slightly upon their fellows by means of gliding joints.

The pelvic girdle comprises the innominate bones, immovably united to the sacrum, posteriorly, by strong ligaments, and joined anteriorly in the median line. The innominate bone is composed of three bones (ilium, ischium, os pubis) which unite in adult life along a Y shaped line located in the cup of the hip-joint. Superiorly the *ilium* spreads out a broad concave surface, in which the intestines are supported; anteriorly the pubic bones reach the median line, beneath which are suspended the external genito-urinary organs; inferiorly the ischium, or haunch bone, forms the projection of the buttock and supports the body while sitting. Between the pubis and ischium is found the obturator foramen. This foramen is closed by the obturator membrane. The pelvis (or basin) furnishes the bony support upon which rest the contents of the abdomen, and is traversed by the outlets of the intestinal, genital, and urinary passages. The broad, expanded portion above is called the false pel-vis, and is part of the abdomen; the narrow, funnel-like portion below is the true pelvis, and contains the rectum, uterus, and blad-The pelvis of the woman is broader der. and much more roomy than that of the man. The lower extremities (the bones of which are thirty in number) join the innominate bones in the hip-joints. This articulation is bones in the hip-joints. This articulation is a perfect example of the ball and socket joint, the globular head of the femur fitting into the cup above mentioned. In addition to the supports afforded by a strong capsular ligament, by an additional rim of fibro-cartilage deepening the bony cup, by great muscles constantly drawing the cup and head together, and by atmospheric pressure resisting the separation of the two joint elements, there is also a round ligament found within the joint, uniting the femoral head to a depression in the bottom of the cup. The femur is the bone of the thigh, and is the longest bone in the human body. Unlike even most of the higher primates, the femur of man is longer than the tibia. We recognize a head, neck, angle, and trochanters (great and small) at the upper end of the shaft. At the lower end are two condyles (external and internal) articulating with the tibia and patella in the knee joint. The patella or kneepan is a sesamoid bone, placed in the tendon of the great quadriceps extensor muscle, at the point where the tendon glides over the external surface of the femur. The knee-joint is a compound articulation formed by a fusion of the femoro-patellar joint, with the two joints lying between the outer and inner condyles of the femur and the corresponding tuberosities of the tibis. Between the surfaces of the two latter joints are interposed two semilunar fibro-cartilages, and partly separating the mesial from the lateral joint are two crucial ligaments. A single synovial membrane is com-mon to all three joints. The femoro-patellar is a gliding joint; the femoro-tibial is a hingejoint, although the surfaces also glide and rotate. The leg contains two bones, tibia and The tibia or shin-bone is the heaviest fibula. bone of the leg, is internal and anterior to the fibula, is the only leg bone to articulate with the femur, and transmits the weight of the body to the tarsus. On the upper extremity are two tuberosities with concave surfaces for articulation with the femoral condyles, and between them a spine to which attach the crucial ligaments and the semilunar fibro-cartilages. In front is a tubercle for the tibial attachment of the patellor tendon. At the lower extremity is a horizontal, smooth surface for the astragalus, and projecting still lower on the inner side is the inner malleolus, The upper part of the astragalus is mortised into a three-sided space, open in front and behind, bounded above by the smooth surface just mentioned, internally by the inner malleolus, and externally by the outer malleolus or lower extremity of the fibula. The ankle is, therefore, a true ginglymus or hinge-joint allowing motion only in an antero-posterior direction. The fibula is a slender bone located on the outside of the leg, covered entirely by muscles except at its upper and lower extremities, articulating above and below with the tibia, and articulating with the astragalus as the outer malleolus.

The foot is made up of a series of bones ar-ranged in three groups: tarsus, comprising astragalus, os calcis, scaphoid, three cuneiform bones, cuboid; metatarsus, made up of five metatarsal bones; and five digits, in each of which are found three phalangeal bones except in the series attached to the great toe, which contains only two. The foot bones are grouped into arches supporting the weight of the body at the ankle joint through the me-dium of the astragalus. On the outside of the foot is an arch reaching from the os calcis to the fifth metatarsal bone and including the cuboid. On the inside of the foot is another arch comprising the os calcis, astragalus, scaphoid, internal cuneiform, and first metatarsal bones. In the crown of these two arches, fitting in like a keystone, is found the larger part of the astragalus, transmitting the weight of the body to the underlying foot. A third arch or dome is formed from side to side in the region of the ball of the foot by the five metatarsal bones, while the foot and leg are bound together by a series of ligaments admitting of motion only in an antero-posterior direction, the more complicated motions observed in the foot take place by gliding joints located between the tarsal bones.

The Muscular System.— The motive power by which the organism effects changes of position is furnished through the muscular system. Muscles are of two kinds: striped or voluntary, and unstriped or involuntary. For the anatomy of each, see *Histology*. Involuntary muscle occurs in the digestive tube, bladder, uterus, and is considered under those organs. We shall consider here those groups of striped

#### Anatomy

muscle by which voluntary motion is effected. Contractility is the essential property of muscle fiber. It is further essential to muscular action that the muscle acting shall be attached with reasonable firmness to the two or more points acted upon. These two points are called Origin and Insertion, the former term denoting the point which, for the time, remains stationary, the latter designating the point yielding to the pull. It should be noted, however, that all muscles attached at both ends to bone may take their base or origin from either extremity and pull toward the other end. Other muscles are attached at one end only to bone, the other end being attached to soft parts and invariably draw those parts toward the bone. Thus, the facial muscles draw the skin in various directions toward the skull. Muscles attached at both ends to bone furnish in almost all cases the power operating levers of any of the three classes. It is therefore a requisite that there shall intervene between the origin and insertion of these muscles, a joint, which shall be the balance upon which the fulcrum and the moving bone or lever are enabled to adjust the difference between power and load. In many cases, muscles skip one bone and two joints on their way from origin to inser-tion, and their action becomes thus compounded with the action of other muscles, which serve to steady the intervening bone, and enable the muscle to subserve two entirely different groups of motions. As muscles approach their terminal points, they become fibrous, the fibers grouping themselves into round cords or tendons, or flattening out into thin glistening sheets. We classify the muscles of the body broadly into a Dorsal and Ventral group, the former acting usually as ex-tensors, the latter as flexors, but the body has experienced so many changes in process of development, that this classification will hardly hold. Nor can we adopt any very lucid system of classification at present for the trunk and head muscles, so varied is their function. We therefore group and name these latter according to anatomical position as much as possible. In the extremities we distinguish the following groups of muscles: flexors, extensors, pronators (action illustrated by laying hand on table with palm down), supinators (palm up), adductors and abductors (drawing to or from the median line of the body), external and internal rotators (of arm and thigh).

Following are the principal divisions of the muscular system of the human body: between spine and upper limb, posteriorly; between ribs and upper limb, anteriorly; between shoulder girdle and humerus: between shoulder, arm, and forearm (flexors and extensors); pronators and flexors of forearm, hand, and fingers (ulnar side); supinators and extensors of forearm, hand, and fingers (radial side); muscles of the palm of the hand; muscles of the thumb; muscles of the little finger; between spine or pelvis, and femur; thigh to leg; thigh to leg or heel (flexors); leg to foot (flexor); leg to foot (abductors and extensors);

#### Anatomy

dorsum of foot; plantar surface of foot; great and little toe muscles; muscles of scalp; muscles of orbit and eye; muscles of expression, in addition to the muscles of mastication; muscles of the plate; muscles of the tongue; muscles of the pharynx and larynx; muscles of head, neck, and trunk (lateral to spine, posterior to spine); muscles of thorax (respiratory); muscles of the abdomen (support, respiration, draw thorax to either side or forward); and muscles of pelvic outlets.

In connection with the muscular system we note a series of broad sheets of fibrous and connective tissue surrounding and separating the layers of muscles from one another, and defining the various regions of the body. These sheets of membrane become in many cases of vast importance to the surgeon, since within their meshes are contained usually the great nerves or blood-vessels of the body on the way from region to region; thus, the deep cervical fascia not only binds the muscles and other organs together, but passes with the trachea and œsophagus as well as the large vessels and nerves downward into the thorax and continues there to bind these structures to the heart, lungs, and pericardium. In many cases also the fascias, by virtue of their excessive thickness and firmness serve to support the contour of the limbs. Again, we find the more superficial fascias giving off thick, fibrous sheets, which pass to the bone between the anterior and posterior muscles of the limb. Other fascias occur as membranes lying between the parallel bones of arm and leg, and are there designated as interosseus membranes.

Circulatory System.—The circulatory system consists of a double pump connected with a series of tubes, propelling and conveying blood (see Histology), through the medium of which the tissues are nourished and oxygenated, and by which waste products are carried from the tissues to the excretory organs. Under Circulatory System we consider Heart, Arteries. Veins, and Lymphatics.

The Heart is a conical organ, located centrally in the thoracic cavity with the base directed upward and backward, the apex directed forward and to the left, and is surrounded by a serous sac called the *pericardium* within which it moves freely, except at the base where the sac is pierced by the aorta, venæ cavæ, and pulmonary vessels. Each half of the pump comprises a receiving chamber or auricle, and a propelling chamber or ventricle. These two pumps, pulmonary and systemic, are situated, the one on the right and the other on the left side of the heart; although in the development of the body the right side has come to lie more anteriorly. The right side of the heart receives venous or impure blood. This blood, received first into the auricle, is propelled through the tricuspid valves into the ventricle and passes thence through three pulmonary semilunar valves into the pulmonary artery and the lungs. Having become oxygenated in the lung, the pure blood is returned to the left auricle by pulmonary veins. A pair of mitral valves

#### Anatomy

directs the blood current into the left ventricle and prevents its return to the auricle. The thick, muscular walls of the left ventricle propel the blood still farther through three semilunar or aortic valves into the aorta. The muscle of which the heart is composed, while involuntary in its action, possesses many of the histological properties of striped muscle fiber, disclosing the striated appearance of the latter, but also showing an intricate system of communication between fiber and fiber never found in voluntary muscles.

Arteries.-In the middle coat of the arteries into which the blood is propelled by the heart, is found the homologue of the heart muscle existing as a series of circular unstriped muscle fibers. These fibers in all probability furnish the basis from which the heart muscle was developed, for while the fibers lack the stripes of voluntary muscles, they possess the intricate interlacing arrangement, and the elongated nuclei, of the heart muscle. We distinguish in the artery three coats or tunics; the internal coat, made up of a basement membrane supporting a layer of shining, flat, epithelial cells along which the blood current can glide smoothly; the middle coat, containing the circular muscle above mentioned; and the external coat, made up of interlacing fibers and connective tissue, passing gradually into the fascia usually found surrounding a blood-vessel. In the sorta are found very few of the muscle cells, but these are replaced by numerous fibers of yellow elastic tissue.

Branching of Arteries. - The arterial blood, propelled through the ascending aorta, is carried to the aortic arch, situated at the root of the neck in front of the trachea and œsophagus. From the arch of the aorta are given off in order the innominate artery, dividing into right carotid and subclavian, and left carotid and subclavian vessels. The common carotid arteries take an upward course from the neck to the head, giving off no branches until they divide into external and internal carotids. The external carotid gives off many branches sup-plying the upper part of the neck and super-ficial portions of the head (superior thyroid, lingual, facial, occipital, temporal, and internal maxillary); the internal carotid artery supplies the brain and orbit, giving off cerebral and ophthalmic branches. The subclavian artery ascends for a short distance into the neck behind the clavicle, arching over the first rib, and giving off a vertebral artery ascending into the skull to join the posterior branches of the internal carotid. Other branches of the subclavian pass to the neck and inner wall of the chest. The subclavian artery, passing into the region of the shoulder behind the clavicle, becomes the axillary space, or armpit, and the inner aspect of the arm. At the front of the elbow, the brachial artery divides into radial and ulnar, which pass down the outer and inner side of the front of the forearm. These two ar eries in the palm of the hand unite as superficial and deep palmar arches. The palmar arches furnish the most perfect examples of the interlacing and union of arte-

### Anatomy

rial branches to be found in the body. By means of interlacing, the system is enabled to correct temporary inequalities in the circulation of any given part; for when through any cause, let us say, the radial artery is obstructed, the blood is enabled to reach the palmar arches by way of the ulnar channel. The arch of the aorta is continued downward along the front of the thoracic spine as the descending tho-racic aorta, giving off in this region the inter-costal arteries. Perforating the diaphragm, the thoracic becomes the abdominal aorta, and gives off the cœliac axis supplying the liver, stomach, spleen, and upper bowels; the inferior-mesenteric supplying the lower bowels; renal arteries supplying the kidneys; spermatic arteries supplying the ovaries or testicles, and certain small arteries supplying the muscles of the loin. Over the fourth lumbar vertebra the aorta divides into right and left common iliac arteries, supplying the lower extremities and the pelvic organs. Each common iliac divides presently into external and internal iliac branches; the latter passing deeply into the pelvis to supply the bladder, rectum, and structures of the pelvic outlet, including the gluteal region, or buttock, and the sciatic nerve. The blood reaches the lower extremity through the external iliac vessel, entering the anterior aspect of the thigh underneath Poupart's ligament, at which point the iliac becomes the common femoral artery. A common femoral artery passing down the anterior aspect of the thigh, presently gives off a deep femoral artery to supply the deeper structures of this region. The superficial femoral, the main trunk, winds around the inner aspect of the thigh from front to back until it comes to lie behind the knee-joint. About two inches below the kneejoint this artery divides into anterior and posterior tibial arteries; the anterior tibial passing above the interosseus membrane and to the front of the leg and foot; the posterior tibial continuing down the posterior aspect of the leg, under the calf muscles, to a point behind the inner malleolus, where it enters the sole of the foot as the external and internal plantar arteries.

Capillaries.-The arteries terminate in a fine network of blood-vessels, in which we find remaining only the internal coat of the artery, and, in some cases, only the epithelial portion of that coat. The blood, on reaching the capillaries, allows its liquid constituents and a few of the white corpuscies to escape through spaces between epithelial cells. These liquid constituents are presently collected again, after parting with their nutriment and taking up waste products from the tissues, into lymphatic vessels, which are found as delicate networks and spaces throughout the body. At certain points in this lymphatic network are located lymphatic glands, which serve as strainers to prevent the re-entrance of poisonous or foreign material into the system; thus, in the groin, in the axillary space, in the neck, in the abdominal and thoracic cavities are located groups of these lymphatics, which are inconspicuous in
health, but in disease become enlarged and inflamed in the effort to dispose of dangerous material. The larger portion of the lymphatic fluid, however, is collected into small channels, of which the thoracic duct is the largest, and reaches the general circulation again through the veins of the neck.

Veins.-The corpuscular elements of the blood do not leave the capillaries, but are collected into vessels of gradually increasing size known as veins. Veins differ from arteries in the thinness of their walls, in the presence of valves, and in the fact that they carry blood in which the oxygen has been replaced by carbon-dioxide. The thinness of the veins is due to the fact that the middle coat, which in the artery contains circular, muscular, and elastic fibers, is almost entirely absent, so the vein lacks not only the property of contrac-tility found in the artery, but is so inelastic that its walls collapse immediately when emptied of blood. Veins follow the same course as arteries, and as a rule receive the same names. In the lower extremity, however, we find two superficial veins. In the upper extremity the superficial veins are known as *cephalic* and *basilic*. It is from the latter vein that the blood is taken in the operation of blood-letting. Within the skull the venous blood is accumulated into great channels lying within the dura mater, and in the neck the large venous channels are known as external and internal jugular veins. The jugular and subclavian veins from either side of the body unite into right and left innominate veins, which pour the blood into the descending vena cava. The blood from the lower part of the body is collected into the ascending vena cava. It is to be noted, however, that the venous blood from the stomach and intestines, is collected into the large portal vein, and through this vein is carried a second time to capillaries located in the liver, from which an hepatic vein carries it into the ascending vena cava. The course taken by the venous blood from the stomach, intestines, and liver to the vena cava is known as the Portal Circulation.

Nervous System.-Within the bony arches, which, we have said, are thrown backward from the bodies of the vertebræas well as from that cranio-facial axis of the skull which is supposed to correspond in some measure to the vertebral bodies, is a neural canal, so-called because it contains the larger portion of the central nervous system. We divide this system into two portions, the one contained within the neural canal, comprising the brain and spinal cord, and known as the cerebro-spinal axis; the other made up of nerve fibers passing to and from this axis, lying external to the neural canal, and called peripheral nerves. In addition to these two sets of nerve structures, classed together as the cerebro-spinal nervous system, the body is served also by a group of nerves made up of conducting fibers, and central cells collected into ganglia at various points, and called the sympathetic nerrous system. This latter system appears to control the purely

vegetative functions of the body, such for instance as digestion, nutrition, elimination, etc. The cerebro-spinal system controls actions of which the brain or the individual is cognizant. The functions in which the central nervous system takes part, may be divided into those (a) in which sensation and its modifications are the essential features, represented by a series of fibers passing toward the central nervous system and known as *afferent* nerves: and (b) motor impulses, or their modifications. represented by a series of fibers passing from the central nervous system, known as efferent nerves. In addition to these peripheral trunks, made of white nerve fibers, or axis cylinders, many of which are contained not only in the peripheral nerves, but within the substance of the spinal cord, and pass upward as far as the gray matter of the brain, the nervous system contains many cells constituting the gray substance, distinctly central in their character, within which the impulses conveyed to and from the periphery are elaborated. These cells are the essential features of the central nervous system, and all fibers passing thereto, whether located in the brain, spinal cord, or are distinctly peripheral. See *Histology*. Peripheral Nerres.—Springing from the cen-

tral nervous system and passing symmetrically to either side of the body, are forty-three pairs of peripheral nerves, some of which contain purely afferent or sensory fibers, some contain efferent or motor fibers, and some are called mixed nerves because they contain both motor and sensory tracts. There are forty-three of these paired nerve trunks, and it is supposed that they indicate, in some manner, an arrangement of the body into segments corresponding, at least in the trunk, to each pair of supplying nerves. Thirty-one pairs spring from the spinal portion of the neural axis and are classed as spinal nerves; twelve pairs spring from the brain, and passing out through openings in the cranium are called *cranial* nerves. Of the twelve cranial nerves we note the following points: 1, Olfactory nerve, an efferent nerve supplying the special sense of smell, arising from the olfactory lobe of the brain, emerging from the skull through a series of small openings in the ethmoid (or sieve) bone, and distributing its filaments over the mucous membrane of the upper part of the nose. 2, Optic nerve, a sensory nerve supplying the retina, or organ of vision, arising from the optic thalamus on either side, crossing to the opposite side, interlacing with the fibers of the opposite nerve, and emerging from the cranial cavity through the optic foramen, enters the orbit and terminates in the back part of the eyeball. 3, Motor oculi, or third nerve, a nerve of motion, arising from the inner side of the crus cerebri, passing into the back part of the orbit to all the muscles of the eyeball except the ex-ternal rectus and superior oblique. 4. The Patheticus or trochlear nerve, arising from the base of the brain near the origin of the preceding nerve, and supplying the superior

oblique muscle of the eyeball. 5, A mixed nerve, dividing before emerging from the cranial cavity into three branches, hence called trifacial or trigeminal nerve. The upper branch supplies the region of the orbit and forehead, the middle branch supplies the region of the nose and the upper jaw and teeth, and the lower branch supplies the lower jaw and the teeth contained within it, also carrying the fibers of the gustatory nerve to the tongue. The lower branch also contains the only fibers of the fifth nerve which are motor in their function. 6, Abducens oculi, a nerve of motion, supplying the external rec-tus muscle of the eye. 7, Facial nerve, a motor nerve presiding over the muscles of the face, arises from the side of the medulla ob-longata near the fourth ventricle, becomes very intimately associated with the eighth nerve in the petrous portion of the temporal bone, and presently leaving that nerve, emerges on the face at the base of the temporal bone. On the face, this nerve divides within the substance of the parotid gland into many branches, supplying the muscles of the ear, the muscles of the eyelid, of the nose, mouth, and a few of the muscles of the neck. 8, Auditory nerve, an afferent nerve carrying fibers from the ear, or auditory organ, arises from the medulla, and is distributed to the organ of hearing. 9, Glosso-pharyngeal, a mixed nerve containing sensory fibers (probably of taste) from the tongue, and carrying motor fibers (probably) to the pharynx.. These fibers originate in the medulla near the fourth ventricle, and pass out through the jugular foramen, together with the tenth and eleventh nerves, between the branches of the internal jugular vein. This nerve lies very deeply in the back part of the throat under cover of the parotid gland, and sends branches to the pharyngeal muscles and the posterior half of the tongue. 10, Pueumo-gastric nerve, or vagus, so called from its extensive distribution to the lungs, heart, and stomach; arises within the medulla, emerges from the cranial cavity with the ninth and eleventh nerve through the jugular foramen, passes very deeply into the neck. and lies closely associated with the carotid vessels. In the neck, it is probable that this nerve sends out a number of branches to the pharyngeal muscles. It sends branches also to the muscles of the larynx. Very slightly diminished in size, it passes from the neck into the chest, and there supplies numerous branches to the heart and root of the lung. The nerve then leaves the chest in company with the cosophagus and supplies branches to both sides of the stomach. It will thus be seen that this nerve supplies the pharynx, larynx, trachea, lungs, heart, œsophagus, and stomach. 11, Spinal accessory nerve is a nerve containing many motor fibers, and (probably) a few sensory fibers. Portions of this nerve pass to the muscles of the pharynx by way of fibers which enter the pneumogastric nerve; the main trunk of the nerve passes backward in the neck to supply the trapezius and sterno-mastoid. 12, Hypoglossal nerve,

a nerve of motion supplying the depressors and elevators of the hyoid bone, and many of the muscles of the tongue, arises in the medulla and emerges from the skull through the anterior condyloid foramen. This nerve has a somewhat superficial course in the neck, lying at one point upon the external carotid artery, and there dividing, sends one set of fibers to the depressors of the hyoid bone, and another set directly forward to the elevators of the hyoid bone and the muscles of the tongue.

Spinal Nerves.-Springing from the side of the spinal cord are thirty-one pairs of nerves, of which we find eight in the cervical region. twelve in the thoracic, five in the lumbar. five in the sacral, and one in the coccygeal region. Each nerve springs from the cord by two roots, a posterior, made up of afferent fibers; and an anterior, carrying motor fibers. On the posterior root is found a ganglionic enlargement. The fibers from the two roots uniting, emerge through intervertebral foramina and divide externally to the spine into anterior and posterior divisions, each containing both motor and sensory fibers. The dorsal divisions of the spinal nerves are small, do not join one another into important plexuses, and their distribution is, in a great measure, limited to corresponding segments of the muscles of the back and overlying skin. The anterior divisions of the spinal nerves are large and important, especially in the cervical, lumbar, and sacral regions. In the thoracic region the anterior divisions of the spinal nerves pass forward between the ribs, preserving in a great measure the undisguisedly segmental character of that region. In the other regions, however, the anterior nerves on emerging from the spinal column, blend immediately into great plexuses made up of interlacing fibers of the adjacent spinal We distinguish the following plexuses nerves. formed from the anterior primary divisions of spinal nerves: 1, a cervical plexus made up of the first four cervical nerves, and supplying the muscles and skin of the neck; 2, a brachial plexus made up of the anterior divisions of the lower four cervical nerves, and a large part of the first dorsal nerve. These nerves unite into three cords, which surround the axillary artery and presently divide into branches supplying the shoulder and upper extremity. They also supply the neck, superficial portions of the chest, the arm, and forearm. The muscles of the back of the arm are supplied by a great nerve which winds around the back of the humerus, presently emerging near the elbow on the interior and external portion of the forearm. The greater number of the muscles in the palm of the hand are supplied through the ulnar nerve, which, coursing down the inner side of the arm and forearm, supplies two of the forearm muscles with motion, and supplies sensation to the remainder of the palmer aspect of the hand. 3, The lumbar plexus is made up of the anterior division of the first four lumbar nerves, supplying motion and sensation to the muscles and skin of the abdomen and the anterior aspect of the thigh. 4, Sacral plexus is made up of portions of the

7

fourth and fifth lumbar nerves, and the first, second, and third, with a portion of the fourth sacral nerves. This plexus supplies motion and sensation to the pelvic outlet, to the posterior aspect of the thigh, to the buttock, and to the leg and foot with the exception of that portion of the skin which is supplied with sensation through the internal saphenous nerve.

sation through the internal suphenous nerve. Sympathetic Nervous System. — The sympathetic system comprises two gangliated cords lying on either side of the vertebral column throughout the trunk. In the thoracic region there are twelve ganglia on each side; in the cervical region there are but three; in the lumbar and sacral regions there are eight or nine, and the system terminates in a median ganglion located on the front of the coccyx. These ganglia are connected with one another by communicating fibers and are also connected with the anterior divisions of the spinal nerves. In addition to the function of visceral control already mentioned, this system governs the blood-vessels by means of vaso-motor fibers, and sends other fibers also to the heart (increasing usually the pulsations of this organ), so that the sympathetic nervous system may be considered to regulate the action of the unstriped muscle fiber throughout the body, as well as the action of glandular organs. In addition to what may be called the central portion of the sympathetic nervous system, networks of communicating fibers surround all the large blood-vessels, governing their action and communicating with the cerebro-spinal nerves located in the vicinity. Branches from the three cervical ganglia surround the carotid artery and descend as cardiac branches into the thorax to the heart, apparently exercising an action antagonistic to the cardiac branches of the pneu-mogastric nerve. From the thoracic portion of the sympathetic system, branches pass downward through the diaphragm into the abdomen. These nerves communicate with a solar or epigastric plexus resting upon the ab-dominal aorta, and govern the action of the digestive system. Fibers radiate from the semilunar ganglia and solar plexus in the direction of plexuses located on the various abdominal organs; thus we find diaphragmatic, supra-renal, renal, cœliac, hepatic, coronary, splenic, mesenteric, spermatic, ovarian, hemorrhoidal, vesical, prostatic, cavernous, vaginal, and uterine plexuses, governing the nutrition, blood supply, and vegetative life of the va-rious organs. In addition to these ganglia found in the sympathetic cord, and to be considered as belonging exclusively to that sys-tem, there are a number of enlargements found on the spinal and cranial nerves, which contain gray cells and appear to be capable of functioning up to a certain point, as a part of the central nervous system — probably governing local reflex actions. Into some of these ganglia we find three kinds of nerve fibers passing, motor, sensory, and sympathetic, from adjacent trunks. The cerebro-spinal axis is made up of the brain and spinal cord enclosed within three membranes, dura mater,

arachnoid, and pia mater. Of these membranes, the dura mater, tough and fibrous, is the most superficial and separates the nervous axis from the overlying bone. At certain points within the skull the dura mater is reflected away from the bone and comes to lie between portions of the brain. The dura mater of the cranium is adherent to the skull and serves as the periosteum; in the spinal canal, however, the dura mater takes only an occasional attachment to adjacent vertebræ by way of support. Beneath the dura mater is found the second membrane, or arachnoid mater, from which is secreted the watery cerebro-spinal fluid found on penetrating the dura mater. Beneath the arachnoid is found the third covering of the cerebro-spinal axis, the pia mater, which supports the blood-vessels supplying the brain and cord, and consists of a very delicate network of white fibrous tissue from which the vessels pass into the nerve tissue. At certain points where ventricles or cavities exist in the cerebral structure. the pia mater becomes fringed.

Spinal Cord. — The spinal cord is that portion of the cerebro-spinal axis lying within the spinal column, but is continuous into that portion of the brain called medulla oblongata without any line of separation. From its commencement at the foramen magnum to its termination near the first lumbar vertebra. it is about seventeen inches in length, and terminates in a bundle of nerve fibers, which pass to the lower end of the sacrum within the spinal canal. The human spinal cord is about eight millimeters in diameter, but there are enlargements in the cervical and lumbar regions corresponding to the points at which the brachial and lumbar plexuses are given off. The cord is traversed from one end to the other by two deeper fissures, anterior and posterior median, which lie in the median line of the cord in an antero-posterior plane. The substance of the cord comprises gray and white nerve matter. The gray substance is composed largely of nerve cells lying in the interior, and having roughly the appearance of the letter H; the white substance, made up entirely of conducting fibers running in a direction parallel to the long axis and filling in the contour of the cord, is poured in, as it were, around the outside of the H, or gray substance. Between the two lateral halves of the cord, at a point where the anterior and posterior median fissures do not meet, are found two series of transverse fibers called commissures, connecting the lateral halves of the gray and white substance respectively. Microscopical and experimental investigation has shown that the white substance, apparently homogeneous, is made up of definitely grouped collections or columns of nerve fibers passing upward to the brain from the periphery, or downward to the periphery from the brain. Investigation also shows that the gray substance is made up largely of tracts and groups of nerve cells controlling certain automatic functions of the body which are not directly dependent on cerebral control.

The brain comprises that portion of the nervous system contained within the cranial cavity, with the exception of such portions of the twelve cranial nerves as lie between the brain and their foramina of exit. The human brain is larger and heavier, not only in proportion to the weight of the body, but in actual mass, than that of any other animal except the elephant and some of the whales. The average male European brain weighs about 50 oz., that of the female about 45 oz. Since the height and weight of the average woman is about eight per cent. less than that of the average man, it appears to be a fact that the average female is possessed of a smaller brain capacity than the average man. In the infant at birth the brain weighs about 10 oz. and continues to increase in size until about the eighth year. The weight, however, increases until middle life. The largest brain is said to have been that of Cuvier, about 64 The smallest brain of an intelligent individual weighs about 35 oz. Among idiots, however, brains have been found with a weight as low as 8<sup>1</sup> oz., and, on the other hand, the brain of an idiot has been observed to weigh as much as 60 oz. Among the lower races of mankind, the average weight is distinctly lower, ranging in males from 45 to 42 oz. It may be remarked in passing that the weight of the brain of the gorilla is about 30 oz. The brain is composed of the Cerebrum, Cere-bellum, Pons Varolii, and Mcdulla Oblongata.

The Medulla Oblongata is that portion of the brain lying most inferiorly, continuous at the foramen magnum with the spinal cord and joined above with the cerebellum and cerebrum by fibers contained in the inferior crura cerebelli and ponsvarolii. It is pyramidal in shape, about an inch long, and rests upon the basilar process of the occipital bone. It is in reality simply the expanded upper portion of the spinal cord, but containing more numerous and more important centers and groups of nerve cells than are contained in the cord proper; thus, many of the motor and sensory cranial nerves have their points of origin buried deeply in the substance of the medulla. The centers governing respiration, the action of the heart and blood-vessels, and many of the functions of digestion, secretion, and nutrition, are found in the medulla. The intimate structure of the medulla is composed of a series of white columns, continuous with the columns of the cord below, and with the pons varolii and peduncles of the cerebellum above. In the me-dian line anteriorly are found sets of fibers passing from one side to the other in what is known as the pyramid. Posteriorly, ascending fibers pass upward from what is known as the restiform body, and, diverging to enclose the fourth ventricle, terminate in the cerebellum, constituting the inferior peduncles of that body. The point at which these fibers diverge is called the Calamus Scriptorius. In the lateral portion of the medulla are found white fibers in a lateral tract, continuous with the same tract of the cord, and an olivary body consisting of an oval mass of white fiber enclosing gray nerve cells. Other bundles of fibers continuous with corresponding bundles in the cord pass upward into the substance of the medulla; bound together by these bundles are the groups of nerve centers above mentioned, represented by gray nuclei. The H shaped arrangement of the gray matter in the cord is lost in the medulla, and gives place to gray nuclei located here and there among the white bundles.

Pons Varolii.— Above and interior to the medulla oblongata is the pons Varolii, made up almost entirely of white connecting fibers passing between various divisions of the brain.. The pons is further situated between and anterior to the lobes of the cerebellum, with which it is connected by the middle peduncles of that structure. Within the pons are found alternating layers of transverse and longitudinal white fibers, the transverse fibers being continuous with the middle peduncle of the cerebellum, the longitudinal fibers are communicating tracts from the medulla, passing upward into the crura cerebri.

The Cerebellum is that portion of the brain which lies posteriorly to medulla and pons, and below the posterior lobes of the cerebrum in the inferior occipital fosse. Separating the cerebrum from the cerebellum is the tentorium cerebelli, and between the two cerebellar lobes is located the falx cerebelli. The cerebellum weighs about one eighth as much as the cerebrum, but is larger in proportion in infants and the lower animals. The white matter of the cerebellum is located internally, the gray matter externally. The convolutions are very numerous and lie in narrow, transverse folds, separated by numerous deep fissures placed very closely together, and appear to possess very little of the distinctive character of the fissures and convolutions of the cerebral hemispheres. The cerebellum is divided into three large lobes, a middle and two lateral, the middle lobe being called the worm or vermis, and the two lateral lobes the hemispheres. These lobes cannot be separated from one another, so that the cerebellum may be described as two large lobes connected perpendicularly by a smaller median ridge, the ridge constituting the middle lobe or vermis. A median section of the cerebellum discloses the great depth of the cerebellar fissures. The surface of the fissures is composed entirely of gray matter, and running toward this from the interior of the cerebellum is the white substance, arranged in a branching manner and called therefore Arbor Vitæ. The fourth ventricle is a lozenge-shaped cavity located between the medulla and pons anteriorly, and the cerebellum posteriorly. The floor or an-terior aspect of this ventricle is diamond shaped, formed by the posterior aspect of the medulla and pons. It is continuous below with the central canal of the spinal cord; above, it is continuous with the ventricles of the brain through the Sylvian aqueduct. The fourth ventricle is closed laterally by the points of contact between medulla, pons, and cere-bellum. Within the fourth ventricle are

located the gray nuclei before mentioned, of the fifth, sixth. seventh, eighth, ninth, tenth, and eleventh cranial nerves. Somewhat below the fourth ventricle is found the nucleus for the twelfth nerve, and somewhat above the ventricle, in the floor of the aqueduct of Sylvius, are found the nuclei for the third and fourth nerves.

The Cerebrum is the largest portion of the brain, is supported in the anterior and middle fosse of the skull, rests posteriorly on the tentorium cerebelli, and is covered above by the dome of the cranium. It is divided into lateral and symmetrical hemispheres, partly separated by the falx cerebri lying in the great longitudinal fissure, and joined more deeply by a great commissure or bridge passing across the median line, known as Corpus Callosum. The outer surface, composed entirely of gray matter, or cortex, is arranged into lobes and convolutions separated by fis-The cortical layer, seen also in the aures. ventricles, is composed of alternate strata of gray and white matter, the entire layer being about one-sixth of an inch thick. The true Interior of the cerebrum is composed of white matter. Before describing the interior structure it is important to note the larger of the lobes and fissures. There are five great lobes, separated by fissures varying from half an inch to one inch in depth. The most important of the fissures are: Sylvian, running upward and outward along the outside of each hemisphere: the fissure of Rolando, commencing at a point a little behind and above the point of junction of the ascending and horizontal limbs of the fissure of Sylvius, and extending upward and backward to a point somewhat behind the parietal eminence; the parieto-occipital fissure, found still farther back. The five lobes of the cerebrum are as follows: frontal lobe, lying in front of the ascending limb of the fissure of Sylvius; parietal lobe, lying between the fissure of Rolando, the parieto-occipital fissure, and the horizontal part of the fissure of Sylvius; occipital lobe, constituting the posterior extremity of the hemispere, and separated from the parietal lobe by the parieto-occipital fissure; temporosphenoidal lobe, in the middle fossa of the skull below and behind the horizontal limb of the fissure of Sylvius: central lobe, or Island of Reil, on the outer surface of the cerebrum, and not visible upon the convex surface. The lobes are divided into many convolutions and gyri by secondary fissures running into those already mentioned. The importance of a study of the convolutions is becoming increasingly obvious, for experimental science has demonstrated beyond question that the gray matter found in each convolution presides over some definite function or portion of the body; thus it is a fact not to be questioned, that certain convolutions in the frontal lobes control the function of speech, certain others control the motions of the head and extremities on the opposite side of the body. The lateral ventricles are lined by a thin serous membrane and contain a small amount of cerebro-spinal fluid.

They are separated in the median line from one another by a thin partition, and each ventricle is divided into a body, and anterior. posterior, and middle cornua. Below the corpus callosum is a mass of white matter made up of longitudinal commissural fibers diverging in front and behind to form anterior and posterior pillars. Behind the anterior pillars of the fornix and below the body, is the foramen of Monro, connecting each lateral ventricle with the anterior part of the third ventricle. Passing through this foramen into the third ventricle and extending into either lateral ventricle, lying in what is known as the great transverse fissure of Bichat, is the velum interpositum, a process of pia mater from which originate the choroid plexuses of the third and lateral ventricles. The posterior boun-dary of the foramen of Monro is the optic thalami, two masses composed externally of white and internally of grav matter. The white and internally of gray matter. thalami form also the lateral boundaries of the third ventricle. The floor of the third ventricle is formed by the lamina cinerea, infundibulum, corpora albicantia, and posterior perforated space. Crossing the third ventricle are three sets of transverse fibers, commissures, joining the optic thalami. Directly behind the third ventricle, and in the Sylvian aqueduct, is the pineal gland, a small reddish body about the size of a split pea and containing a clear albuminous liquid and minute phos-phatic calculi called brain sand. Above the Sylvian aqueduct and forming its roof are four bodies, ranged in pairs, known as corpora quadrigentina, masses of gray matter with a thin covering of white fibers. Resting against the back part of each thalamus and external to the corpora quadrigemina, are the geniculate bodies, two small masses of nerve tissue, called external and internal, and separated from each other by a portion of the optic tract. Especial attention should be directed to the fact that the cavities of the brain and spinal cord are directly continuous; thus, we may trace the central canal of the cord into the fourth ventricle, into the Sylvian aqueduct and third ventricle, and thence through the foramen of Monro into the lateral ventricles. This continuity arises from the method by which the nervous system is developed, a central nerve tube running from a very early period throughout the entire length of the body, around which presently appear enlargements of nerve tissue corresponding to the various anatomical divisions of the adult brain. The lateral ventricles of the cerebral hemispheres are pushed forward and outward from each side of the anterior extremity of the central tube.

Organs of Special Sense comprise: the Nose, or organ of smell, containing terminal fibers of the first or olfactory nerve; the Eye, or organ of sight, supplied by the second or optic nerve; the *Tongue*, or organ of taste, supplied by the gustatory branch of the fifth nerve, and the lingual branch of the glosso-pharyngeal nerve; and the Ear, or organ of hearing, supplied by the eighth or auditory nerve. In ad-

dition to these nerves of special sense, localized in their distribution, the skin is supplied with tactile corpuscles, very largely distributed, and presiding over the sense of touch. It is probable that the nerves of smell, hearing, sight, and taste are merely highly specialized modifications of the nerves of touch.

The organ of smell is contained within the nose, and is found in the Schneiderian (mucous) membrane covering the bones and cartilages of the nasal fossæ. The openings of the nose are the nares, anterior on the face, and posterior into the pharynx. Dividing the nose into two more or less equal and parallel fossæ, is a median osseo-cartilaginous septum extending in an antero-posterior plane. Into either fossa project from the lateral aspect the three turbinal bones, twisted like scrolls and covered by the Schneiderian membrane. Upon the walls of the superior meatus only, are found the terminal filaments of the olfactory nerve, thus explaining why it is necessary to inhale deeply into the nose before the sense of smell can be excited by delicate odors. Opening into the nose are the lachrymal canal from the orbid, and the apertures of the frontal, ethmoidal, sphenoidal, and maxillary sinuses.

The Eye is the organ of sight, and with its appendages is located within and in front of the orbit. The appendages include the eyebrows, two projecting lids, and the lachrymal apparatus. Opening on the inner aspect of each lid are lachrymal ducts, conveying the tears from a lachrymal gland, located in the upper and outer segment of the orbit above the upper lid. The tears, after moistening the eye. are carried into a lachrymal sac beneath the inner angle of the lids, by means of two lachrymal canals commencing on the inner extremity of each tarsal cartilage. From the lachrymal sac, the tears fall into the inferior meatus of the nose through the nasal duct. The eyeball lies within the orbital fat and is about one inch in diameter in the transverse plane, somewhat less in the sagittal plane. It is spherical in shape, but the anterior one sixth of the surface is interrupted by a segment of a smaller sphere introduced to form the clear cornea, projecting somewhat beyond the circumference of the posterior larger sphere, the latter being bounded by the tough opaque, and fibrous sclerotic. Entering the eyeball posteriorly is the optic nerve, and rotating it freely upon its cushion of fat are the six ocular muscles, four recti and two oblique. On penetrating the cornea, a clear aqueous humor gushes from that part of the eyeball in front of the crystalline lens. This space is partially divided into a large anterior and a small posterior chamber by the iris; the pupil, or circular opening in the iris, allowing the aqueous humor to circulate in both chambers. The iris is that membrane which gives the eye its color and is composed of circular and radiating muscular (unstriped) fibers, bounding the pupil and inserted circumferentially into the junction of cornea and sclerotic. The choroid is of a deep brownish color, contains many pigment cells, and furnishes the blood-

vessels supplying the eyeball. Hung behind the iris, by means of a suspensory ligament attaching to the ciliary processes, is the crystalline lens enclosed in a transparent capsule. The lens is biconvex, one third of an inch in diameter, one fifth of an inch thick anteroposteriorly, and is composed of concentric and hard but transparent laminæ. With its susfrom the vitreous humor. The vitreous humor is a clear, gelatinous fluid filling the larger sphere of the eyeball, and is contained in a thin, transparent, hyaloid membrane by which it is separated from the retina. The retina is the expanded and differentiated termination of the optic nerve, and lies between the choroid and vitreous. It is very scantily pigmented, but at certain thin points, the dark choroid may be seen behind it. Posteriorly, the optic nerve enters it, and anteriorly it terminates at the outer edge of the ciliary processes. At the point of entrance of the optio nerve there are no terminal elements, hence the "blind spot." The retina presents a yel-low spot a little external to the entrance of the nerve, at which point vision is held to be most acute. The intimate nervous structure of the retina is made of a series of terminal fibers called rods and cones, arranged in ten layers, in which are also found pigment cells and limiting membranes. The rods and cones lie in a radial direction, and it is a curious fact that their terminal elements are found in contact, not with the vitreous humor, but with the choroid, and are turned away from the point of most immediate contact with the impinging visual ray.

The Ear is divided into external, middle, and internal ear. The external ear is composed of the convoluted portion seen externally, and the external auditory canal, terminating at a depth of one and a quarter inches in the drum membrane. The middle ear, or tympanum, is a cavity in the petrous part of the temporal bone about one sixth of an inch wide, containing the ear bones; it is closed externally by the drum membrane, internally by the wall of the internal ear, and opens by a Eustachian tube passing downward, forward, and inward for one-and-a-half inches into the naso-pharnyx. The tympanum is filled with air, and by means of a chain of three small bones, called malleus, incus, and stapes, articulating with one another and connecting the drum membrane with the internal ear, sound waves are transmitted from the outer world to the end filaments of the auditory nerve. Opening posteriorly into the middle ear and serving probably as a sounding board, are the mastoid cells contained within the mastoid portion of the temporal bone. Discharges retained in the middle ear by closure of the Eustachian tube cause abcesses, which, through lack of opportunity to discharge, often spread to the mastoid cells and cause the well-known mastoid abcesses. These latter are occasionally fatal, because the cells are sepa-rated by but a thin layer of bone from the brain. The essential part of the organ of

#### Anaxagoras

hearing, and the only portion existing in many lower animals, is the internal ear or labyrinth. This is made up of a series of cavities lying within the petrous part of the temporal bone and called the bony labyrinth. Within this bony shell is contained the auditory nerve distributed on the membranous labyrinth, and bathed in the clear endolymph filling the cavity of the labyrinth. The bony labyrinth consists of a vestibule opening into the tympanum by a fenestra ovalis, which is closed by a part of the stapes (ossicle). Piercing the inner wall of the vestibule from the internal auditory meatus are several small openings for the fibers of the auditory nerve; in the anterior wall is an opening into the cochlea; and in the posterior wall are the five openings of the semicircular canals. The semicircular canals are three in number (superior, posterior, and external), lying in transverse, sagittal, and hori-zontal planes. They contain a part of the membranous labyrinth, within which are found a few small grains of chalky material (otoliths) moving in the endolymph. The cochlea resembles a small shell, and is a canal coiled spirally two-and-a-half times around a columella or central piece; the canal is divided into two compartments. partly by a bony shelf and by a membrane. The semicircular canals contain that portion of the auditory organ devoted to equilibration, the organ of Corti probably presides over sensations more strictly produced by sounds.

The Tongue or organ of taste is supplied with special sense through branches of the glossopharyngeal nerve distributed to the base of that organ. The so-called gustatory or lingual branch of the fifth nerve is distributed to the anterior two thirds of the tongue, and is said to be merely a nerve of common sensation. Located upon the dorsum or upper surface are numerous elevations or papillæ, arranged in rows running from the median line obliquely outward and forward. The largest of these, lying most posteriorly, and eight or ten in number, contain the taste buds or terminal modifications of the ninth nerve. . Farther forward are more numerous and smaller fungiform papillæ, and scattered in among these are the conical (or smallest) papillæ. Mucous and serous glands furnish the moisture necessary to bring food substance in contact with the taste buds.

The organs of touch will be described with the skin. See *Histology*.

For minute or textural anatomy, see *His*-tology.

For developmental anatomy, see Embryology.

Anaxag oras (500-428 B. C.), an ancient Greek philosopher of the Ionic school, born at Clazomenæ, in Ionia, gathered around him a circle of renowned pupils, including Pericles, Euripides, Socrates, etc. At the age of fifty he was publicly charged with impiety and sentenced to perpetual banishment. He went to Sampsacus, where he died. He held that there was an infinite number of different kinds of elementary atoms, and that these, in themselves motionless and originally existing in a state of chaos, were put in motion by an internal, immaterial, spiritual, elementary being, *Nous* (Intelligence), from which motion the world was produced. The stars were, according to him, of earthy materials; the sun a glowing mass, about as large as the Peloponnesus; the earth was flat; the moon a dark, inhabitable body, receiving its light from the sun, the comets wandering stars. **Anaximan' der** (611-547 B. C.), an ancient

Anaximan' der (611-547 B. C.), an ancient Greek (Ionic) philosopher, was born at Miletus. The fundamental principle of his philosophy is that the source of all things is an undefined substance infinite in quantity. The firmament is composed of heat and cold, the stars of air and fire. The sun occupies the highest place in the heavens, has a circumference twenty-eight times larger than the earth, and resembles a cylinder, from which streams of fire issue. The moon is likewise a cylinder, nineteen times larger than the earth. The earth has the shape of a cylinder, and is placed in the midst of the universe, where it remains suspended. To him is credited the invention of geographical maps and the first application of the style fixed on a horizontal plane to determine the solstices and equinoxes.

Anaximines (an-aks-im'e-nēz) of Miletus, an ancient Greek philosopher, according to whom air was the first principle of all things. Finite things were formed from the infinite air by compression and rarefaction produced by eternally existent motion; and heat and cold resulted from varying degrees of density of the primal element. He flourished about 550 B. C.

Ancachs (ån-kåch'), a dep. of Peru, between the Andes and the Pacific. Area 18,000 sq. mi; pop. 284,000.

Anchises (an-k1'sēz), the father of the Trojan hero Æneas, who carried him off on his shoulders at the burning of Troy and made him the companion of his voyage to Italy. He died during the voyage at Drepanum, in Sicily.

Anchor, in Navigation, a crook or hook, an instrument of iron or other heavy material used for holding ships in any situation in which they may be required to lie, and preventing them from drifting by the winds or tides, by the currents of rivers, or any other cause. This is done by the anchor, after it is let down from the ship by means of the cable, fixing itself into the ground, and there hold-ing the vessel fast. The anchor is thus obviously an implement of the first importance in navigation, and one on which too much attention cannot be bestowed in its manufacture and proper construction, seeing that on it depends the safety of the vessel in storms. The invention of so necessary an instrument is to be referred, as may be supposed, to the remotest antiquity. The most ancient an-chors consisted merely of large stones, baskets full of stones, sacks filled with sand, or logs of wood loaded with lead.

Up to the commencement of the present century what was termed the "old-plan longshanked" anchor seems to have been generally used. It was made of wrought iron, but the appliances of the anchor smith were so crude that little dependence could be placed upon it.

The size of anchors for various ships has been determined by practise, but is based upon the theory that as the anchor is required to withstand the force brought upon the ship by the wind and tide, which would otherwise cause her to drift, its strength must be nearly proportional to her resistance.

A large ironclad carries 8 anchors -2 bow, 2 sheet, 1 stream, 1 stern, and 2 kedge.

Mooring anchors are those which are placed in harbors, etc., for the convenience of vessels frequenting them. A large buoy is attached to the end of the mooring cable, and the ship is made fast to a ring-bolt fitted on the buoy. Mooring anchors are not limited by considerations of weight, etc., as other anchors are, the only requirements being that they have sufficient holding power, and do not project above the ground, as any projection in the shallow waters in which they are usually placed would render ships liable to injury from grounding on them, and be dangerous to fishing-nets, etc.

Anchovy (an-chô'vi), a small fish of the Herring family, all the species, with exception of the common anchovy, inhabitants of the tropical seas of India and America. The common

anchovy, so esteemed for its rich and peculiar flavor, is not larger than the middle finger. It is caught in vast numbers in the Mediterranean, and frequently on the coasts of France, Holland, and the south of England, and pickled for exportation.

Ancho' vy-pear, a tree of the natural order Myrtaceæ, a native of Jamaica, growing to the height of 50 feet, with large leaves and large white flowers, and bearing a fruit somewhat bigger than a hen's egg, which is pickled and eaten like the mango, which it strongly resembles in taste.

Anco'na, a seaport of Italy, capital of the province of the same name, 130 mi. n. e. of Rome, with harbor works begun by Trajan, who built the ancient mole or quay. A triumphal arch of white marble, erected in honor of Trajan, stands on the mole. Ancona is a station of the Italian fleet, and the commerce is increasing. There is a colossal statue of Count Cavour. Ancona is said to have been founded about four centuries B. C., by Syracusan refugees. It fell into the hands of the Romans in the first half of the third century B. C., and became a Roman colony. Pop. 31,277. The province has an area of 740 sq. mi., and a population of 277,861.

Andalu'sia, a large and fertile district in the south of Spain; area about 33,650 sq. mi., including the modern provinces of Seville, Huelva, Cadiz, Jaen, Cordova, Granada, Almeria, and Malaga. It is traversed by mountains, the loftiest being the Sierra Nevada. Minerals abound, especially in the province of Huelva, where the Tharsis and Rio Tinto copper-mines are situated. The principal river is the Guadalquivir. The vine, myrtle, olive, palm, banana, carob, etc., grow abundantly in the valley of the Guadalquivir. Wheat, maize, barley, and many varieties of fruit grow almost spontaneously; besides which, honey, silk, and cochineal form important articles of culture. The horses and mules are the best in the Peninsula; the bulls are sought for bullfighting over all Spain; sheep are reared in vast numbers. Agriculture is in a backward state, and the manufactures are by no means extensive. The Andalusians are descended in part from the Moors, of whom they still preserve decided characteristics. Pop. 3,282,448.

An'damans, a chain of islands on the east side of the Bay of Bengal. The inhabitants are about 14,500 in number, and mostly in a very savage state, living almost naked in the rudest habitations. They are small (generally much less than five feet), well formed, and active, skilful archers and canoeists, and excellent swimmers and divers. These islands have been used since 1858 as a penal settlement by the Indian government, the settlement being at Port Blair, on South Andaman.

An' dersen, HANS CHRISTIAN (1805-1875), a famous Danish novelist, poet, and writer of fairy tales, was born at Odense. Picking up what education he could at leisure he wrote several tragedies, and in 1810 went to Copenhagen, but failed in getting any of his plays accepted. His abilities at last brought him under the notice of Councillor Collin, a man of considerable influence, who procured for him free entrance into a government school at Slagelse. From this school he was transferred to the university, and soon became favorably known by his poetic works. He received a royal grant to enable him to travel, and in 1833 he visited Italy, his impressions of which he pub-lished in *The Improvisatore*. The scene of his following novel, O. T., was laid in Den-mark, and in Only a Fiddler he described his own early struggles. In 1835 appeared the first volume of his Fairy Tales. Among his other works are, Picture-books Without Pictures, A Poet's Bazaar, and a number of dramas. In 1845 he received an annuity from the gov-ernment. He visited England in 1848, and acquired such a command of the language that his next work, The Two Baronesses, was

#### Anderson

written in English. In 1853 he published an autobiography, under the title My Life's Romance, an English translation of which, published in 1871, contained additional chapters by the author, bringing the narrative to 1867. Among his later works we may mention. To Be or Not To Be; Tules from Jutland; The Ice Muiden.

Anderson, Madison co., Ind., on White River. Railroads: Big 4 (C. C. C. & St. L.); Pan Handle (P. C. C. & St. L.); Midland (C. S. & E.). Industries: wire nail works, three flouring mills, four iron foundries, and other factories. Surrounding country agricultural. Oil and gas in abundance. The town was first settled in 1825 and became a city in 1864. Pop. est. 1807, 22, 186.

city in 1864. Pop. est. 1807, 22, 186. Anderson, GALUSHA, b. 1832 in Bergen, N. Y.; educated for the Baptist ministry, held pastorates in Brooklyn and Chicago, and from 1878 to 1885 was president of the old Chicago University. He is now professor in the Divinity school of the new University of Chicago.

Anderson, JOHN (1726-1796), professor of natural philosophy in the University of Glas-gow, Scotland. By his will be directed that the whole of his effects should be devoted to the establishment of Anderson's University. There were to be four colleges-arts, medicine, law, and theology-besides an initiatory school. As the funds, however, were totally inadequate to the plan, it was at first commenced with only a single course of lectures on natural philosophy and chemistry. The institution gradually enlarged its sphere of instruction, the medical school in particular possessing a high reputation. Latterly it has been incorporated with other institutions to form the Glasgow and West of Scotland Technical College, the medical school, however, retaining a distinct position.

Anderson, MARY, a very beautiful and exemplary American actress; born in California in 1859. Her principal successes were in Shakesperian rôles. She married Antonio F. de Navarro in 1890, and retiring absolutely from the stage, published some interesting memoirs.

Anderson, ROBERT (1805-1871), an American soldier, born in Kentucky. He served in the Black Hawk, Florida, and Mexican wars and was wounded at Molino del Rey. As Major of Artillery he was in charge of Forts Moultrie and Sumter in Charleston Harbor on the outbreak of the Civil War in 1861 and gallantly defended Sumter. He was promoted major-general, and died in France.

Andersonville, Sumter co., Ga., the site of a Confederate prison wherein 12,926 Union soldiers died out of 49,485 confined. Henry Wirz, its superintendent, was convicted by a military commission on a charge of cruelty to prisoners, and hanged Nov. 1, 1865. The site is now a National cemetery, wherein 13,-705 soldiers are buried.

Andes (an'dēz), or, as they are called in Spanish South America, Cordilleras (ridges) de los Andes, or simply Cordilleras, a range of mountains stretching along the whole of the west coast of South America, from Cape Horn to the Isthmus of Panama and the Caribbean Sea. In absolute length (4,500 miles) no single chain of mountains approaches the Andes, and only a certain number of the higher peaks of the Himalayan chain rise higher above the sea level; which peak is highest of all is not yet settled. Several main sections of this huge chain are distinguishable. The Southern Andes present a lofty main chain, with a minor chain running parallel to it on the east, from Terra del Fuego and the Straits of Magellan, rising in Aconcagua to a height of 22,860 feet. North of this is the double chain of the central Andes, inclosing the wide and lofty plateaus of Bolivia and Peru, which lie at an elevation of more than 12,000 feet above the sea. The mountain system is here at its broadest, being about 500 miles across. Here are also several very lofty peaks, as Illampu or Sorata (21,484 feet), Sahama (21,054), Illimani (21,024). Farther north the outer and inner ranges draw closer together, and in Ecuador there is but a single system of elevated masses, generally described as forming two parallel chains. In this section are crowded together a number of lofty peaks, most of them volcanoes, either extinct or active. Of the latter class are Pichincha (15,918 feet), with a crater 2,500 feet deep; Tunguragua (16,685 feet); Sangay (17,460 feet); Cotopaxi (19,550 feet). The loftiest summit here appears to be Chimborazo (20,581 feet); others are Antisana (19,260 feet) and Cayambe (19,200 feet). Northward of this section the Andes break into three distinct ranges, the eastmost running northeastward into Venezuela, the westmost running northwestward to the Isthmusof Panama. In the central range is the volcano of Tolima (17,-660 feet). The western slope of the Andes is generally exceedingly steep, the eastern much less so, the mountains sinking gradually to the plains. The whole range gives evidence of volcanic action, but it consists almost entirely of sedimentary rocks. Thus mountains may of sedimentary rocks. Thus mountains may be found rising to the height of over 20,000 feet, and fossiliferous to their summits (as Illimani, and Sorata or Illampu). There are about thirty volcanoes in a state of activity. The loftiest of these burning mountains seems to be Gualaterri, in Peru (21,960 feet). The The heights of the others vary from 13,000 to 20,-000 feet. All the districts of the Andes system have suffered severely from earthquakes, towns having been either destroyed or greatly injured by these visitations. Peaks crowned with perpetual snow are seen all along the range, and glaciers are also met with, more especially from Aconcagua southward. The passes are gen-erally at a great height, the most important being from 10,000 to 15,000 feet. Railways have been constructed to cross the chain at a similar elevation. The Andes are extremely rich in the precious metals, gold, silver, copper, platinum, mercury, and tin, all being wrought; lead and iron are also found. In the Andes are towns at a greater elevation than anywhere else in the world, the highest being

#### Andorre

the silver mining town of Cerro de Pasco (14,-270 feet), the next being Potosi.

Andorre' (or Andor'ra), a small, nominally independent state in the Pyrenees, with an area of about 230 sq. mi.; pop. 10,000. It has been a separate state for six hundred years; is governed by its own civil and criminal codes, and has its own courts of justice, the laws being administered by two judges, one of whom is chosen by France, the other by the Bishop of Urgel, in Spain. The chief industry is the rearing of sheep and cattle. The commerce is largely in importing contraband goods into Spain. Capital, Old Andorré.

Andover, Essex co., Mass., on Shaushin River, 3 mi. e. of Lawrence. Railroad, western division of Boston & Maine. Industries: woolen mills, flax mill, flannel mill, and rubber company. Surrounding country agricultural. Seat of Andover Theological Seminary, Phillips Academy, and Abbot Academy. The town was first settled in 1646. Pop. est. 1897, 6,300.

Ândrassy (an-drä'shē), COUNT JULIUS (1823-1890), Hungarian statesman; took part in the revolution of 1848, was condemned to death, but escaped and went into exile; appointed premier when self-government was restored to Hungary in 1867; became imperial minister for foreign affairs in 1871, retiring from public life in 1879.

André (an'drā), MAJOR JOHN, adjutant-, general in the British army during the American Revolutionary war. Employed to nego-tiate the treason of the American general, Arnold, and the delivery of the works at West Point, he was apprehended in disguise, Sept. 23, 1780, within the American lines; declared a spy from the enemy, and hanged Oct. 2, 1780. His remains were taken to England in 1821 and interred in Westminster Abbey, where a monument has been erected to his memory. Much sympathy was felt for him in the patriot army, but military jurists are agreed that his punishment was merited and necessary. His own letter to Washington was so frank an admission of guilt as to warrant his conviction, and his one chance of escape was destroyed by the British refusal to surrender Arnold. André's personal characteristics made him a universal favorite, and the entire British army wore crape at his loss. His error lay in landing to confer with Arnold, in assuming disguise, and taking a false name in the safe-conduct or pass given him by Arnold.

An drew, ST., brother of St. Peter, and the first disciple whom Christ chose. According to tradition he was crucified at Patræ, now Patras, in Achaia, on a cross of the form  $\times$ . Hence such a cross is now known as a St. Andrew's cross. The Russians revere him as the apostle who brought the gospel to them; the Scots, as the patron saint of their country. The day dedicated to him is November 30. The Russian order of St. Andrew, the highest of the empire, was instituted by Peter the Great in 1698.

An'drews, ELISHA BENJAMIN, D.D., LL.D., born at Hinsdale, N. H., graduated at Brown University, 1870. He taught two years at Suffield, Conn., and was a student at the Theological Institute, 1872-74. He preached one year at Beverly, Mass., and was president of Denison University, Ohio, 1875-79. He studied in Europe, 1882-3, and was professor of public finance at Cornell University, 1888-9. In 1889, he was chosen president of Brown University, which position he still occupies. He was a Union soldier, 1861-64. Among the books of which he is the author, are. Institutes of Economics, Institutes of General History, History of the U. S., and several articles in various magazines.

An drew, JOHN ALBION (1818-1867), born in Albion, Me. He was graduated at Bowdoin, studied law, and was admitted to practise at Boston. He became an antislavery man, and was elected to the Legislature in 1858. In 1860 he was a delegate to the Republican convention which nominated Abraham Lincoln for president, and in the same year was elected governor of Massachusetts. To this office he was re-elected until 1866. In January, 1861, he began to prepare for war by reorganizing the militia. He also called on the governors of the other New England states to do like-wise. Within a week after the president's proclamation of 1861, he dispatched five regiments of infantry, a battalion of riflemen, and a battery of artillery to Washington. In September, 1862, he attended the convention of the governors of the loyal states at Altoona, Pa., and drew up the address they presented to the president.

An'drews, LANCELOT (1555-1626), bishop of the English Church; high in favor both with Queen Elizabeth and James I. In 1605 he became bishop of Chichester, in 1609 was transferred to Ely, and appointed one of the king's privy-councilors; and in 1618 he was transferred to Winchester. He was one of those engaged in preparing the Authorized Version of the Scriptures. He left sermons, lectures, and other writings.

An' drews, ST., an ancient city in Fifeshire, Scotland, 31 mi. n.e. from Edinburgh; was erected into a royal burgh by David I in 1140, and after having been an episcopal, became an archiepiscopal see in 1472, and was for long the ecclesiastical capital of Scotland. The cathedral, now in ruins, was begun about 1160, and took 157 years to finish. The old castle, founded about 1200, and rebuilt in the fourteenth century, is also an almost shapeless ruin. In it James III was born and Cardinal Beaton assassinated, and in front of it George Wishart was burned. There are several other interesting ruins. The trade and manufactures are of no importance, but the town is in favor as a watering-place. Golf is much played here. Pop. 7,000. THE UNI-VERSITY OF ST. ANDREWS, the oldest of the Scotch universities, founded in 1411, consists of three colleges, St. Salvator, St. Leonard's, and St. Mary's. Originally all three had teachers both in arts and theology; but in 1579 the colleges of St. Salvator and St. Leonard were confined to the teaching of arts

and medicine, and that of St. Mary to theology. In 1747 the two former colleges were united by act of Parliament. Degrees are conferred in arts, divinity, medicine, and law; but there is a complete teaching staff only in arts and divinity.

Andrews, STEPHEN PEARL (1812-1886), author, b. in Templeton, Mass. He studied at Amherst College, removed to New Orleans, La., became a lawyer, and in 1839 went to Texas. In 1843 Andrews went to England to raise money with which to purchase the freedom of the Texan slaves, and render it a free state. He was unsuccessful, and returned home, settling in Boston, where he became a leader in the antislavery movement. In 1847 he removed to New York City, where he published a series of phonographic instruction books. He was an accomplished linguist. He also evolved a scientific universal language called "Alwato;" in this he conversed and corresponded with his pupils, and was preparing a dictionary of it at the time of his death.

An'dria, a town of south Italy, province of Bari, with a fine cathedral, founded in 1046; the church of Sant' Agostino, with a beautiful pointed Gothic portal; a college; manufactures of majolica, and a good trade. Pop. 37,-192.

Andromache (an-drom'a-kē), in Greek mythology, wife of Hector, one of the most attractive female characters of Homer's lliad. The passage describing her parting with Hector when he was setting out to his last battle, is well known and much admired. Euripides and Racine have made her the chief character of tragedies.

Androm'eda, in Greek mythology, daughter of the Ethiopian king Cepheus and of Cassiopeia. Cassiopeia having boasted that her daughter surpassed the Nereids, if not Hēra (Juno) herself, in beauty, the offended goddesses prevailed on their father, Poseidön (Neptune), to afflict the country with a horrid sea-monster, which threatened universal destruction. To appease the offended god, Andromeda was chained to a rock, but was rescued by Perseus; and after death, was changed into a constellation.

Androni'cus, the name of four emperors of Constantinople. ANDRONICUS I, Comnenus, b. 1110, murdered 1185. ANDRONICUS II, Palæologus, b. 1258, d. 1332. His reign is celebrated for the invasion of the Turks. An-DRONICUS III, Palæologus the Younger, b. 1296, d. 1341. ANDRONICUS IV, Palæologus, reigned in the absence of John IV. In 1373 he gave way to his brother Manuel, and d. a monk.

Androni' cus of Rhodes, a Peripatetic philosopher who lived at Rome in the time of Cicero. He arranged Aristotle's works in much the same form as they retain in present editions.

Androni'cus, LIVIUS, the most ancient of the Latin dramatic poets; flourished about 240 B. C.; by origin a Greek, and long a slave. A few fragments of his works have come down to us.

#### Anemoscope

Androni'cus Cyrrhestes (sir-es'tēz), a Greek architect about 100 B. C., who constructed at Athens the Tower of the Winds, an octagonal building, still standing. On the top was a Triton, which indicated the direction of the wind. Each of the sides had a sort of dial, and the building formerly contained a clepsydra or water-clock.

Andros, SIR EDMUND (1637-1714), an English colonial governor. Governor of New York in 1674; of New England 1686, of Virginia 1692. He died in England. His conduct in New England was tyrannical and his taxation of the colonists extremely unpopular. His expedition to Hartford gave rise to the Charter Oak incident.

Andros Islands, a group of isles belonging to the Bahamas, lying southwest of New Providence, not far from the east entrance to the Gulf of Florida. The passages through them are dangerous.

Andujar  $(\sin -d\ddot{o} - \hbar\ddot{a}r')$ , a town in Spain, in Andalusia, 50 mi. e. n. e. of Cordova, manufactures a peculiar kind of porous earthen water bottles and jugs. Pop. 12,605.

water bottles and jugs. Pop. 12,605. Anega'da, a British West Indian island, the most northern of the Virgin group, 10 mi. long by 44 broad; contains numerous salt ponds, from which quantities of salt are obtained.

Anemom'eter, an instrument for measuring the force and velocity of the wind. This force is usually measured by the pressure of the wind upon a square plate attached to one end of a spiral spring (with its axis horizontal), which yields more or less according to the force of the wind, and transmits its motion to a pencil which leaves a trace upon paper moved by clockwork. For indicating the velocity of the wind, the instrument which has yielded the best results consists of four hemispherical cups, attached to the ends of equal horizontal arms, forming a horizontal cross which turns freely about a vertical axis. By means of an endless screw, carried by the axis, a train of wheel-work is set in motion; and the indication is given by a hand which moves round a dial; or in some instruments by several hands moving round different dials like those of a gas-meter. It is found that the center of each cup moves with a velocity which is almost exactly one third of that of the wind. There are various other forms of instruments, one of which is portable, and is especially intended for measuring the velocity of currents of air passing through mines, and the ventilating spaces of hospitals and other public buildings. The direction of the wind as indicated by a vane can also be made to leave a continuous record by various contrivances; one of the most common being a pinion carried by the shaft of a vane, and driving a rack which carries a pencil.

Anem'oscope, any contrivance indicating the direction of the wind; generally applied to a vane which turns a spindle descending through the roof to a chamber, where, by means of a compass-card and index, the direction of the wind is shown.

## Angel

Angel, one of those spiritual intelligences who are regarded as dwelling in heaven and employed as the ministers or agents of God. Scripture frequently speaks of angels, but with great reserve, Michael and Gabriel alone being mentioned by name in the canonical books, while Raphael is mentioned in the Apocrypha.

Angel, a gold coin introduced into England in the reign of Edward IV and coined down to the Commonwealth, so named from having

Angel of Edward IV.

the representation of the archangel Michael piercing a dragon upon it. It had different values in different reigns, varying from \$1.75 to \$2.50.

Angel-fish, a fish nearly allied to the sharks, very ugly and voracious, preying on other fish. It is from 6 to 8 feet long, and takes its name from its pectoral fins, which are very large, extending horizontally like wings when spread. This fish connects the rays with the sharks, but it differs from both in having its mouth placed at the extremity of the head.

placed at the extremity of the head. Angelico (an-jel'i-kö), FRA (1387-1455), the common appellation of Fra Giovanni da Fiesole, one of the most celebrated of the early Italian painters. He entered the Dominican order in 1407, and was employed by Cosmo de Medici in painting the monastery of St. Mark and the church of St. Annunziata with frescoes. These pictures gained him so much celebrity that Nicholas V invited him to Rome, to ornament his private chapel in the Vatican, and offered him the archbishopric of Florence, which was declined. His works were considered unrivaled in finish and in sweetness and harmony of color, and were made the models for religious painters of his own and succeeding generations.

Angell, JAMES BURRILL, LL. D., was born in Rhode Island, 1829, graduated at Brown University, 1849, and later became professor of modern languages and literature in the same university. In 1860 he became editor of . the Providence Journal, in 1866 president of the University of Vermont, and in 1871 president of the University of Michigan, where he is at present. He was minister to China in 1880-81, and is a regent of the Smithsonian Institute. He was appointed minister to Turkey by President McKinley in 1897.

**Angelo** (an' je-lo), MICHAEL (Buonarroti) (1475-1563), b. at Caprese, in Tuscany, d. in Rome. He was of the ancient family of the counts of Canossa. He became a distinguished Italian painter, sculptor, architect, and poet. He studied drawing under Domenico Ghirlandaio, and sculpture under Bertoldo

## **Angina Pectoris**

at Florence, and having attracted the notice of Lorenzo de Medici, was for several years an inmate of his household. Having distinguished himself both in sculpture and painting, he was commissioned (together with Leonardo da Vinci) to decorate the senate-hall at Florence with a historical design, but before it was finished, in 1505, he was induced by Pope Julius II to settle in Rome. Here he sculptured the monument of the pontiff (there are seven statues belonging to it) now in the church of St. Pietro in Vincoli; and painted the dome of the Sistine Chapel, his frescoes representing the creation and the principal events of sacred history. In 1530 he took a leading part in the defense of Florence against Charles V. Three years later he began his great picture in the Sistine Chapel, The Last Judgment, which occupied him eight years. His last considerable works in painting were two large pictures: the Conversion of St. Paul, and The Crucifixion of St. Peter, in the Pauline Chapel. In sculpture he executed The Descent of Christ from the Cross, four figures, of one piece of marble. His statue of Bacchus was thought by Raphael to possess equal perfection with the masterpieces of Phidias and Praxiteles. As late as 1546 he was obliged to undertake the continuation of the building of St. Peter's, and planned and built the dome, but he did not live long enough to see his plan finished, in which many alterations were made after his death. Besides this, he undertook the building of the Piazza del Campidoglio (Capitol) of the Farnese Palace, and of many other edifices. His style in architecture is distinguished by grandeur and boidness, and in his ornaments the untamed character of his imagination frequently appears, preferring the uncommon to the simple and elegant. His poems, which he considered merely as pastimes, contain, likewise, convincing proofs of his great genius. His prose works consist of lectures, speeches, etc.

Angers (an-zha), a town and river port of France, capital of the department of Maine-et-Loire, and formerly of the province of Anjou, 54 mi. from the Loire, 150 mi. s. w. of Paris. Has an old castle, once a place of great strength, now used as a prison, barrack, and powder-magazine; a fine cathedral of the twelfth and thirtcenth centuries, with very fine old painted windows, is the seat of a bishop, and has a school of arts and manufactures; a public library, an art-gallery, a large modern hospital, the remains of a hospital founded by Henry II of England in 1155, courts of law, theater, etc. Manufactures: sail-cloth, hosiery, leather, and chemicals. foundries, etc. the neighborhood are immense slate-quarries. Pop. 73,044.

Angina Pectoris (an-jI'na pek'to-ris), or Heart-spasm, a disease characterized by an extremely acute constriction, felt generally in the lower part of the sternum, and extending along the whole side of the chest and into the corresponding arm, a sense of suffocation, faintness, and apprehension of approaching death; seldom experienced by any but those with organic heart-disease. The disease rarely occurs before middle age and is more frequent in men than in women. Those liable to attack must lead a quiet, temperate life, avoiding all scenes which would unduly rouse their emotions. The first attack is occasionally fatal, but usually death occurs as the result of repeated seizures. The paroxysm may be relieved by opiates, or the inhalation, under due precaution, of anæsthetic vapors.

Angler, also from its habits and appearance called *Fishing-frog* and *Sea-devil*, a remarkable fish often found on the British coasts. It is from 3 to 5 feet long; the head is very wide, depressed with protuberances, and bearing long separate movable tendrils; the mouth is

Angler.

capacious. The American Angler, Fishingfrog or Goose-fish, of the Atlantic, is from two to three feet long; it is exceedingly voracious; its large mouth allows it to swallow fish about as big as itself.

Angles, a low German tribe who in the earliest historical period had their seats in the district about Angeln, in the duchy of Sleswig, and who in the fifth century subsequently crossed over to Britain along with bands of Saxons and Jutes (and probably Frisians also), and colonized a great part of what from them has received the name of England, as well as a portion of the Lowlands of Scotland. The Angles formed the largest body among the Germanic settlers in Britain, and founded the three kingdoms of East Anglia, Mercia, and Northumbria.

Anglesey (ang'gl-se) (or Anglesea) ("the Angles' Island"), an island and county of north Wales, separated from the mainland by the Menai Strait. Area 193,511 acres; pop. 50,500. The chief agricultural products are oats and barley, wheat, rye, potatoes, and turnips. Numbers of cattle and sheep are raised. Anglesey yields a little copper, lead, silver, ocher, etc. The Menai Strait is crossed by a magnificent suspension-bridge, 580 feet between the piers and 100 feet above highwater mark, and also by the great Britannia Tubular Railway Bridge. The chief market towns are Beaumaris, Holyhead, Llangefni, and Amlwch.

Anglican Church, a term which strictly embraces only the Church of England and the Protestant Episcopal churches in Ireland, Scotland, and the colonies: but is sometimes used to include also the Episcopal churches of the U. S. The doctrines of the Anglican Church are laid down in the Thirty-nine Articles, and its ritual is contained in the Book of Common Prayer. Within the body there is room for considerable latitude of belief and doctrine, and three sections are sometimes spoken of by the names of the High Church, Low Church, and Broad Church.

Angling, the art of catching fish with a hook, or *angle* baited with worms, small fish, flies, etc. We find occasional allusions to this pursuit among the Greek and Latin classical writers. It is mentioned several times in the Old Testament, and it was practised by the ancient Egyptians. The old-est work on the subject in English is the *Treatyse of Fysshinge with an Angle*, printed by Wynkyn de Worde, in 1496, along with treatises on hunting and hawking, the whole being ascribed to Dame Juliana Berners, or Barnes, prioress of a nunnery near St. Al-bans, England. Walton's inimitable disbans, England. Walton's inimitable dis-course on angling was first printed in 1653. The chief appliances required by an angler are a rod, line, hooks, and baits. Rods are made of various materials, and of various sizes. The cane rods are lightest; and where fishing-tackle is sold they most commonly have the preference; but in country places the rod is often of the angler's own manufacture. Rods are commonly made in sepa-rate joints so as to be easily taken to pieces and put up again. They are made to taper from the butt end to the top, and are usually possessed of a considerable amount of elasticity. In length they may vary from ten feet to more than double, with a corresponding difference in strength -a rod for salmon being necessarily much stronger than one suited for ordinary brook trout. The *reel*, an apparatus for winding up the line, is attached to the rod near the lower end, where the hand grasps it while fishing. The best are usually made of brass, are of simple construction, and are so made as to wind or unwind freely and rapidly. That part of the line which passes along the rod and is wound on the reel is called the reel line, and may vary from 20 to 100 yards in length, according to the size of the water and the habits of the fish angled for; it is usually made of twisted horsehair and silk, or of oiled silk alone. The casting line, which is attached to this, is made of the same materials but lighter and finer. To the end of this is tied a piece of fine gut, on which the hook or hooks are fixed. The which the hook or hooks are fixed. The casting or gut lines should decrease in thickness from the reel line to the hooks. The hook of finely tempered steel should readily bend without breaking, and yet retain a sharp point. It should be long in

# Anglo-Saxons

the shank and deep in the bend; the point straight and true to the level of the shank; and the barb long. Their sizes and sorts must of course entirely depend on the kind of fish that are angled for. Floats formed of cork, goose and swan quills, etc., are often used to buoy up the hook so that it may float clear of the bottom. For heavy fish or strong streams a cork float is used; in slow water and for lighter fish, quill floats. Baits may consist of a great variety of materials, natural or artificial. The principal natural baits are worms: common garden worms, brandlings, and red worms, maggots, or gentles (the larvæ of blow-flies such as fish (as minnows), salmon roe, etc. The ar-tificial flies so much used in angling for trout and salmon are composed of hairs, furs, and wools of every variety, mingled with pieces of feathers and secured together by plaited wire, or gold and silver thread, marking silk, wax, etc. The wings may be made of the feathers of domestic fowls, or any others of a showy color. Some angling authorities recommend that the arti-ficial flies should be made to resemble as closely as possible the insects on which the fish is wont to feed, but experience has shown that the most capricious and unnatural combinations of feather, fur, etc., have been often successful where the most artistic imitations have failed. Artificial minnows, or other small fish, are also used by way of bait, and are so contrived as to spin rapidly when drawn through the water in order to attract the notice of the fish angled for. Angling, especially with the fly, demands a great deal of skill and practise, the throwing of the line properly being the initial difficulty. Nowhere is the art pursued with greater success and enthusiasm than in the U. B.

Anglo-Saxons, the name commonly given to the nation or people formed by the amalgamation of the Angles, Saxons, and Jutes, who settled in Britain in the fifth and sixth centuries after Christ, the Anglo-Saxons being simply the English people of the earlier period of English history. The tribes who were thus the ancestors of the bulk of the Englishspeaking nationalities came from north Germany where they inhabited the parts about the mouths of the Elbe and Weser, and the first body of them who gained a footing in Britain are said to have landed in 449, and to have been led by Hengist and Horsa. From the preponderance of the Angles the whole country came to be called *Engla-land*; that is, the land of the Angles or English. Modern officials such as sheriffs and aldermen and at least one rank of nobility, that of earl, owe their origin to Anglo-Saxon institutions.

Ango'la, a Portuguese territory in Western Africa, s. of the Congo; area 300,000 sq. mi.; pop. 2,000,000; sometimes in the northern part of it, also known as Loanda. The principal town is the seaport of St. Paul de Loanda, which was long the great Portuguese slave-mart.

Exports: ivory, palm oil, coffee, hides, gum, wax, etc. Pop. 600,000.

Ango ra, a town in the interior of Asiatic Turkey, 215 mi. e.s.e. of Constantinople, with considerable remains of Byzantine architecture, and relics of earlier times, both Greek and Roman, such as the remnants of the Monumentum Ancyranum, raised in honor of the Emperor Augustus. All the animals of this region are long haired, especially the goats (see Goat), sheep, and cats. This hair forms an important export, as well as the fabric called camlet here manufactured from it, other exports being goats' skins, dye-stuffs, gums, honey, and wax, etc. Est. pop. 35,000.

Angostu'ra (or Ciudad Bolivar), a city of Venezuela, capital of the province of Bolivar, on the Orinoco, about 240 mi. from the sea. Exports: gold, cotton, indigo, tobacco, coffee, cattle, etc.; imports: manufactured goods, wines, flour, etc. Pop. 10,861. Angostura Bark, the aromatic bitter medic-

Angostura Bark, the aromatic bitter medicinal bark obtained chiefly from a tree of 10 to 20 feet high, growing in the northern regions of South America. The bark is valuable as a tonic and febrifuge, and is also used for a kind of bitters. From this bark being adulterated, indeed sometimes entirely replaced, its use as a medicine has been almost given up.

Angoulême (ån-gö-lām), an ancient town of western France, capital of dep. Charente, 60 mi. n.n.e. of Bordeaux. It has a fine old cathedral, a beautiful modern town-hall, a lyceum, public library, natural history museum, hospital, lunatic asylum, etc. There are manufactures of paper, woolens, linens, distilleries, sugar-works, tanneries, etc. Pop. 34,647.

Angra (an' gra), a seaport of Terceira, one of the Azores, with the only convenient harbor in the whole group. It has a cathedral, a military college, and arsenal, etc., and is the residence of the governor-general of the Azores and of the foreign consuls. Pop. 11,281.

Angra Pequena ("little bay"), a bay on the west of Namaqualand, S. Africa, where the German commercial firm Lüderitz in 1883 acquired a strip of territory and established a trading station. In 1884, notwithstanding some weak protests of the British, Germany took under her protection the coast territory around this port, and soon after extended the protectorate to the Portuguese frontier, but not including the British settlement of Walfisch Bay.

Anguilla (ang-gil'a) (or Snake Island), one of the British West India Islands, 60 mi. n. e. of St. Kitts. Area 35 sq. mi. A little sugar, cotton, tobacco, and maize are grown. There is a saline lake in the center which yields a large quantity of salt. Pop. 2,773, of which 100 is white.

An'halt, a duchy of north Germany, area 906 sq. mi. All sorts of grain, wheat especially, are grown in abundance: also flax, rape, potatoes, tobacco, hops, and fruit. Excellent cattle are bred. The inhabitants are principally occupied in agriculture, though there are some iron works and manufactures of woolens, linens, beet-sugar, tobacco, etc. The united principality is now incorporated in the German Empire, and has one vote in the Bundesrath and two in the Reichstag. Pop. 232,592, almost all Protestants. The chief towns are Dessau, Bernburg, Köthen, and Zerbst.

Anhy' drite, anhydrous sulphate of calcium, a mineral presenting several varieties of structure and color. The *vulpinite* of Italy possesses a granular structure, resembling a coarsegrained marble, and is used in sculpture. Its color is grayish white, intermingled with blue.

An' iline, a substance which has become of great importance, as being the basis of a number of brilliant and durable dyes. It is found in small quantities in coal-tar, but the aniline of commerce is obtained from benzine or benzole, a constituent of coal-tar, consisting of hydrogen and carbon. Benzine, when acted on by nitric acid, produces nitro-benzine; and this substance again, when treated with nascent hydrogen, generally produced by the action of acetic acid upon iron-filings or acraps, produces aniline. It is a colorless, oily liquid, somewhat heavier than water, with a peculiar, vinous smell, and a burning taste. Its name is derived from anil, the Portuguese and Spanish name for indigo, from the dry distillation of which substance it was first obtained by the chemist Unverdorben in 1826. When acted on by arsenious acid, bichromate of potassium, stannic chloride, etc., aniline produces a great variety of compounds, many of which are possessed of very beautiful colors, and are known by the names of aniline purple, aniline green, rosëine, violine, bleu de Paris, magenta, etc. The manufacture of these aniline or coal-tar dyes as a branch of industry was introduced in 1856 by Perkin of London. Since then the manufacture has reached large dimensions.

Animal, an organized and sentient living being. Life in the earlier periods of natural history was\_attributed almost exclusively to animals. With the progress of science, however, it was extended to plants. In the case of the higher animals and plants there is no difficulty in assigning the individual to one of the two great kingdoms of organic nature, but in their lowest manifestations, the vegetable and animal kingdoms are brought into such immediate contact that it becomes almost impossible to assign them precise limits, and to say with certainty where the one begins and the other ends. From form no absolute distinction can be fixed between animals and plants. Many animals, such as the sea-shrubs, sea-mats, etc., so resemble plants in external appearance that they were, and even yet popularly are, looked upon as such. With regard to internal structure no line of demarkation can be laid down, all plants and animals being, in this respect, fundamentally similar; that is, alike composed of molecular, cellular, and fibrous tissues. Neither are the chemical characters of animal and vegetable substances more distinct. Animals contain in their tissues and fluids a larger proportion of nitrogen

than plants, while plants are richer in carbonaceous, compounds than the former. In some animals, moreover, substances, almost exclusively confined to plants, are found. Thus the outer wall of Sea-squirts contains cellulose, a substance largely found in plant-tissues; while chlorophyll, the coloring-matter, of plants, occurs in Hydra and many other lower animals. Power of motion, again, though broadly distinctive of animals, cannot be said Thus to be absolutely characteristic of them. many animals, as oysters, sponges, corals, etc.. in their mature condition are rooted or fixed, while the embryos of many plants, together with numerous fully developed forms, are endowed with locomotive power by means of vibratile, hair-like processes called cilia. The distinctive points between animals and plants which are most to be relied on are those derived from the nature and mode of assimilation of the food. Plants feed on inorganic matters. consisting of water, ammonia, carbonic acid. and mineral matters. They can only take in food which is presented to them in a *liquid* or gaseous state. The exceptions to these rules are found chiefly in the case of plants which live parasitically on other plants or on animals. in which cases the plant may be said to feed on organic matters, represented by the juices of their hosts. Animals, on the contrary, require organized matters for food. They feed either upon plants or upon other animals. But even carnivorous animals can be shown to be dependent upon plants for subsistence, since the animals upon which Carnivora prey are in their turn supported by plants. Animals, further, can subsist on solid food in addition to liquids and gases; but many animals (such as the Tapeworms) live by the mere imbibition of fluids which are absorbed by their tissues, such forms possessing no distinct digestive system. Animals require a due supply of *waygen gas* for their sustenance, this gas being used in respiration. Plants, on the contrary, require carbonic acid. The animal exhales or gives out carbonic acid as the part result of its tissue-waste, while the plant taking in this gas is enabled to decompose it into its constituent carbon and oxygen. The plant retains the former for the uses of its economy, and liberates the oxygen, which is thus restored to the atmosphere for the use of the animal. Animals receive the food into the interior of their bodies, and assimilation takes place in their internal surfaces. Plants, on the other hand, receive their food into their external surfaces, and assimilation is effected in the external parts, as is exemplified in the leaf-surfaces, under the influence of sunlight. All animals possess a certain amount of heat or temperature which is necessary for the performance of vital action. The only classes of animals in which a constantly-elevated temperature is kept up are birds and mammals. The bodily heat of the former varies from  $100^{\circ}$  F. to  $112^{\circ}$  F., and of the latter from  $96^{\circ}$  F. to  $104^{\circ}$  F. The mean or average heat of the human body is about  $99^{\circ}$  F., and it never falls much below this in health. Below birds,

## Animal Chemistry

animals are named "cold-blooded;" this term meaning in its strictly physiological sense that their temperature is usually that of the medium in which they live, and that it varies with that of the surrounding medium. "Warmblooded" animals, on the contrary, do not exhibit such variations, but mostly retain their normal temperature in any atmosphere. The cause of the evolution of heat in the animal body is referred to the union (by a process resembling ordinary combustion) of the carbon and hydrogen of the system with the oxygen taken in from the air in the process of respiration.

Animal Chemistry, the department of organic chemistry which investigates the composition of the fluids and the solids of animals, and the chemical action that takes place in animal bodies. There are four elements, sometimes distinctively named organic elements, which are invariably found in living bodies; viz., carbon, hydrogen, oxygen, and nitrogen. To these may be added, as frequent constitu-ents of the human body, sulphur, phosphorus, lime, sodium, potassium, chlorine, and iron. The four organic elements are found in all the fluids and solids of the body. Sulphur occurs in blood and in many of the secretions. Phosphorus is also common, being found in nerves, in the teeth, and in fluids. Chlorine occurs almost universally throughout the body; lime is found in bone, in the teeth, and in the secretions; iron occurs in the blood, in urine, and in bile; and sodium, like chlorine, is of almost universal occurrence. Potassium occurs in muscles, in nerves, and in the blood corpus-Minute quantities of copper, silicon, cles. manganese, lead, and lithium are also found in the human body. The compounds formed in the human organism are divisible into the organic and inorganic. The most frequent of the latter is water, of which two thirds (by weight) of the body is composed. The organic compounds may, like the foods from which they are formed, be divided into the nitrogenous and non-nitrogenous. Of the former the chief are albumen (found in blood, lymph, and chyle), casein (found in milk), myosine (in muscle), gelatine (obtained from bone), and others. The non-nitrogenous compounds are represented by organic acids, such as formic, acetic, butyric, stearic, etc.; by animal starches, sugars; and by fats and oils, as stearine and olein.

Animalcule (an-i-mal'kūl), a general name given to many forms of animal life from their minute size. We thus speak of the Infusoria Animalcules among the Protozoa, of the Rotifera or Wheel Animalcules, etc., but the term is not now used in zoology in any strict significance, nor is it employed in classification.

Animal Intelligence.— In considering the intelligence of animals we must guard against errors resulting from reading human experiences into brute life. It is rather difficult to provide against this common mistake; but it makes results unreliable if we interpret the various expressions of animals in the light of human experiences alone.

#### Animal Intelligence

We gain the best conception of the mentality of animals by studying them from the point of view of the elements of mental life. What elements of consciousness are possessed by this or that animal, and what characteristics are absent that are so essential to human mind? Do all animals possess the same senses - seeing, hearing, smell, taste, temperature, touch. etc. — as do human beings? What can be said of their memory power? Do they form mental images? Have they the powers of judgment and comparison? Do they experience emotions such as anger, grief, joy? Are they able to reason? Let us consider some of these elements of mental life more particularly as being present or absent in the experiences of the lower animals.

SENSE POWERS.— The sense experiences constitute the most important of all the group of facts that go to make up mental life. The senses furnish the raw material for the mind to operate on in its acts of memory, imagination, judgment, comparison, reasoning, and the higher processes. What we remember depends upon what we have received through our senses. What we compare are the data gained from sense experiences of various sorts. We reason about material furnished the mind through the various avenues of sense.

TOUCH.— The various parts of the human body differ in the delicacy of the sense of touch. The red part of the lips, the finger tips, the tip of the tongue have a more delicate sense of touch than any other portion of the human body. The covering or skin of the various animals differs greatly in the delicacy of the tactile sense. In some animals special hairs are very delicate touch-organs, as in the whiskers of the cat and the long hair on the rabbit's lip. With the aid of these the rabbit can readily find the way to the burrow in the densest darkness: clip them off, and the poor animal is unable to find its way in the dark. The wing of the bat is very sensitive to touch. Through that sense alone the bat is able to direct its way while flying rapidly through the darkest caves. Many insects as well as the crustaceans are covered with a tough skin and sometimes with even a dense armor, and many would suppose that such creatures would be deprived of the sense of touch. But even in these animals the sense of touch is by no means absent. Seated on the tough skin are little hairs almost invisible, through the base of which a little delicate nerve passes through a very small perforation in the integument. These are very numerous in the end branches of the legs of many insects. It seems that even the lowest forms of animal life (the primitive amœba, for example) possess the sense of touch in a greater or less degree. And by the way, this is the most important sense of all those

with which even human beings are endowed. TEMPERATURE SENSE.—This is closely associated with the sense of touch. It has been shown by Goldscheider and others that there are on the skin of the human hand, for example, special points that are sensitive to heat and cold. These are called heat and cold spots. Neither the heat nor cold spots are sensitive to pressure, pain, touch, or any other stimulus. They are nervous end-organs set apart for the special service of the temperature sense. They are present in some of the lower animals.

TASTE. — This sense is brought into exercise by fluids coming into contact with special end-organs, like the taste bulbs located in the skin covering the tongue and palate of the human being. What is ordinarily called taste is really taste plus smell. If the nose be stopped so that air cannot pass over the olfactory end-organs, one cannot tell the taste of the scraped apple, pear, banana, peach, or onion from one another. These substances cannot be distinguished from each other by taste alone. Vanilla is almost absolutely tasteless, but is detected in the ice cream by its odor rather than taste. On the other hand quinine is absolutely odorless, but has a marked bitter Tastes are classified into sweet, sour, taste. salt, bitter, and alkaline.

In birds and reptiles the sense of taste is not very well developed. Parrots have the most delicate sense of taste of all the birds. A snake, when partially blind owing to a change of skin, will eat a piece of cloth as readily as a field mouse. In fishes the scales and skin are provided with sense organs that distinguish the taste of liquids. In he codfish these taste bulbs are located along the clearly marked lines on both its sides. Caterpillars refuse to eat certain herbs because of their bitter taste. Moisten the end of the legs (where the taste organs are located) of the cockroach with a bitter solution (quinine) and see how quickly he tries to get rid of it. Butterflies are delighted with sweetened water. Drop a little Epsom Salts into such a solution, and the poor butterfly spits and sputters and hastily leaves off his indulgence. Tempt bees with sugar, and they will rapidly congregate in great glee. Substitute powdered alum for the sugar, and they will become viciously angry. Mix strychnine and honey and offer it to a colony of ants. The smell of the honey will attract them, but when they begin to feed, the effect of the taste at once becomes evident.

SMELL.-In some of the lower animals this sense is exceedingly acute. See how the dog can track its master through the crowded street. Deer are also endowed with an exceedingly keen sense of smell. In birds this sense is but little developed. Even vultures cannot detect the presence of food when it is hidden from their sight. Reptiles likewise are very dull with respect to the sense of smell. Among the fishes the shark has a very keen sense of Deprive it of this sense, and it will smell. refuse to eat or move, but becomes perfectly helpless. The shark is so dependent on the sense of smell that it will starve when unable to exercise this sense, though food be placed immediately in front of it where it can be plainly seen. There is no doubt that insects possess the sense of smell in a marked degree. Dr. McCook introduced a little piece of blotting paper saturated with cologne water into

the neighborhood of a lot of pavement ants who were engaged in a flerce battle. The effect was immediate. They stopped fighting, The letting go of their enemies' legs and bodies at once. In insects the sense of smell is located in the extremity of the legs. Clip these off, and even the carrion fly will fail to discover the putrid flesh, its chosen morsel. Likewise as to the cockroach, bumble-bee, crawfish, and other animals. In the snail the sense of smell is located in the horns. In shell-fish it is found in the little seam of flesh near the parting of the shells. In worms it is located in little pits or depressions. Starfish can scent the oyster, its chosen article of food, at a distance of several hundred yards.

HEARING.— The horse and deer have the keenest sense of hearing. Some animals, such as the dog, will howl with misery when certain notes are struck; e. g., tenor D. Birds also have a very delicate sense of hearing. Note how the thrush listens for worms in the early summer morning. Observe also the astounding accuracy with which some birds imitate the songs of other birds. Fishes are especially dull as to the sense of hearing, though carp in the royal park at Potsdam, in Germany, come to be fed at the sound of a bell. But in this case it is not clearly proven that the person who came to feed them was hidden from sight. Even animals so low in the scale as jelly-fish and medusa have organs of hearing. Shell-fish also hear. In the lobster and crawfish the end-organs of hearing are found at the little ending branches of the leg. This is also the case with most insects. The capricorn beetle will, on hearing a sound, hold its antennules erect while intently listening for further developments. The mosquito hears by means of organs located in its hair-like legs. Some insects, the cricket, for example, can certainly hear sounds pitched higher than the compass of the human ear.

SIGHT.-In many animals the acuteness of vision is remarkable. Dogs can be taught to distinguish between variously colored cards. Insect-eating mammals have a well-developed color-sense. Bulls have a strong color antipathy. Birds have the keenest sense of vision of all the animals. The swift will detect the minute insects that constitute its food as they crawl on the ground below. Even barn-yard fowls will detect with astonishing accuracy the difference between sand grains and crumbs of food. At near distances certain reptiles see with remarkable clearness. The chameleon is a striking example. Also frogs and toads use a keen sense of vision in capturing the insects they eat. Fish seem to be unable to distinguish worms at a greater horizontal distance than four feet. Insects, especially those with compound eyes, can readily distinguish between colors. John Lubbock found that if he brought a bee to some honey on a glass placed on a bit of blue paper, having also placed about three feet away some honey on a bit of glass over yellow paper, no matter how often the papers were changed or where placed, the bee would always come to the bit of honey that

happened to be placed over the bit of blue paper. As Lubbock says, "No one can have the slightest doubt as to the bee accurately perceiving the difference between colors." The water flea always prefers the yellows and greens to the blues and reds. In worms, eyes are sometimes present, but more frequently they are absent. In starfish, eyes frequently occur. In medusa they are found on the margin of the umbrella. In most of them, however, sight means merely the ability to distinguish between light and darkness.

MUSCLE SENSE.—The muscle sense is well developed in most animals. That is also true of the organic sense of hunger and thirst. Some animals also possess the sense of rotation.

MEMORY.-Some persons are naturally slow, others quick, with respect to remembering and recalling past experiences. It does not follow that those who are slow are really inferior in mental power. Sharp, quick, ready boys and girls do not always make strong original thinkers. So some animals may seem to be very slow in exercising their powers of recollection, and yet stand rather high in the scale of intelligence. In the first place it should be noticed that with animals as with men, those ideas that are associated with some strong feeling of pleasure or pain-ideas that are tinged with emotionare those that are best remembered. Observation plainly shows that some animals have remarkably tenacious memories. Even a very young chick once being stung by a hive bee will ever after avoid taking a bee into its bill, in this way manifesting a memory similar to that of a child, who after having been burnt, avoids the fire. Darwin's dog recognized him on his return after a five years' voyage round the world. Some dogs learn rapidly, but soon forget the tricks one has taught them. Circustrained dogs are usually slow in learning, but are more valuable because they retain impressions so tenaciously. Captain Shipp gave an elephant a sandwich of cayenne pepper. He then waited six weeks before again visiting the animal, and when he went into the stable he began to fondle the elephant, as had always Watching his opportunity been his custom. the elephant filled his trunk with water, and seems to be an excellent example of definite memory of a specific occurrence.

**REASONING.**—Do animals reason? In attempting to answer this question we must clearly define what is meant by reasoning. As Morgan says, "If we apply the term 'reasoning' to that process by which an animal, profiting by experience adapts his actions to somewhat differing conditions, there can be no hesitation in saying that animals do reason." We are also warranted in going further. Animals also draw inferences. You may have seen the horse you were driving make a start forward as he hears the whip drawn from the socket; he has an image of the pain caused by the sting of the lash even before feeling it again, and infers that if he does not trot faster he will feel the painful cut of the whip. Is the process going on in the mind of the horse very different from that of the school-boy who hears his teacher take the whip from its resting place over the blackboard? See how quickly he leaves off his misdemeanor, turns round in his seat, sits erect, seemingly focuses his attention on his lesson and looks innocent. I remember, when yet a boy, of strolling one morning along the banks of the White River at Indianapolis. Soon I noticed that a blind horse had wandered into the river, and, getting beyond his depth, was in danger of drowning; for he could not tell in which direction the shore lay. Men planning to save him were seeking for boats and a rope with which to go to his rescue. At this juncture a saddle horse which had been left standing in front of a store near the bank, hearing the piteous sounds of the blind horse, galloped to the water's edge and then swam to the bewildered and struggling animal, taking hold of the mane with his teeth, led the sinking horse to the opposite bank where it was easier to land than at the one whence he had come. This seems to me a mental process very akin to reasoning in man.

The mental states of animals are more naive and not so interrelated and complex as our own, and can therefore be traced to their origin and sources much better and more readily than is possible with our own activities. Mr. Romanes records an interesting observation of which one of his dogs was the subject, and which, since it is typical of its kind, we may here briefly consider. The dog was cowed by the sound of apples being rolled on the floor of the loft above the stable; but when Mr. Romanes took the dog up into the loft and let him see what was going on, he seemed Mr. Romanes enters this under the heading, "Appreciation of cause by the dog." the dog really perceived the relation of causation as such, he had rational grounds for ceasing to be disquieted. Such illustrations as these, despite the severest criticism, seem to show a wonderful intelligence and even reasoning in animals. W. O. KROHN.

Animals, Cruelty to, an offense against which societies have been formed and laws passed in England and other countries. The American society for its prevention owes its existence to the lifelong endeavors of Henry Bergh.

Animal Worship, a practise found to prevail, or to have prevailed, in the most widely distant parts of the world, both the Old and the New, but nowhere to such an amazing extent as in ancient Egypt, notwithstanding its high civilization. Nearly all the more important animals found in the country were regarded as sacred in some part of Egypt, and the degree of reverence paid to them was such that throughout Egypt the killing of a hawk or an ibis, whether voluntary or not, was punished with death. The worship, however, was not, except in a few instances, paid to them as actual deities. The animals were merely regarded as sacred to the deities, and the worship paid to them was symbolical.

8

Anise (an is), an annual plant, a native of the Levant, and cultivated in Spain, France, Italy, Malta, etc., whence the fruit popularly called *aniseed*, is imported. It has an aromatic smell, and is largely employed to flavor liquors (aniseed or anisette), sweetmeats, etc. Staranise is the fruit of an evergreen Asiatic tree, and is brought chiefly from China. An essential oil is obtained from both kinds of anise, and is used in the preparation of cordials, for scenting soaps, etc.

Anjou (an-zhö), an ancient province of France, now forming the department of Maine-et-Loire, and parts of the departments of Indre-et-Loire, Mayenne, and Sarthe. Area about 3,000 sq. mi. In 1060 the province passed into the hands of the house of Gatinais, of which sprang Count Godfrey V who, in 1127, married Matilda, daughter of Henry I of England, and so became the ancestor of the Plantagenet kings. Anjou remained in the possession of the English kings up to 1204, when John lost it to the French king Philip Augustus. In 1226 Louis VIII bestowed this province on his brother Charles; but in 1328 it was remitted to the French crown. John I raised it to the rank of a ducal peerage, and gave it to his son Louis. Henceforth it re-mained separate from the French crown till 1480, when it fell to Louis XI.

Anna Comme'na (1083-1148), daughter of Alexius Comnenus I, Byzantine emperor. After her father's death she endeavored to secure the succession to her husband, Nicephorus Briennius, but was baffled by his want of energy and ambition. She wrote (in Greek) a life of her father Alexius, which, in the midst of much fulsome panegyric, contains some valuable and interesting information. She forms a character in Sir Walter Scott's. Count Robert of Paris.

Anna lvanov'na (1693-1740), empress of Russia; the daughter of Ivan, the elder halfbrother of Peter the Great. She was married in 1710 to the Duke of Courland, in the following year was left a widow, and in 1730 ascended the throne of the czars on the condition proposed by the senate, that she would limit the absolute power of the czars, and do nothing without the advice of the council composed of the leading members of the Russian aristocracy. But no sooner had she ascended the throne than she declared her promise null, and proclaimed herself autocrat of all the Russias. She chose as her favorite Ernest John von Biren (or Biron), who was soon all-powerful in Russia, and ruled with great severity. Several of the leading nobles were executed, and many thousand men exiled to In 1737 Anna forced the Courlanders Siberia. to choose Biren as their duke, and nominated him at her death regent of the empire during the minority of Prince Ivan (of Brunswick).

Annap'olis, capital of Maryland, on the Severn, near its mouth in Chesapeake Bay. It contains a college (St. John's), a state-house, and the U. S. naval academy. Pop. 7,604.

Annap'olis, a small town in Nova Scotia, on an inlet of the Bay of Fundy, with an im-

# Annealing

portant herring-fishery. It is one of the oldest European settlements in America, dating from 1604.

Ann Arbor, Washtenaw co., Mich., on Huron river, 38 mi. w. of Detroit. Railroads: Michigan Central; Ann Arbor Ry. Industries: furniture factory, three flouring mills, two agricultural implement works. Surrounding country agricultural. It is the seat of the University of Michigan. Pop. est. 1897, 13,000.

Annat'to (Arnot'to), an orange-red coloring matter, obtained from the pulp surrounding the seeds of a shrub native to tropical America, and cultivated in Guiana, St. Domingo, and the East Indies. It is sometimes used as a dye for silk and cotton goods though it does not produce a very durable color, but it is much used in medicine for tinging plasters and ointments, and to a considerable extent by farmers for giving a rich cofor to cheese.

Anne (1664-1714), Queen of Great Britain and Ireland, was born at Twickenham, near London. She was the second daughter of James II, then Duke of York, and Anne, his wife, daughter of the Earl of Clarendon. With her father's permission she was educated according to the principles of the English Church. In 1683 she was married to Prince George, brother to King Christian V of Denmark. On the arrival of the Prince of Orange in 1088, Anne wished to remain with her father: but she was prevailed upon by Lord Churchill (afterward Duke of Marlborough) and his wife to join the triumphant party. After the death of William III in 1702 she ascended the English throne. Her character was essentially weak, and she was governed first by Marlborough and his wife, and afterwards by Mrs. Masham. Most of the principal events of her reign are connected with the war of the Spanish Succession. The only important acquisition that England made by it was Gibraltar, which was captured in 1704. Another very important event of this reign was the union of England and Scotland under the name of Great Britain, which was accomplished in 1707. The reign of Anne was distinguished not only by the brilliant successes of the British arms, but also on account of the number of admirable and excellent writers who flourished at this time, among whom were Pope, Swift, and Anne bore her husband many chil-Addison. dren, all of whom died in infancy except one son, the Duke of Gloucester, who died at the age of twelve.

Annealing (an-ēl'ing), a process to which many articles of metal and glass are subjected after making, in order to render them more tenacious, and which consists in heating them and allowing them to cool slowly. When the metals are worked by the hammer, or rolled into plates, or drawn into wire, they acquire a certain amount of brittleness, which destroys their usefulness and has to be remedied by annealing. The tempering of steel is one kind of annealing. Annealing is particularly employed in glass-houses, and consists in putting the gluss vessels, as soon as they are formed and while they are yet hot, into a furnace or ٠,

oven, in which they are suffered to cool gradually. The toughness is greatly increased by cooling the articles in oil.

Annecy (an-sē), an ancient town in France, department of Haute-Savoie, 21 mi. s. of Geneva; manufactures of cotton, leather, paper, and hardware. Pop. 9,144.

Annel'ida, an extensive division or class of articulate animals, so called because their bodies are formed of a great number of small rings. The earth-worm, the lobworm, the nereis, and the leech belong to this division.

Anniston, a thriving town in Calhoun co., Ala., 15 mi. s.w. of Jacksonville. Iron mines and the works of the Woodstock Iron Co. are here. Pop. 9,876.

**Annobon'** (or Annobom), a beautiful Spanish island of western Africa, s. of the Bight of Biafra, about 4 mi. long by 2 mi. broad, and rising abruptly to the height of 3,000 feet, richly covered with vegetation. Pop. 3,000.

richly covered with vegetation. Pop. 3,000. Annonay (ån-o-nä), a town in southern France, department of Ardèche. 37 mi. s.s.w. of Lyons. It is the most important town of Ardèche, manufacturing paper and glove leather to a large extent, also cloth, felt, silk stuffs, gloves, hosiery, etc. There is an obelisk in memory of Joseph Montgolfier of balloon fame, a native of the town. Pop. 14,549.

Annu'ity, a sum of money paid annually to a person and continuing either a certain number of years, or for an uncertain period to be determined by a particular event, as the death of the recipient (or annuitant) or that of the party liable to pay the annuity; or the annu-ity may be perpetual. The payments are made at the end of each year, or semi-annually, or at other periods. An annuity is usually raised by the present payment of a certain sum as a consideration whereby the party making the payment, or some other person named by him, becomes entitled to an annuity, and the rules and principles by which this present value is to be computed have been the subjects of careful investigation. The present value of a perpetual annuity is evidently a sum of money that will yield an interest equal to the annuity, and payable at the same periods; and an annuity of this description, payable quarterly, will evidently be of greater value than one of the same amount payable annually, since the annuitant has the additional advantage of the interest on three of the quarterly payments until the expiration of the year. In other words, it requires a greater present capital to be put at interest to yield a given sum per annum, payable quarterly, than to yield the same annual sum payable at the end of each year. The present value of an annuity for a limited period is a sum which, if put at interest, will at the end of that period give an amount equal to the sum of all the payments of the annuity and interest; and accordingly, if it be proposed to invest a certain sum of money in the purchase of an annuity, for a given number of years, the comparative value of the two may be precisely estimated, the rate of interest being given. But annuities for uncertain periods,

and particularly life annuities, are more frequent, and the value of the annuity is computed according to the probable duration of the life by which it is limited. Such annuities are often created by contract, whereby the government or a private annuity office agrees, for a certain sum advanced by the purchaser, to pay a certain sum in yearly, quarterly, or other periodical payments, to the person advancing the money, or to some other named by him, during the life of the annuitant. Or the annuity may be granted to the annuitant during the life of some other person, or during two or more joint lives, or during the life of the longest liver or survivor among a number of persons named. If a person having a certain capital, and intending to spend this capital and the income of it during his own life, could know precisely how long he should live, he might lend this capital at a certain rate during his life, and by taking every year, besides the interest, a certain amount of the capital, he might secure the same annual amount for his support during his life in such manner that he should have the same sum to spend every year, and consume precisely his whole capital during his But since he does not know how long he life. is to live, he agrees with the government or an annuity office to take the risk of the duration of his life, and the office agrees to pay him a cer-tain annuity during his life in exchange for the capital which he proposes to invest in this The probable duration of his life therewav. fore becomes a subject of computation; and for the purpose of making this calculation, tables of longevity are made by noting the proportions of deaths at certain ages in the same country or district. In the U.S. the granting of annuities is conducted by private companies or corporations. The following are the approved rates of the best managed companies: In consideration of \$1,000 paid to a company the annuity granted to a person aged 40 would be \$52.75; aged 45, \$58.10; aged 50, \$64.70; uged 55, \$73.50; aged 60, \$86.20; aged 65, \$100; aged 70, \$123.45; aged 75, \$145.95; aged 80, \$180.15. The purchase of annuities. as a system, has never gained much foothold in the U.S.-the endowment plan of life insurance, by which after the lapse of a term of years the insured receives a sum in bulk, being preferred. In England the granting of annuities is conducted by the government.

An'ode, the positive pole of the voltaic current, being that part of the surface of a decomposing body which the electric current enters: opposed to *cathode*, the way by which it departs.

Anquetil - Duperron (ank-tēl-du-pā-ron), ABRAHAM HYACINTHE (1731-1805), a French Orientalist. His zeal for the Oriental languages induced him to set out for India, where he prevailed on some of the Parsee priests to instruct him in the Zend and Pehlevi and to give him some of the Zoroastrian books. In 1762 he returned to France with a valuable collection of MSS. In 1771 he published his Zend-Aresta, a translation of the Vendidad, and other sacred books, which excited great sensation. His knowledge of the Oriental languages was by no means exact.

Ans'gar (or Anshar) (801-865), called the "Apostle of the North," was born in Picardy, and took the monastic vows while still in his boyhood. In the midst of many difficulties he labored as a missionary in Denmark and Sweden; obtaining the reputation of having undertaken, if not the first, the most successful attempts for the propagation of Christianity in the North.

An'son, GEORGE, LORD (1697-1762). celebrated English navigator. He entered the navy at an early age and became a commander in 1722, and captain in 1724. His adventures and discoveries are described in the well-known Anson's Voyage, compiled from materials furnished by Anson.

Ansonia, New Haven co., Conn., on Naugatuck River, 12 mi. n.w. of New Haven. Railroads: Naugatuck and Berkshire division, consolidated system. Industries: iron foundry, brass and copper foundry, clock, eyelet, dial factories, and other smaller industries. Surrounding country agricultural. Was first settled about 1845 and became a city about 1890. Pop. est. 1897, 11,000.

Anspach (an'spah) (or Ansbach), a town in Bavaria, 24 mi. s.w. of Nürnberg. Anspach gave its name to an ancient principality or margravate, which had a territory of about 1,300 sq. mi., with 300,000 inhabitants, in the end of the eighteenth century. The last margrave sold his possessions in 1791 to Prussia. It was occupied by the French in 1806, and transferred by Napoleon to Bavaria. The town has manufactures of trimmings, buttons, straw-wares, etc. Pop. 14,195.

Ant, the common name of membranouswinged insects of various genera, found in most temperate and tropical regions. They are small but powerful insects, and have long been noted for their remarkable intelligence and interesting habits. They live in communities regulated by definite laws, each member of the society bearing a well-defined and separate part of the work of the colony. Each community consists of males; of females much larger than the males; and of barren females, otherwise called neuters, workers, or nurses. The neuters are wingless, and the males and females only acquire wings for their "nuptial flight," after which the males perish, and the few females which escape the pursuit of their numerous enemies, divest themselves of their wings, and either return to establish nests, or become the foundresses of new colonies. The neuters perform all the labors of the ant-hill or abode of the community; they excavate the galleries, procure food, and feed the larvæ or young ants, which are destitute of organs of motion. In fine weather they carefully convey them to the surface for the benefit of the sun's heat, and as attentively carry them to a place of safety either when bad weather is threatened, or the ant-hill is disturbed. In like manner they watch over the safety of the nymphs or pupze about to

acquire their perfect growth. Some communities possess a special type of neuters, known as "soldiers," from the duties that especially fall upon them, and from their powerful biting jaws. There is a very considerable variety in the materials, size, and form of ant-hills, or nests, according to the peculiar nature or instinct of the species. Most of American ants form nests in woods, fields, or gardens, their abodes being generally in the form of small mounds rising above the surface of the ground and containing numerous gal-leries and apartments. Some excavate nests in old tree trunks. Houses built by the common wood-ant are frequently as large as a small hay-cock. Some ants live on animal food, very quickly picking quite clean the skeleton of any dead animal they may light on. Others live on saccharine matter, being very fond of the sweet substance called honeydew, which exudes from the bodies of Aphi-des, or plant-lice. These they sometimes keep in their nests, and sometimes tend on the plants where they feed; sometimes they even superintend their breeding. By stroking the Aphides with their antennæ they cause them to emit the sweet fluid, which the ants then greedily sip up. Various other insects are looked after by ants in a similar manner, or are found in their nests. It has been observed that some species, like the Sanguinary Ant, resort to violence to obtain working ants of other species for their own use, plundering the nests of suitable kinds of their larvæ and pupie, which they carry off to their own nests to be carefully reared and kept as slaves. In temperate countries male and female ants survive, at most, till autumn, or to the commencement of cool weather, though a very large proportion of them cease to exist long previous to that time. The neuters pass the winter in a state of torpor, and of course require no food. The only time when they require food is during the season of activity, when they have a vast number of young to feed. Some ants of Southern Europe feed on grain, and store it up in their nests for use when required. Some species have stings as weapons, others only their powerful mandibles, or an they can emit. The name ant is also given to the neuropterous insects otherwise called Termites.

There is a family of ants which pays particular funeral honors to the dead. Whenever one of their number is found dead the whole number of occupants of the ant-hill is notified, and they turn out *en masse* to convey the deceased member to his last resting-place. They proceed slowly two-by-two to the place where the dead is lying. Two ants take up the dead one and march off, followed by two others as mourners. These two empty-handed followers relieve their fellows in advance, the latter following behind in the place of those who relieve them, continuing to alternate from time to time. When they have reached the place of burial, about half the number take part in digging the grave. The dead body is

## Antæus

laid in and the other half of the ants cover it up. In one instance which was observed, about a half dozen ants did not take part in the ceremonies, standing idly by, and on these the others fell and killed them, and buried them, not in separate graves, but all in one large pit. The ants then all paired off, marched back to the place where they found the dead, and after a few minutes, retired to their own habitations.

There is another peculiar ant known as the umbrella or parasol ant on account of the curious habit it has of carrying a leaf in its mouth. The stem of the leaf is held in the

Umbrella Ant.

mouth, and the palm extends back over the head. These leaves are employed in house building. In the accompanying illustration is shown an umbrella ant on the march.

Antæ'us, the giant son of Poseidon (Neptune) and Gö (the Earth), who was invincible so long as he was in contact with the earth. Heracles (Hercules) grasped him in his arms and stifled him suspended in the air.

Antananarivo (an-tan-an-a- $r\bar{e}' - v\bar{o}$ ), the capital of Madagascar. It contained two royal palaces, immense timber structures, one of which has been lately surrounded with a massive stone veranda with lofty corner towers. It has manufactures of metal work, cutlery, silk, etc., and exports sugar, soap, and oil. Pop. about 100,000.

Antarctic (ant-ürk'tik), relating to the southern pole or to the region near it. The Antarctic Circle is a circle parallel to the equator and distant from the south pole 23° 28', marking the area within which the sun does not set when on the Trapic of Capricorn. The Antarctic Circle has been arbitrarily fixed on as the limits of the Antarctic Ocean, it being the average limit of the pack-ice; but the name is often extended to embrace a much wider area. The lands in or near the Antarctic Circle are but imperfectly known, the work of exploration having been hitherto baffied by what seems an unsurmountable ice-barrier. Sir James Ross reached the highest south latitude yet attained in 1841-42, discovering Victoria Land, with its volcanoes, Erebus (12,400

## Antennæ

ft.) and Terror (10,900 ft.). The South Shetland Islands, Enderby Land, Graham's Land, etc., have also been discovered in this ocean.

Ant-eater, a name given to mammals of various genera that prey chiefly on ants, but usu-

Great Ant-eater.

ally confined to one genus of the toothless order. In this genus the head is remarkably elongated, the jaws destitute of teeth, and the mouth furnished with a long extensile tongue covered with glutinous saliva, by the aid of which the animals secure their insect prey. The eyes are particularly small, the ears short and round, and the legs, especially the anterior, very robust, and furnished with long, compressed, acute nails, admirably adapted for breaking into the ant-hills. The most remarkable species is the ant-bear, a native of the warmer parts of South America. It is from 4 to 5 feet in length from the tip of the muzzle to the origin of the black bushy tail, which is about two feet long. The body is covered with long hair, particularly along the neck and back. It is a harmless and solitary animal, and spends most of its time in sleep. Some are adapted for climbing trees in quest of the insects on which they feed, having prehensile tails. All are natives of South America. The name ant-eater is also given to The the pangolins and to the aardvark. echidna of Australia is sometimes called porcupine ant-eater.

An'telope, the name given to the members of a large family of Mammalia, closely resembling the deer in general appearance, but essentially different in nature from the latter animals. They are included with the sheep and oxen in the family of the Cavicornia or "hollow-horned" ruminants. Their horns, unlike those of the deer, are not deciduous, but are permanent; are never branched, but are often twisted spirally, and may be borne by both sexes. They are found in greatest number and variety in Africa. Well-known species are the chamois (European), the gazelle, the addax, the eland, the koodoo, the gnu, the springbok, the sasin or Indian antelope, and the prongbuck of America.

Antennæ (or feelers), the anterior appendages on the head of crustaceans, insects, and myriapods. The lobster has two pairs of feelers, while insects and myriapods have only one pair. The name may also be applied to sensory processes on the head of some marine worms. They are really "head-legs" modified for sensory purposes, and consist of a long

#### Antequera

series of joints, sometimes over 100 in number. They are supplied with nerve branches, and are used by the animals for feeling their way, for testing surrounding objects, and apparently for communicating with one another. The olfactory function of the antennæ of the cockroach has been demonstrated, but some insects can smell their food even when robbed of their feelers. The smelling bristles of the blowfly occur very abundantly on the third

Various Forms of Antennæ.

joint of the antennæ. Peculiar sensory cones and knobs occur on the antennæ of some myriapods. The small antennæ of the lobster bear olfactory bristles, and have an ear lodged at the base. And in short there are numerous observations to justify the general statement that in many cases the antennæ are sensitive to smell, sound, and probably taste. Deprived of its antennæ, an ant, for instance, is peculiarly helpless.

Antequera (ån-te-kā'rå), a city of Andalusia, in Spain, in the province of Malaga, a place of some importance under the Romans, with a ruined Moorish castle. Manufactures of woolens, leather, soap, etc. Pop. 27,201.

Ant'eros, in Greek mythology, the god of mutual love. According to some, however, Anteros is the enemy of love, or the god of antipathy; he was also said to punish those who did not return the love of others.

Anthe' mius, a Greek mathematician and architect of Lydia; designed the church of St. Sophia at Constantinople, and is credited with the invention of the dome; d. A. D. 534.

Anthol'ogy, the name given to several collections of short poems which have come down from antiquity. The first who compiled a Greek Anthology was Meleager, a Syrian, about 60 B. c. Later collections are that of Constantine Cephalas, in the tenth century, and that of Maximus Planudes, in the fourteenth century. There are also Arabic, Persian, Turkish, etc., anthologies.

An'thon, CHARLES, LL.D. (1797-1867), an American editor of classical school-books, and of works intended to facilitate the study of Greek and Latin literature. He was long a professor in Columbia College, New York.

An'thony, HENRY BOWEN (1815-1884), born in Coventry, R. I. He graduated in 1833 at Brown University, and edited the Providence Journal from 1838 to 1859. He was governor of Rhode Island, 1849-1851, and in 1859 was elected as a Republican to the U. S. Senate. He was four times re-elected to the Senate, and was chosen president pro tem. of that body in 1803, 1869, and 1871.

An'thony, SUSAN B., b. 1820, in South Adams, Mass.; became an anti-slavery and totalabstinence orator and an advocate of female suffrage.

An thracite, glance or blind coal, a nonbituminous coal of a shining luster, approaching to metallic, and which burns without smoke, with a weak or no flame, and with intense heat. See *Coal*.

An'thrax, a fatal disease to which cattle, horses, sheep, and other animals are subject, always associated with the presence of an extremely minute micro-organism in the blood. It frequently assumes an epizootic form, and extends over large districts, affecting all classes of animals which are exposed to the exciting causes. It is also called splenic fever, and is communicable to man, appearing as carbuncle, malignant pustule, or woolsorter's disease.

Anthropoid Apes, the highest and most manlike monkeys, including Gorilla, Chimpanzee, Orang-utan, Gibbon, and several other species. described by the They are technically Linnæan title Anthropomorpha, and readily distinguished, as tailless, semi-erect, and long-armed, from the dog-like apes, which have also a narrow partition between the nos-trils, and also inhabit the Old World. With the decidedly lower flat-nosed New-World monkeys, there is no possibility of confusion. The anthropoid apes are all arboreal, and inhabit Africa, Southeastern Asia, and the Malay Archipelago. In all, about a dozen species have been described with more or less definiteness. The family is of special interest and importance in connection with the views held by evolutionists as to the descent of man. It is recognized by anatomists that all the attempts to establish a fundamental distinction, on anatomical grounds, between the physical structure of the higher apes and that of man are futile. Generic differences, indeed, there are in abundance, but these establish only a difference of degree, and not of kind. Thus, in man, the great toe is not opposable to the others for grasping purposes, the angle between the face and the top of the skull does not exceed 120°, the teeth form an uninterrupted series, and so on; while the strong spines on the back of the gorilla's neck, the very marked eyebrow ridges in gorilla and chimpanzee, the especially long arms of the gibbon, and the protruding jaws of all the anthropoids, are equally characteristic adaptations to different ways of life. Even in the minutiæ of blood-vessels, muscles, nerves, and brain-convolutions, impartial observers have

#### Authropology

demonstrated the closest resemblance. The difference of structure between the lowest monkeys and the higher are far greater than those between man and any anthropoid ape, the resemblance being especially obvious when young forms are compared. In their expressions of cerebral activity, whether intellectual or emotional, the anthropoids come in some respects very near the lowest human tribes,

On the other hand, while it is impossible to establish any fundamental distinction in physical structure between Homo and the Anthropomorpha, there is among evolutionists an equal consensus of opinion as to the impossi-

#### Antigonus

bolical, mentioned or alluded to in various other passages both of the Old and New Testament

Anticos'ti, an island of Canada, in the mouth of the St. Lawrence, 125 mi. long by 30 mi. broad. The interior is mountainous and wooded, but there is much good land, and it is well adapted for agriculture. The fisheries are valuable. The population is scanty, however.

Antietam (an-tē'tam), a small stream in Maryland which falls into the Potomac about 50 mi. n.w. of Washington; scene of a battle between the Federal and Confederate armies, Sept. 17, 1862. The Union army numbered

Skeletons of Anthropoid Apes Compared with that of Man-

bility of regarding an ape of any existing anthropoid species as in the direct line of human ancestry. As regards brain-structure, the most man-like ape is the orang, while the chimpanzee has the most closely related skull, the gorilla the most human feet and hands, the gibbon the most similar chest. The study of anthropoid fossils has not yet discovered the remains of any form which can be accepted as the "missing link," although extinct anthropoids, such as Dryopithecus, unquestionably serve to lessen the distance to be bridged over.

Anthropol'ogy, the science of man and mankind, including the study of man's place in nature, that is, of the measure of his agreement with and divergence from other animals; of his physical structure and psychological nature, together with the extent to which these act and react on each other; and of the various tribes of men, determining how these may have been produced or modified by external conditions, and consequently taking account also of the advance or retrogression of the human race. It puts under contribution all sciences which have man for their object, as archæology, comparative anatomy, physiology, psychology, climatology, etc. See Ethnology.

An'tichrist, a word occurring in the first and second epistles of St. John, and nowhere else in Scripture, in passages having an evident reference to a personage, real or sym87,000 under General McClellan while Gen. R. E. Lee commanded some 70,000 Confederate soldiers. After two days' fighting the Confederates asked for an armistice to bury their dead and then retreated across the Potomac. The Union loss was about 12,500 killed, wounded, and missing, while the Confederates, having the advantage of shelter in the woods, lost about 9,000.

'Antifriction Metal, a name given to various alloys of tin, zinc, copper, antimony, lead, etc., which oppose little resistance to motion, with great resistance to the effects of friction, so far as concerns the wearing away of the surfaces of contact. Babbitt's metal (50 parts tin, 5 antimony, 1 copper) is one of them.

Antigone (an-tig'o-nē), in Greek mythology, the daughter of Ædipus and Jocasta, celebrated for her devotion to her father and to her brother Polynices, for burying whom, against the decree of King Creon, she suffered death. She is heroine of Sophocles's Ædipus at Colonus and his Antigone; also of Racine's tragedy, Les Freres Ennemis.

**Antig** onish, a town in the e. of Nova Scotia, in county of the same name; the seat of a Roman Catholic bishop, with a cathedral, a college, and a good harbor. Pop. 3,500.

Antig'onus, one of the generals of Alexander the Great, born about 382 B. c. After the death of Alexander. Antigonus obtained Greater Phrygia, Lycia, and Pamphylia as his dominion. Ptolemy, Cassander, and Lysimachus, alarmed by his ambition, united themselves against him; and a long series of contests ensued in Syria, Phœnicia, Asia Minor, and Greece, ending in 301 B. c. with the battle of Ipsus in Phrygia, in which Antigonus was defeated and slain.—ANTIGONUS GON'ATAS, son of Demetrius Poliorcētēs, and grandson of the above, succeeded his father in the kingdom of Macedon and all his other European dominions; died after a reign of forty-four years, B. c. 239.

Antigua (an-tē'ga), one of the British West Indies, the most important of the Leeward group. Area 108 sq. mi. Discovered by Columbus, 1493. Its shores are high and rocky: the surface is varied and fertile. The capital, St. John, the residence of the governor of the Leeward Islands, stands on the shore of a well-sheltered harbor in the n. w. part of the island. The staple articles of export are sugar, molasses, and rum. Pop. (including Barbuda), 34,904.

Anti-Lebanon, the eastern of the two parallel ranges known as the Mountains of Lebanon in Palestine.

An' timony, a brittle metal of a bluish-white or silver-white color, and a crystalline or laminated structure. It melts at  $842^{\circ}$  F., and burns with a bluish-white flame. The mineral called stibuite or antimony-glance, is a tri-sulphide, and is the chief ore from which the metal is obtained. It is found in many places, including Mexico, France, Spain, Hungary, Italy, Canada, Australia, and Borneo. The metal, or as it was formerly called, the regulus of antimony, does not rust or tarnish when exposed to the air. When alloyed with other metals it hardens them, and is therefore used in the manufacture of alloys, such as Britannia-metal, type-metal, and pewter. In bells it renders the sound more clear; it renders tin more white and sonorous as well as harder, and gives to printing types more firmness and smoothness. The salts of antimony are very poisonous. The protoxide is the active base of tartar emetic and James's powder, and is justly regarded as a most valuable remedy in many diseases. *Yellow antimony* is a preparation of antimony of a deep yellow color, used in enamel and porcelain painting. It is of various tints, and the brilliancy of the brighter hues is not affected by foul air.

Antino' mianism ("opposition to the law"), the name given by Luther to the inference drawn by John Agricola from the doctrine of justification by faith, that the moral law is not binding on Christians as a rule of life. The term antinomian has since been applied to all doctrines and practises which seem to condemn or discountenance strict moral obligations. The Lutherans and Calvinists have both been charged with antinomianism; the former on account of their doctrine of justification by faith, the latter both on this ground and that of the doctrine of predestination. The charge is, of course, vigorously repelled by both.

Antinous (an-tin'o-us), a young Bithynian whom the extreme love of Hadrian has immortalized. He drowned himself in the Nile in 122 A. D. Hadrian set no bounds to his grief for his loss. He gave his name to a newlydiscovered star, erected temples to his honor, called a city after him, and caused him to be adored as a god throughout the empire. Statues, busts, etc., of him are numerous.

Antioch (an'ti-ok), a famous city of aucient times, the capital of the Greek kings of Syria, on the left bank of Orontes, about 21 mi. from the sea, in a beautiful and fertile plain; founded by Seleucus Nicator in 300 B. c., and named after his father Antiochus. In Roman times it was the seat of the Syrian governors, and the center of a widely-extended commerce. It was called the "Queen of the East," and "The Beautiful." Antioch is frequently mentioned in the New Testament, and it was here that the disciples of our Saviour were first called Christians (Acts 11:26). In the first half of the seventh century it was taken by the Saracens, and in 1098 by the Crusaders. They established the principality of Antioch, of which the first ruler was Bohemond, and which lasted till 1268, when it was taken by the Mameluke sultan of Egypt. In 1516 it passed into the hands of the Turks. The modern Antioch, or Antakieh, occupies but a small portion of the site of the ancient Antioch. Pop. est. 10,000. There was another Antioch, in Pisidia, at which Paul preached on his first missionary journey

Antiochus (an-ti'o-kus), a name of several Græco-Syrian kings of the dynasty of the Seleusidie, who reigned B. c. 324-164.

Antioquia (ån-tē-ō-kē'à), a town of South America, in Colombia, on the River Cauca; founded in 1542. Pop. 10,000. It gives name to a department of the republic. Area 22,316 sq. mi.; pop. 365,974. Capital, Medellin.

Antip'ater, a general and friend of Philip of Macedon, father of Alexander the Great. On the death of Alexander, in 323 B. C., the regency of Macedonia was assigned to Antipater, who succeeded in establishing the Macedonian rule in Greece on a firm footing. He died in B. C. 317 at an advanced age.

An'tiphon, a Greek orator, born near Athens; founder of political oratory in Greece. His orations are the oldest extant, and he is said to have been the first who wrote speeches for hire. He was put to death for taking part in the revolution of B. c. 411, which established the oligarchic government of the Four Hundred.

An'tipope, the name applied to those who at different periods have produced a schism in the Catholic Church by opposing the authority of the pope, under the pretense that they were themselves popes. The Roman Church cannot admit that there ever existed two popes; but the fact is, that in several cases both competitors for the papal chair (sometimes there were three or even four) were equally popes; that is to say, the claims of all were equally good. Each was frequently supported by whole nations, and the schism was nothing but the struggle of political interests, which induced particular governments to support a pope

against the pope supported by other governments. The greatest schism of this kind lasted for fifty years - 1378-1429.

Antisana (ån-tē-sä'nå), a volcano in the Andes of Ecuador, 35 mi. e.s.e. of Quito. Whymper, who ascended it in 1880, makes its height 19,260 feet.

Antiseptic (to rot), an agent by which the putrefaction of vegetable or animal matter is prevented or arrested. There are a great number of substances having this preservative property, among which are salt, alcohol, vegetable charcoal, creosote, corrosive sublimate, tannic acid, sulphurous acid, sulphuric ether, chloroform, arsenic, wood-spirit, aloes, camphor, benzine, aniline, etc. The packing of fish in ice, and the curing of herring and other fish with salt, are familiar antiseptic The different antiseptics act in processes. different ways. The term is applied in a specific manner to that mode of treatment in surgery by which air is excluded from wounds, or allowed access only through substances capable of destroying the germs in the atmosphere on whose presence suppuration is assumed to depend.

Ant-lion, the larva of a Neuropterous insect which in its perfect state greatly resembles a dragon-fly; curious on account of its ingenious method of catching the insects — chiefly ants — on which it feeds. It digs a funnel-shaped hole in the driest

#### Ant-lion.

and finest sand it can find, and when the pit is deep enough, and the sides are quite smooth and sloping, it buries itself at the bottom with ouly its formidable mandibles projecting, and waits till some luckless insect stumbles over the edge, when it is immediately seized, its juices sucked, and the dead body jerked from the hole.

Antofagas'ta, a Chilean seaport on the Bay of Morena; and a territory of the same name recently taken from Bolivia. The territory has an area of 60,988 sq. mi., and a pop. of 21,213. The port is connected by railway with the silver mines of Caracoles, and

#### Antoninus

exports silver, copper, cubic niter, etc. Pop. 7,946.

Antoinette (ån-twå-net), MARIE (Marie Antoinette Joseph Jeanne de Lorraine) (1755-1793), Archduchess of Austria and Queen of France, the youngest daughter of the Emperor Francis I and of Maria Theresa, was born at Vienna, executed at Paris. She was married at the age of fifteen to the Dauphin, afterward Louis XVI, but her manners were ill-suited to the French court, and she made many enemies among the highest families by her contempt for its ceremonies, which excited her ridicule. The freedom of her manners, indeed, even after she became queen, was a cause of scandal. The extraordinary affair of the diamond necklace, in which the Cardinal Louis de Rohan, the great quack Cagliostro, and a cer-tain Countess de Lamotte were the chief actors, tarnished her name, and added force to the calumnies against her. Though it was proved in the examination which she demanded that she had never ordered the necklace, her enemies succeeded in casting a stigma on her, and the credulous people laid every public disaster to her charge. There is no doubt she had great influence over the king, and that she constantly opposed all measures of reform. The enthusiastic reception given her at the guard's ball at Versailles on Oct. 1, 1789, raised the general indignation to the highest pitch, and was followed in a few days by the insurrection of women, and the attack on Versailles. When practically prisoners in the Tuileries it was she who advised the flight of the royal family in June, 1791, which ended in their capture and return. On Aug. 10, 1792, she heard her husband's deposition pronounced by the Legislative Assembly, and ac-companied him to the prison in the Temple, where she displayed the magnanimity of a heroine and the patient endurance of a martyr. In January, 1793, she parted with her husband who had been condemned by the Convention; in August she was removed to the Conciergerie; and in October she was charged before the revolutionary tribunal with having dissipated the finances, exhausted the treasury, corresponded with the foreign ene-mies of France, and favored the domestic foes of the country. She defended herself with firmness, decision, and indignation; and heard the sentence of death pronounced with perfect calmness — a calmness which did not forsake her when the sentence was carried out the following morning. Her son, eight years of age, died shortly afterward, as was generally believed by poison, and her daughter was suffered to quit France, and afterward married her cousin, the Duke of Angoulême.

Antonell'o (of Messina), an Italian painter who died in the end of the sixteenth century, and is said to have introduced oil-painting into Italy (at Venice), having been instructed in it by John Van Eyck.

Antoni nus, Wall of, a barrier erected by the Romans across the isthmus between the Forth and the Clyde, in Scotland, in the reign of Antoninus Pius. Its whole length exceeded 27 miles. It may still be traced at various points, and is commonly known as *Graham's Dyke*.

Antoni'nus Plus, TITUS AURELIUS FULVUS (86-161 A. D.), Roman emperor. In A. D. 120 he became consul, and he was one of the four persons of consular rank among whom Hadrian divided the supreme administration of Italy. He then went as proconsul to Asia. In A. D. 138 he was selected by that emperor as his successor, and the same year he as-cended the throne. The persecutions of the Christians he speedily abolished. He carried on but a few wars. In Britain he extended the Roman dominion, and by raising a new wall put a stop to the invasions of the Picts and Scots. The senate gave him the surname *Pius*, that is, dutiful or showing filial affection, because to keep alive the memory of Hadrian he had built a temple in his honor. He was succeeded by Marcus Aurelius, his adopted son.

Antony, MARK (Marcus Antonius) (B. C. 83-30), Roman triumvir, was connected with the family of Cæsar by his mother. Debauchery and prodigality marked his youth. To escape his creditors he went to Greece in 58, and from thence followed the consul Gabinius on a campaign in Syria as commander of the cavalry. He served in Gaul under Cæsar in 52 and 51. In 50 he returned to Rome to support the interests of Cæsar against the aristocratical party headed by Pompey, and was appointed tribune. When war broke out between Cæsar and Pompey, Antony led reinforcements to Cæsar in Greece, and in the battle of Pharsalia he commanded the left wing. He afterward returned to Rome with the appointment of master of the horse and governor of Italy (47). In B. c. 44 he became Cæsar's colleague in the consulship. Soon after, Cæsar was assassinated, and Antony would have shared the same fate had not Brutus stood up in his behalf. Antony, by the reading of Cæsar's will, and by the oration which he delivered over his body, excited the people to anger and revenge, and the murderers were obliged to flee. After several quarrels and reconciliations with Octavianus, Cæsar's heir, Antony departed to Cisalpine Gaul, which province had been conferred upon him against the will of the senate. But Cicero thundered against him in his famous Philippics; the senate declared him a public enemy, and intrusted the conduct of the war against him to Octavianus and the consuls Hirtius and Pansa. After a campaign of varied fortunes Antony fled with his troops over the Alps. Here he was joined by Lepidus. who commanded in Gaul, and through whose mediation Antony and Octavianus were again reconciled. It was agreed that the Roman world should be divided among the three conspirators, who were called triumvirs. Antony was to take Gaul; Lepidus, Spain; and Oc-tavianus, Africa and Sicily. They decided upon the proscription of their mutual enemies, each giving up his friends to the others, the most celebrated of the victims being Cicero the orator. Antony and Octavianus departed

in 42 for Macedonia, where the united forces of their enemies, Brutus and Cassius, formed a powerful army, which was, however, speedily defeated at Philippi. Antony next visited Athens, and thence proceeded to Asia. In Cilicia he ordered Cleopatra, queen of Egypt, to apologize for her insolent behavior to the triumviri. She appeared in person, and her charms fettered him forever. He followed her to Alexandria, where he bestowed not even a thought upon the affairs of the world, till he was aroused by a report that hostilities had commenced in Italy between his own relatives and Octavianus. A short war followed, which was decided in favor of Octavianus before the arrival of Antony in Italy. A reconciliation was effected, which was sealed by the marriage of Antony with Octavia, the sister of Octavianus. A new division of the Roman dominions was now made (in 40), by which Antony obtained the east, and Octavianus the west. After his return to Asia, Antony gave himself up entirely to Cleopatra, assuming the style of an eastern despot, and so alienating many of his adherents and embittering public opinion against him at Rome. At length war was declared at Rome against the queen of Egypt, and Antony was deprived of his consulship and government. Each party assembled its forces, and Antony lost, in the naval battle at Actium (B. C. 31), the dominion of the world. He followed Cleopatra to Alexandria, and on the arrival of Octavianus, his fleet and cavalry deserted, and his infantry was defeated. Deceived by a false report which Cleopatra had disseminated of her death, he fell upon his own sword.

An 'trim, a county of Ireland, province of Ulster, in the n.e. of the island. Area 762,080 acres, of which about a third are arable. A range of basaltic strata stretches along the northern coast, of which the celebrated Giant's Causeway is the most remarkable portion. The spinning of linen and cotton yarn, and the weaving of linen and cotten are the staple manufactures. The principal towns are Belfast, Ballymena, and Larne. Pop. 427,968.— The town of Antrim, at the north end of Lough Neagh, is a small place with a population of 2,020.

Ant' werp, the chief port of Belgium, and the capital of a province of the same name, on the Scheldt, about 50 miles from the open sea. It is strongly fortified, being completely surrounded on the land side by a semicircular inner line of fortifications, the defenses being completed by an outer line of forts and outworks. The cathedral, with a spire 400 feet high, one of the largest and most beautiful specimens of Gothic architecture in Belgium, contains Rubens's celebrated masterpieces— the Descent from the Cross, the Elevation of the Cross, and The Assumption. The other churches of note are St. James's, St. Andrew's, and St. Paul's, all enriched with paintings by Rubens, Vandyck, and other masters. The harbor accommodation is extensive. The shipping trade has greatly advanced in recent times, and is now very large, the goods being

largely in transit. There are numerous and varied industries. Antwerp is mentioned as early as the eighth century. In the sixteenth century it is said to have had a population of 200,000. The wars between the Netherlands and Spain greatly injured its commerce, which was almost ruined by the closing of the navigation of the Scheldt in accordance with the peace of Westphalia (1648). It is only in the present century that its prosperity has revived. Pop. 204,498. The province consists of a fertile plain 1,100 sq. mi. in area, and has a population of 652,061.

Anu bis, one of the deities of the ancient Egyptians, the son of Osiris by Isis. His office was to conduct the souls of the dead from this world to the next.

Anvil, an instrument on which pieces of metal are laid for the purpose of being ham-mered. The common smith's anvil is generally made of seven pieces; namely, the core or body; the four corners for the purpose of enlarging its base; the projecting end, which contains a square hole for the reception of a set or chisel to cut off pieces of iron; and the beak or conical end, used for turning pieces of iron into a circular form, etc. These pieces are each separately welded to the core and hammered so as to form a regular surface with the whole. When the anvil has received its due form, it is faced with steel, and is then tempered in cold The smith's anvil is generally placed water. loose upon a wooden block. The anvil for heavy operations, such as the forging of ordnance and shafting, consists of a huge iron block deeply imbedded, and resting on piles of masonry

Aor'ta, in anatomy, the great artery or trunk of the arterial system, proceeding from the left ventricle of the heart, and giving origin to all the arteries except the pulmonary. It first rises toward the top of the breast-bone, when it is called the *ascending aorta*; then makes a great curve, called the transverse or

great arch of the aorta, whence it gives off branches to the head and upper extremities; thence proceeding toward the lower extremities, under the name of the descending aorta, it gives off branches to the trunk; and finally divides into the two iliacs, which supply the pelvis and lower extremities.

Apaches (a-pä' chez), a warlike race of Indians inhabiting Arizo-

Apache.

inhabiting Arizona, New Mexico, and the northern states of Mexico. Ages ago they migrated from the vicinity of the Great Slave Lake in Canada: they have become the veritable Ishmaels of the West. For years they carried on a guerrilla warfare with settlers and troops. Their leader, Geronimo, was captured by General Miles and with other hostiles, kept as prisoners of war. Civilization is slowly benefiting the-Apaches on the San Carlos and White Mountain reservations in Arizona. One highly educated Apache, Antonio Apache, was one of the officials of the department of anthropology at the World's Columbian Exposition in Chicago, 1803.

Ap'atite, a translucent but seldom transparent mineral, a compound of phosphate of lime with fluoride and chloride of calcium. It occurs principally in primitive rocks and in veins, extensive deposits being found in all parts of the world. It is now largely utilized as a source of artificial phosphate manures.

Ape, a common name of a number of quadrumanous animals inhabiting the Old World (Asia and the Asiatic islands, and Africa), and including a variety of species. The word ape was formerly applied indiscriminately to all quadrumanous mammals; but it is now limited to the anthropoid or man-like monkeys. The family includes the chimpanzee, gorilla, orangoutang, etc.

Apelles (a-pel'ez), the most famous of the painters of ancient Greece and of antiquity, was born in the fourth century B. C., probably at Colophon. Ephorus of Ephesus was his first teacher, but attracted by the renown of the Sicyonian school he went and studied at Sicyon. In the time of Philip he went to Macedonia, and there a close friendship between him and Alexander the Great was established. The most admired of his pictures was that of Venus rising from the sea and wringing the water from her dripping locks. His portrait of Alexander with a thunderbolt in his hand was no less celebrated. His renown was at its height about B. c. 330, and he died about the end of the century. Among the anecdotes told of Apelles is the one which gave rise to the proverb, "Let not the shoemaker go beyond his shoe." Having heard a cobbler point out an error in the drawing of a shoe in one of his pictures he corrected it, whereupon the cobbler took upon him to criticise the leg, and received from the artist the famous reply.

Ap ennines, a prolongation of the Alps, forming the "backbone of Italy." The average height of the mountains composing the range is about 4,000 feet, and nowhere do they reach the limits of perpetual snow, though some summits exceed 9,000 feet in height. They consist almost entirely of limestone rocks, and are exceedingly rich in the finest marbles. On the south slopes volcanic masses are not uncommon. Mount Vesuvius, the only active volcano on the continent of Europe, is an instance. The lower slopes are well clothed with vegetation, the summits are sterile and bare.

Apha'sia, in pathology, a symptom of certain morbid conditions of the nervous system, in which the patient loses the power of expressing ideas by means of words, or loses the

appropriate use of words, the vocal organs the while remaining intact and the intelligence sound. There is sometimes an entire loss of words as connected with ideas, and sometimes only the loss of a few. In one form of the disease, called *aphemia*, the patient can think and write, but cannot speak; in another called *agraphia*, he can think and speak, but cannot express his ideas in writing. In a great majority of cases, where post-mortem examinations have been made, morbid changes have been found in the left frontal convolution of the brain.

**Aphrodite** (af-ro- $d\bar{i}'t\bar{e}$ ), the goddess of love among the Greeks; usually regarded as equivalent to the Roman Venus. A festival called Aphrodisia, was celebrated to her in various parts of Greece, but especially in Cyprus.

Aphthæ (af'thē), a disease occurring especially in infants, but occasionally seen in old persons, and consisting of small, white ulcers upon the tongue, gums, inside of the lips, and palate, resembling particles of curdled milk; commonly called *thrush* or *milk thrush*.

A'pia, the chief place and trading center of the Samoan Islands, on the north side of the island of Upolu. It was the scene of a terrible disaster to the American and German navies during a hurricane.

A'piary, a place for keeping bees. The apiary should be well sheltered from strong winds, moisture, and the extremes of heat and cold. The hives should face the south or southeast, and should be placed on shelves two feet above the ground, and about the same distance from each other. As to the form of the hives, and materials of which they should be constructed, there are great differ-ences of opinion. Wooden hives of square, boxlike form are now gaining general favor among bee keepers. They usually consist of a large breeding chamber below, and two sliding removable boxes called supers above, for the abstraction of honey without disturbing the contents of the main chamber. It is of great importance that the apiary should be situated in the neighborhood of good feeding grounds, such as gardens, clover fields, or heath-covered hills. When their stores of honey are removed the bees must be fed during the winter and part of spring with syrup or with a solution consisting of 2 lbs. loaf sugar to a pint of water. In the early spring slow and continuous feeding (a few ounces of syrup each day) will stimulate the queen to deposit her eggs, by which means the colony is rapidly strengthened and throws off early swarms. New swarms may make their appearance as early as May and as late as August, but swarming usually takes place in the intervening months.

Apic'ius, MARCUS GABIUS, a Roman epicure in the time of Augustus and Tiberius. who, having exhausted his vast fortune on the gratification of his palate, and having only about \$400,000 left, poisoned himself that he might escape the misery of plain diet. The book of cookery published under the name of Apicius was written by one Cælius, and belongs to a much later date.

0

A'pls, a bull to which divine honors were paid by the ancient Egyptians, who regarded him as a symbol of Osiris. He was not suffered to live beyond twenty-five years, being secretly killed by the priests and thrown into a sacred well. Another bull was selected in his place. His birthday was annually celebrated, and his death was a season of public mourning.

Apoc'alypse, the name frequently given to the last book of the New Testament, in the English version called the Revelation of St. John the Divine. It is generally believed that the Apocalypse was written by the apostle John in his old age (95-97 A. D.) in the Isle of Patmos, whither he had been banished by the Roman emperor Domitian.

Apoc rypha (Greek, "things concealed or spurious"), a term applied in the earliest churches to various sacred or professedly inspired writings, sometimes given to those whose authors were unknown, sometimes to those with a hidden meaning, and sometimes to those considered objectionable. The term is specially applied to the fourteen undermentioned books which were written during the two centuries preceding the birth of Christ: The first and second books of Esdras. Tobit, Judith, the rest of the book of Esther, the Wisdom of Solomon, the Wisdom of Jesus the son of Sirach, or Ecclesiasticus, Baruch the Prophet, the Song of the Three Children, Susanna and the Elders, Bel and the Dragon, the Prayer of Manasses, and the first and second Books of Maccabees.

Apollina'ris Water, a natural aërated water, belonging to the class of acidulated soda waters, and derived from the Apollinarisbrunnen, a spring in the valley of the Ahr, near the Rhine, in Rhenish Prussia, forming a highly esteemed beverage.

Apol lo, son of Zeus (Jupiter) and Leto, the twin brother of Diana. He slew the serpent Python on the fifth day after his birth; afterward, with his sister Artemis, he killed the children of Niobe. He destroyed the Cyclops, because they forged the thunderbolts with which Zeus killed his son Æscula-Apollo was originally the sun god. In pius. later times the view was almost universal that Apollo and Helios were identical. From being the god of light and purity in physical sense, he gradually became the god of moral and spiritual light and purity, and political progress. He came to be regarded as the god of song and prophecy, the institutor and guardian of civil and political order, and the founder of cities. His worship was introduced at Rome. probably in the time of the Tarquins. Among the ancient statues of Apollo that have come down to us, the most remarkable is the one called the Apollo Belvedere, from the Belvedere Gallery in the Vatican at Rome.

Apoilo nius OF TYRE, the hero of a tale which had an immense popularity in the Middle Ages and which furnished the plot of Shakespeare's *Pericles*, *Prince of Tyre*. The story, originally in Greek, first appeared in the third century after Christ.

#### Apoplexy

Ap'oplexy, abolition or sudden diminution of sensation and voluntary motion, from suspension of the functions of the cerebrum, resulting from congestion or rupture of the blood-vessels of the brain and the resulting pressure on this organ. In a complete apoplexy the person falls suddenly, is unable to move his limbs or to speak, gives no proof of seeing, hearing, or feeling, and the breathing is stertorous or snoring, like that of a person in deep sleep. The premonitory symptoms of this dangerous disease are drowsiness, giddiness, dulness of hearing, frequent yawning, disordered vision, noise in the ears, vertigo, etc. It is most frequent between the ages of fifty and seventy. A large head, short neck, full chest, sanguine and plethoric constitution, and corpulency are generally considered signs of predisposition to it; but the state of the heart's action, with a plethoric condition of the vascular system, has a more marked in-fluence. Out of 63 cases carefully investigated only 10 were fat and plethoric, 23 being thin, and the rest of ordinary habit. Among the common predisposing causes are long and intense thought, continued anxiety, habitual indulgence of the temper and passions, sedentary and luxurious living, sexual indulgence, intoxication, etc. More or less complete recovery from a first and second attack is common, but a third is almost invariably fatal.

**Apos'tles** (literally, persons sent out), the twelve men whom Jesus selected to attend him during his ministry and to promulgate his religion. Their names were as follows: Simon Peter, and Andrew his brother; James, and John his brother, sons of Zebedee; Philip; Bartholomew; Thomas; Matthew; James, the son of Alpheus; Lebbeus, his brother, called Judas; Simon, the Canaanite; and Judas Iscariot. To these were subsequently added Matthias (chosen by lot in place of Judas Iscariot) and Paul. The Bible gives the name of apostle to Barnabas also, who accompanied Paul on his missions (Acts 14:14). In a wider sense those preachers who first taught Christianity in heathen countries are sometimes termed apostles; for example, St. Denis, the apostle of the Gauls; St. Boniface, the apostle of Germany; St. Augustine, the apostle of England; Francis Xavier, the apostle of Prussia proper. Their subsequent history is only imperfectly known.

history is only imperfectly known. **Apostles' Creed,** a well-known formula or declaration of Christian belief, formerly believed to be the work of the apostles themselves, but it can only be traced to the fourth century.

Apothecaries' weight, the weight used in dispensing drugs, in which the pound (lb.) is divided into 12 ounces, the ounce into 8 drams, the dram into 3 scruples, and the scruple into 20 grains, the grain being equivalent to that in avoirdupois weight.

Apoth ecary, in a general sense, one who keeps a shop or laboratory for preparing, compounding, and vending medicines, and for the

making up of medical prescriptions. It is well known that the word "apotheca" signified any kind of store, magazine, or warehouse, and that the proprietor or keeper of such a store was called apothecarius. The physicians in Africa first began to give up the preparation of medicines after prescriptions to in-genious men. It is probable, therefore, that many Arabic terms of art were by these means introduced into pharmacy and chemistry, and have been still retained and adopted. In England the term was long applied (and to some little extent still) to a regularly licensed class of medical practitioners, being such persons as were members of, or licensed by, the Apothecaries' Company in London. The Apothecaries' Company in London. The apothecaries of London were at one time ranked with the grocers, with whom they were incorporated by James I in 1606. In 1617, however, the apothecaries received a new charter as a distinct company. In the U. S. the several states have laws controlling apothecaries.

Apotheo'sis (deification), a solemnity among the ancients by which a mortal was raised to the rank of the gods. The custom of placing mortals who had rendered their countrymen important services, among the gods, was very ancient among the Greeks. The Romans, for several centuries, deified none but Romulus, and first imitated the Greeks in the fashion of frequent apotheosis after the time of Cresar. From this period apotheosis was regulated by the decrees of the senate, and accompanied with great solemnities. The greater part of the Roman emperors were dei-fied.

Appalachian Mountains (ap-pa-la'chi-an), also called Alleghanies, a vast mountain range in N. America extending for 1,300 mi. from Cape Gaspé, on the Gulf of St. Lawrence, s.w. to Alabama. The system has been divided into three great sections: the northern (including the Adirondacks, the Green Mountains, the White Mountains, etc.), from Cape Gaspé to New York; the central (including a large portion of the Blue Ridge, the Alleghanies proper, and numerous lesser ranges), from New York to the valley of the New River; and the *southern* (including the continuation of the Blue Ridge, the Black Mountains, the Smoky Mountains, etc., from the New River southward. The chain consists of several ranges generally parallel to each other, the altitude of the individual mountains increasing on approaching the south. The highest peaks rise over 6,600 feet (not one at all approaching the snow-level), but the mean height is about 2,500 feet. Lake Champlain is the only lake of great importance in the system, but numerous rivers of considerable size take their rise here. Magnetite, hematite, and other iron ores occur in great abundance and the coal-measures are among the most extensive in the world. Gold, silver, lead, and copper are also found, but not in paying quantities, while marble, limestone, fire-clay, gypsum, and salt abound. The forests covering many of the ranges yield large quantities of valuable timber, such as
sugar-maple, white birch, beech, ash, oak, cherry-tree, white poplar, white and yellow pine.

Appalachicola (chi-co'la), a river of the U.S. formed by the Chattahoochee and Flint Rivers, which unite near the northern border of Florida; length about 100 mi.; flows into the Gulf of Mexico and is navigable.

Appenzell (ap' pen-tsel), a Swiss canton. Area 162 sq. mi. It is divided into two independent portions or half-cantons, Ausser-Rhoden, which is Protestant, and Inner-Rhoden, which is Catholic. Glaciers occupy the higher valleys. Flax, hemp, grain, fruit, etc., are produced, but the wealth of Inner-Rhoden lies in its herds and flocks: that of Outer-Rhoden in its manufactures of embroidered muslins, gauzes, cambrics, and other cotton stuffs: also of silk goods and paper. The town of Appenzell (German Abtenzelle, abbot's cell) is the capital of Inner-Rhoden, on the Sitter, with about 4,300 inhabitants. Trogen is the capital of Outer-Rhoden, Herisau the largest town (pop. 11,000). Pop. of Outer-Rhoden, 51,960; Inner-Rhoden, 12,882.

Ap'petite, in its widest sense, means the natural desire for gratification, either of the body or the mind; but is generally applied to the recurrent and intermittent desire for food. A healthy appetite is favored by work, exercise, plain living, and cheerfulness; absence of this feeling, or defective appetite, indicates diseased action of the stomach, or of the nervous system or circulation, or it may result from vicious habits. Depraved appetite, or a desire for unnatural food, as chalk, ashes, dirt, soap, etc., depends often in the case of children on vicious tastes or habits; in grown up persons it may be symptomatic of dyspepsia, pregnancy, or chlorosis. Insatiable or canine appetite or voracity, when it occurs in childhood, is generally symptomatic of worms; in adults common causes are pregnancy, vicious habits, and indigestion, caused by stomach complaints or gluttony, when the gnawing pains of disease are mistaken for hunger.

**Appla'ni**, ANDREA, a painter (1754–1817), a painter born at Milan. As a fresco-painter he excelled every contemporary painter in Italy.

Applan Way, called Regina Viarum, the Queen of Roads; the oldest and most renowned Roman road, was constructed during the censorship of Appius Claudius Cæcus (B. c. 313-310). It was built with large square stones on a raised platform, and was made direct from the gates of Rome to Capua, in Campania. It was afterward extended through Samnium and Apulia to Brundusium, the modern Brindisi. It was partially restored by Pius VI, and in 1850-53 it was excavated by order of Pius IX, as far as the eleventh milestone from Rome.

Appius Claudius Crassus, one of the Roman decemvirs, appointed B. c. 451 to draw up a new code of laws. He and his colleagues plotted to retain their power permanently, and at the expiry of their year of office refused to give up their authority. The people were incensed

against them, and the following circumstances led to their overthrow: Appius Claudius had conceived an evil passion for Virginia, the daughter of Lucius Virginius, then absent with the army in the war with the Æqui and Sabines. At the instigation of Appius, Marcus Claudius, one of his clients, claimed Virginia as the daughter of one of his own female slaves, and the decemvir, acting as judge, decided that in the meantime she should remain in the custody of the claimant. Virginius, hastily summoned from the army, appeared with his daughter next day in the forum, and appealed to the people; but Appius Claudius again adjudged her to M. Claudius. Unable to rescue his daughter, the unhappy father stabbed her to the heart. The decemvirs were deposed by the indignant people B. c. 449, and Appius Claudius died in prison or was strangled.

Apple, the fruit of a well-known tree, or the tree itself. The apple belongs to the temperate regions of the globe, over which it is almost universally spread and cultivated. The tree attains a moderate height, with spreading branches; the leaf is ovate; and the flowers are produced from the wood of the former year, but more generally from very

Branch of apple with young fruit. a.—piece of blossom.

short shoots or spurs from wood of two years' growth. The original of all the varieties of the cultivated apple is the wild crab, which has a small and extremely sour fruit, and is a native of most of the countries of Europe. The apple was probably introduced into Britain by the Romans. To the facility of multiplying varieties by grafting is to be ascribed the amazing extension of the sorts of apples. Many of the more marked varieties are known by general names, as pippins, codlins, rennets, etc. Apples for the table are characterized by a firm, juicy pulp, a sweetish acid flavor, regu-

lar form, and beautiful coloring; those for cooking, by the property of forming, by the aid of heat, into a pulpy mass of equal consistency, as also by their large size and keeping properties; apples for cider must have a considerable degree of astringency, with richness of juice. The propagation of apple-trees is accomplished by seeds, cuttings, suckers, layers, budding, or grafting, the last being almost the universal practice. The tree thrives best in a rich, deep loam or marshy clay, but will thrive in any soil provided it is not too wet or too dry. The wood of the appletree or the common crab is hard, close-grained, and often richly colored, and is suitable for turning and cabinet work. The fermented juice of the crab is employed in cookery and medicine. Cider, the fermented juice of the apple, is a favorite drink in many portions of the U.S. The designation apple, with various modifying words, is applied to a number of fruits having nothing in common with the apple proper, as alligator-apple, love-apple, etc.

Apple of Discord, according to the story in the Greek mythology, the golden apple thrown into an assembly of the golds by the goldess of discord (Eris) bearing the inscription "for the fairest." Approditē (Venus). Hera (Juno), and Pallas (Minerva), became competitors for it, and its adjudication to the first by Paris so inflamed the jealousy and hatred of Hera to all of the Trojan race (to which Paris belonged) that she did not cease her machinations till Troy was destroyed.

Appleton, Outagamie co., Wis., on Fox River, 100 mi. n. of Milwaukee. Railroads: C. & N. W. (Wis. Division); C. & N. W. (Ashland Division); and C. M. & St. P. Industries: paper and pulp mills, flour mill, three iron foundries, two woolen mills, tile and sash and door factories, saw mills, planing mills, machine shops, knitting works, and bicycle works. Surrounding country agricultural. The town was first settled in 1848 and became a city in 1857. Pop. est. 1897, 16,000.

Appleton, CHARLES EDWARD (1841-1879), was born at Reading, and was educated at Oxford and in Germany. His reading was wide and varied, but he wrote little. He founded in 1869 the *Academy*, whose special feature is its signed articles. He died at Luxor, in Upper Egypt.

Appleton, DANIEL (1785-1849), the founder of the American publishing house of D. Appleton & Co., was born at Haverhill, Mass., where he commenced business as a retail trader. He settled as a bookseller in New York, and gradually built up one of the largest businesses of its kind in the U. S. He retired in 1848, leaving the business to four sons and their descendants. The firm published, 1857, the *New American Cyclopedia*, under the editorship of George Ripley and Charles A. Dana, which was completed in 1863. A new edition was published in 1872-76. The same firm has issued many scientific and educational works. Appomatt'ox Court-House, a village in Virginia, 20 mi. e. of Lynchburg. Here on April 9, 1865, General Lee surrendered to General Grant, and thus virtually concluded the Civil war.

Appropriation.—In the U. S. no money can be drawn from the Treasury but in consequence of appropriations made by law (Constitution, Art. I). Under this clause it is necessary for Congress to appropriate money for the support of the Federal government, and in payment of claims against it. In the House of Representatives appropriation bills have precedence.

Ap'ricot, a fruit of the plum genus which was introduced into Europe from Asia more than three centuries before Christ, and into England in the first half of the sixteenth century. It is a native of Armenia and other parts of Asia and also of Africa. The apricot is a low tree, of rather crooked growth, with somewhat heart-shaped leaves and sessile flowers. The fruit is sweet, more or less juicy, of a yellowish color, about the size of the peach, and resembling it in delicacy of flavor. The wood is coarsely grained and soft. Apricot-trees are chiefly raised against walls, and are propagated by budding and grafting.

A'pril ("to open," because the buds open at this time), the fourth month of the year. The strange custom of making fools on the 1st of April by sending people upon errands and expeditions which end in disappointment, and raise a laugh at the expense of the person sent, prevails throughout America. It has been connected with the miracle plays of the Middle Ages, in which the Saviour was represented as having been sent at this period of the year, from Annas to Caiaphas and from Pilate to Herod. In France the party fooled is called an April fish.

Apse, a portion of any building forming a termination or projection semicircular or polygonal in plan, and having a roof forming externally a semi-dome or semi-cone, or having ridges corresponding to the angles of the polygon; especially such a semi-circular or polygonal recess projecting from the east end of the choir or chancel of a church, in which the altar is placed. The apse was developed from the somewhat similar part of the Roman basilicæ, in which the magistrate sat.

Apsis (pl. Ap'sides or Apsi'des), in astronomy one of the two points of the orbit of a heavenly body situated at the extremities of the major axis of the ellipse formed by the orbit, one of the points being that at which the body is at its greatest, and the other that at which it is at its least, distance from its primary. In regard to the earth and the other planets, these two points correspond to the aphelion and perihelion; and in regard to the moon they correspond to the apogee and perigee. The line of the apsides has a slow, forward, angular motion in the plane of the planet's orbit, being retrograde only in Venus. This in the earth's orbit produces the anomalistic year.

9

Ap teryx, a nearly extinct genus of running birds, distinguished from the ostriches by having three toes with a rudimentary hallux, which forms a spur. They are natives of the south island

of New Zea-

land; are totally wingless and tailless, with feathers resembling hairs, about the size of a small goose, with long, curved beak something like that of a curlew. They are entirely nocturnal, feeding on insects, worms, and seeds. *Kiwi-kiwi*, from its cry, is the best known species.

**Apu' lia**, a department or division in the southeast of Italy, on the Adriatic, composed of the provinces of Foggia, Bari, and Lecce. Area 8,539 sq. mi.; pop. 1,587,713.

Aq'uamarine, a name given to some of the finest varieties of beryl of a sea green or blue color. Varieties of topaz are also so called.

Aqua'rium, a vessel or series of vessels constructed wholly or partly of glass and containing salt or fresh water in which are kept living specimens of marine or fresh-water animals along with aquatic plants. In principle the aquarium depends on the interdependence of animal and vegetable life; animals consuming oxygen and exhaling carbonic acid, plants reversing the process by absorbing carbonic acid and giving out oxygen. The aquarium must consequently be stocked both with plants and animals, and for the welfare of both something like a proper proportion should exist between them. The simplest form of aquarium is that of a glass vase; but aquariums on a larger scale consist of a tank or a number of tanks with plate-glass sides and stone floors, and contain sand and gravel, rocks, seaweeds, etc. By improved arrangements, light is admitted from above, passing through the water in the tanks and illuminating their contents, while the spectator is in comparative darkness. Aquariums on a large scale have been constructed in connection with public parks or gardens, and the name is also given to places of public entertainment in which large aquariums are exhibited. The largest aquarium in the world is at Castle Garden, N. Y. There are large aquaria at Brighton, Hamburg, and Paris. The Brighton Aquarium, which takes the lead, has forty-one tanks, containing all varieties of fish, from the stickleback to the sturgeon. Its area is 715 ft. in length by 100 ft. in breadth. There is one tank which con-tains 110,000 gallons of water, and has a plateglass front, through which the habits of very large fish may be studied. The Hamburg Aqua. rium is nearly the same size as that at Brighton

### Aqueduct

The Paris Aquarium, belonging to the French Acclimatization Society, is 50 yards in length by about 12 in breadth, and contains 40 tanks. Castle Garden, N. Y., has been transformed into an aquarium, and has 150 tanks for smaller fish, while there are gigantic tanks for sharks and other large and dangerous fish. There are fish in the Royal Aquarium at St. Petersburg that are known by record to have been there 140 years. Some of these fish have grown to be five times as large as when they were placed there, while others have not grown at all.

Aquarius, the water-bearer; a sign in the zodiac which the sun enters about January 21; so called from the rains which prevail at that season in Italy and the East.

Aquatint, a method of etching on copper by which a beautiful effect is produced, resembling a fine drawing in sepia or Indian ink. The special character of the effect is the result of sprinkling finely powdered resin or mastic over the plate, and causing this to adhere by heat, the design being previously etched or being now traced out. The nitric acid acts only in the interstices between the particles of resin or mastic, thus giving a slightly granular appearance.

Âq'ueduct, an artificial channel or conduit for the conveyance of water from one place to another; more particularly applied to structures for conveying water from distant sources for the supply of large cities. Aqueducts were extensively used by the Romans, and many of them still remain in different places on the continent of Europe, some being still in use. The Pont du Gard in the south of France, 14 mi. from Nismes, is still nearly perfect, and is a grand monument of the Roman occupation of that country. The ancient aqueducts were constructed of stone, or brick, sometimes tunneled through hills, and carried over valleys and rivers on arches. The Pont du Gard is built of great blocks of stone; its height is 160 ft.; length of the highest arcade, 882 ft. The aqueduct at Segovia, originally built by the Romans, has in some parts two tiers of arcades 100 ft. high, is 2,921 ft. in length, and is one of the most admired works of antiquity. One of the most remarkable aqueducts of modern times is that constructed by Louis XIV for conveying the waters of the Eure to Versailles. The extensive application of metal pipes has rendered the construction of aqueducts of the old type unnecessary; but what may be called aqueduct bridges are still frequently constructed in connection with water works for the supply of towns, and where canals exist, canal aqueducts are common, since the water in a canal must be kept on a perfect level. In the U.S. there are some important aqueducts, as the Croton, about 404 mi. long, bringing water to New York. The water is carried through 16 tunnels, the total length of which is 6,841 ft., cut through the gneiss rock. The open cutting is for the most part rock work. From the dam to Harlem River the aqueduct is of stone, brick, and cement, and has a capacity of 115 million gallons daily. The rate of flow is

14 miles per hour. There are two cast iron pipes two feet in diameter across the Harlem River, and over these one wrought iron pipe 74 ft. in diameter. What is called the high bridge, which is over 1,450 ft. long, with eight arches in the river and seven on the banks, supports the pipe. The two receiving reservoirs in Central Park cover 135 acres and have a capacity of 1,180,000,000 gallons. From these reservoirs the water is conveyed by two lines of pipe 30 inches in diameter, two of 36 inches, and one of 48 inches to the distributing reservoir.

The aqueduct or flume which conveys the water from the mountains to the reservoir at San Diego, Cal., is 35 mi. long and built almost wholly of redwood. It crosses 315 streams and cañons on trestles, the longest of which is 1,700 ft. and 85 ft. high. The timbers used in these trestles were put together on the ground and raised to their position by horse power. This aqueduct passes also through eight tunnels, the longest being 2,100 ft.

Aquila (ak wē-la), a town in Italy, capital of the province of Aquila, 55 mi. n.e. of Rome. In 1703 and 1706 it suffered severely from earthquakes. Pop. 14,720. The province has an area of 2,500 sq. mi.; a pop. of 371,332. Aquinas (a-kwī'nas), ST. THOMAS (1227-1274), a celebrated scholastic divine. He died

Aquinas (a-kwi'nas), Sr. THOMAS (1227-1274), a celebrated scholastic divine. He died on his way to Lyons to attend a general council for the purpose of uniting the Greek and Latin Churches. He was called, after the fashion of the times, the angelic doctor, and was canonized. The most important of his numerous works, which were all written in Latin, is the Summa Theologia.

Aquita' nia (later, Aquitaine), a Roman province in Gaul, which comprised the countries on the coast from the Garonne to the Pyrences, and from the sea to Toulouse. It was brought into connection with England by the marriage of Henry II with Eleanor, daughter of the last Duke of Aquitaine. The title to the province was for long disputed by England and France, but it was finally secured by the latter (1453).

Arabesque (ar'a-besk), a species of ornamentation for enriching flat surfaces, often consisting of fanciful figures, human or animal,

Arabesque.

combined with floral forms. There may be said to be three periods and distinctive varieties of arabesque: (a) the Roman or Græco-Roman, introduced into Rome from the East when pure art was declining; (b) the Arabesque of the Moors as seen in the Alhambra, introduced by them into Europe in the Middle Ages; (c) Modern Arabesque, which took its rise in Italy in the Renaissance period of art. The arabesques of the Moors, who are prohibited by their religion from representing animal forms, consist essentially of complicated ornamental designs based on the suggestion of plant-growth, combined with extremely complex geometrical forms.

Ara bl Pasha, Egyptian soldier and revolutionary leader, b. 1837. In September, 1881, he headed a military revolt, and was for a time virtually dictator of Egypt. Britain interfered, and after a short campaign, beginning with the bombardment of Alexandria and ending with the defeat of Arabi and his army at Telel-Kebir, he surrendered, and was banished to Ceylon.

Ara'bia, a vast peninsula in the s.w. of Asia, area rather over 1,000,000 sq. mi., its pop. probably not more than 5,000,000. Roughly described, it exhibits a central table-land surrounded by a series of deserts, with numerous scattered oases, while around this is a line of mountains parallel to and approaching the coasts, and with a narrow rim of low grounds between them and the sea. In its general features Arabia resembles the Sahara, of which it may be considered a continuation. Like the Sahara it has its wastes of loose sand, its mountains devoid of vegetation, its oases with their wells and streams, their palm-groves and cultivated fields. By the ancients the whole peninsula was broadly divided into three great sections: Arabia Petræa (containing the city Petra), Deserta (desert), and Felix (happy). The first and last of these answer roughly to the modern divisions of the region of Sinai in the n.w. and Yemen in the s.w., while the name Deserta was vaguely given to the rest of the country. The principal divisions at the present are Madian in the n.w.; south of this, Hejaz, Assir, and Yemen, all on the Red Sea, the last named occupying the southwestern part of the peninsula, and comprising a maritime lowland on the shores of the Red Sea, with an elevated inland district of considerable breadth; Hadramaut, on the south coast; Oman occupying the southeast angle; El-Hasa and Kovelt on the Persian Gulf; El-Hamad (Desert of Syria), Nefûd, and Jebel Shammar in the north; Nejd, the Central Highlands, which occupies a great part of the interior of the country, while south of it is the great unexplored Dahkna or sandy desert. Madian belongs to Egypt, the Hejaz, Yemen, Bahr-el-Hasa, Koveït, etc., are more or less under the suzerainty of Turkey. The rest of the country is ruled by independent chiefs, while the title of sultan has been assumed by the chief of the Wahabis in Nejd, the sovereign of Oman, and some petty princes in the south of the peninsula. The chief towns are: south of the peninsula. Mecca, the birthplace of Mohammed; Medina, the place to which he fled from Mecca (A. D. 622), and where he is buried; Mocha, a seaport celebrated for its coffee; Aden, on the s.w. coast, a strongly fortified garrison belonging to Britain; Sana, the capital of Yemen; and Muscat, the capital of Oman, a busy port

with a safe anchorage. The chief towns of the interior are Hall, the residence of the emir of Northern Nejd; Oneizah, under the same ruler; and Riad, capital of Southern Nejd. The most flourishing portions of Arabia are in Oman, Hadramaut, and Nejd. In the two former are localities with numerous towns and villages and settled industrious populations like that of Hindustan or Europe.

The climate of Arabia in general is marked by extreme heat and dryness. Aridity and barrenness characterize both high and low grounds, and the date-palm is often the only representative of vegetable existence. There are districts which in the course of the year are hardly refreshed by a single shower of rain. Forests there are few or none. Grassy pastures have their place supplied by steppe-like tracts. which are covered for a short season with aromatic herbs, serving as food for the cattle. The date-palm furnishes the staple article of food; the cereals are wheat, barley, maize, and millet; various sorts of fruit flourish; stances, such as gum-arabic, benzoin, mastic, balsam, aloes, myrrh, frankincense, etc., are produced. There are also cultivated in different parts of the peninsula, according to the soil and climate, beans, rice, lentils, tobacco, melons, saffron, colocynth, poppies, olives, etc. Sheep, goats, oxen, the horse, the camel, ass, and mule supply man's domestic and personal wants. Among wild animals are gazelles, ostriches, the lion, panther, hyena, jackal, etc. Among mineral products are saltpeter, mineral pitch, petroleum, salt, sulphur, and several precious stones, as the carnelian, agate, and onyx.

The Arabs, as a race, are of middle stature, of a powerful though slender build, and have a skin of a more or less brownish color; in towns and the uplands often almost white. Their features are well cut, the nose straight, the forehead high. They are naturally active, intelligent, and courteous; and their character is marked by temperance, bravery, and hospitality. The first religion of the Arabs, the worship of the stars, was supplanted by the doctrines of Mohammedanism, which succeeded rapidly in establishing itself throughout Arabia. Besides the two principal sects of Islam, the Sunnites and the Shiites, there also exists, in considerable numbers, a third Mohammedan sect, the Wahabis, which arose in the latter half of the eighteenth century, and for a time possessed great political importance in the peninsula. The mode of life of the Arabs is either nomadic or settled. The nomadic tribes are termed Bedouins, and among them are considered to be the Arabs of the purest blood. Commerce is largely in the hands of foreigners, among whom the Jews and Banians (Indian merchants) are the most numerous.

The history of the Arabs previous to Mohammed is obscure. The earliest inhabitants are believed to have been of the Semitic race. Jews in great numbers migrated into Arabia after the destruction of Jerusalem, and, mak-

ing numerous proselvtes, indirectly favored the introduction of the doctrines of Mohammed. With his advent the Arabians uprose and united for the purpose of extending the new creed; and under the caliphs - the successors of Mohammed — they attained great power, and founded large and powerful kingdoms in three continents. On the fall of the caliphate of Bagdad in 1258 the decline set in, and on the expulsion of the Moors from Spain the foreign rule of the Arabs came to an end. In the sixteenth century Turkey subjected Hejaz and Yemen, and received the nominal submission of the tribes inhabiting the rest of Arabia. The subjection of Hejaz has continued down to the present day; but Yemen achieved its independence in the seventeenth century, and maintained it till 1871, when the territory again fell into the hands of the Turks. In 1839 Aden was occupied by the British. Oman early became virtually independent of the caliphs, and grew into a well-organized kingdom. In 1507 its capital, Maskat, or Muscat, was occupied by the Portuguese, who were not driven out till 1659. The Wahabis appeared toward the end of the eighteenth century, and took an important part in the political affairs of Arabia, but their progress was interrupted by Mohammed Ali, pasha of Egypt, and they suffered a complete defeat by Ibrahim Pasha. He extended his power over most of the country, but the events of 1840 in Syria compelled him to renounce all claims to Arabia. The Hejaz thus again be-came subject to Turkish sway. Turkey has since extended its rule not only over Yemen, but also over the district of El-Hasa on the Persian Gulf.

The Arabic language belongs to the Semitic dialects, among which it is distinguished for its richness, softness, and high degree of de-velopment. By the spread of Islam it became the sole written language and the prevailing speech in all southwestern Asia and eastern and northern Africa, and for a time in southern Spain, in Malta, and in Sicily; and it is still used as a learned and sacred language wherever Islam is spread. Almost a third part of the Persian vocabulary consists of Arabic words, and there is the same proportion of Arabic in Turkish. The Arabic language is written in an alphabet of its own, which has also been adopted in writing Persian, Hindustani, Turkish, etc. As in all Semitic languages (except the Ethiopic), it is read from right to left. The vowels are usually omitted in Arabic manuscripts, only the consonants being written.

Before the time of Mohammed, poetical contests were held and prizes awarded for the best pieces. The collection called the *Moallukit* contains seven pre-Mohammedan poems by seven authors. Mohammed gave a new direction to Arab literature. The rules of faith and life which he laid down were collected by Abu-Bekr, first caliph after his death, and published by Othman, the third caliph, and constitute the *Koran*—the Mohammedan Bible. The progress of the Arabs in literature, the arts, and sciences, may be said to have begun with the government of the caliphs of the family of the Abbassides, A. D. 749, at Bagdad, several of whom, as Harun al Rashid and Al Mamun, were munificent patrons of learning; and their example was followed by the Ommiades in Spain. In Spain important works were written on geography, history, philosophy, medicine, physics, mathematics, arithmetic, geometry, and astronomy. Most of the geography in the Middle Ages is the work of the Arabians, and their historians since the eighth century have been very numerous. The philosophy of the Arabians was of Greek origin, and derived principally from that of Aristotle. Of their philosophical authors the most celebrated are Alfarabi (tenth century), Ibn Sina or Avicenna (d. A. D. 1037), Alghazzali (d. 1111) Ibn Roshd or Averroes (twelfth century), called by pre-eminence, The Commentator. In medicine they excelled all other nations in the Middle Ages, and they are commonly regarded as the earliest experimenters in chemistry. Their mathematics and astron-omy were based on the works of Greek writers, but the former they enriched, simplified, and extended. It was by them that algebra (a name of Arabic origin) was in-troduced to the Western peoples, and the Arabic numerals were similarly introduced. Astronomy they especially cultivated, and observatories were erected at Bagdad and Cordova. The Almagest of Ptolemy, in an Arabic translation, was early a text-book among them. Among poets were Abu Nowas, Asmai, Abu Temmam, Motenabbi, Abul-Ala, Busiri, Tograi, and Hariri. Tales and romances in prose and verse were written. The tales of fairies, genii, enchanters, and sorcerers in particular, passed from the Arabians to the Western nations, as in The Thousand and One Nights. At the present day Arabic literature is almost confined to the production of com-mentaries and scholia, discussions on points of dogma and jurisprudence, and grammatical works on the classical language. There are a few newspapers published in Arabic. Arabian Nights (or The Thousand and One

Nights), a celebrated collection of Eastern tales, long current in the East, and supposed to have been derived by the Arabians from India, through the medium of Persia. They were first introduced into Europe in the beginning of the eighteenth century by means of the French translation of Antoine Galland. Of some of them no original MS. is known to exist; they were taken down by Galland from the oral communication of a Syrian friend. The story which connects the tales of The Thousand and One Nights is as follows: The Sultan Shahriyar, exasperated by the faithlessness of his bride, made a law that every one of his future wives should be put to death the morning after marriage. At length one of them, Shahrazad, the generous daughter of the grand-vizier, succeeded in abolishing the cruel custom. By the charm of her stories the fair narrator induced the sultan to defer her execution every day till the dawn of another, by breaking off in the middle of an interesting tale which she had begun to relate. In the form we possess them these tales belong to a comparatively late period, though the exact date of their composition is not known. Lane, who published a translation of a number of the tales, with valuable notes, is of the opinion that they took their present form some time between 1475 and 1525. Two complete English translations have recently been printed, giving many passages that previous translators had omitted on the score of morality or decency.

Arabian Sea, the part of the Indian Ocean between Arabia and India.

**Arabic Figures**, the characters 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; of Indian origin, introduced into Europe by the Moors. They did not come into general use till after the invention of printing.

Aracan (ar-a-kan'), the most northern division of Lower Burmah, on the Bay of Bengal; Area 14,520 sq. mi.; pop. 587,518. Ceded to the English in 1826, as a result of the first Burmese war.

Arachis (ar'a-kis), a genus of leguminous plants much cultivated in warm climates, and esteemed a valuable article of food. The most remarkable feature of the genus is that when the flower falls the stalk supporting the small, undeveloped fruit lengthens, and bending toward the ground pushes the fruit into the ground, when it begins to enlarge and ripen. The pod of arachis (popularly called ground, earth-, or pea-nut) is of a pale yellow color, and contains two seeds the size of a hazel-nut, in flavor sweet as almonds, and yields when pressed an excellent oil. See *Peanut*.

Arachnida (a-rak' ni-da), a class of animals, including the spiders, scorpions, mites, ticks, etc. They have the body divided into a number of segments or *somites*, some of which have always articulated appendages (limbs, etc.).

always articulated appendages (limbs, etc.). Arad (órod), a town of Hungary, on the Maros, 30 mi. n. of Temeswar, divided by the river into O (Old) Arad and Uj (New) Arad, connected by a bridge; it has a fortress, and is an important railway center, with a large trade and manufactures. Pop. Old Arad, 35,556; New Arad, 5,141.

Arafat' (or Jebel er Rahmeh) ("Mountain of Mercy"), a hill in Arabia, about 200 ft. high, with stone steps reaching to the summit, 15 mi. s. e. of Mecca; one of the principal objects of pilgrimage among Mohammedans, who say that it was the place where Adam first received his wife Eve, after they had been expelled from Paradise and separated from each other 120 years. A sermon delivered on the mount constitutes the main ceremony of the Hadj or pilgrimage to Mecca, and entitles the hearer to the name and privileges of a Hadji, or pilgrim.

Ar'ago, DOMINIQUE FRANCOIS (1786-1853), a celebrated French scientist and statesman; was an investigator especially in physics and astronomy, made important discoveries in magnetism and optics, and was a skilful

#### Aragon

popular writer on these subjects. As a statesman he is famous as a close friend of Napoleon the Great, and later as a champion of republican institutions and liberties. Arago graduated from the polytechnic school in 1805, and was appointed to a commission which was making certain measurements of longitude that were to serve as the basis of a decimal metric system. While engaged in this work he was taken prisoner as a spy by the Spaniards (1808), underwent hardships and narrow escapes, but finally reached Marseilles, 1809. Arrived at Paris, he was at once elected a member of the Institute, though only 23 years old, was appointed a professor at the polytechnic school, and in 1830 became perpetual secretary of the Academy of Sciences and director of the observatory. These offices he retained until his death. He rendered great service to the science of optics, and made valuable contributions to meteorology, especially in con-nection with electricity. In 1829 Arago re-ceived the Copley medal from the London Royal Society, being the first Frenchman to be awarded that honor. Napoleon in-vited Arago to accompany him to the U.S., whither he thought of coming after Waterloo, to devote the rest of his life to scientific pursuits. Arago was urged to accompany him to St. Helena, but refused. In the Revolution of 1830, Arago supported the cause of the people. He was elected a member of the Chamber of Deputies in 1831, and there made many famous speeches, in behalf of education, science, and especially the rights of the people. He opposed the government mo-nopoly of railways. Arago was president of the Council General of the Seine until 1849, and was the chief instrument in the emancipation of slaves. He was active in the over-throw of Louis Philippe, 1848, was a member of the provisional government and afterward

minister of war and marine. As a member of the executive commission he displayed great courage in the Revolution of 1848. He favored liberal institutions as exemplified in the U.S. He opposed the election of Louis Napoleon to the presidency, and after the *coup d'état* of 1857, refused to take oath to his government, remaining true to his republican principles. The last three years of his life he was blind. Arago was the author of about sixty scientific works and memoirs.

Aragon', kingdom of, a former province or kingdom of Spain, now divided into the three provinces of Teruel, Huesca, and Saragossa. Area 14,726 sq. mi. It was governed by its own monarchs until the union with Castile on the marriage of Ferdinand and Isabella (1469). Pop. 909,261.

Araguaya (à-rà-gwl'à), a Brazilian river, length, about 1,300 mi., of which over 1,000 are navigable.

A'ral, a salt-water lake in Asia, in Russian territory, about 150 mi. west of the Caspian Sea. Area 26,650 sq. mi. It receives the Amoo Daria or Oxus and the SIr Daria or Jaxartes, and contains a multitude of sturgeon

### Araucanians

and other fish. It has no outlet. The Aral contains a large number of small islands; steamers have been placed on it by the Russians.

Aramæ'an (or Aramaic), a Semitic language nearly allied to the Hebrew and Phœnician, anciently spoken in Syria and Palestine and eastward to the Euphrates and Tigris, being the official language of this region under the Persian domination. In Palestine it supplanted Hebrew, and it was it and not the latter that was the tongue of the Jews in the time of Christ. Parts of Daniel and Ezra are written in Aramaic, or, as this form of it is often incorrectly named, Chaldee, from an old notion that the Jews brought it from Babylon. An important Aramaic dialect is the Syriac, in which there is an extensive Christian literature.

Aranjuez ( $\dot{a}$ -r $\dot{a}$ n- $\dot{h}u$ -eth'), a small town and palace in Spain, 30 mi. from Madrid, with splendid gardens laid out by Philip II. The court used to reside here from Easter till the close of June, when the number of people increased from 4,000 to about 20,000.

**Arap'ahocs**, a tribe of American Indians once located near the head-waters of the Arkansas and Platte rivers, not now of any importance. The survivors are located in the Indian Territory.

Ar'arat, a celebrated mountain in Armenia, forming the point of contact of Russia with Turkey and Persia; an isolated volcanic mass showing two separate cones known as the Great and Little Ararat, resting on a common base and separated by a deep intervening depression. The elevations are: Great Ararat, 18,916 feet; Little Ararat, 12,840 feet; the connecting ridge, 8,780 feet. Vegetation extends to 14,200 feet, which marks the snow-line. According to tradition Mount Ararat was the resting-place of the ark when the waters of the flood abated.

Araucanians.

Arauca'nians, a South American native race in the southern part of Chile. They are warlike and more civilized than many of the

Digitized by Google

#### Araucaria

native races of S. America, and maintained almost unceasing war with the Spaniards from 1537 to 1773, when their independence was recognized by Spain, though their territory was much curtailed. Their early contests with the Spaniards were celebrated in Ercilla's Spanish poem Araucana. With the republic of Chile they were long at feud, and latterly had at their head a French adventurer named Tonneins, who claimed the title of king. In 1882 they submitted to Chile. The Chilean province of Arauco receives its name from them.

Arauca'ria, a genus of trees of the coniferous or pine order, belonging to the southern hemisphere. The species are large evergreen trees with pretty large, stiff, flattened, and generally imbricated leaves, verticillate spreading branches, and bearing large cones, each scale having a single large seed. Its seeds are eaten when roasted. The Moreton Bay pine, of N. S. Wales supplies a valuable timber used in house and boat building, in making furniture, and in other carpenter work. Another species, the Norfolk Island pine, abounds in several of the South Sea Islands, where it attains a height of 220 feet with a circumference of 30 feet and is described as one of the most beautiful of trees. Its foliage is light and graceful, and quite unlike that of the Chile pine, having nothing of its stiff formality. Its timber is of some value, being white, tough, and close-grained.

Arau'co, a province of Chile, named from the Araucanian Indians. Area 4,246 sq. mi.; pop. 73,658; capital, Lebu.

pop. 73,658; capital, Lebu. Ar'baces, one of the generals of Sardanapälus, king of Assyria. He revolted and defeated his master, and became the founder of the Median Empire 846 B. c.

Arbe'la (now Erbil), a place in the Turkish vilayet of Bagdad, giving name to the decisive battle fought by Alexander the Great against Darius, at Gaugamela, about 20 mi. distant from it, Oct. 1, B. c. 331.

Arbitra'tion, the hearing and determination of a cause between parties in controversy, by a person or persons chosen by the parties. This may be done by one person, but it is common to choose more than one. Frequently two are nominated, one by each party, with a third, the *umpire*, who is called on to decide in case of the primary arbitrators differing. In such a case the umpire may be agreed upon either by the parties themselves, or by the arbitrators, when they have received authority from the parties to the dispute to settle this The determination of arbitrators is point. called an award. The disputes of nations were formerly arbitrated only by war, but in this regard the U.S. has set a high example to the world by repeatedly inviting arbitration in international disputes. Her notable triumphs in this respect include the Alabama, Bering Sea, and Venezuela boundary disputes.

**Arbor Day**, a day designated by legislative enactment, in the different states, for the voluntary planting of trees by the people; the pupils in the public schools now take part in

#### Arcade

the observance of the day. It was inaugurated in 1874 by the Nebraska state board of agriculture at the suggestion of Julius Sterling Morton, afterwards secretary of agriculture in President Cleveland's second administration. Nearly every one of the states has already established an annual Arbor Day, and observes it as a legal holiday.

Arbor Vitæ ("tree of life"), the name of several coniferous trees, allied to the cypress, with flattened branchlets, and small imbricated or scale-like leaves. The common Arbor Vitæ is a native of N. America, where it grows to the height of 40 or 50 feet. The young twigs have an agreeable balsamic smell. The Chinese Arbor Vitæ, common in Britain, yields a resin which was formerly thought to have medicinal virtues.

**Ar' butus,** a genus of plants belonging to the heath order, and comprising a number of small trees and shrubs, natives chiefly of Europe and N. America.

Arbutus. a.-fruit: b.-section of fruit.

The trailing arbutus or May-flower of N. America, a plant with fragrant and beautiful blossoms, is of the same natural order.

Arcade, a series of arches supported on piers or pillars, used generally as a screen and support of a roof, or of the wall of a building, and having beneath the covered part an ambulatory as round a cloister, or a footpath with shops or dwellings, as frequently seen in old Italian towns. Sometimes a porch or other prominent part of an important building is treated with arcades.

At the present day Bologna, Padua, and Berne have fine examples of mediæval arcaded streets, and among more modern work various streets in Turin, and the Rue de Rivoli, Paris, are lined with arcades, with shops underneath. In mediæval architecture the term arcade is also applied to a series of arches supported on pillars forming an ornamental dressing or enrichment of a wall, a mode of treatment of very frequent occurrence in the towers, apses, and other parts of churches. In modern use the name arcade is often applied to a passage

or narrow street containing shops arched over and covered with glass; as for example, the Burlington Arcade, London, and the Galleria Vittorio Emmanuele, in Milan.

Arca dia, the central and most mountainous portion of the Peloponnesus (Morea), the inhabitants of which in ancient times were celebrated for simplicity of character and manners. Their occupation was almost entirely pastoral, and thus the country came to be regarded as typical of rural simplicity and happiness. At the present day Arcadia forms a nomarchy of the kingdom of Greece. Area 2,028 sq. mi.; pop. 148,600.

Arch, a structure composed of separate pieces, such as stones or bricks, having the shape of truncated wedges, arranged on a curved line, so as to retain their position by mutual pressure. The separate stones which compose the curve of

compose the curve of an arch are called *ous*soirs or arch-stones; the extreme or lowest voussoirs are termed springers, and the uppermost or central one is called the keystone. The under or concave side of the voussoirs is called the *intrados*, and the upper or convex side the *extrados*, of the arch. The supports which af-

ford resting and resisting points to the arch are called *piers* and *abutments*. The upper part of the pier or abutment where the arch rests -technically where it springs from—is the impost. The span of an arch is in circular arches the length of its chord, and generally the width between the points of its opposite imposts whence it springs. The rise of an arch is the height of the highest point of its intrados above the line of the imposts; this point is sometimes called the under side of the crown, the highest point of the extrados being the croten. Arches are designated in various ways, as from their shape (circular, elliptic, etc.), or from the resemblance of the whole contour of the curve to some familiar object (lancet arch, horse-shoe arch), or from the method used in describing the curve, as equilateral, three-centered, four-centered, ogee, and the like; or from the style of architecture to which they belong, as Roman, pointed, and Saracenic arches. Triumphal arch, originally a simple decorated arch under which a victorious Roman general and army passed in triumph. At a later period the triumphal arch was a richly sculptured, massive, and permanent structure, having an archway passing through it, with generally a smaller arch on either side. The name is sometimes given to an arch, generally of wood decorated with flowers or evergreens, erected on occasion of some public rejoicing, etc.

Archeol'ogy, the science which takes cognizance of the history of nations and peoples as evlnced by the remains, architectural, implemental, or otherwise, which belong to the

earlier epoch of their existence. In a more extended sense the term embraces every branch of knowledge which bears on the origin, religion, laws, language, science, arts, and literature of ancient peoples. It is to a great extent synonymous with *prehistoric annals*, as a large if not the principal part of its field of study extends over those periods in the history of the human race in regard to which we possess almost no information derivable from written records. Archæology divides the primeval period of the human race, more especially as exhibited by remains found in Europe, into the Stone, the Bronze, and the Iron Age, these names being given in accordance with the materials employed for weapons, implements, etc., during the particular period. The Stone Age has been subdivided into the Palæolithic and Neolithic, the former being that older period in which the stone implements were not polished as they are in the latter and more recent period. The Bronze Age, which admits of a similar subdivision, is that in which implements were of copper or bronze. In this age the dead were burned and their ashes deposited in urns or stone chests, covered with conical mounds of earth or cairns of stones. Gold and amber ornaments appear in this age. The Iron Age is that in which im-plements, etc., of iron begin to appear, although stone and bronze implements are found along with them. The word age in this sense (as explained under Age) simply denotes the stage at which a people has arrived. The phrase "Stone Age," therefore, merely marks the period before the use of bronze, the "Bronze Age" that before the employment of iron, among any specific people.

Archangel (ärk-an'jel), a seaport, capital of the Russian government of same name, on the right bank of the northern Dwina, about 20 mi. above its mouth in the White Sea. The place has some manufactures and an important trade, exporting linseed, flax, tow, tallow, train-oil, mats, timber, pitch and tar, etc. The port is closed for six months by ice. Archangel, founded in 1584, was long the only port which Russia possessed. Pop. 10,540. The province has an area of 331,400, sq. mi. Pop. 311,673.

Årchelaus (år-kē-lā'us), the name of several personages in ancient history, one of whom was the son of Herod the Great. He received from Augustus the sovereignty of Judea, Samaria, and Idumea. The people, tired of his tyrannical and bloody reign, accused him before Augustus, who banished him to Gaul.

Archer-fish, a name given to a scaly-finned fish, about 6 inches long, inhabiting the seas around Java, which has the faculty of shooting drops of water to the distance of 3 or 4 feet at insects, thereby causing them to fall into the water, when it seizes and devours them. The soft, and even the spiny portion of their dorsal fins are so covered with scales as to be scarcely distinguishable from the rest of the body.

Arch'ery, the art of shooting with a bow and arrow. The use of these weapons in war

### Archimedean Screw

Archer Fish.

and the chase dates from the earliest antiquity. Ishmael, we learn from Genesis 21, "became an archer." The Egyptians, Assyrians, Persians, and Parthians excelled in the use of the bow; and while the Greeks and Romans themselves made little use of it they employed foreign archers as mercenaries. Coming to much more recent times we find the American Indians exceedingly skilful archers. The Swiss archers generally use the arbalist or cross-bow. The English victories of Crécy, Poitiers, and Agincourt may be ascribed to the bowmen. Archery disappeared gradually as firearms came into use, and as an instrument of war or the chase the bow is now confined to the most savage tribes of both hemispheres. But though the bow has been long abandoned among civilized nations as a military weapon, it is still cherished as an instrument of healthful recreation. In recent years a number of archery clubs have been formed in the U.S. Archery has the merit of forming a sport open to women as well as men.

Archime' dean Screw, a machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for irrigating the land. It is formed by winding a tube spirally round a cylinder so as to have

Archimedean Screw.

the form of a screw, or by hollowing out the cylinder itself into a double or triple threaded screw and inclosing it in a water-tight case. When the screw is placed in an inclined position and the lower end immersed in water, by

### Architecture

causing the screw to revolve, the water may be raised to a limited extent.

Archimedes (år-ki-me'döz), a celebrated ancient Greek physicist and geometrician, born at Syracuse, in Sicily, about 287 B. c. He devoted himself entirely to science, and enriched mathematics with discoveries of the highest importance, upon which the moderns have founded their admeasurements of curvilinear surfaces and solids. Archimedes is the only one among the ancients who has left us anything satisfactory on the theory of mechanics and on hydrostatics. He first taught the hydrostatic principle to which his name is attached, "that a body immersed in a fluid loses as much in weight as the weight of an equal volume of the fluid," and de-termined by means of it that an artist had fraudulently added too much alloy to a crown which King Hiero had ordered to be made of pure gold. He discovered the solution of this problem while bathing; and it is said to have caused him so much joy that he hastened home from the bath undressed, and crying out, Eureka! Eureka! "I have found it, I have found it!" Practical mechanics also received a great deal of attention from Archimedes, who boasted that if he had a fulcrum or standpoint he could move the world. He is the inventor of the compound pulley, probably of the endless screw, the Archimedean screw, etc. During the siege of Syracuse by the Romans he is said to have constructed many wonderful machines with which he repelled their attacks, and he is stated to have set on fire their fleet by burning-glasses! At the moment when the Romans gained possession of the city by assault (212 B. C.) tradition relates that Archimedes was slain while sitting in the market-place contemplating some mathematical figures which he had drawn in the sand.

Architec'ture, in a general sense, is the art of designing and constructing houses, bridges, and other buildings for the purposes of civil life; or, that branch of the fine arts which has for its object the production of edifices not only convenient but characterized by unity, beauty, and grandeur. The first habitations of man were caves, huts, and tents. But as soon as men rose in civilization they began to build more commodious and comfortable habitations. They prepared bricks of clay or earth, which they at first dried in the air, but afterward baked by fire; and latterly they smoothed stones and joined them with mortar or cement. After they had learned to build houses, they erected temples for their gods on a larger and more splendid scale than their own dwellings. The Egyptians are the most ancient nation known to us among whom architecture had attained the character of a fine art. Other ancient peoples among whom it had made great progress were the Babylonians, whose most celebrated buildings were temples, palaces, and hanging-gardens; the Assyrians, whose capital, Nineyeh, was rich in splendid buildings; the Phænicians, whose cities, Sidon, Tyre,

# Architecture

etc., were adorned with equal magnificence; and the Israelites, whose temple was a wonder of architecture. But comparatively few architectural monuments of these latter nations have remained till our day. This is not the case with the architecture of Egypt, however, of which we possess ample remains in the shape of pyramids, temples, sepulchres, obe-lisks, etc. The Egyptian temples had walls of great thickness and sloping on the outside from bottom to top; the roofs were flat, and composed of blocks of stone reaching from one wall or column to another. The principle of the arch was not employed for architectural purposes. Statues of enormous size, sphinxes carved in stone, and on the walls sculptures in outline of deities and animals, with innumerable hieroglyphics, are the decorative objects which belong to this style. In historic times the Greeks developed an architecture of noble simplicity and dignity, in part derived from the Egyptian. It is considered to have attained its greatest perfection in the age of Pericles, or about 460-430 B. c. The great masters of this period were Phidias, Ictinus, Callicrates, etc. All the extant buildings are more or less in ruins. The style is characterized by beauty, harmony, and simplicity in the highest degree. The Greeks had three orders, called respectively the Doric, Ionic, and Corinthian. See articles under these names. Greek buildings were abundantly adorned with sculptures, and painting was extensively used, the details of the structures being enriched by different colors or tints. Lowness of roofs and the absence of arches were distinctive features of Greek architecture. The most remarkable public edifices of the Greeks were temples, of which the most famous is the Parthenon at Athens. Their theaters were semicircular on one side and square on the other, the semicircular part being usually excavated in the side of some convenient hill. This part, the auditorium, was filled with concentric seats, and might be capable of containing 20,000 spectators. A number exist in Greece, Sicily, and Asia Minor, and elsewhere. After the death of Alexander the Great (323) the decline was very marked. The Romans early took the foremost place in the construction of such works as aqueducts and sewers, the arch being in extensive use among this people. As a fine art, Roman architecture had its origin in copies of the Greek models. Their number, moreover, was augmented by the addition of two new orders—the Tuscan and the Composite. Rome attained, under Augustus, its greatest perfection in architecture. Among the great works now erected were temples, aqueducts, amphitheaters, magnificent villas, triumphal arches, monumental pillars, etc. The amphitheater differed from the theater in being a completely circular or rather elliptical building, filled on all sides with ascending seats for spectators and leaving only the central space, called the arena, for the combatants and public shows. The Coliseum is a stupendous structure of this kind. The therma, or baths, were vast structures in which multitudes of people could bathe at once. The excavations at Pompeii in particular have thrown great light on the internal arrangements of the Roman dwellinghouse. After the period of Hadrian (117-138 A. D.) Roman architecture is considered to have been on the decline. In Constantinople, after its virtual separation from the Western Empire, arose a style of art and architecture which was practised by the Greek Church during the whole of the Middle Ages. This is called the Byzantine style. The church of St. Sophia at Constantinople, built by Justinian (reigned 527-565), offers the most typical specimen of the style, of which the fundamental principle was an application of the Roman arch, the dome being the most striking feature of the building. In the most typical examples the dome or cupola rests on four pendentives.

the dome or cupola rests on four pendentives. After the dismemberment of the Roman Empire the beautiful works of ancient architecture were almost entirely destroyed by the Goths, Vandals, and other barba-rians in Italy, Greece, Asia, Spain, and Africa; or what was spared by them was ruined by the fanaticism of the Christians. A new style of architecture now arose, two forms of which, the Lombard and the Norman-Romanesque, form important phases of art. The Lombard prevailed in north Italy and south Germany from the eighth or ninth to the thirteenth century (though the Lombard rule came to an end in 774). The semicircular arch is the characteristic feature of the Norman-Romanesque style, which flourished in England from the eleventh to the middle of the thirteenth century. With the Lombard-Romanesque were combined Byzantine features, and buildings in the pure Byzantine style were also erected in Italy, as the Church of St. Mark at Venice.

The conquests of the Moors introduced a fresh style of architecture into Europe after the eighth century—the Moorish or Saracenic. The edifices erected by the Moors and Saracens in Spain, Egypt, and Turkey, are distinguished, among other things, by a peculiar form of the arch, which forms a curve constituting more than half a circle or ellipse. A peculiar flowery decoration, called *arabesque*, is a common ornament of this style, of which the building called the Alhambra is perhaps the chief glory.

The Germans were unacquainted with architecture until the time of Charlemagne (or Charles the Great, 742-814). He introduced into Germany the Byzantine and Romanesque styles. Afterward the Moorish or Arabian style had some influence upon that of the Western nations, and thus originated the mixed style which maintained itself till the middle of the thirteenth century. Then began the modern Gothic style, which grew up in France, England, and Germany. Its striking characteristics are its pointed arches, its pinnacles and spires, its large buttresses, clustered pillars, vaulted roofs, profusion of ornament, and, on the whole, its

### Architecture

lofty, bold character. Its most distinctive feature, as compared with the Greek or the Egyptian style, is the predominance in it of perpendicular or rising lines, producing forms that convey the idea of soaring or mounting upward. Its greatest capabilities have been best displayed in ecclesi-astical edifices. The Gothic style is divided into four principal epochs: The Early Pointed, or general style of the thirteenth century; the Decorated, or style of the fourteenth century; the Perpendicular, prac-tised during the fifteenth and early part of the sixteenth centuries; and the Tudor, or general style of the sixteenth century. This style lasted in England up to the seventeenth century, being gradually dis-placed by that branch of the Renaissance or modified revival of ancient Roman architecture which is known as the Elizabethan style, and which is perhaps more purely an English style than any other that can be named. The rise of the Renaissance style in Italy is the greatest event in the history of architecture after the introduction of the Gothic The Gothic style had been introstyle. duced into the country and extensively em-ployed, but had never been thoroughly naturalized. The Renaissance is a revival of the classic style based on the study of the ancient models; and having practically commenced in Florence about the beginning of the fifteenth century, it soon spread with great rapidity over Italy, and the greater part of Europe. The most illustrious architects of this early period of the style were Brunelleschi, who built at Florence the dome of the cathedral, the Pitti Palace, etc., besides many edifices at Milan, Pisa, Pesaro, and Mantua; Alberti, who wrote an im-portant work on architecture, and erected many admired churches; Bramante, who began the building of St. Peter's, Rome; and Michael Angelo, who erected its magnificent dome. On St. Peter's were also employed Raphael, Peruzzi, and San Gallo.

Since the Renaissance period there has been no architectural development requiring special note. In edifices erected at the present day some one of the various styles of architecture is employed according to taste. Modern dwell-ing-houses have necessarily a style of their own as far as stories, and apartments, and windows, and chimneys can give them one. In general the Grecian style, as handed down by Rome, and modified by the Italian architects of the Renaissance, from its right angles and straight entablatures, is more convenient, and fits better with the distribution of our common edifices, than the pointed and irregu-lar Gothic. But the occasional introduction of the Gothic outline and the partial employment of its ornaments has undoubtedly an agreeable effect, both in public and private edifices; and we are indebted to it, among other things, for the spire, a structure exclusively Gothic, which, though often misplaced, has become an object of general approbation, and a pleasing landmark to cities and villages.

# Architecture

The works most characteristic of the present day are the grand bridges, viaducts, etc., in many of which iron is the sole or most characteristic portion of the material. The U. S., Canada, and the Australian colonies have not been backward in following the lead of the older countries of Europe. In America the increase in the number of handsome buildings has been very noteworthy since the termination of the Civil War, and the architectural accomplishments of the World's Columbian Exposition at Chicago, in 1893, have never been excelled in any country.

A new era has dawned in the construction of high buildings. "Chicago construction" is a term applied to the new method of building high structures, having a steel frame skeleton, starting with the foundation and built up complete like a bridge. This method originated in Chicago. Each floor is absolutely independent so far as the walls and partitions are concerned, for the walls have nothing but their own weight to carry in the height of each story. The contractor may begin exterior work on the third, fifth, or any story he pleases, and leave the first to be enclosed after every other floor has been walled in and plastered. The steel framework is put up as rapidly as possible so as to get the roof on to protect the interior from the weather. Then the hollow tile partitions or the walls are built in as desired. This method of building ignores the massive foundations, heavy piers, the use of thick walls, and solid partition walls, running from the foundation to the roof. In this system, the columns, starting from the foundations, can carry the floors as well as partitions and thus permit any arrangement of a floor without interfering with the construction. The demand for high buildings set the architects to work to solve the problem of overcoming the instability of the original soil of Chicago. In Chicago construction the foundations are made of steel railroad rails, or "I" beams. First a bed of concrete is laid, and on this is placed a layer of rails, or beams placed side by side. On this bottom layer another layer of rails or beams is laid, crossing the lower members of the foundation at right angles. On top of the rails a cast iron plate is laid. This is the shoe for the steel The column is always made of column. wrought steel, and is of the same size for each of two stories, diminishing in size as it nears the roof. The entire framework is riveted together with hot rivets. Every piece of exposed steel work is completely surrounded with some fire-proof material, such as blocks of tile or brick.

A few words may be added on the architecture of India and China. Although many widely differing styles are to be found in India, the oldest and only true native style of Indian ecclesiastical architecture is the Buddhist, the earliest specimens dating to 250 B. c. Among the chief objects of Buddhist art are stupas or topes, built in the form of large towers, and employed as digobas to contain relics of Buddha or of some noted saint. Other works

of Buddhist art are temples or monasteries excavated from the solid rock, and supported by pillars of the natural rock left in their places. Buddhist architecture is found in Ceylon, Thibet, Java, etc., as well as in India. The most remarkable Hindu or Brahmanical temples are in southern India. They are pyramidal in form, rising in a series of stories. The Saracenic or Mohammedan architecture latterly introduced into India is of course of foreign origin. The Chinese have made the tent the elementary feature of their architecture; and of their style any one may form an idea by inspecting the figures which are depicted upon common chinaware. Chinese roofs are concave on the upper side, as if made of canvas instead of wood. (For further information on the different subjects pertaining to architecture see separate articles on the different styles, Greek, Roman, Gothic, etc., and such entries as Arch, Column, Aqueduct, Corinthian, Doric, Ionic, Theater).

Archytas (ar-k1' tas), an ancient Greek mathematician, statesman, and general, who flourished about 400 B. c., and belonged to Tarentum in southern Italy. The invention of the analytic method in mathematics is ascribed to him, as well as the solution of many geometrical and mechanical problems. He constructed various machines and automata, among which was his flying pigeon. He was a Pythagorean in philosophy, and Plato and Aristotle are said to have been both deeply indebted to him. Only inconsiderable fragments of his works are extant.

Arcis-sur-Aube (ar-sē-sur-öb), a small town of France, dep. Aube, at which, in 1814, was fought a battle between Napoleon and the allies, after which the latter marched to Paris. Pop. 2,928.

Arc-light, that species of the electric light in which the illuminating source is the current of electricity passing between two sticks of carbon kept a short distance apart, one of them being in connection with the positive, the other with the negative terminal of a battery or dynamo.

**Arcole** (ar'ko-lā), a village in north Italy, 15 mi. s. e. of Verona, celebrated for the battles of Nov. 15, 16, and 17, 1796, fought between the French under Bonaparte and the Austrians, in which the latter were defeated with great slaughter.

Ar cot, two districts and a town of India, within the Presidency of Madras.—NORTH ARCOT is an inland district with an area of 7,256 sq. mi. The country is partly flat and partly mountainous, where intersected by the eastern Gháts. Pop. 1,817,814.—SOUTH ARCOT lies on the Bay of Bengal, and has two seaports, Cuddalor and Porto Novo. Pop. 1,814,738.— The town Arcot is in north Arcot, on the Palar, about 70 mi. w. by s. of Madras. There is a military cantonment at 3 miles' distance. Pop. 12,000.

Arctic (ark'tik), an epithet given to the north pole from the proximity of the constellation of the Bear, in Greek called *arktos*. The Arctic Circle is an imaginary circle on the globe, parallel to the equator, and 23° 28' distant from the north pole. This and its opposite, the *Antarctic*, are called the two polar circles.

Arctic Ocean, that part of the water surface of the earth which surrounds the north pole, and washes the northern shores of Europe, Asia, and America; its southern boundary roughly coinciding with the Arctic Circle. It incloses many large islands, and contains large bays and gulfs which deeply indent the northern shores of the three continents. Its great characteristic is ice, which is nearly constant everywhere.

Arctic Regions, the regions around the north pole, and extending from the pole on all sides to the Arctic Circle. The Arctic or North Polar Circle just touches the northern headlands of Iceland, cuts off the southern and narrowest portion of Greenland, crosses Fox's Strait north of Hudson's Bay, whence it goes over the American continent to Bering's Strait. Thence it runs to Obdorsk at the mouth of the Obi, then crossing northern Russia, the White Sea, and the Scandinavian Peninsula, returns to Iceland. Though much skill and heroism have been developed in the exploration of this portion of the earth, there is still an area round the pole estimated at 2,500,000 sq. mi., which is a blank to geographers. Many have adopted the belief in the existence of an open polar sea about the north pole; but this belief is not supported by any positive evidence. Valuable minerals, fossils, etc., have been discovered within the Arctic regions. In the archipelago north of the American continent excellent coal frequently occurs. The min-eral cryolite is mined in Greenland. Fossil ivory is obtained in the islands at the mouth of the Lena. In Scandinavia, parts of Siberia, and northwest America, the forest region extends within the Arctic Circle. The most characteristic of the natives of the Arctic regions are the Esquimaux. The most notable animals are the white-bear, the musk-ox, the reindeer, and the whalebone whale. Fur-bearing animals are numerous. The most intense cold ever registered in those regions was  $74^{\circ}$  below zero F. The aurora borealis is a brilliant phenomenon of Arctic nights.

Arctu'rus, a fixed star of the first magnitude in the constellation of Boötes, and thought by some to be the nearest to our system of any of the fixed stars. It is one of the stars observed to have a motion of its own, and is a noticeable object in the northern heavens.

Ar'dea, the genus of birds to which the heron belongs, which includes also cranes, storks. bitterns, etc.

Ardèche (ar-dāsh), a dep. in the south of France (Languedoc). Area 2,134 sq. mi. It is generally of a mountainous character, and contains the culminating point of the Cevennes. Silk and wine are produced. Annonay is the principal town, but Privas is the capital. Pop. 375,472.

Ardennes (ar-den'), an extensive tract of hilly land stretching over a large portion of the northeast of France and the southwest of Belgium. Anciently the whole tract formed one immense forest (*Arduenna Silta* of Cæsar); but though extensive districts are still under wood, large portions are now occupied by cultivated fields and populous towns.

Ardennes (ar-den<sup>7</sup>), a frontier department in the northeast of France; area 2,020 sq. mi., partly consisting of the Forest of Ardennes. There are extensive slate-quarries, numerous iron works, and important manufactures of cloth, ironware, leather, glass, earthenware, etc. Chief towns, Mézières (the capital), Rocroi, and Sedan. Pop. 332,759.

Are (är), the unit of the French land measure, equal to a hundred square meters, or 1,076.44 square feet. A *hectare* is 100 ares, equal to 2.47 acres.

Are'ca, a genus of lofty palms with pinnated leaves, and a drupe-like fruit enclosed in a fibrous rind. One species of the Coromandel and Malabar coasts is the common areca palm which yields areca or betel nuts, and also the astringent juice catechu. Another is the cabbage-tree or cabbage-palm of the West Indies. With lime and the leaves of the betel-pepper, the areca-nuts when green form the celebrated masticatory of the East. They are an important article in Eastern trade.

**Arecibo** ( $\dot{a}$ -re-th $\bar{e}'b\bar{o}$ ), a seaport town on the north coast of the island of Porto Rico. Pop. 10,000.

Are'na, the inclosed space in the central part of the Roman amphitheaters, in which took place the combats of gladiators or wild beasts. It was usually covered with sand or sawdust to prevent the gladiators from slipping, and to absorb the blood.

Arcometer. See Hydrometer.

Areopagus, the oldest of the Athenian courts of justice. It obtained its name from its place of meeting, on the Hill of Ares (Mars), near the citadel. It existed from very remote times, and the crimes tried before it were wilful murder, poisoning, robbery, arson, dissoluteness of morals, and innovations in the state and in religion.

Arequipa (a-rā-kē' pá), a city of Peru, 200 mi. s. of Cuzco, situated in a fertile valley, 7,850 feet above sea-level. Before the earthquake of 1868, which almost totally destroyed it, it was one of the best-built towns of South America. Behind the city rises the volcano of Arequipa, or Peak of Misté (20,328 feet). A considerable trade is carried on through Mollendo, which has superseded Islay as the port of Arequipa, and is connected with it by railway. Pop. 40,000.

**Arethu'sa,** in Greek mythology, a daughter of Nereus and Doris, a nymph changed by Artěmis into a fountain in order to free her from the pursuit of the river god Alpheus.

Arezzo (a-ret'sō), a city of central Italy, capital of a province of the same name in Tuscany. It has a cathedral, containing some fine pictures and monuments; remains of an ancient amphitheater, etc. It was one of the twelve chief Etruscan towns, and in later times fought long against the Florentines, to whom it had finally to succumb. It is the birthplace of Mæcenas, Petrarch, Pietro Aretino, Redi, and Vasari. Pop. 11,816. The province of Arezzo contains 1,276 sq. mi. and 238,744 inhabitants. Ar'gal (Argol, or Tartar), a hard crust formed

Ar'gal (Argol, or Tartar), a hard crust formed on the sides of vessels in which wine has been kept, red or white according to the color of the wine. It is an impure bitartrate of potassium, and is of considerable use among dyers as a mordant. When purified it forms cream of tartar.

Ar'gall, SAMUEL (1572-1639), one of the early English adventurers to Virginia. He planned and executed the abduction of Pocahontas, the daughter of the Indian chief Powhattan, in order to secure the ransom of English prisoners. He was deputy-governor of Virginia (1617-1619), and was accused of many acts of rapacity and tyranny.

Ar'gand Lamp, a lamp named after its inventor, Aimé Argand (1755-1803), a Swiss chemist and physician, the distinctive feature of which is a burner forming a ring or hollow cylinder covered by a chimney, so that the flame receives a current of air both on the inside and on the outside.

**Argaum** (ar gá' um), a village of India, in Berar, celebrated for the victory of General Wellesley (Duke of Wellington) over the Mahrattas under Scindia and the Rajah of Berar, Nov. 20, 1803.

Ar'gelander, FREIDRICH WILHELM AUGUST (1709-1875), eminent German astronomer, director successively of the observatories of Abo and of Helsingfors: appointed professor of astronomy at Bonn, 1837, where he superintended the erection of a new observatory, catalogued over 320,000 stars, and produced several important astronomical works.

Argensola (ar-hen-so'lá), LUPERCIO and BARTOLOME LEONARDO DE, brothers, the "Horaces of Spain," b. at Barbastro, in Aragon, the former in 1565, d. in 1613; the latter b. 1566, d. in 1631. Lupercio produced tragedies and lyric poems; Bartolomé a number of poems and a history of the conquest of the Moluccas. Their writings are singularly alike in character, and are reckoned among the Spanish classics.

Ar'gentine Republic, formerly called the United Provinces of La Plata, a vast country of South America, the total area comprising 1,125,086 sq. mi. It comprises four great natural divisions: (1) the Andine region, containing the provinces of Mendoza, San Juan, Rioja, Catamarca, Tucuman, Salta, and Jujuy; (2) the Pampas, containing the provinces of Santiago, Santa Fé, Cordova, San Luis, and Buenos Ayres; with the territories Formosa, Pampa, and Chaco; (3) the Argentine Mesopotamia, between the rivers Paraná and Uruguay, containing the provinces of Entre Rios and Corrientes, and the territory Misiones: (4) Patagonia, including the eastern half of Terra del Fuego. With the exception of the n. w., where lateral branches of the Andes run into the plain for 150 or 200 mi., and the province of Entre Rios, which is hilly, the character-

# Argentine Republic

istic feature of the country is the great monotonous and level plains called "pampas." In the north these plains are partly forestcovered, but all the central and southern parts present vast treeless tracts, which afford pasture to immense herds of horses, oxen, sheep, and are varied in some places by brackish swamps, in others by salt steppes. The great water-course of the country is the Paraná, having a length of fully 2,000 miles from its source in the mountains of Goyaz, Brazil, to its junction with the Uruguay, where begins the estuary of La Plata. The Paraná is formed by the union of the Upper Paraná and Paraguay rivers, near the n.e. corner of the state. Important tributaries are the Pilcomayo, the Vermejo, and the Salado. The Paraná, Paraguay, and Uruguay are valuable for internal navigation. Many of the streams which tend eastward terminate in marshes and salt lakes, some of which are rather ex-tensive. Not connected with the La Plata system are the Colorado and the Rio Negro, the latter formerly the southern boundary of the state, separating it from Patagonia. The source of the Negro is Lake Nahuel Huapi, in Patagonia (area 1,200 sq. mi.), in the midst of magnificent scenery. The level portions of the country are mostly of tertiary formation, and the river and coast regions consist mainly of alluvial soil of great fertility. In the pampas clay have been found the fossil remains of extinct mammalia, some of them of colossal size.

European grains and fruits, including the vine, have been successfully introduced, and are cultivated to some extent in most parts of the republic, but the great wealth of the state lies in its countless herds of cattle and horses and flocks of sheep, which are pastured on the pampas, and which multiply there very rapidly. Gold, silver, nickel, copper, tin, lead, and iron, besides marble, jasper, precious stones, and bitumen, are found in the mountainous districts of the n. w., while petroleum wells have been discovered on the Rio Vermejo; but the development of this mineral wealth has hither to been greatly retarded by the want of proper means of transport. As a whole there are not extensive forests in the state except in the region of the Gran Chaco (which extends also into Bolivia), where there is known to be 60,000 sq. mi. of timber. Thousands of square miles are covered with thistles, which grow to a great height in their season. Cacti also form great thickets. Peach and apple trees are abundant in some districts. The native fauna includes the puma, the jaguar, the tapir, the llama, the alpaca, the vicuña, armadillos, the rhea or nandu, a species of ostrich, etc. The climate is agreeable and healthy, 97° being about the highest temperature experienced. Rain is less frequent than in the United Kingdom.

As a whole this vast country is very thinly inhabited, some parts of it as yet being very little known. The native Indians were never very numerous, and have given little trouble to the European settlers. Tribes of them, yet

### Argonauts

in the savage state, still inhabit the less known districts, and live by hunting and fishing. Some of the Gran Chaco tribes are said to be very fierce, and European travelers have been killed by them. The European element is strong in the republic, more than half the population being Europeans or of pure Euro-pean descent. Large numbers of immigrants arrive from Southern Europe, the Italians having the preponderance among those of foreign birth. The typical inhabitants of the pampas are the Gauchos, a race of half-breed cattlerearers and horse-breakers; they are almost continually on horseback, galloping over the plains, collecting their herds and droves, taming wild horses, or catching and slaughtering cattle. In such occupations they acquire a marvelous dexterity in the use of the lasso and bolas. The river La Plata was discovered in 1512 by the Spanish navigator, Juan Diaz de Solis, and the La Plata territory had been brought into the possession of Spain by the end of the sixteenth century. In 1810 the territory cast off the Spanish rule, and in 1816 the independence of the United States of the Rio de la Plata was formally declared, but it was long before a settled government was es-tablished. The present constitution dates from 1853, being subsequently modified. The executive power is vested in a presidentelected by the representatives of the fourteen provinces for a term of six years. A national congress of two chambers-a senate and a house of deputies-wields the legislative authority, and the republic is making rapid advances in social and political life. There are about 11,000 miles of railway constructed. The external commerce is important, the chief exports being wool, skins, and hides, live animals, mutton, tallow, bones, corn, and flax. The imports are chiefly manufactured goods. The trade is largely with Britain and France, and is increasing rapidly. Buenos Ayres is the capital of the state. Other towns are Cordova, Rosario, La Plata (a new city), Tucu-man, Mendoza, and Corrientes. The popula-tion of the republic, which is rapidly increasing, is estimated at 4,500,000.

Argives (ar') (or Argivi), the inhabitants of Argos; used by Homer and other ancient authors as a generic appellation for all the Greeks.

Ar gonaut, a name given to a species of cuttle-fishes, popularly known as the Paper Nautilus, or Paper Sailor. This is the animal so celebrated in poetry, and which formerly used to be regarded as sailing on the surface of the sea, using its two expanded arms as sails, and the other arms as oars—a statement purely fletitious and erroneous. The expanded arms are always clasped round the shell, and the creature can move only after the fashion of other cuttle-fishes.

Argonauts, in the legendary history of Greece, those heroes who performed a hazardous voyage to Colchis, a far-distant country at the eastern extremity of the Euxine (Black Sea), with Jason in the ship Argo, for the purpose of securing a golden fleece, which was

Argonaut.

preserved suspended upon a tree, and under the guardianship of a sleepless dragon. By the aid of Medea, daughter of the king of Colchis, Jason was enabled to seize the fleece, and, after many strange adventures, to reach his home at Iolcos in Thessaly. Among the Argonauts were Hercules, Castor and Pollux, Orpheus, and Theseus.

**Årgo-Navis**, the southern constellation of the Ship, containing 9 clusters, 3 nebulæ, 13 double, and 540 single stars, of which about 64 are visible.

Argonne, a district of France between the rivers Meuse, Marne, and Aisne, celebrated for the campaign of Dumouriez against the Prussians in 1702, and for the military movements and actions which took place therein previous to the battle of Sedan, in 1870.

Ar'gos, a town of Greece, in the northeast of the Peloponnesus, between the gulfs of Ægina and Nauplia or Argos. This town and the surrounding territory of Argolis were famous from the legendary period of Greek history onward, the territory containing, besides Argos. Mycenæ, where Agamemnon ruled, with a kind of sovereignty, over all the Peloponnesus. Argolis and Corinth now form a monarchy of the kingdom of Greece. Area 1,447 sq. mi.; pop. 136,081.

1,447 sq. mi.; pop. 136,081. **Ar'gus**, in Greek mythology, a fabulous being, said to have had a hundred eyes, placed by Juno to guard Io. Hence "argus-eyed," applied to one who is exceedingly watchful.

Argyle (or Argyll) (ar-gil'), a county in the Highlands of Scotland, consisting partly of mainland and partly of islands belonging to the Hebrides group, the chief of which are Islay, Mull, Jura, Tiree, Coll, Rum, Lismore, and Colonsay, with Iona and Staffa. Area 3,255 sq. mi., of which the islands comprise about 1,000 sq. mi. The county is mountainous. There are several lakes, the principal of which is Loch Awe. Cattle and sheep are reared in numbers, and fishing is largely carried on, as is also the making of whisky. There is but little arable land. The chief minerals are slate, marble, Ilmestone, and granite. County town, Inverary; others, Campbelton, Oban, and Dunoon. Pop. 75,495.

Argyle, CAMPBELLS OF, a historic Scottish family raised to the peerage in the person of Sir Duncan Campbell of Lochow, in 1445. The more eminent members are: (1) ARCHI-BALD, 2d Earl, killed at the battle of Flodden, 1513.—ARCHIBALD, 5th Earl, was the means of averting a collision between the Reformers and the French troops in 1559; commanded troops at the battle of Langside; d. 1575 .-ARCHIBALD, 8th Earl and Marquis, b. 1598; partisan of the covenanters; created a marquis by Charles I. It was by his persuasion that Charles II visited Scotland, and was crowned at Scone in 1651; tried for treason, and beheaded in 1661.-ARCHIBALD, 9th Earl, son of the preceding, was excluded from the general pardon by Cromwell in 1654. On the passing of the Test Act in 1681 he refused to take the required oath, was tried and sentenced to death. He escaped to Holland, was taken and conveyed to Edinburgh, where he was be-headed in 1685.—ARCHIBALD, 10th Earl and 1st Duke, son of the preceding, d. 1703; took an active part in the Revolution of 1688-89, which placed William and Mary on the throne. – JOHN, 2d Duke and Duke of Greenwich, son of the above, b. 1678, d. 1743; served at the battles of Ramilies, Oudenarde, and Malplaquet, and assisted at the sieges of Lisle and Ghent. He was long a supporter of Walpole, but his political career was full of intrigue. He is the Duke of Argyle in Scott's Heart of Midlothian.-George Douglas Campbell, 8th Duke, Baron Sundridge and Hamilton, was b. in 1823. In 1852 he became lord privy seal under Lord Aberdeen, and again under Lord Palmerston in 1859; postmaster-general in 1860; secretary for India from 1868 to 1874; again lord privy seal in 1880, but retired, being unable to agree with his colleagues on their Irish policy. He is author of *The Reign of Law, Scotland as* It Was and as It Is, etc. His eldest son, the Marquis of Lorne, married the Princess Louise, fourth daughter of Queen Victoria, in 1871.

Ariadne (a-ri-ad'ne), in Greek mythology, a daughter of Minos, king of Crete. She gave Theseus a clue of thread to conduct him out of the labyrinth after his defeat of the Minotaur. Theseus abandoned her on the Isle of Naxos, where she was found by Bacchus, who married her.

Arica (å-rē'ka), a seaport of Chile, 30 mi. s. of Tacna; previous to 1882 it belonged to Peru. It has suffered frequently from earthquakes, being in 1808 almost entirely destroyed, part of it being also submerged by an earthquake wave. Pop. about 4,000.

**Ariége** (å-rē-āzh), a mountainous department of France, on the northern slopes of the Pyrenees, comprising the ancient countship of Foix and parts of Languedoc and Gascony. Sheep and cattle are reared; the arable land is small in quantity. Chief town, Foix. Area 1,890 sq. mi.; pop. 1891, 22,749.

Aries (ā'ri-ēz) (the Ram), a northern con-

stellation of 156 stars, of which 50 are visible. It is the first of the twelve signs in the zodiac, which the sun enters at the vernal equinox, about the 21st of March. The first point in Aries is that where the equator cuts the ecliptic in the ascending node, and from which the right ascensions of heavenly bodies are reckoned on the equator, and their longitudes upon the ecliptic. Owing to the precession of the equinoxes the sign Aries no longer corresponds with the constellation Aries, which it did 2,000 years ago.

Ari'on, an ancient Greek poet and musician, born at Methymna, in Lesbos, flourished about B. c. 625. A fragment of a hymn to Poseidon, ascribed to Arion, is extant.

Arios'to, LUDOVI'CO (1474-1533), one of the most celebrated poets of Italy, b. at Reggio, in Lombardy. His lyric poems in the Italian and Latin languages, distinguished for ease and elegance of style, introduced him to the notice of the Cardinal Ippolito d'Este, son of Duke Ercole I of Ferrara. He began and finished, in ten or eleven years, his immortal poem, the Orlando Furioso, which was published in 1515, and immediately became highly popular. At Ferrara he employed himself in the composition of his comedies, and in putting the last touches to his Orlando. The Orlando Furioso is a continuation of the Orlando Innamorata of Bojardo, details the chivalrous adventures of the paladins of the age of Charlemagne, and extends to forty-six cantos.

Arista, MARIANO (1802-1855), Mexican general, born in the state of San Luis Potosi, died on board the British steamer Tagus. He took part in the war that established Mexican independence, was a successful military leader, and in 1836 was second in command to General Santa Anna. He commanded at Palo Alto and Resaca de lá Palma in the war between Mexico and the U. S. He was appointed minister of war in 1848. In 1850 General Arista became president of Mexico, which office he resigned Jan. 6, 1853. Soon afterward Arista was banished, and died in exile. In 1881 his remains were sent to Mexico.

Aristæus, in Greek mythology, son of Appollo and Cyrene, the introducer of beekeeping.

Aristarchus (a-ris-tär'kus), an ancient Greek grammarian, b. at Samothrace B. c. 160, d. at Cyprus B, c. 88. He criticised Homer's poems with the greatest acuteness and ability. His edition of Homer furnished the basis of all subsequent ones.

Aristarchus, an ancient Greek astronomer belonging to Samos, flourished between 280 and 264 B. C., and first asserted the revolution of the earth about the sun; also regarded as the inventor of the sun-dial.

**Aris' teas**, a personage of ancient Greek legend, represented to have lived over many centuries, disappearing and reappearing by turns.

Aristides, surnamed "the Just" (d. 468 B. c.), a celebrated Athenian statesman and military commander. At the time of the Per-

sian invasian under Darius, Aristides was one of the leaders of the Athenians. Owing to his influence and persuasion the chief command was given to Miltiades instead of changing daily among the ten generals as had been customary. To this fact was due in great measure the important victory at Marathon (490). The next year (489 B. C.) Aristides was appointed archon (chief magistrate), but his rival Themistocles managed to secure his ostracism on the pretext that he was becoming dangerous to the democracy (483). In connection with this incident is told the familiar story of Aristides's writing his own name on the shell for an illiterate citizen who wanted to vote for his ostracism, and gave as his only reason that he was tired of hearing Aristides called the Just. Such was his unselfish patriotism that during his exile he sought to unite the Grecian cities against the coming Persian invasian, and before the battle of Salamis (480) went to Themistocles and gave him his hearty support. He assisted in planning the engagement and himself took part in it. He afterward commanded the Athenian forces. When the Delian League was formed, certain states having become offended at the arrogance of Pausanias, they decided to form a confederation under the hegemony of Athens. Aristides was assigned the difficult task of adjusting the relations of the several members and assessing the expenses of the Persian war. When Themistocles was suspected, he did not join the prosecution, and after his rival's banishment always "spoke of him with admiration and respect." Aristides was so poor at his death that he was buried at public cost, but from a grateful country his children received dowries and a landed estate.

Aristip' pus, a disciple of Socrates, and founder of a philosophical school among the Greeks, which was called Cyrenaic, from his native town Cryěně, in Africa; flourished 380 В. С. His moral philosophy differed widely from that of Socrates, and was a science of refined voluptuousness. His fundamental principle was, that all human sensations may be reduced to two, pleasure and pain. Pleasure is a gentle, and pain a violent emotion. Ali living beings seek the former and avoid the latter. Happiness is nothing but a continued pleasure, composed of separate gratifications; and as it is the object of all human exertions we should abstain from no kind of pleasure. Still we should always be governed by taste and reason in our enjoyments. His doctrines were taught only by his daughter Arete, and his grandson Aristippus the younger, by whom they were systematized.

**Aristogeiton** (gi'ton), a citizen of Athens, whose name is rendered famous by a conspiracy (514 B. C.) formed in conjunction with his friend Harmodius against the tyrants Hippias and Hipparchus, the sons of Pisistratus. Both Aristogeiton and Harmodius lost their lives through their attempts to free the country, and were reckoned martyrs of liberty.

Aristophanes (tof a-nez) (444-380 B. c.), the greatest comic poet of ancient Greece, born

at Athens. He appeared as a poet in B. c. 427, and having indulged in some sarcasms on the powerful demagogue Cleon, was ineffectually accused by the latter of having unlawfully assumed the title of an Athenian citizen. He afterward revenged himself on Cleon in his comedy of the Knights, in which he himself acted the part of Cleon. The names of his extant plays are Acharnians, Knights, Clouds, Wasps, Peace, Birds, Lysistrata, Thesmophoriazusæ, Frogs, Ecclesiazusæ and Plutus.

Aristotie (384-322 B. c.), the greatest of ancient philosophers, founder of the Peripatetic School, the last and greatest of the famous trio of Greek philosophers which in-cluded the names of Socrates and Plato. At the age of 17 Aristotle went to study at Athens, where he remained for 20 years. He was a favorite pupil of Plato, who called him "the intellect of his school." He remained a warm admirer of Plato, though opposed to his philosophical teaching. About 343 Aristotle became the teacher of Alexander the Great. After the conquest of Persia, Alexander pre-sented him with nearly a million dollars. He also aided his scientific researches greatly by sending him a specimen of any plant or ani-mal found on his expeditions that was un-known in Greece. This friendship led the Athenians to accuse Aristotle of favoring Macedonia, and he was forced to flee to Chalcis, on the island of Eubœa, where he died. While at Athens Aristotle taught in the Lyceum, a gymnasium near the city, by which title the school is sometimes referred to. The name "Peripatetic" is due to the fact that he walked up and down (Gk. peripatein) while teaching. It was his custom to instruct his more intimate pupils in the problems of philosophy during the forenoon, and in the evening he gave public lectures to the people on less weighty subjects. Only a portion of Aristotle's writings has come down to us. Of his pre-served works the most important are: Logic, Rhetoric, Postics, Physics, Metaphysics, Eth-ics, Psychology, Politics, History of Animals, Meteorology. He was the creator of natural science. He was the first to divide the animal kingdom into classes, and came near discovering the circulation of the blood. Aristotle's moral and political philosophy is based on the peculiarities of the human organism, and all science must be based on logic, the science of thought. To him is due the famous syllogism, the simplest form that an argument may assume. He was the first to distinguish the substance of things from their accidental characteristics; i.e. matter and form. He established the so-called "cosmological argument" for the existence of God. This is, in substance, that everything in the world has a finite cause, and back of the long succession of finite causes there must be an infinite being, a first something, absolute reason, God. One of the problems of the ancient schools of philosophy was the attainment of the highest possible happiness. This Aristotle finds to be in the intelligent use of the reasoning powers, and it is the possession of these which distinguishes man from the beasts. Before the eleventh century Aristotle was but little known to the Christian world, although prized by the Arabians for three centuries prior to this. For four centuries he remained the authority of the Christian thinkers, but gradually his teachings became distorted and misunderstood. With the revival of learning his works were carefully studied and correctly interpreted, and their effect is felt in all subsequent philosophy, notably in Bacon, Kant, Spinoza, and Descartes.

Arith' metic, is primarily the science of numbers. As opposed to algebra it is the practical part of the science. Although the processes of arithmetical operations are often highly complicated, they all resolve them-selves into the repetition of four primary operations — addition, subtraction, multiplication, and division. Of these the two latter are only complex forms of the two former, and subtraction again is merely a reversal of the process of addition. Little or nothing is known as to the origin and invention of arithmetic. Some elementary conception of it is in all probability coeval with the first dawn of human intelligence. In consequence of their rude methods of numeration, the science made but small advance among the ancient Egyptians, Greeks, and Romans, and it was not until the introduction of the decimal scale of notation and the Arabic or rather Indian, numerals into Europe that any great progress can be traced. In this scale of notation every number is expressed by means of the ten digits -1, 2, 3, 4, 5, 6, 7, 8, 9, 0, by glving each digit a local as well as its proper or natural value. The value of every digit increases in a tenfold proportion from the right toward the left; the distance of any figure from the right indicating the power of 10, and the digit itself the number of those powers intended to be expressed; thus,  $3464=3000+400+60+4=3 \times 10^3+4 \times 10^2+6 \times 10+4$ . The earliest arithmetical signs appear to have been hieroglyphical, but the Egyptian hieroglyphics were too diffuse to be of any arithmetical value. The units were successive strokes to the number required, the ten an open circle, the hundred a curled palm-leaf, the thousand a lotus flower, ten thousand a bent finger. The letters of the alphabet afforded a convenient mode of representing figures, and were used accordingly by the Chaldeans, Hebrews, and Greeks. The first nine letters of the Hebrew alphabet represented the units; the second nine, tens; the remaining four, together with five repeated with additional marks, hundreds; the same succession of letters with added points was repeated for thousands, tens of thousands, and hundreds of thousands. The Greeks followed the same system up to tens of thousands. They wrote the different classes of numbers in succession as we do, and they transferred operations performed on units to numbers in higher places; but the use of different signs for the different ranks clearly shows a want of full perception of the value of place as such. They adopted the letter M as

a sign for 10,000 and by combining this mark with their other numerals they could note numbers as high as 100,000,000. The Roman numerals which are still used in marking dates or numbering chapters were almost useless for purposes of computation. From one to four were represented by vertical strokes I, II, III, IIII, five by V, ten by X, fifty by L, one hundred by C, five hundred by D, a thousand by M. These signs were derived from each other according to particular rules; thus, V was the half of X; L was likewise the balf of C: M was artistically written M, and D became five hundred. CCI represented 5,000. They were also compounded by addition and subtraction; thus, IV stood for four, VI for six, XXX for thirty, XL for forty, LX for sixty. Arithmetic is divided into abstract and practical; the former comprehends notation, numeration, addition, subtraction, multiplication, and division, measures and multiples, fractions, powers and roots; the latter treats of the combinations and practical applications of these and the so-called rules, such as reduction, compound addition, subtraction, multiplication, and division, proportion, interest, profit and loss, etc. Another division is integral and fractional arithmetic, the former treating of integers, or whole num-bers, and the latter of fractions. Decimal fractions were invented in the sixteenth century, and logarithms, embodying the last great advance in the science, in the seventeenth century.

Arithmet' ical, pertaining to arithmetic or its operations. Arithmetical mean, the middle term of three quantities in arithmetical progression, or half the sum of any two proposed numbers; thus 11 is the arithmetical mean to 8 and 14. Arithmetical progression, a series of numbers increasing or decreasing by a common difference, as 1, 3, 5, 7, etc. Arithmetical signs, certain symbols used in arithmetic, and indicating processes or facts. The common signs used in arithmetic are the following: + signifying that the numbers between which it is placed are to be added; that the second is to be subtracted from the first;  $\times$  that the one is to be multiplied by the other: + that the former is to be divided by the latter: = signifies that the one number is equal to the other; :, ::, : are the signs placed between the members of a proportional series, as 4:6::8:12. A period placed to the left of a series of figures indicates that they are decimal fractions.

Arizona, a territory of the U. S., containing 113,020 sq. mi. Its breadth is about 335 mi., length about 390 mi. The surface consists of elevated table-lands intersected by mountains and interspersed with valleys. The soil is rich. The agricultural and horticultural products are principally alfalfa, grain, potatoes, sorghum, apricots, peaches, grapes, apples, oranges, lemons, pears, plums, figs, almonds, dates, etc. The precious metals are gold, silver, copper, lead, and limestone. The mineral output for 1896 aggregated \$13,978,-263.20. The stock industry is one of consider-

able proportions. For 1896 it gave a return of \$2,757,287.50. Arizona possesses valuable forests which cover an area of 10,000 sq. mi. Its plains sustain large herds of cattle and sheep. The climate varies from the temperate in the northern portion of the territory to a semitropical in the southern. The air is dry and pure. Manufacturing is carried on in a limited way. Twelve railroads are operated in the territory with a total mileage of 1,295,928. The names of the different railroads are as follows: Atlantic & Pacific; Southern Pacific; Arizona & New Mexico; Central Ari-zona; Arizona & Southeastern; Maricopa & Phœnix; New Mexico & Arizona. The Santa Fé, Prescott & Phœnix; The United Verde & Pacific; Globe, Gila Valley & Northern; Phœnix, Tempe & Mesa; and The Congress Gold Mine Railroad. A conservative estimate of the taxable property of the territory is at least \$90,000,000. There are five national banks in Arizona with a paid-up capital of \$400,000 and a surplus of about \$84,180. There are seven banks organized under the incorporation laws of the territory, and one private bank. There are, on reservations within the borders of the territory, as near as can be ascertained, 38,000 Indians. For these people the government has established Indian schools which have produced good Considerable attention is given to results. education in general, and the manner in which the normal and public schools are carried on is meritorious. The University of Arizona, located at Tucson, was established in 1885 and is now in a flourishing condition. The number of public schools in the terri-tory is 223. The whole amount expended for school purposes during 1896 was nearly \$250,-000, and the valuation of school property was \$500,000. The library at the University of Arizona contains about 700 volumes and receives the principal educational publications. The penal, charitable, and reformatory institutions of the territory are three in number: the insane asylum, the Territorial prison, and the reform school. There are various church organizations with property of considerable value. The social advancement in the last few years has been very great. The news-paper field of Arizona is well occupied, there being a newspaper published in every county. There is scarcely a town of 300 inhabitants in which there is not a weekly newspaper. The total number of papers in the territory is 35, of which 8 are daily, 26 weekly, and one monthly. Arizona has twelve counties. The principal towns are Prescott, the seat of the capital; Tucson, a Mexican town; Yuma; Tomb-stone; Phœnix; Saint John; Clifton; Globe; and Mineral Park. It was first visited by the Spaniards in 1570. From 1821 to 1848 it was a part of Mexico when it passed to the U.S. by the treaty of Guadalupe Hidalgo. In 1863 it was organized into a territory. In 1896 the population was 101,240.

**Àrk**, the name applied in our translation of the Bible to the boat or floating edifice in which Noah resided during the flood or deluge; to the floating vessel of bulrushes in which the infant Moses was laid; and to the chest in which the tables of the law were preserved—the *ark of the covenant*.

Arkansas (ar'-kan-sa), one of the southwestern states of the U.S. with an area of 52,198 sq. mi. It is bounded n. by Missouri; e. by Tennessee and Mississippi, from which it is separated by the Mississippi River; s. by Louisiana; and w. by the Indian territory. It belongs to the great basin of the Mississippi, being watered by that river, and by several of its main tributaries, which are all more or less navigable. Of these the principal are the St. Francis, in the north east; the White River with its affluents, the Cache, Little Red, and Black rivers in the north; and notably the Arkansas, which, entering the state at Fort Smith, traverses it in a southeasterly direction until it joins the Mississippi at Napoleon. The southern part of the state is watered by the Washita in the east, and by a bend of the Red River in the The eastern part of the state, bordering west. on the Mississippi, is low and swampy, and is annually overflowed. Westward the country gradually attains a greater elevation, pas-sing off into hills and undulating prairies, which lead up to the Ozark Mountains, beyond which, again, an elevated plain stretches toward the Rocky Mountains. The Ozark Mountains do not exceed 2,000 feet in height, and the only other great masses of elevation are the Black Hills and the Washita Hills.

Soil.—In the eastern part of the state lies a strip of rich, alluvial, swampy land which extends as far west as Crowley's Ridge. The lower Arkansas River also traverses a similar low and wet tract. In the southern half of the state are great areas of loamy land interspersed with tracts of lead clay and hills of iron ore. There are great slity prairies west of Crowley's Ridge; in the west and northwest are prairies of red loam, and in the north is the Ozark mountain region. In many regions coal comes to the surface of the ground and is being worked to some extent; the quality is very good. Silver, galena, and zinc are abundant, as also are iron ores. There are many stone quarries in the state which yield novaculate hone stone.

Vegetation.-- Extensive forests of valuable timber are found in the hill country and occasionally in the bottom-lands of Arkansas. About one fourth of the area of the state is covered with yellow-pine timber land. Along the lakes and bayous are dense forests of cypress. The other timber trees are several species of oak, red cedar, black walnut, tupelo gum, cherry, maple, black locust, sassafras, red mulberry, and osage orange. There are also ash, hickory, gum, beech, pecan, sycamore, elm, cottonwood, and hackberry trees; also the holly, willow, catlep, box elder, butternut, palmetto, dogwood, plum, hornbeam, ironwood, mockery nut, juniper and laurel. There are also extensive canebrakes in the lowlands. There are some wild fruit and berries, as the paw-paw, persimmon, haw, whortleberry, wild plum, and chinquapin. Apples,

peaches, pears, plums, apricots, cherries, nectarines, grapes, blackberries, and strawberries are of fine quality and abundant. Arkansas is rich in cereals and Indian corn. There are over thirty varieties of grasses in Arkansas, the hay crop being more important than that of any other southern state. Cotton is the staple product and is grown on the lowlands and on the hills.

Climate. — On the whole, Arkansas has a very fine climate, although malarial fevers and extreme heat are to be encountered in the marshy and flat districts. In the northwestern part of the state the mean annual temperature is about 61°, and the annual rainfall about 55 inches. In the western part of the state the rainfall is about 41 inches. The eastern part of the state is hot, and in the swampy, overflowed lands there is considerable fever and ague and sometimes yellow fever. The climate is noted for the relief it gives to people afflicted with pulmonary diseases. Hot Springs, Ark., is a popular resort for invalids during the winter season.

Manufactures.—There are many mills for the sawing of lumber and kindred operations, and mills for the extraction of cottonseed oil are being established very rapidly.

History.—This region was formerly a part of the French colony of Louisiana which was purchased by the U. S. in 1803. The earliest French settlement was made at Arkansas Post in 1685. Arkansas was organized as a territory in 1819 and became a state in 1836. This was one of the seceding states in 1861 and on its soil were fought many of the battles. The principal towns are Little Rock, the capital, Hot Springs, Pine Bluff, Texarcana. Helena and Ft. Smith. The population in 1890 was 1,128,179, of which over 300,000 were colored.

Governors.—James S. Conway, 1836; Archibald Yell, 1840; Samuel Adams, 1844; Thomas S. Drew, 1844; John S. Roane, 1848; Elias N. Conway, 1852; Henry M. Rector, 1860; Harris Flanagin, 1862; Isaac Murphy, 1804; Powell Clayton, 1868; Orzo H. Hadley, 1871; Elisha Bayter, 1872; Augustus H. Garland, 1874; William R. Miller, 1877; Thomas J. Churchill, 1881; James H. Berry, 1883; Simon P. Hughes, 1885; James P. Eagle, 1889; William M. Fishback, 1893; James P. Clarke, 1805; D. W. Jones, 1896.

Arkansas City, Cowley co., Kan., on Arkansas and Walnut rivers. Railroads: Santa Fé; Missouri Pacific; St. L. & S. F.; and Northwestern. Industries: railroad shops, three flouring mills, two iron foundries, chair, mattress, and other factories. There is some natural gas in the vicinity, not extensively developed. Arkansas City has been for many years the outfitting point for the various reservations in Oklahoma and Indian Territory. The town was first settled in 1869 by the Norton Colony and became a city in 1870. Pop. est. 1897, 7,000.

Arkansas, a river of the U.S., which gives its name to the above state, the largest affluent of the Mississippi after the Missouri. It

rises in the Rocky Mountains, about lat.  $39^{\circ}$ n. lon.  $107^{\circ}$  w., flows in a general southeasterly direction through Colorado, Kansas, the Indian Territory, and falls into the Mississippi. Length 2,170 mi.

Ark' wright, RICHARD (1732-1792), famous for his inventions in cotton-spinning, was born at Preston, in Lancashire. The youngest of thirteen children, he was bred to the trade of a barber. When about thirty-five years of age he gave himself up exclusively to the subject of inventions for spinning cotton. The thread spun by Hargreaves's jenny could not be used except as weft, being destitute of the firmness or hardness required in the longitudinal threads or warp. But Arkwright supplied this deficiency by the invention of the spinningframe, which spins a vast number of threads of any degree of fineness and hardness, leaving the operator merely to feed the machine with cotton and to join the threads when they happen to break. His invention introduced the system of spinning by rollers, the carding, or roring, as it is technically termed (that is, the soft, loose strip of cotton), passing through one pair of rollers, and being received by a second pair, which are made to revolve with (as the case may be) three, four, or five times the velocity of the first pair. By this contrivance the roving is drawn out into a thread of the desired degree of tenuity and hardness. His inventions being brought into a pretty advanced state, Arkwright removed to Nottingham in 1768 in order to avoid the attacks of the same lawless rabble that had driven Hargreaves out of Lancashire. Here his operations were at first greatly fettered by a want of capital; but two gentlemen of means having entered into partnership with him, the necessary funds were obtained, and Arkwright erected his first mill, which was driven by horses, at Nottingham, and took out a patent for spinning by rollers in 1769. As the mode of working the machinery by horse-power was found too expensive he built a second factory on a much larger scale at Cromford, in Derbyshire, in 1771, the machinery of which was turned by a water-wheel. Having made several additional discoveries and improvements in the processes of carding, roving, and spinning, he took out a fresh patent for the whole in 1775, and thus completed a series of the most ingenious and complicated machinery. Notwithstanding a series of lawsuits in defense of his patent rights, and the destruction of his property by mobs, he amassed a large fortune. He was knighted by George III in 1786.

Arle (arl), a town of southern France, dep. Bouches du Rhône, 17 mi. s.e. of Nismes. It was an important town at the time of Cæsar's invasion, and under the later emperors it became one of the most flourishing towns on the further side of the Alps. It still possesses numerous ancient remains, of which the most conspicuous are those of a Roman amphitheater, which accommodated 24,000 spectators. It has a considerable trade, manufactures of silk, etc., and furnishes a market for the surrounding country. Pop. 13,291.

# Armadillo

Arlington, Alexandria co., Va., a few miles from Washington city, on the opposite bank of the Potomac. Close by lies the famous "Arlington Heights," the country-seat of Gen. R. E. Lee, which was confiscated by the government after the war, but was restored to his family subsequently. Pop. 5,000.

Arlington, Middlesex co., Mass., 6 mi. from Boston, seat of Mount Hope Hospital for the Insane. It has several small factories and a savings bank. Pop. 5,625.

Arm, the upper limb in man, connected with the thorax or chest by means of the scapula or shoulder-blade, and the clavicle or collar-bone. See Anatomy.

Arma'da, the Spanish name for any large naval force; usually applied to the Spanish fleet vaingloriously designated the *Invincible* Armada, intended to act against England A. D. 1588. It was under the command of the Duke of Medina-Sidonia, and consisted of 130 great war vessels, larger and stronger than any belonging to the English fleet, with 30 smaller ships of war, and carried 19,925 marines, 8,460 sailors, 2,088 slaves, and 2,630 cannons. It had scarcely quitted Lisbon on May 29, 1588, when it was shattered by a storm, and had to be refitted in Corunna. It was to co-operate with a land force collected in Flanders under the Prince of Parma, and to unite with this it proceeded through the English Channel toward Calais. In its progress it was attacked by the English fleet under Lord Howard, who, with his lieutenants Drake, Hawkins and Frobisher, endeavored by dexterous seamanship and the discharge of well directed volleys of shot to destroy or capture the vessels of the enemy. The great lumbering Spanish vessels suffered severely from their smaller opponents, which most of their shot missed. Arrived at length off Dunkirk, the armada was becalmed, thrown into confusion by fire-ships, and many of the Spanish vessels destroyed or taken. The Duke of Medina-Sidona, owing to the severe losses, at last resolved to abandon the enterprise, and conceived the idea of reconveying his fleet to Spain by a voyage round the north of Great Britain; but storm after storm assailed his ships, scattering them in all directions and sinking many. Some went down on the cliffs of Norway, others in the open sea, others on the Scottish coast. About thirty vessels reached the Atlantic Ocean, and of these several were driven on the coast of Ireland and wrecked. In all, seventy-two large vessels and over 10,000 men were lost.

Armadil' lo, a toothless mammal, peculiar to South America, consisting of various species, belonging to a family intermediate between the sloths and ant-eaters.

and ant-eaters. Armadillo. They are covered with a hard, bony shell,

divided into belts, composed of small separate plates like a coat of mail, flexible everywhere except on the forehead, shoulders, and haunches, where it is not movable. The belts are connected by a membrane, which enables the animal to roll itself up like a hedgehog. These animals burrow in the earth, where they lie during the daytime, seldom going abroad except at night. They are of different sizes: the largest being 3 feet in length without the tail, and the smallest only 10 inches. They subsist chiefly on fruits and roots, sometimes on insects and flesh. They are inoffensive, and their flesh is esteemed good food.

Armagh (ar-mä'), a county of Ireland, in the province of Ulster. Area 328,086 acres, of which about half is under tillage. The manufacture of linen is carried on very extensively. Armagh, Lurgan, and Portadown are the chief towns. Pop. 143,056.—The county town, ARMAGH, formerly a Parliamentary borough, is situated partly on a hill, about half a mile from the Callan. It has a Protestant cathedral crowning the hill, a Gothic building dating from the eighth century, repaired and beautified recently; a new Roman Catholic cathedral in the pointed Gothic style, and various public buildings. It is the see of an archbishop of the Protestant Episcopal Church, who is primate of all Ireland, and is a place of great antiquity. Pop. 1891, 8,303.

Armagnac (ar-ma-nyak), an ancient territory of France, in the province of Gascony, some of the counts of which hold prominent places in the history of France.

Ar'mature, a term applied to the piece of soft iron which is placed across the poles of permanent or electro-magnets for the purpose of receiving and concentrating the attractive force. In the case of permanent magnets it is also important for preserving their magnetism when not in use, and hence is sometimes termed the keeper. It produces this effect in virtue of the well-known law of induction, by which the armature, when placed near or across the poles of the magnet, is itself converted into a temporary magnet with reversed poles, and these, reacting upon the permanent magnet, keep its particles in a state of constant magnetic tension, or in other words, in that constrained position which is supposed to constitute magnetism. A horseshoe magnet should therefore never be laid aside without its armature; and in the case of straight-bar magnets two should be placed parallel to each other, with their poles reversed, and a keeper or armature across them at both ends. The term is also applied to the core and coil of the electro-magnet, which revolves before the poles of the permanent magnet in the magneto-electric machine.

Arme' nia, a mountainous country of western Asia, not now politically existing, but of great historical interest, as the original seat of one of the oldest civilized peoples in the world. It is now shared between Turkey, Persia, and Russia. It has an area of about 137,000 sq. mi., and is intersected by the Euphrates, which divides it into the ancient divisions, Armenia Major and Armenia Minor. The country is an elevated plateau, inclosed on several sides by the ranges of Taurus and Anti-Taurus, and partly occupied by other mountains, the loftiest of which is Ararat. Several important rivers take their rise in Armenia; namely, the Kur

or Cyrus, and its tributary the Aras or Araxes, flowing east to the Caspian Sea: the Halys or Kizil - Irmak. flowing north to the Black Sea; and the Tigris and Euphrates, which flow into the Persian Gulf. The chief lakes are Van 4 and Urumi-

Armenian.

The climate is rather severe. vah. soil is on the whole productive, though in many places it would be quite barren were it not for the great care taken to irrigate it. Wheat, barley, tobacco, hemp, grapes, and cotton are raised; and in some of the valleys apricots, peaches, mulberries, and walnuts are grown. The inhabitants are chiefly of the genuine Armenian stock, a branch of the Aryan or Indo-European race; but besides them, in consequence of the repeated subjugation of the country, various other races have obtained a footing. The total number of Armenians is estimated at 2,000,000, of whom probably one-half are in Armenia. The remainder, like the Jews, are scattered over various countries, and being strongly addicted to commerce, play an important part as merchants. They retain, however, in their different colonies their distinct nationality. Little is known of the early history of Armenia, but it was a separate state as early as the eighth century B. c., when it became sub-ject to Assyria, as it did subsequently to the Medes and the Persians. It was conquered by Alexander the Great in 325 B. C., but regained its independence about 190 B. c. Its king Tigranes, son-in-law of the celebrated Mithridates, was defeated by the Romans under Lucullus and Pompey about 69-66 B. c., but was left on the throne. Since then its fortunes have been various under the Romans, Parthians, Byzantine emperors, Persians, Saracens, Turks, etc. A considerable portion of it has been acquired by Russia in the present century, part of this in 1878.

The Armenians received Christianity as early as the second century. During the Monophysitic disputes they held with those who rejected the twofold nature of Christ, and being dissatisfied with the decisions of the Council of Chalcedon (451) they separated from the Greek Church in 536. The popes have at different times attempted to gain them

over to the Roman Catholic faith, but have not been able to unite them permanently and generally with the Roman Church. There are, however, small numbers here and there of United Armenians, who acknowledge the spiritual supremacy of the pope, agree in their doctrines with the Catholics, but retain their peculiar ceremonies and discipline. But the far greater part are yet Monophysites, and have remained faithful to their old religion and worship. Their doctrine differs from the orthodox chiefly in their admitting only one nature in Christ, and believing the Holy Spirit to proceed from the Father alone. Their sac-raments are seven in number. They adore saints and their images, but do not believe in purgatory. Their hierarchy differs little from that of the Greeks. The Catholicus, or head of the church, has his seat at Etchmiadzin, a monastery near Erivan, the capital of Russian Armenia, on Mount Ararat. Turkish Armenia has been the scene of repeated massacres and outrages on Christians, evoking the indignation of the civilized world.

The Armenian language belongs to the Indo-European family of languages, and is most closely connected with the Iranic group. The Old Armenian or Haikan language, which is still the literary and ecclesiastical language, is distinguished from the new Armenian, the ordinary spoken language, which contains a large intermixture of Persian and Turkish elements. The most flourishing period of Armenian literature extended from the fourth to the fourteenth century. It then declined, but a revival began in the seventeenth century, and at the present day wherever any extensive community of Armenians have settled they have set up a printing-press. The Armenian Bible, translated from the Septuagint by Isaac or Sahak, the patriarch, early in the fifth century, is a model of the classic style.

Armentières (ar-man-tyar), a town in France, dep. Nord, 10 mi. w. n. w. of Lille, on the The town has extensive manufactures Lys. of linen and cotton goods and an extensive trade. Pop. 26,614.

Armida (ar-mē'-da), a beautiful enchantress in Tasso's Jerusalem Delivered, who succeeds in bringing the hero, Rinaldo, with whom she had fallen violently in love, to her enchanted gardens. Here he completely forgets the high task to which he had devoted himself, until messengers from the Christian host, having arrived at the island, Rinaldo escapes with them by means of a powerful talisman. In the sequel Armida becomes a Christian.

Armin'ius, an ancient German hero celebrated by his fellow-countrymen as their deliverer from the Roman yoke; b. about 18-16 B. C., assassinated A. D. 19. He served in the Roman army, and was raised to the rank of eques. Returning home he found the Roman governor, Quintilius Varus, making efforts to Romanize the German tribes near the Rhine. He completely annihilated the army of Varus, consisting of three legions, in a three days' battle fought in the Teutoburg forest. After many years' resistance to the power of the empire he drew upon himself the hatred of his countrymen by aiming at the regal authority, and was assassinated.

Armiston, Calhoun co., Ala., 60 mi. e. of Birmingham. Railroads: two branches of Southern Railroad System, and Louisville & Nashville. Industries: iron and steel works, machine shops, net and frame works, iron pipe, and furnace factories. Surrounding country agricultural and mineral. The town was first settled in 1881 and became a city the same year. Pop. est. 1897, 12,500.

Armitage, EDWARD, an English historical painter, born in London, 1817. He is best known by his allegorical picture of Britannia and Columbia relieving Chicago.

Armor'ica ("upon the sea"), a name anciently applied to all northwestern Gaul, latterly limited to what is now Brittany. Hence Armoric is one name for Breton or the language of the inhabitants of Brittany, a Celtic dialect closely allied to Welsh.

Arms and Armor.-The former term is applied to weapons of offense, the latter to the various articles of defensive covering used in war and military exercises, especially before the introduction of gunpowder. Weapons of offense are divisible into two distinct sections -firearms, and arms used without gunpowder or other explosive substance. The first arms of offense would probably be wooden clubs; then would follow wooden weapons made more

deadly by means of stone or bone, stone axes, slings, bows and arrows with heads of flint or bone, and afterward various weapons of bronze. Subsequently a variety of arms of iron and steel were

Armor and Horse Armor.

introduced, which comprised the sword, javelin, pike, spear or lance, dagger, axe, mace, chariot scythe, etc.; with a rude artillery consisting of catapults, ballistæ, and battering-rams. From the descriptions of Homer we know that almost all the Grecian armor, defensive and offensive, in his time was of bronze; though iron was sometimes used. The lance, spear, and javelin were the principal weapons of this age among the Greeks. The bow is not often mentioned. Among ancient nations the Egyptians seem to have been most accustomed to the use of the bow, which was the principal weapon of the Egyptian infantry. Peculiar to the Egyptians was a defensive weapon intended to catch and break the sword of the enemy. With the Assyrians the bow was a favorite weapon; but with them lances, spears, and javelins were in more common use than with the Egyptians. Most of the large engines of warchariots with scythes projecting at each side from the axle, catapults, and ballistæ — seem to have been of Assyrian origin. During the historical age of Greece the characteristic weapon was a heavy spear from 21 to 24 feet in length.

#### Arms

The sword used by the Greeks was short, and was worn on the right side. The Roman sword was from 22 to 24 inches in length, straight, two-edged, and obtusely pointed, and as by the Greeks was worn on the right side. It was used principally as a stabbing weapon. It was originally of bronze. The most characteristic weapon of the Roman legionary soldier, however, was the *pilum*, which was a kind of pike

1, 2, Early Greek. 3, Greek. 4, 5, Roman. 6, Barbarian.

or javelin, 6 feet or more in length. The pilum was sometimes used at close quarters, but more commonly it was thrown. The favorite weapons of the ancient Germanic races were the battle-axe, the lance or dart, and sword. The weapons of the Anglo-Saxons were spears, axes, swords, knives, and maces or clubs. The Normans had similar weapons, and were well furnished with archers and cavalry. The crossbow was a comparatively late invention introduced by the Normans. Gunpowder was not used in Europe to discharge projectiles till the beginning of the fourteenth century. Cannon are first mentioned in England in 1338, and there seems to be no doubt that they were used by the English at the siege of Cambrai in 1339. The projectiles first used for cannon were of stone. Hand firearms date from the fifteenth century. At first they required two men to serve them, and it was necessary to rest the muzzle on a stand in aiming and firing. The muzzle on a stand in aiming and firing. first improvement was the invention of the match-lock, about 1476; this was followed by the wheel-lock, and about the middle of the seventeenth century by the flint-lock, which was in universal use until it was superseded by the percussion-lock, the invention of a Scotch clergyman early in the nineteenth century. The needle-gun dates from 1827. The only important weapon not a firearm that has been invented since the introduction of gunpowder is the bayonet, which is believed to

have been invented about 1650. See Cannon, Musket, Rifle, etc.

Some kind of defensive covering was probably of almost as early invention as weapons of offense. The principal pieces of defensive armor used by the ancients were shields, helmets, cuirasses, and greaves. In the earliest ages of Greece the shield is described as of immense size, but in the time of the Peloponnesian war (about B. c. 420) it was much smaller. The Romans had two sorts of shields: the *scutum*, a large, oblong, rectan-gular, highly convex shield, carried by the legionaries; and the *parma*, a small, round, or oval flat shield, carried by the light-armed troops and the cavalry. In the declining days of Rome the shields became larger and more varied in form. The helmet was a characteristic piece of armor among the Assyrians, Greeks, Etruscans, and Romans. Like all other body armor it was usually made of bronze. The helmet of the historical age of Greece was distinguished by its lofty crest. The Roman helmet in the time of the early emperors fitted close to the head, and had a neck-guard and hinged cheek-pieces fastened under the chin, and a small bar across the face for a visor. Both Greeks and Romans wore cuirasses, at one time of bronze, but latterly of flexible materials. Greaves for the legs were worn by both, but among the Romans usually on one The ancient Germans had large shields leg. of plaited osier covered with leather; afterward their shields were small, bound with iron, and studded with bosses. The Anglo-Saxons had round or oval shields of wood, covered with leather, and having a boss in the center; and they had also corselets, or coats of mail, strengthened with iron rings. The Normans were well protected by mail; their shields were somewhat triangular in shape, their helmets conical. In Europe generally metal armor was used from the tenth to the eighteenth century, and at first consisted of a tunic made of iron rings firmly sewn flat upon strong cloth or leather. The rings were afterward interlinked one with another so as to form a garment of themselves, called chain-Great variety is found in the pattern of mail. the armor, and in some cases small pieces of metal were used instead of rings, forming what is called scale-armor. A suit of armor consisting of larger pieces of metal, called platearmor, was now introduced, and the whole body came to be incased in a heavy metal covering. The various forms of ring or scale armor were gradually superseded by the plate-armor, which continued to be worn until long after the introduction of firearms and field artillery. A complete suit of armor was an elaborate and costly equipment, consisting of a number of different pieces, each with its distinctive name. In modern European armies the metal cuirass is still to some extent in use, the cuirassiers being heavy cavalry; and it is said that this piece of armor proves a useful defense against rifle bullets. During all the time that the use of heavy armor prevailed, the horsemen, who

alone were fully armed, formed the principal strength of armies: and infantry were generally regarded as of hardly any account. England was, however, an exception, as the English archers were almost at all times, before the invention of gunpowder, an important and sometimes the chief force in the army. The bow (long-bow) of the English archers was from 5 to 6 feet in length, and the arrow discharged from it was itself a yard long. The long-bow continued in general use in England till the end of the reign of Elizabeth, and even as late as 1627 there was a body of English archers in the pay of Richelieu at the siege of La Rochelle.

Armstrong, JOHN (1758-1843), soldier, b. in Carlisle, Pa. In 1775, while a student at Princeton, he enlisted in a Pennsylvania regiment, and was appointed aide to Gen. Hugh Mercer. Afterward he became aide to General Gates, with the rank of major, serving in the campaign against Burgoyne and in the South. On March 10, 1783, an anonymous notice was circulated among the officers, urging the troops to lay down their arms, and complaining of the neglect of Congress to give proper attention to their condition. This paper is known as the "Newburg Memorial;" in later years Major Armstrong confessed that he was the author. When the army disbanded Armstrong returned to Carlisle, and soon afterward was made secretary of state, and later adjutant-general of Pennsylvania. Armstrong married a sister of Robert R. Livingston, of New York, removed to that state, and settled on a farm in the old Livingston manor, 1789. In 1800 he was elected to the U.S. Senate, and in 1804 was appointed minister to France: later he became minister to Spain. In 1810 he returned to New York. During the war of 1812 he was made brigadier-general, and in 1813 was appointed secretary of war. He resigned in September, 1814. He published a History of the War of 1812, and a Review of General Wil-kinson's Memoirs.

Armstrong, WILLIAM GEORGE, engineer and mechanical inventor, born at Newcastle-on-Tyne, 1810. Among his early inventious were the hydro-electric machine, a powerful apparatus for producing frictional electricity, and the hydraulic crane. In 1846 the Elswick works, near Newcastle, were established for the manufacture of his cranes and other heavy iron machinery, and these works are now among the most extensive of their kind. Here the first rifled ordnance gun which bears his name was made in 1854. (See next article.) His improvements in the manufacture of guns and shells led to his being appointed engineer of rifled ordnance under government, and he was knighted in 1858. This appointment came to an end in 1863, since which time his ordnance has taken a prominent place in the armaments of different countries. He was raised to the peerage as Baron Armstrong in 1887.

Armstrong Gun, a kind of cannon, so-called from its inventor, made of wrought-iron, principally of spirally-coiled bars, so disposed as to bring the metal into the most favorable position for the strain to which it is to be exposed, and occasionally having an inner tube or core of steel, rifled with numerous shallow grooves. The size of these guns ranges from the smallest field-piece to pieces of the highest caliber. The projectile is coated with lead, and inserted into a chamber behind the bore. This the explosion drives forward, compressing its soft coating into the grooves, so as to give it a rotary motion, and at the same time obviate windage. Both breech-loading and muzzle-loading Armstrong guns are made.

Army, a body of armed men, so organized and disciplined as to act together, be mutually reliant, and perform in unison the evolutions of the march and battle-field according to the absolute will of one man. An army is a movable engine composed of a vast number of individual parts or powers, arranged so as not only to act in concert, but to exert their whole aggregate force in any direction and upon any point which may be ordered or required. The organization of an army is of two kinds,— tactical and administrative. The former enables the leader of an army to transmit his orders to three or four subordinate commanders, who pass them on to three or four others under them, until, through a regular chain of responsibility, the original impulse is communicated to the private soldier. The latter, in a similar manner, divides the army into groups of gradually decreasing size, so that the men may be efficiently paid, fed, clothed, and armed. The present article will treat only of the constitution and establishment of armies, and indicate their gradual historical develop-ment. Technical terms generally, as well as all the component elements of the army, in personnel and material, and the organization and duties of the troops, will be found noticed under their proper headings; the tactical positions of an army are defined below. Ancient Armies.—The earliest regular mili-

tary organization is attributed to Sesostris, who flourished in Egypt about sixteen cen-turies B.C. This extraordinary conqueror divided Egypt into thirty-six military prov-inces, and established a sort of militia, or warrior caste, to each member of which he allotted lands for the support of himself and his family. After him, little further progress was made in military art until the Persian Empire arose. Its soldiers introduced the mass-formation, with cavalry in intervals of squares; but the most important feature of the Persian organization was the establishment of what was practically a standing army, divided as garrisons throughout the conquered provinces, and under the control of military governors distinct from the satraps. In time of war this standing army was augmented by a general levy which included the tributary nations, and therefore resulted in a heterogeneous collection of barbarous and undisciplined peoples: a source of weakness which caused the defeat of Xerxes's numerically powerful army. In Greece, it was not a standing army, but a sort of national

militia, that gained Marathon, Platæa, and Mycale. The leading men in each state paid attention to organization and tactics in a way never before seen. The Lacedæmonians invented the phalanx, a particular mass-formation for foot-soldiers; and to this the Athenians added lighter troops to cover the front and harass the enemy in march. Their cavalry also were efficient and alert. The Thebans introduced the column formation, which, being deeper and narrower than the phalanx, was intended to pierce the enemy's line at some one point, and throw them into confusion. Philip, the father of Alexander the Great, established in Macedonia the world's second standing army; and, as a further change, made the phalanx deeper and more massive than it had been among the Lacedæmonians. He brought into use the Macedonian pike, a formidable weapon 24 feet in length. With a phalanx sixteen ranks in depth, six rows of men could present the points of these long pikes protruding in front of the front rank, forming a bristling array of steel terrible to encounter. Meanwhile, a more western power was developing what was perhaps the most perfect organization in the annals of military history. The Romans initiated changes in army matters which have had a wide-spread influence throughout the civilized world. About the period 200 B.C., every Roman, from the age of 17 to 46, was liable to be called upon to serve as a soldier; the younger men were preferred, but all were available up to the middle time of life. They They went through a very severe course of drill and discipline, to fit them alike for marching, fighting, camping, working, carrying, and other active duties. The Roman legion, in its best days, excelled all other troops alike in discipline and in esprit. So long as none but freemen were enlisted, the position of a legionary was one of honor; but when it became necessary to supply the armies of ambitious leaders with large drafts of slaves and crimiwith that of the individual. With a gradual laxity in discipline, the decline of the Roman power commenced. The undercurrent of insubordination resulted in reverses, and though discipline was revived spasmodically under great commanders, it ultimately died out.

Medieval Armies. — With the decline of the Roman power, all that remained of scientific warfare was lost for a time. The northern invaders made little use of tactics, but relied chiefly on their personal bravery, and on the impetuosity and weight of their attack in column. The army, among the Franks and Germans, was the nation. Kings and generals were intrusted in time of war with an absolute power, which the nation resumed with the return of peace. The conquerors of the Roman Empire at first recognized no superior save the community, of which all conquests were the property; individual chiefs rewarding their own followers with gifts of the lands they had helped to conquer. The growth of a feeling that such gifts could be revoked, and

that they implied an obligation to future service, marks the beginning of the Feudal System, under which national armies disappeared. and each baron had a small army composed of his own militia or retainers, available for bat-tle at short notice. The contests of these small armies, sometimes combined and sometimes isolated, make up the greater part of the wars of the Middle Ages. Of military tactics or strategy there was very little; the campaigns were desultory and indecisive; and the battles were gained more by individual valor than by any well-concerted plan. The Crusades effected some improvements in all these respects. The forces which went to the Holy Land were at first mere armed mobs, upheld by fanaticism, but ignorant of all discipline, and under leaders destitute alike of forethought and powers of combination. The reverses they sustained, however, showed the necessity for some organization, and the extended service called attention to and developed the value of the foot-soldiers. The invention of gunpowder effected much less change, during the Middle Ages, than is generally supposed. When men could fight at a greater distance than before, and on a system which brought mechanism to the aid of valor, everything connected with the military art underwent a revolution. The art of making good cannon and hand-guns grew up gradually, like other arts; and armies long continued to depend principally on the older weapons,—spears, darts, arrows, axes, maces, swords, and daggers. Each knight sought how he could best distinguish himself by personal valor; and sometimes it happened that the fate of a battle was allowed to depend on

a combat between two knights. Modern Armies. — The Turkish Janissary force, the earliest standing army in Europe. was fully organized in 1362; but the formation of standing armies among Western powers, which may be said to have introduced the modern military system, dates from the es-tablishment of compagnies d'ordonnance by Charles VII of France, nearly a century later. These companies of men-at-arms amounted, with their attendants, to 9,000 men; and to them the king afterward added 16,000 francarchers, largely recruited from the mercenaries which growing wealth and luxury had developed. Monarchs contracted with powerful nobles to raise, by enlistment, regiments, which were now broken up into squadrons or battalions as tactical units, the regiment remaining the administrative unit. Between the beginning of the sixteenth and the end of the eighteenth centuries, the proportion of the musketeers gradually increased; the pike was abandoned for the bayonet, and even the cavalry were taught to rely more on their fire than on the effect of their charge. The improvements in weapons naturally affected the formation. During the Thirty Years' War (1618-48) Gustavus Adolphus and Wallenstein adopted opposite modes of dealing with masses of infantry; the former spread them out to a great width, and only six ranks in depth; whereas the lat-

ter adopted a narrower front, with a depth of twenty to thirty ranks. In Louis XIV's reign, the prolonged wars introduced the larger grouping in brigades and divisions. Frederick the Great, in the next century, reduced the depth of his infantry formation to three ranks, and introduced a most rigid and exact system of tactics and drill. He greatly improved the cavalry tactics, and restored to this arm a reliance on the effect of a rapid charge, while the introduction of horse artillery added to its power.

The French Revolution effected almost as great changes in the military as in the polit-ical organization of Europe. The struggle from which France emerged victorious in 1797 had exhausted even the enormous levies which had fed her armies for the previous five years; and in 1798 a law was passed establishing compulsory military service. Every citizen was declared liable to five years' service, and all between the ages of 20 and 25 were enrolled. The immense advantage which this terrible power gave Napoleon, compelled other nations to follow the example of France, and in Europe voluntary enlistment has since survived in England alone. In spite of the strength which Prussia mustered under Blücher, the teaching of Sadowa and the events of 1870 and 1871 were required to induce the other powers to follow her example. Now, in most nations will be found an army of reserve, intended to augment the standing army, or first fighting line, from a peace to a war strength, and consisting of two classes-those waiting for an immediate call to arms, if required, and those constituting the militia or second line of reserves—the entire effective military power of the state. The principles of organization were also modified in the large armies which took the field in the beginning of the century. In 1792, mixed divisions, composed of all arms, had been introduced, and in 1804 Napoleon organized, under his marshals, corps d'armee, each in itself a complete army. A smaller force taking the field consisting of one corps or less, is generally called an expeditionary force. It should perhaps be added that a corps d'armee takes up on the line of march from 20 to 30 miles, the actual rate of marching may be stated at from 1 to 2 miles an hour, even this rate being dependent on the state of the roads and any circumstances (such as an excessive proportion of guns) that may impede a column of march.

U. S. Army.—By the constitution of the U. S. the president is commander-in-chief of the army and navy of the Union, and Congress has power to raise and support armies, to regulate them, and to provide for executing the laws of the Union, suppress insurrections, and repet invasions. The military history of the U. S. begins with the army of Washington, and the growth has been spasmodic. In 1790, the army as fixed by act of Congress, consisted of 1,216 men. In 1861, at the commencement of the Civil War, the regular force amounted to only 14,000 men. In April of that year, President Lincoln called out 75,000 volunieers for

three months, and in May, 42,000. In July two calls of 500,000 each were authorized by Congress, and it was found necessary to introduce conscription. In October, 1863, a levy of 300,000 was ordered, and in the following February a call for 500,000 was made. In the early part of 1865 two levies amounting in all to 500,000 were made, but were only partially carried out on account of the cessation of hostilities. Thus the total number of men in the army between April, 1861, and April, 1865, amounted to 2,759,050. The Southern states during this time raised an army of about 1,100,000 men, and thus in the whole U.S. was raised the enormous army of nearly 4,000,000 men, or about one eighth of the total population. Within three years from the close of the war, the army had shrunk to a normal strength of 30,000 men. The army of the U. S., June 30, 1896, consisted of 2,171 officers, and 24,784 enlisted men. The U. S. is divided into eight military departments as follows: Department of the East: New England states, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Mississippi, Alabama, Kentucky, Tennessee, Ohio, and District of Columbia; Department of Missouri: Michigan, Missouri, Indiana, Illinois, Wisconsin, Kansas, Arkansas, Indian and Oklahoma Territories; Department of California: California and Nevada; Department of Dakota: Minnesota, South Dakota except so much as lies south of 44th parallel, North Dakota, Montana, and the post of Fort Yellowstone, Wyoming: Department of Texas: Texas; Department of the Platte: Iowa, Nebraska, Wyoming, except post Yellowstone, Idaho, so much as lies east of the lines formed by the extension of the western boundary of Utah and the northeastern boundary of Idaho, and so much of South Dakota as lies south of the 44th parallel; Department of Colorado: Colorado, Utah, Arizona, and New Mexico; Department of Columbia: Oregon, Washington, Idaho and Alaska, excepting so much of Idaho as is embraced in the department of the Platte.

Jan. 1, 1897, the state militias of the states of the Union amounted to the following: Generals, and general staff officers, 1,407; cavalry, 5,061; artillery, 5,058; infantry, 107,450; total actually serving, 118,976; total liable to military duty, 10,149,598. The yearly salary of officers is as follows: major-general, \$7,500; brigadier-general, \$5,500; lieutenant-colonels, \$3,000 which is raised \$300 every five years until they have served fifteen years, when it is raised \$100, making a total of \$4,000 after twenty years of service; major \$2,500, which is raised \$250 every five years; captains, mounted, \$2,000, raised \$200 every five years for twenty years; captains, not mounted, \$1,800, raised \$180 every five years for twenty years: first lieutenant, mounted, \$1,600, raised \$160 every five years for twenty years; first lieutenant, not mounted, \$1,500, raised \$150 every five years for twenty years; second lieutenant, mounted, \$1,500, raised \$150 every five

years for twenty years; second lieutenant, not mounted, \$1,400, raised \$140 every five years for twenty years; the maximum pay of colonels is limited to \$4,500, and lieutenant-colonels to \$4,000. -

The U. S. army is little more than a police force of which a few regiments serve as a reserve to the civil power in the large towns, and the rest are dispersed along the frontier and among the Indian districts. By an act of 1871 the strength of the army was limited to 30,000 men, and consists of 10 regiments of cavalry, each of 12 companies; and 25 regiments of infantry of 10 companies each; 5 regiments of artillery; and one engineer's battalion. Two regiments of cavalry and one of infantry are composed of negroes, but are commanded by white officers. The officers of the army are furnished by the U. S. military academy at West Point.

British Army.— According to the system of localization commenced in 1872, the United Kingdom is divided into 10 military districts, 6 of which are in England, 3 in Ireland, while Scotland makes one by itself. Aldershot, Woolwich, Chatham, and the Curragh are not included in any of these districts. In each district a general officer has command of all the forces within it, including the militia and volunteers. These districts are subdivided into 70 sub-districts called infantry brigade districts, of which 54 are in England, 8 in Scotland, and 8 in Ireland. Each brigade consists of 2 battalions of the line, a brigade depot, 2 battalions of militia, besides the re-serve of the district. The terms of enlistment are either for 12 years' army service (long service), or for 7 years' army service and 5 years' reserve service (short service). After 12 years' service in the army a soldier may be permitted to re-engage for another 9 years, and after the completion of the whole period of 21 years' service is entitled to be discharged with a pension. British soldiers under the rank of a commissioned officer receive payment varying from one shilling a day, which is the pay of a private in an infantry regiment, up to 6 shillings a day, the pay of a regimental sergant-major in the Royal Engineers. According to the regulations now in force, first commissions are given to successful candidates at the Civil Service Commissioners' open examinations; to university students or lieutenants of militia who pass certain examinations; or to noncommissioned officers specially recommended; while promotion is regulated by seniority principally, but partly by selection. The military strength of the British army in 1897 was: regular troops enrolled, home and colonial, 154,-000; grand war total, 570,634.

Germany.— By the imperial constitution of 1871, the Prussian obligation to serve in the army is extended to the whole empire. Every German capable of bearing arms must serve in the army or navy for 12 years — 7 in the standing army (3 with the colors, and 4 in the reserve), and 5 in the landwehr; or corresponding periods in the fleet and seewehr. Afterward he is enrolled in the landsturm until 42 years of age. In the infantry, however, many of the more intelligent men are subjected to only 2 years' training; and "one-year volunteers" are passed into the reserve at the end of their first year, on condition of passing certain examinations, and bearing the expense of their clothing, equipment, etc., for the year. In the German organization the territorial system is carried out thoroughly. The army consists of 18 army corps, 13 of which are Prussian; and each of these is raised, recruited, and stationed within a par-ticular district. These corps districts are divided into divisional and brigade districts. which are subdivided into landwehr battalion districts, and these in turn into company districts, so that every village has its definite place. Each line regiment (3 battalions) draws its recruits from an allotted district, and passes its time-expired men into the landwehr regiment (2 battalions) of the same district. After the exemptions common to all countries have been granted, the ballot allows a margin of about 10 per cent.; those who draw the fortunate numbers passing at once into the Ersatz reserve, which receive no training, but may be called upon to replace casualties in the field.

France.—A law passed in 1872 enacted that every Frenchman, with a few specified exceptions, unless serving in the navy, was liable to personal service in the army, and forbade substitution. The period of liability extended to 20 years, of which 5 were spent in the active army, 4 in the reserve of the active army, 5 in the territorial army, and 6 in the reserve of the territorial army. The expense of keeping up such an establishment in peace, however, led to the division of the recruits by ballot into two classes, one of which served the full 5 years in the active army, while the other was sent home after 6 months' or a year's training. One-year volunteers were also accepted; but so many men joined in that capacity, that, in 1887, a bill was brought before the French legislature abolishing the privilege. In the same year an Army Reorganization Bill was introduced, reducing the period of service with the colors to 3 years, and proposing a large addition to the establishment; the object of the changes being to materially add to the number of efflcients without increasing the military budget. By the law of 1873, France is divided, for military purposes, into 18 regions, each occupied by a corps d'armée, containing 2 divisions of infantry, 1 brigade of cavalry, 1 of artillery, 1 battalion of engineers, and 1 squadron of the military train, and retaining its organi-zation permanently in peace and in war. The corps are not permanently localized, but frequently change stations; and in time of war the region in which a corps happened to be stationed would be drawn on for reserves and stores

Austria. — The military forces of the Austro-Hungarian empire are divided into the standing army, the landwehr, and the landsturm. All subjects are liable to service, and those exempted on physical grounds pay a fine pro-

portionate to their means. In principle every qualified man must serve three years with the colors, 4 in the reserve, 5 in the landwehr, and, by a law passed in 1886, 12 in the landsturm, from which, in time of war, men may be drafted into the landwehr; and men who have passed through the regular army will be liable for service in the landsturm as officers or non-commissioned officers till the age of sixty. In practise, however, financial considerations cause the division of recruits into three classes: about 95,000 annually form the first class, trained as above; nearly 10,000 are drawn to supply the Ersatz reserve; and all the remainder are passed at once into the landwehr, there to serve their The regiments of the standing 12 years. army are under the control of the minister of war of the empire, while the landwehr is controlled by the Austrian and Hungarian minis-ters of national defense. There is no permanent corps organization, the division being the principal unit; but in war, 3 infantry divisions, with a proportion of cavalry and a regiment of artillery, would be joined to form a corps.

Russia.—Universal liability to service has been established since 1870, but, although prohibited, the purchase of exemption has hitherto been permitted, at a fixed rate of 800 roubles (about \$635). The period of service is 15 years; 6 in active service (2 generally on furlough), and 9 in the reserve. The Russian military forces are composed of regular and irregular troops, and militia, only called out to repel invasions. Every man not in the army or reserve belongs to the militia up to his fortieth year. The country has been divided into 15 military districts, with sub-districts and "circles" as in Germany. The number of army corps is 17, with the army of the Caucasus (7 divisions of infantry and 1 of cavalry) in addition. The irregular troops are supplied by the Cossacks, who give military service in lieu of taxes, and comprise about 190,000 men, chiefly cavalry. The want of barrack accommodation leads to a great deal of billeting, and many men stationed in country districts see their officers only in summer, when they are assembled for training in large standing camps.

Italy.-The Sardinian law of conscription forms the basis of the Italian military system, and all are liable from eighteen to forty. Substitution is allowed in the case of brothers, and one-year volunteers are accepted. Contingents are divided by lot into two classes, one enjoying unlimited furlough, and the other serving 8 years in the army, 4 in the active militia, and the rest of their time in the local militia. In infantry regiments 3, in cavalry regiments 5 years only are served with the colors; the remainder, as a rule, being spent on furlough. The kingdom is divided into five "zones," and, in direct opposition to the Prussian principle, recruits are drawn from all zones for each regiment.

Of the other military powers of Europe, the army of Belgium, including the staff and all arms, rank and file, number about 50,000 men, besides the Garde Civique, 40,000; Denmark, 50,000, including the extra reserve of 14,000; Netherlands, 6,000 in Europe, and 31,000 in the East Indies; Spain, 145,000, with 40,000 in the colonies; Sweden, 40,000, besides the conscription troops, 135,000, and the militia, 16,000; in Norway the troops of the line are about 12,000 in peace, and in time of war not more than 18,000 without the consent of the Storthing: Switzerland, 117,000, and the landwehr 4,000; Turkey can be raised by mobilization to 475,000.

Army Worm, the very destructive larva of a moth so called from its habit of marching in compact bodies of enormous number, devouring almost every green thing it meets. It is about 14 in. long, greenish in color, with black stripes, and is found in various parts of the world, but is particularly destructive in North America. The larva of a European two-winged fly is also called army worm.

Arndt (arnt), ERNST MORITZ, German patriot and poet; b. 1769, d. 1860. He was appointed professor of history at Griefswald in 1806, and stirred up the national feeling against Napoleon in his work *Geist der* Zeit (Spirit of the Time). In 1812-13 he zealously promoted the war of independence by a number of pamphlets, poems, and spirited songs, among which it is sufficient to refer to his Was ist des Deutschen Vaterland? Der Gott, der Eisen wachsen lies, and Was blasen die trompeten? Husaren heraus! which were caught up and sung from one end of Germany to the other.

Arne (àrn), THOMAS AUGUSTINE (1710-1778), English composer. To him the British owe the national air, *Rule Britannia*, originally given in a popular piece called the *Masque of* Alfred.

Arn hem (or Arnheim), a town in Holland, province of Gelderland, 18 mi. s.w. of Zutphen,

on the right bank of the Rhine. It manufactures cabinet wares, mirrors, carriages, mathematical instruments, etc.; has paper-mills, and its trade is important. In 1795 it was stormed by the French, who were driven from it by the Prussians in 1813. Pop. 46,233.

Ar'nica, a genus of plants, consisting of some twelve species, one of which is found in Central Europe and in the Western states. Ithas a perennial root, a stem about two feet high, bearing on the summit flowers of a dark golden yellow. In every part of the plant there is an acrid resin

there is an acrid resin Arnica. and a volatile oil, and in the flowers an acrid bitter principle called *arnicia*. The root contains also a considerable quantity of tannin.

A tincture of it is employed as an external application to wounds and bruises.

Ar'no, a river of Italy which rises in the Etruscan Apennines, makes a sweep to the south and then trends westward, divides Florence into two parts, washes Pisa, and falls 4 mi. below it, into the Tuscan Sea, after a course of 130 mi.

Arnold, ARTHUR (b. 1833), an English editor and statesman, brother of Sir Edwin Arnold. He edited the London *Echo*, a liberal newspaper, became connected with the London *Telegraph*, and entered Parliament in 1880. He has written *From the Levant*, and has also published two novels.

Arnold, BENEDICT (1741-1801), b. in Nor-wich, Conn.; d. in London. He had a common school education, and went to New Haven and conducted a book and drug store. He visited Honduras, where he fought a duel with an English captain, provoked by the captain's reflections on New England. In 1767, he married Miss Margaret Mansfield. After the battle of Lexington, Arnold was sent by Massachusetts to lead an expedition for the capture of Crown Point and Ticon-deroga, and on his way thither met Col. Ethan Allen with a company of soldiers devoted to the same purpose. Allen took the lead, to which he was entitled. and captured Ticonderoga on May 10, 1775. Four days later Arnold captured St. John's. In the autumn of the same year Washington dis-patched Arnold with 1,100 men to assist in capturing Quebec. On December 31 he was joined by the corps of General Montgomery, and a combined attack was made. The American army was defeated, Montgomery killed, and Arnold's leg fractured. Congress promoted him to the rank of brigadier-general. On Oct. 11, 1776, he fought a naval battle with a force of the British, during which he ran his own vessel ashore, burnt her, and with his other ships retreated to Ticonderoga. In 1777, congress appointed five major-generals for the army, all of whom were juniors of Arnold. He was stung by this injustice, and Washington wrote to assure him that he would endeavor to remedy "the error." On presenting his claims for advancement in rank, Congress voted him thanks, but did not promote him. Arnold resigned, but his resignation was not accepted. At that time Washington urged Congress to send Arnold north to head off General Burgoyne. Arnold consented to serve. He joined Gen. Philip Schuyler, and led an expedition to relieve Fort Stanwix, then besieged by a force of British and Indians. He returned to the main army, and took part in the first battle of Bemis Heights, October 19, 1777. Arnold then joined General Washington, and soon after Congress sent him his commission as majorgeneral. In June, 1778, he was appointed to the command of Philadelphia. He became involved in quarrels with the authorities of Pennsylvania. He was tried by court-martial but was acquitted of intentional wrong-doing, though in some respects his conduct was de-

clared improper. The sentence was that he should receive a reprimand from the com-mander-in-chief. Washington discharged this duty with considerable reluctance, and assured him of his continued esteem and the high estimate he placed on his services. Arnold's first wife had died recently, and he married Miss Margaret Shippen, a daughter of Chief Justice Shippen of Pennsylvania. Through this marriage he was brought into connection with several Tory families, and a correspondence was opened with Sir Henry Clinton. In 1780 Arnold visited the camp of Washington, and was tendered the command of the left wing of the army. He declined on the pretense of inability to perform service in the field, on account of the wound received at Saratoga. Instead he desired the command at West Point, on which he entered in 1780. Arnold's treachery became manifest through the capture of Major André, and he escaped to New York City. He was compensated with a British brigadier-general's commission and a sum of money. Early in 1781, at the head of a British force, he led a raid into Virginia. and made an attack on New London. He went to London in 1782. In 1797 the British Government gave him 13,400 acres of land in Canada. All his sons received commissions in the British army. But Arnold was despised and shunned even by the British, and died in obscurity

Arnold, EDWIN, SIR, a British poet, Sanskrit scholar, and journalist, b. 1832. In 1861 he joined the editorial staff of the Daily Telegraph, with which he has ever since been connected. He is author of poems, narrative and lyrical, numerous translations from the Greek and Sanskrit; The Light of Asia, a poem presenting the life and teaching of Guatama, the founder of Buddhism; Pearls of the Faith; Lotus and Jewel; etc.

Arnold, ISAAC NEWTON (1815-1884), b. in Oswego co., N. Y., was admitted to the bar in 1835. He moved to Chicago, of which, in 1837, he became the first city clerk. In 1842-43 he was a member of the Illinois legislature, and again in 1856. He served in Congress as a Republican 1860-65. In 1867 he published *The* Life of Abraham Lincoln, and in 1880 The Life of Benedict Arnold. He was for several years president of the Chicago Historical Society, and published pamphlets on the early history of Illinois.

Arnold, MATTHEW (1822-1888), English critic, essayist, and poet, was b. at Laleham, near Staines, being a son of Dr. Arnold of Rugby. He was the author of many essays and poems of much merit.

Arnold, THOMAS (1795-1842), an English educator. In 1828 he was appointed head-master of Rugby School. His success was remarkable. Not only did Rugby School become crowded beyond any former precedent, but the superiority of Dr. Arnold's system became so generally recognized that it may be justly said to have done much for the general improvement of the public schools of England. In 1841 he was appointed professor of modern

history at Oxford. His chief works are his edition of *Thucydides*, his *Roman History*, and his *Sermons*.

Arnsberg (årnz'berk), a town in Prussia, prov. Westphalia, capital of the government of same name, on the Ruhr. Pop. 6,733.— The government of Arnsberg has an area of 2,972 sq. mi., and a population of 1,189,688.

Ar'null, great grandson of Charlemagne, elected king of Germany A. D. 887; invaded Italy, captured Rome, and was crowned emperor by the pope (896); d. A. D. 889.

Aromat'ics, drugs, or other substances which yield a fragrant smell, and often a warm, pungent taste, as calamus, ginger, cinnamon, cassia, lavender, rosemary, laurel, nutmegs, cardamoms, pepper, pimento, cloves, vanilla, saffron. Some of them are used medicinally as tonics, stimulants, etc.

**Arpad** (ar-päd') (870-907), the hero of Hunt garian ballad and romance, founder of the kingdom of Hungary. The Arpad dynasty reigned till 1301.

**Årpino** (ar-pē'nō), a town of southern Italy, province of Caserta, celebrated as the birthplace of Caius Marius and Cicero. It manu factures woolens, linen, paper, etc. Pop. 11,535.

Ar'quebus, a hand-gun; a species of firearm resembling a musket, anciently used. It was fired from a forked rest, and sometimes cocked by a wheel, and carried a ball that weighed nearly two ounces. A larger kind used in fortresses carried a heaver shot.

Ar'rah, a town of British India, in Shahabad district, Bengal, rendered famous during the mutiny of 1857 by the heroic resistance of a body of twenty civilians and fifty Sikhs, cooped up within a detached house, to a force of 3,000 sepoys, who were ultimately routed and overthrown by the arrival of a small European reinforcement. Pop. 42,008.

Ar'ran, an island of Scotland, in the Firth of Clyde, part of Bute county. Area 165 sq. mi. It is of a wild and romantic appearance, particularly the northern half, where the island attains its loftiest summit in Goatfell, 2,806 feet high. The geology of Arran has attracted much attention, as furnishing within a comparatively narrow space distinct sections of the great geological formations; while the botany possesses almost equal interest, both in the variety and the rarity of many of its plants.

Arras (å-rä), a town of France, capital of the department Pas-de-Calais, with several handsome squares and a citadel, cathedral, public library, botanic garden, museum, and numerous flourishing industries. In the Middle Ages it was famous for the manufacture of tapestry, to which the English applied the name of the town itself. Pop. 27,041.

Arrest of Judgment, in law, the staying or stopping of a judgment after verdict, for causes assigned. Courts have power to arrest judgment for intrinsic causes appearing upon the face of the record; as when the declaration varies from the original writ; when the verdict differs materially from the pleadings; or when the case laid in the declaration is not

### Arsenic '

sufficient in point of law to found an action upon.

Ar'ria, the heroic wife of a Roman named Cæcina Pætus. Pætus was condemned to death in 42 A. D., for his share in a conspiracy against the emperor Claudius, and was encouraged to suicide by his wife, who stabbed herself and then handed the dagger to her husband with the words, "It does not hurt, Pætus!"

Arrowroot, a starch largely used for food and for other purposes. Arrowroot proper is obtained from the rhizomes or root-stocks of several species of plants, and perhaps owes its name to the scales which cover the rhizome, which have some resemblance to the point of an arrow. Some, however, suppose that the

Arrowroot

name is due to the fact of the fresh roots being used as an application against wounds inflicted by poisoned arrows, and others say that arrow is a corruption of ara, the Indian name of the plant. Brazilian arrowroot or tapioca meal, is got from the large, fleshy root of another variety, after the poisonous juice has been got rid of; and Oswego arrowroot from Indian corn.

Ar'ru (or Aroo) **Islands**, a group belonging to the Dutch, s. of western New Guinea, and extending from north to south about 127 mi. They are composed of coralline limestone, nowhere exceeding 200 feet above the sea, and are well wooded and tolerably fertile. The natives belong to the Papuan race, with an intermixture of foreign blood, and are partly Christians. The chief exports are trepang, tortoise-shell, pearls, mother-of-pearl, and edible birds'-nests. Pop. of group about 20,000.

Ar'senk, a metallic element of very common occurrence, being found in combination with many of the metals in a variety of minerals. It is of a dark-gray color, and readily tarnishes on exposure to the air, first changing to yellow, and finally to black. In hardness it equals copper; it is extremely brittle, and very volatile, beginning to sublime before it melts. It burns with a blue flame, and emits a smell of garlic. It forms alloys with most of the metals. Combined with sulphur it forms orpiment and realgar, which are the yellow and red sulphides of arsenic. With oxygen, arsenic forms two compounds, the more important of which is arsenious oxide or arsenic trioxide, which is the white arsenic, or simply arsenic of the shops. It is usually seen in white glassy, translucent masses, and is ob-tained by sublimation from several ores containing arsenic in combination with metals, particularly from arsenical pyrites. Of all substances arsenic is that which has most frequently occasioned death by poisoning, both by accident and design. The best remedies against the effects of arsenic on the stomach are hydrated sesquioxide of iron or gelatinous hydrate of magnesia, or a mixture of both, with copious draughts of bland liquids of a mucilaginous consistence, which serve to procure its complete ejection from the stomach. Oils and fats generally, milk, albumen, wheat-flour, oatmeal, sugar or syrup, have all proved use-ful in counteracting its effect. Like many other virulent poisons it is a safe and useful medicine, especially in skin diseases, when ju-diciously employed. It is used as a flux for glass, and also for forming pigments. The arsenite of copper and a double arsenite and acetate of copper (emerald green) are largely used by painters; they are also used to color paper-hangings for rooms, a practise not unaccompanied with considerable danger, especially if flock-papers are used or if the room is a confined one. Arsenic has been too frequently used to give that bright green often seen in colored confectionery, and to produce a green dye for articles of dress and artificial flowers.

Arsin'oe, a city of ancient Egypt on Lake Mœris, said to have been founded about B. C. 2300, but renamed after Arsinoë, wife and sister of Ptolemy II, of Egypt, and called also Crocodilopolis, from the sacred crocodiles kept at it.

Ar'son, in common law, the malicious burning of a dwelling-house or outhouse of another man, which by the common law is felony, and which, if homicide result, is murder. Also, the wilful setting fire to any church, chapel, warehouse, mill, barn, agricultural produce, ship, coal-mine, and the like. In the U.S. and Great Britain it is a considerable aggravation if the burning is to defraud insurers.

Art, in its most extended sense, as distinguished from nature on the one hand and from science on the other, has been defined as every regulated operation or dexterity by which organized beings pursue ends which they know beforehand, together with the rules and the result of every such operation or dexterity. In this wide sense it embraces what are usually called the useful arts. In a narrower and purely æsthetic sense it designates what is more specifically termed the fine arts, as architecture, sculpture, painting, music, and poetry. The useful arts have their origin in positive practical needs, and restrict themselves to satisfying them. The fine arts minister to the

-----

sentiment of taste through the medium of the beautiful in form, color, rhythm, or harmony. See *Painting, Sculpture*, etc. In the Middle Ages it was common to give certain branches of study the name of arts.

Artaxerx'es ("the mighty"), the name of several Persian kings.—1. ARTAXERXES, surnamed LONGIMANUS, succeeded his father, Xerxes I, B. C. 465. He subjected the rebellious Egyptians, terminated the war with Athens, governed his subjects in peace, and d. B. C. 425.—2. ARTAXERXES, surnamed MNEMON, succeeded his father, Darius II, in the year 405 B. C. After having vanquished his brother Cyrus he made war on the Spartans, who had assisted his enemy, and forced them to abandon the Greek cities and islands of Asia to the Persians. On his death, B. C. 330, his son Ochus ascended the throne under the name of—3. ARTAXERXES OCHUS (359 to 339 B. C.). After having subjected the Phœnicians and Egyptians, and displayed great cruelty in both countries, he was poisoned by his general Bagoas.

Ar'temis, an ancient Greek divinity, identified with the Roman Diana. She was the daughter of Zeus (Jupiter) and Leto (or Latona), and was the twin sister of Apollo, born in the island of Delos. She is variously represented as a huntress, with bow and arrows; as a goddess of the nymphs, in a chariot drawn by four stags; and as the moon goddess, with the crescent of the moon above her forchead. She was a maiden divinity, never conquered by love, except when Endymion made her feel its power. She demanded the strictest chastity from her worshipers, and she is represented as having changed Actwon into a stag. and caused him to be torn in pieces by his own dogs, because he had secretly watched her as she was bathing.

Artemi'sia, Queen of Caria, in Asia Minor, about 352-350 B. C., sister and wife of Mausolus, to whom she erected in her capital Halicarnassus, a monument called the Mausoleum, which was reckoned among the seven wonders of the world.

Artemi'sium, a promontory in Eubœa, an island of the Ægean, near which several naval battles between the Greeks and Persians were fought, B. c. 480.

Ar'temus Ward (CHARLES FARRAR BROWNE) (1834-1867), an American humorist, b. at Waterford, Maine, d. at Southampton, England. Originally a printer, he became editor of papers in Ohio, where his humorous letters became very popular. He subsequently lectured on California and Utah in the U. S. and in England, where he contributed to *Punch*. His writings consist of letters and papers by Artemus Ward, a pretended exhibitor of wax figures and wild beasts, and are full of drollery and eccentricity.

Ar'teries, the system of cylindrical vessels or tubes, membranous, elastic, and pulsatile, which convey the blood from the heart to all parts of the body, by ramifications which as they proceed diminish in size and increase in number, and terminate in minute capillaries uniting the ends of the arteries with the beginnings of the veins. See Anatomy.

Arte' sian Wells, so called from the French province of Artois, where they appear to have been first used on an extensive scale, are perpendicular borings into the ground through which water rises to the surface of the soil, producing a constant flow or stream, the ultimate sources of supply being higher than the mouth of the boring, and the water thus rising by the well-known law. They are generally sunk in valley plains and districts where the lower previous strata are bent into basin-shaped curves. The rain falling on the outcrops of these, saturates the whole porous bed, so that when the bore reaches it the water by hydraulic pressure rushes up toward the level of the highest portion of the strata. The supply is sometimes so abundant as to be used extensively as a moving power, and in arid regions for fertilizing the ground, to which purpose artesian springs have been applied from a very remote period. Thus many artesian wells have been sunk in the Algerian Sahara which have proved an immense boon to the district. The water of most of these is potable, but a few are a little saline, though not to such an extent as to influence vegetation. The hollows in which London and Paris lie are both perforated in many places by borings of this nature. One of the most celebrated artesian wells is that of Grenelle, near Paris, 1,798 feet deep, completed in 1841, after eight years' work. One of the deepest is at Rochefort, in France, 2,765 feet. Wells of great depth are also found in America. As the temperature of water from great depths is invariably higher than that at the surface, artesian wells have been made to supply warm water for heating manufactories, greenhouses, hospitals, fish-ponds, etc. The oil wells of America are of the same technical description. These wells are now made with larger diameters than formerly, and altogether their construction has been rendered much more easy in modern times.

The process of boring artesian wells, drivewells, oil. or gas-wells has become a distinct branch of hydraulic engineering. In driving a tube well either a horse-power machine or a steam engine is used as power. A hole is bored for some distance and cased with an iron pipe which is driven into the hole by means of a drill-rod which may be lengthened from time to time by screwing sections onto it. The drill-rods are made of iron pipe, and about every 30 feet in the hollow drill-rod is a valve which opens from underneath. In the drill at the bottom of the rod is a hole, and as the drill is lifted and dropped alternately by the mechanism on the ground, water is poured into the well, forming a slush of the crushed earth, clay, or gravel, which enters the drill rod through a hole in the drill. When the drill is lifted the rods containing the water and slush are raised, the drill is dropped suddenly and the slush and water pass into the next section above through the valves, which close when the drill is again raised. Thus the

drillings are lifted to the surface and are there discharged. As fast as the drill crushes its way deeper into the earth, iron casing is driven down. A pump is always attached to the head of the apparatus and started when water is reached. The sand in the gravel bed is pumped out, thus forming a reservoir in the clean gravel. Another method is known as the rolling and jetting process. This com-bines the principles of hydraulic mining and the diamond drill. A diamond drill cuts its way into the earth and rock by revolving a drill point studded with black diamonds. ĺn the rolling and jetting system used, the cutter is a section of pipe on the lower end of which teeth are cut. This is revolved in the ground by a machine which grips the pipe. Jets of water are forced down inside of the pipe, the water rushes out from under the cutter's teeth and returns to the surface on the outside of the pipe, thus forming a water cushion between the pipe and the earth and lessening the friction. Whenever a material is struck which is too hard to be cut by the steel cutter, a cutter set with black diamonds is used. Enormous augers, which bore holes from 8 to 30 inches in diameter, are used to sink shallow wells. Wells more than 60 feet deep are almost universally bored with well-driving machinery. In boring shallow wells a large auger is fixed to the end of a vertical shaft Such wells are cased and twisted around. with stone or brick.

Arteveld (Artevelde)(år' te-velt, år' te-vel-de), the name of two men distinguished in the history of the Low Countries. 1. JACOB VAN, a brewer of Ghent, b. about 1300; was selected by his fellow townsmen to lead them in their struggles against Count Louis of Flanders. In 1338 he was appointed captain of the forces of Ghent, and for several years exercised a sort of sovereign power. A proposal to make the Black Prince, son of Edward III of England, governor of Flanders, led to an insurrection, in which Arteveld lost his life. (1345). 2. PHLIP, son of the former, at the head of the forces of Ghent, gained a great victory over the Count of Flanders, Louis II, and for a time assumed the state of a sovereign prince. Arteveld fell with 25,000 Flemings at Rooseboke in 1382.

Arthur, CHESTER ALAN (1830-1886), twentyfirst president of the U. S.; the son of Scottish parents, his father being pastor of Baptist churches in Vermont and New York. He chose law as a profession, and practised in New York. As a politician he became a leader in the Republican party. During the Civil War he was energetic as quartermaster general of New York in getting troops raised and equipped. He was afterward collector of customs for the port of New York. In 1880 he was elected vice-president, succeeding as president on the death of Garfield in 1881.

Ar'thur, KING, an ancient British hero of the sixth century, son of Uther Pendragon, and the Princess Igerna, wife of Gorlois, duke of Cornwall. He married Guinevere (or Ginevra); established the famous order of the

-11

#### Arthur

Round Table; and reigned twelve years in peace. After this he conquered Denmark, Norway, and France, and went to Rome. While away, Modred, his nephew, stirred up his subjects to rebellion. He subdued the rebels, but died in consequence of his wounds, on the island of Avalon. The story of Arthur is supposed to have some foundation in fact.

Arthur, TIMOTHY S. (1809–1885), born in Orange co., N. Y. He wrote many popular domestic tales, and founded Arthur's Home Magazine.

Arthur's Seat, a picturesque hill near Edinburgh, Scotland; altitude 822 feet. It is composed of a diversity of eruptive rocks, with some interposed and uptilted sedimentary ones; and derives its name from the legendary King Arthur.

Artichoke, a well-known plant somewhat resembling the thistle, with large, divided, prickly leaves. The erect flower-stem terminates in a large, round head of numerous

#### Artichoke.

imbricated oval, spiny scales which surround the flowers. The fleshy bases of the scales, with the large receptacle, are the parts that are eaten. The Jerusalem artichoke is a species of sunflower, whose roots are used like potatoes.

Articles, The THIRTY-NINE, of the Church of England, a statement of the particular points of doctrine, thirty-nine in number, maintained by the English Church; first promulgated by a convocation held in London in 1562-63, and confirmed by royal authority; founded on, and superseding, an older code issued in the reign of Edward VI. They were ratified anew in 1604 and 1628. All candidates for ordination must subscribe to these articles. This formulary is now accepted by the Episcopalian Churches of Scotland, Ireland, and America.

Articula'ta, the third great section of the animal kingdom, according to the arrangement of Cuvier, including all the invertebrates with the external skeleton forming a series of rings articulated together and enveloping the body, distinct respiratory organs, and an internal ganglionated nervous system along the middle line of the

# Artifical Limbs

body. They are divided into five classes. The first four classes are now commonly placed together under the name of *Arthrop*oda, and the whole are sometimes called Arthrozoa.

Articula tion, in anatomy a joint: the joining or juncture of the bones. This is of three kinds: 1, a movable connection, such as the ball-and-socket joint; 2, immovable connection, as by suture, or junction by serrated margins; 3, union by means of another substance, by a cartilage, tendon, or ligament.

Artificial Limbs are made principally of extra fine close-grained wood of the English weeping willow. Within the last few years aluminum has come into use to a considerable extent and is particularly valuable on account of its lightness, strength, and non-corrosive quality. When made of wood, the piece is first turned in the lathe to the general shape of a leg or arm and then hollowed out until the shell is from one fourth to five eighths of an inch thick. It is then whittled down to the general shape required, when the proper angles and depression in the top of the inside portion are cut so that it will exactly fit the stump for which it is intended. Upon the accuracy of this fit depends the comfort which the wearer will take with it. The foot is whittled out by hand entirely, and fastened to the leg by means of a hinge, and the more expensive pieces have another hinge fitted up for the toes. When the amputation is above the knee an-

other hinge is prepared for the knee-joint so that the leg will swing readily in walking. After the wooden pieces have been completed and polished a fine piece of rawhide is shrunk over them and fastened by means of glue. As it dries it shrinks and adds much strength, and does not increase the The weight materially. bottom of the foot is made of soft rubber for the purpose of giving a natural spring in walking. After the leg has been painted it is ready for use. Limbs are attached usually by means of leather bands which may be laced tight, or they are held up by straps running over the

Artificial Leg.

shoulders like suspenders. Arms are often so fitted that the hand may be unscrewed and a knife or fork, or hair brush, made especially for the purpose, can be put in its place. Deformed feet are often pieced out with blocks of wood whittled to the proper shape. An ordinary artificial hand of the best make is worth about \$100, legs from \$50 to \$125, and arms from \$50 to \$150. Under the general head of the manufacture of artificial limbs is included the manufacture of ears, fingers and noses. A nose for instance is first molded

in the proper shape from papier maché. It is then waxed and varnished to the tint of the complexion of the noseless person. It is fastened on by means of a pair of spectacles to the nose piece, to which it is firmly at-tached, or where the remaining stump is large enough, it is clamped in place. Ears are made in the same way but are more difficult to attach. They are usually attached by means of small springs which fit into the ear duct. Artificial eyes are made of glass. First a bulb is blown from molten glass and when cold one side is carefully broken off so as to leave a shell, the edges of which are blunted by melting. The proper size of eye is secured by measurement and the eye designed is worked by placing the bulb over a Bunsen burner so that its upper surface will just touch the flame. In this way little sticks of varied colored glass are worked into the eye design. Great skill is required to made the iris and the retina of the proper color and shape.

Artil'lery, all sorts of great guns, cannon, or ordnance, mortars, howitzers, machine-guns, etc., together with all the apparatus and stores thereto belonging, which are taken into the field, or used for besieging and defending fortified places. The improvements and alterations in artillery and projectiles have of late years been extraordinary. The most important modern improvement in artillery, besides the increase in size, is the general adoption of rifled ordnance, breech-loaders, and machine-guns. See *Cannon* and other articles. The name artillery is also given to the land troops by whom these arms are served, whether they accompany an army in the field, take part in sieges, or occupy fixed posts.

**Artois** (år-twä), a former province of France, anciently one of the seventeen provinces of the Netherlands, now almost completely included in the department of Pas de Calais.

Arts, the name given to certain branches of study in the Middle Ages, originally called the "liberal arts" to distinguish them from the "servile arts" or mechanical occupations. These arts were usually given as grammar, dialectics, rhetoric, music, arithmetic, geometry, and astronomy. Hence originated the terms "art classes," "degrees in arts," "Bachelor of Arts." "Master of Arts," etc., still in common use in universities, the faculty of arts being distinguished from those of divinity, law, medicine, or science.

Arundelian *l'iarbles*, a series of ancient sculptured marbles discovered by William Petty, who explored the ruins of Greece at the expense of and for Thomas Howard, earl of Arundel, who lived in the time of James I and Charles I, and was a liberal patron of scholarship and art. After the Restoration they were presented by the grandson of the collector to the University of Oxford. Among them is the Parian Chronicle, a chronological account of the principal events in Grecian, and particularly in Athenian history, during a period of 1,318 years, from the reign of Cecrops (B. c. 1450) to the archonship of Diognetus (B. c. 264).

**Aruwimi,** a large river of equatorial Africa, a tributary of the Congo, which it enters from the north.

Arval Brothers, a college or company of twelve members elected for life from the highest ranks in ancient Rome, so called from offering annually public sacrifices for the fertility of the fields.

Arvic'oia, a genus of rodent animals, suborder Mice. It includes the water-vole (or water-rat), and the field-vole or short-tailed field-mouse.

A'ryan (or Indo-European Family of Languages). See Indo-European Family.

As, a Roman weight of 12 oz., answering to the libra or pound, and equal to 237.5 grains avoirdupois, or 327.1873 grams, French measure. In the most ancient times of Rome the copper or bronze coin which was called *as*, actually weighed an *as*, or a pound, but in 264 B. c. it was reduced to 2 oz., in 217 to 1 oz., and in 191 to  $\frac{1}{2}$  oz.

A'sa, great grandson of Solomon and third king of Judah. He died after a prosperous reign of 41 years.

reign of 41 years. Asafet'ida (asafœtida), a fetid inspissated sap from Central Asia, the solidified juice of a large umbelliferous plant. It is used in medicine as an anti - spasmodic, and in cases of flatulency, in hysteric paroxysms, and other nervous affections. Notwithstanding its very disagreeable odor it is used as a seasoning in the East, and sometimes in Europe.

A'saph, a Levite and psalmist appointed by David as leading

Ferula Asafetida.

chorister in the divine services. He founded a school of poets and musicians, which were called, after him, "the sons of Asaph."

Asarabac'ca, a small, hardy European plant. Its leaves are acrid, bitter, and nauseous, and its root is extremely acrid. Both the leaves and root were formerly used as an emetic. The Canada snake-root is found in the western states.

Asben (Air, or Ahir), a kingdom of Africa.

in the Sahara. The inhabitants are Tuaregs (or Berbers), with an admixture of negro blood. They live partly in villages, partly as nomads. It is nominally ruled over by a sultan, who resides in the capital, Agades. Pop. about 60,000.

Asbes' tos (asbestus), a remarkable and highly useful mineral, a fibrous variety of several members of the hornblende family, composed of separable filaments, with a silky luster. The fibers are sometimes delicate, flexible, and elastic; at other times stiff and brittle. It is incombustible, and anciently was wrought into a soft, flexible cloth, which was used as a shroud for dead bodies. Some varieties are compact and take a fine polish, others are loose, like flax or silky wool. Mountain-wood is a variety presenting an irregular filamentous, structure, like wood. Rock-cork, mountain-leather, fossil-paper, and fossil-flax, are varieties.

Asbestos is always found in connection with a hard, crystal-like substance. The veins of asbestos as found in the mines are from two to four inches in thickness and separated by thin layers of hornblende crystals. The nearer to the surface the veins run the coarser are the The fibers and therefore the less valuable. most improved quarrying machinery is used in mining asbestos. Holes are drilled in long rows into the sides of the cliffs by means of steam drills. These holes are then loaded with dynamite and exploded simultaneously by electricity, thus a whole section of an asbestos cliff is broken off in one lump. The workmen break out as much of the pure asbestos as possible and convey it by means of trucks to the "cob house." Here the asbestos is separated from the pieces of rock and placed in rough bales and shipped to the factory. The proportion of asbestos in the amount of material quarried is about 1 to 25. As asbestos comes from the mines it is in small lumps of a greenish or yellowish hue and the edges are furred with loose fibers. The best grades of asbestos are nearly white. Another important item is the length of the fibers, the longest being the most valuable. After the asbestos, roughly baled, reaches the factory, it is dumped into hoppers of powerfully built machines and there crushed through a series of rolls until the fibers are separated into fluffy masses when it passes out into a separator where the small pieces of stone and dirt are extracted. The short fibers are taken out and sent to the pulp mill where they are ground up fine for the manufacture of solid packing for steam pistons, mill-board, and other commodities. The long fibers are gathered together, carded, and spun into yarn, just like cotton or wool, after which the substance may be woven into cloth as desired. Asbestos cloth is of a dirty white color and has a soapy feeling.

Asbestos has been known for ages as mountain cork or mountain leather, but its geological history and formation is still a matter of conjecture. Its attributes, too, have been known; but until about twenty years ago, very little practical use has been made of the substance. To-day it forms one of the giant industries of the U.S. The uses of asbestos are many and Ground fine and combined with colvaried. ors and oils in a certain manner it makes a paint. Roofs are made by treating strong canvas with a combination of asbestos and felt, and backing it with manilla paper. It is extensively used for roofs of factories, railroad shops, bridges, and other places where there is danger of fire. Steam-pipes are covered with asbestos, and asbestos cement is used for hotblast pipes and fire-heated surfaces. It is used for locomotive pistons, valve-stems, and oil pumps. It is made into ropes and millboards, and in some states, theaters are required to use an asbestos drop curtain to protect the audience in case of a fire in the scenery. Iron and glass workers use mittens knit from asbestos yarn. Asbestos soldering blocks are used by goldsmiths. Asbestos, in combination with rubber, is much used as an electrical insulator. Asbestos cloth is used for acid filters in all sorts of chemical processes for the reason that no acid will eat it. Asbestos is found in Italy and Canada, and rich deposits have recently been found in Wyoming, California, and Montana. At present Canada is the principal source of supply. A good asbestos mine is considered to be worth more than a gold mine; and as new uses for the substance are found, it becomes more valuable.

Asbjornsen (ås'byeurn-sen), PETER KRIS-TEN, b. 1812, d. 1885, a distinguished Norwegian naturalist and collector of the popular tales and legends, fairy stories, etc., of his native country.

Asbury Park, a small town on the coast of New Jersey, a great summer resort, its population being in summer increased from 4,000 to 20,000 or 25,000.

Asbury, FRANCIS (1745-1846), M. E. bishop, b. in Handsworth, England, d. in Spottsylvania, Va. He was the first bishop of the M. E. church ordained in this country. He came as a missionary to this country. He came as a made general assistant to John Wesley. In 1777 the ministers of his church, at a conference in Maryland, decided that they should return to Europe; Asbury, alone, chose to remain. He was unanimously elected bishop and consecrated by Doctor Coke, 1784, with a fixed salary of \$64 per year. His annual travels extended from Canada to the Mississippi River.

As'calon (or Ash'kelon), a ruined town of Palestine, on the seacoast, 40 mi. w.s. w. of Jerusalem. It was occupied by the Crusaders under Richard I after a great battle with Saladin (1192).

Asca' nius, the son of Æneas and Creusa, and the companion of his father's wanderings from Troy to Italy.

Ascen'sion (discovered on Ascension Day), an island of volcanic origin belonging to Britain, near the middle of the South Atlantic Ocean, 800 mi. n. w. of St. Helena. Area about 36 sq. mi.: pop. 165. It is retained by Britain mainly as a station at which ships may

touch for stores. It has a steam factory, naval and victualing yards, hospitals, and a coal depot.

Ascension, Right, of a star, in astronomy, the arc of the equator intercepted between the first point of Aries and that point of the equator which comes to the meridian at the same instant with the star.

Ascension Day, the day on which the ascension of the Saviour is commemorated, often called *Holy Thursday*; a movable feast, always falling on the Thursday but one before Whitsuntide.

Ascham (as'kam), ROGER (1515-1568), a learned Englishman, born in Yorkshire. He became Latin secretary to Edward VI and also to Mary. Was preceptor to Elizabeth during her girlhood and her secretary after she ascended the throne. In 1544 he wrote a book in praise of his favorite amusement and exercise-archery. In 1563-68 he wrote his Schoolmaster, a treatise on the best method of teaching children Latin. His life was written by Dr. Johnson to accompany an edition of his works published in 1769.

Aschersleben (åsh'erz-la-ben), a town of Prussian Saxony, in the district of Magdeburg, near the junction of the Eine with the Wipper. Industries: woolens, machinery, and metal goods, sugar, paper, etc. Pop. 21,519.

Ascid'ia, the name given to the "Sea-squirts" or main section of the Tunicata, molluscous animals of low grade, resembling a double-

Compound Ascidian.

piration, the other is the excretory aperture. A single ganglion represents the nervous system, placed between the two apertures. Male and female reproductive organs exist in each ascidian. They pass through peculiar phases of development, the young ascidian appearing like a tadpole-body. They may be single or simple, social or compound.

One of the

Ascle' piades (-dez), the name of a number of ancient Greek writers—poets, grammarians, etc. - of whom little is known, and also of several ancient physicians, the most celebrated of whom was AscLEPIADES, of Bithynia, who acquired considerable repute at Rome about the beginning of the first century B. C.

Ascle plas (or Swallow-wort), a genus of plants, the type and the largest genus of the natural order Asclepiadaceae. Most of the species are North American herbs, having opposite, alternate, or verticillate leaves. Many of them possess powerful medicinal qualities. One is diaphoretic and sudorific, and has the singular property of exciting general perspiration without increasing in any sensible degree

the heat of the body; another is emetic, and its roots are frequently sent to England as ipecacuanha; the roots of a third are famed for diaphoretic properties.

As'coli (or Ascoli Piceno), a town in middle Italy, capital of the province of the same name. Pop. 11,199. The province has an area of 809 sq. mi.; a pop. of 222,146.

As gard (lit. gods' yard, or the abode of the gods), in Scandinavian mythology, the home of the gods or *Æsir*, rising, like the Greek Olympus, from *midgard*, or the middle world, that is, the earth.

Ash, a genus of deciduous trees, having imperfect flowers and a seed-vessel prolonged into a thin wing at the apex. There are a good many species, chiefly indigenous to Europe and North America. It is one of the most useful trees on account of its hard, tough wood and the rapidity of its growth. There are many varieties of it, as the weeping ash, the curled-leaved ash, the entire-leaved ash, etc. The flowering, or manna-ash, is a native of the south of Europe and Palestine. It yields the substance called manna, which is obtained by making incisions in the bark. when the juice exudes and hardens. Among the American species are the white ash, with lighter bark and leaves; the red or black ash, with a brown bark; the black ash, the blue ash, the green ash, etc. They are all valuable The mountain-ash or rowan belongs to trees. a different order.

Ash (Ashes), the incombustible residue of organic bodies (animal or vegetable) remaining after combustion; in common usage, any incombustible residue of bodies used as fuel; as a commercial term, the word generally means the ashes of vegetable substances, from which are extracted the alkaline matters called potash, pearl-ash, kelp, barilla, etc.

Ashan'go, a region in the interior of Southern Africa, belonging now to the French. The inhabitants belong to the Bantu stock, and among them are a dwarfish people, the Obongo,

said to be about 44 feet high at most. Ashantee', a kingdom of West Africa, in the interior of the Gold Coast. Area about 70,000 sq. mi. Gold is abundant, being found either in the form of dust or in nuggets. The Ashantees are warlike and ferocious, with a love of shedding human blood **amounting to a** passion, human sacriflees being common. The The government is a despotic monarchy. chief town is Coomassie, which, before being burned down in 1874, was well and regularly built with wide streets, and had from 70,000 to 100,000 inhabitants. The British first came in contact with the Ashantees in 1807, and hostilities continued, off and on, till 1826, when they were driven from the seacoast. Immediately after the transfer of the Dutch settlements on the Gold Coast to Britain in 1872when the entire coast remained in British hands—the Ashantees reclaimed the sovereignty of the tribes round the settlement of Elmina. This brought on a sanguinary war, leading to a British expedition in 1874, in which Coomassie was captured, and British

supremacy established along the Gold Coast. In 1896 another expedition became necessary and was successfully concluded. King Prempeh was deposed and imprisoned and the country annexed. Pop. est. at between 1,000-000 and 2,000,000.

Ash burton Treaty, a treaty concluded at Washington, 1842, by Daniel Webster and Lord Ashburton. It defined the n. e. boundaries between the U. S. and Canada.

Asheville, Buncombe co., N. C., near French, Broad, and Swannanoa rivers, 140 mi. e. of Knoxville. Railroad: Southern. Industries: cotton mills, flouring mill, two iron foundries, cigar and furniture factories, and saw mill. Surrounding country mostly agricultural. The town was first settled in 1794, and was then called Morris, but was shortly afterward changed to its present name in honor of Governor Ashe. Was incorporated in 1833. Pop. est. 1897, 14,000.

Ashland, Schuylkill co., Pa., 120 mi. s.w. of Philadelphia. Railroads: Philadelphia & Reading, and Lehigh Valley. Industries: steam pump works, flour mill, two iron foundries, two screen factories, three planingmills, shoe and shirt factories, and powdermill. Surrounding country partly agricultural, largely anthracite coal mining. The town was first settled in 1847 and became a borough in 1857. Pop. est. 1897, 8,000.

Ashland, Ashland co., Wis., on Lake Superior, has rapidly increased in population; a prosperous town. Pop. 9,956.

Ashton-under-Lyon, a town of Lancashire, England. The chief employment is the cotton manufacture and iron-works. Pop. 10,494.

manufacture and iron-works. Pop. 10,494. Ashtabula, Ashtabula co., Ohio, on Lake Erie, 55 mi. e. of Cleveland. Railroads: L. S. & M. S.; N. Y. C. & St. L.; and Pennsylvania. Industries: tool works, three flouring mills, two iron foundries, and fifteen factories. Natural gas in vicinity. Surrounding country, agricultural. Is a great receiving port for iron ore. The town was first settled in 1801 and became a city in 1892. Pop. est. 1897, 15,-000.

Ash-Wednesday, the first day of Lent, so called from a custom in the Western Church of sprinkling ashes that day on the heads of peniterts, then admitted to penance. The period at which the fast of Ash-Wednesday was instituted is uncertain.

Asia, the largest of the great divisions of the earth. Area est. at 17,296,000 sq. mi., about a third of all the land of the earth's surface. On three sides, n., e., and s., the ocean forms its natural boundary, while in the w. the frontier is marked mainly by the Ural Mountains, the Ural River, Caspian Sea, the Caucasus, the Black Sea, the Mediterranean, the Suez Canal, and the Red Sea. There is no proper separation between Asia and Europe, the later being really a great peninsula of the former. Asia, though not so irregular in shape as Europe, is broken in the s. by three great peninsulas, Arabia, Hindustan, and Farther India, while the e. coast presents peninsular projections and islands, forming a series of sheltered seas and bays, the principal peninsulas being Kamtchatka and Corea. The principal islands are those forming the Malay or Asiatic Archipelago, which stretch round in a wide curve on the s. e. of the continent. Besides the larger islands—Sumatra, Java, Borneo, Celebes, Mindanao, and Luzon (in the Philippine group)—there are countless smaller islands grouped round these. Other islands are Ceylon, in the s. of India; the Japanese islands and Sakhalin on the e. of the continent; Formosa, s. e. of China; Cyprus, s. of Asia Minor; and New Siberia and Wrangell Land, in the Arctic Ocean.

Political Divisions.—A large portion of Asia is under the dominion of European powers. Russia possesses the whole of Northern Asia (Siberia) and a considerable portion of Central Asia, together with a great part of ancient Armenia, on the s. of the Caucasus (pop. 16,-000,000); Turkey holds Asia Minor, Syria, and Palestine, part of Arabia, Mesopotamia, etc. (pop. 16,000,000); Great Britain rules over India, Ceylon, a part of the Indo-Chinese Peninsula (Upper and Lower Burmah) and several other possessions (pop. 290,000,000); France has acquired a considerable portion of the Indo-Chinese Peninsula, and has one or two other settlements (pop. 18,000,000); while to Holland belong Java, Sumatra, and other islands, or parts of islands, and to Spain the Phil-The chief independent states are the ippines. Chinese Empire (pop. 386,000,000), Japan (pop. 40,000,000), Siam (pop. 6,000,000). Afghanistan (pop. 5,000,000), Beluchistan, Persia (pop. 7,-000,000), and the Arabian states (pop. 3,000,-000). The most important of the religions of Asia are the Brahmanism of India, the creeds of Buddha, Confucius, and Lao-tse in China, and the various forms of Mohammedanism in Arabia, Persia, India, etc. Prob-ably more than half of the whole popula-tion profess some form of Buddhism. Several native Christian sects are found in India, Armenia, Kurdistan, and Syria.

Surface, Rivers, and Lakes.—The mountain systems of Asia are of great extent, and their culminating points are the highest in the world. The greatest of all is the Himalayan system, which lies mainly between lon. 70<sup>o</sup> and 100° e. and lat. 28° and 37° n. It extends, roughly speaking, from northwest to southeast, its total length being about 1,500 mi., forming the northern barrier of Hindustan. The loftiest summits are Mount Everest, 29,002 feet high, another peak 28,265, and Kinchinjinga, 28,156. The principal passes, which rise to the height of 18,000 to 20,000 feet, are the highest in the world. A second great mountain system of Central Asia, connected with the northwestern extremity of the Himalayan system by the elevated region of Pamir, is the Thian-Shan system, which runs northeastward for a distance of 1,200 mi. In this direction, the Altai, Sayan, and other ranges continue the line of elevations to the northeastern coast. A northwestern continuation of the Himalayas is the Hindu Kush, and farther westward a connection may be traced between the Hima-

layan mass and the Elburz range (18,460 ft.), south of the Caspian, and thence to the mountains of Kurdistan, Armenia, and Asia Minor. There are vast plateaus and elevated valley regions connected with the great central mountain systems, but large portions of the conti-nent are low and flat. Thibet forms the most elevated table-land in Asia, its mean height being estimated at 15,000 feet. On its south is the Himalayan range, while the Kuen-Lun range forms its northern barrier. Another great but much lower plateau is that which comprises Afghanistan, Beluchistan, and Persia, and which to the northwest joins into the plateau of Asia Minor. The principal plain of Asia is that of Siberia, which extends along the north of the continent and forms an immense alluvial tract sloping to the Arctic Ocean. Vast swamps or peat-mosses called tundras cover large portions of this region. Southwest of Siberia, and stretching eastward from the Caspian, is a low-lying tract consisting, to a great extent, of steppes and deserts, and including in its area the Sca of Aral. In the east of China there is an alluvial plain of some 200,000 sq. mi. in extent; in Hindustan are plains extending for 2,000 mi. along the south slope of the Himalayas; and between Arabia and Persia, watered by the Tigris and Euphrates, is the plain of Mesopotamia or Assyria, one of the richest in the world. Of the deserts of Asia the largest is that of Gobi (lon. 90°-120° e., lat. 40°-48° n.), large portions of which are covered with nothing but sand or display a surface of bare rock. An almost continuous desert region may also be traced from the desert of North Africa through Arabia (which is largely occupied by bare deserts), Persia, and Beluchistan to the Indus.

Some of the largest rivers of Asia flow northward to the Arctic Ocean—the Obi, the Yenisei, and the Lena. The Hoang-Ho, and Yangtse, and the Amoor, are the chief of those which flow into the Pacific. The Ganges, Brahmaputra, Irawaddy, and Indus empty into the Indian Ocean. The Persian Gulf receives the united waters of the Euphrates and the Tigris. There are several systems of inland drainage, large rivers falling into lakes which have no outlet.

The largest lake of Asia (partly also European) is the Caspian Sea, which receives the Kur from the Caucasus (with its tributary the Aras from Armenia), and the Sefid Rud and other streams from Persia (besides the Volga from European Russia, and the Ural, which is partly European, partly Asiatic). The Caspian lies in the center of a great depression, being 83 feet below the level of the Sea of Azof. East from the Caspian is the Sea of Aral, which, like the Caspian, has no outlet, and is fed by the rivers Amoo Daria (Oxus) and Syr Daria. Still farther east, to the north of the Thian-Shan Mountains, and fed by the Ili and other streams, is Lake Balkash, also without an outlet and very salt. Other lakes having no communication with the ocean are Lob Nor, in the desert of Gobl, receiving the river Tarim, and the Dead Sea, far below the level of the Mediterranean,

and fed by the Jordan. The chief fresh-water lake is Lake Baikal, in the south of Siberia, between lon.  $104^{\circ}$  and  $110^{\circ}$  e., a mountain lake from which Yenisei draws a portion of its waters.

Geology.-Geologically speaking large areas of Asia are of comparatively recent date, the lowlands of Siberia, for instance, being submerged during the tertiary period, if not more recently. Many geologists believe that subsequently to the glacial period there was a great sea in Western Asia, of which the Caspian and Aral Seas are the remains. The desiccation of Central Asia is still going on, as is also probably the upheaval of a great part of the continent. The great mountain chains and elevated plateaus are of ancient origin, however, and in them granite and other crystalline Active volcarocks are largely represented. noes are only met with in the extreme east (Kamtchatka) and in the Eastern Archipelago. From the remotest times Asia has been celebrated for its mineral wealth. In the Altai and Ural Mountains gold, iron, lead, and platinum are found; in India and other parts rubies, diamonds, and other gems are, or have been, procured; salt in Central Asia; coal in China, India, Central Asia, etc.; petroleum in the districts about the Caspian and in Burmah: bitumen in Syria; while silver, copper, sulphur, etc., are found in various parts.

Climate.—Every variety of climate may be experienced in Asia, but as a whole it is marked by extremes of heat and cold and by great dryness, this in particular being the case with vast regions in the center of the  $\mathbf{The}$ continent and distant from the sea. great lowland region of Siberia has a short but very hot summer, and a long but intensely cold winter, the rivers and their estuaries being fast bound with ice, and at a certain depth the soil is hard frozen all the year round. The northern part of China to the east of Central Asia has a temperate climate with a warm summer, and in the extreme north a severe winter. The districts lying to the south of the central region, comprising the Indian and Indo-Chinese peninsulas, southern China, and the adjacent islands, present the characteristic climate and vegetation of the southern temperate and tropical regions modified by the effects of altitude. Some locali-ties in Southeastern Asia have the heaviest rainfall anywhere known. As the equator is approached the extremes of temperature diminish till at the southern extremity of the continent they are such as may be experienced in any tropical country. Among climatic features are the monsoons of the Indian Ocean and the eastern seas, and the cyclones or typhoons, which are often very destructive.

Vegetation.—The plants and animals of Northern and Western Asia generally resemble those of similar latitudes in Europe (which is really a prolongation of the Asiatic continent), differing more in species than in genera. The principal mountain trees are the pine, larch, and birch: the willow, alder, and poplar are found in lower grounds. In the central

region European species reach as far as the western and central Himalayas, but are rare in the eastern. They are here met by Chinese and Japanese forms. The lower slopes of the Himalayas are clothed almost exclusively with tropical forms. Higher up, between 4,000 and 10,000 feet, are found all the types of trees and plants that belong to the temperate zone, there being extensive forests of conifers. Here is the native home of the deodar cedar. The southeastern region, including India, the Eastern Peninsula, and China, with the is-lands, contains a vast variety of plants useful to man and having here their original habitat. such as the sugar-cane, rice, cotton, and indigo, pepper, cinnamon, cassia, clove, nutmeg, and cardamoms, banana, cocoa-nut, areca and sago palms; the mango and many other fruits, with plants producing a vast number of drugs, caoutchouc and gutta-percha. The forests of India and the Malay Peninsula contain oak, teak, sál, and other timber woods, besides bam-boos, palms, sandal-wood, etc. The palmyra palm is characteristic of southern India; while the talipot palm flourishes on the western coast of Hindustan, Ceylon, and the Malay Peninsula. The cultivated plants of India and China include wheat, barley, rice, maize, millet, sorghum, tea, coffee, indigo, cotton, jute, opium, tobacco, etc. In north China and the Japanese islands large numbers of deciduous trees occur, such as oaks, maples, limes, walnuts, poplars, and willows, the genera being European, but the individual species Asiatic. Among cultivated plants are wheat, and in favorable situations, rice, cotton, the vine, etc. Coffee, rice, maize, etc., are extensively grown in some of the islands of the Asiatic Archipelago. In Arabia and the warmer valleys of Persia, Afghanistan, and Beluchistan, aromatic shrubs are abundant. Over large parts of these regions the date-palm flourishes and affords a valuable article of food. Gum-producing acacias are, with the date-palm, the commonest trees in Arabia. African forms are found extending from the Sahara along the desert region of Asia.

Zoology.—Nearly all the mammals of Europe occur in Northern Asia, with numerous additions to the species. Central Asia is the native land of the horse, the ass, the ox, the sheep, and the goat. Both varieties of the camel, the single and the double humped, are Asiatic. To the inhabitants of Thibet and the higher plateaus of the Himalayas the yak is what the reindeer is to the tribes of the Siberian plain, almost their sole wealth and support. The elephant, of a different species from that of Africa, is a native of tropical Asia. The Asiatic lion, which inhabits Arabia, Persia, Asia Minor, Beluchistan, and some parts of India, is smaller than the African species. Bears are found in all parts, the white bear in the far north, and tropical parts. The tiger is the most characteristic of the larger Asiatic carnivora. It extends from Armenia across the entire continent, being absent, however, from

the greater portion of Siberia and from the high table-land of Tibet; it extends also into Sumatra, Java, and Bali. In Southeastern Asia and the islands we find the rhinoceros, buffalo, ox, deer, squirrels, porcupines, etc. In birds nearly every order is represented. Among the most interesting forms are the hornbills, the peacock, the Impey pheasant, the tragopan or horned pheasant, and other gallinaceous birds, the pheasant family being very characteristic of Southeastern Asia. It was from Asia that the common domestic fowl was introduced into Europe. The tropical parts of Asia abound in monkeys, of which the species are numerous. Some are tailed, others, such as the orang, are tailless, but none have prehensile tails like the American monkeys. In the Malay Archipelago marsupial animals, so characteristic of Australia, first occur in the Moluccas, and Celebes, while various mammals common in the western part of the Archipelago are absent. A similar transition toward the Australian type takes place in the species of Of marine mammals the dugong is birds. peculiar to the Indian Ocean; in the Ganges is found a peculiar species of dolphin. At the head of the reptiles stands the Gangetic crocodile, frequenting the Ganges and other large da capello, one of the most deadly snakes in existence; there are also large boas and pythons, besides sea and freshwater snakes. The seas and rivers produce a great variety of fish. The Salmonidæ are found in the rivers flowing into the Arctic Ocean. Two rather remarkable fishes are the climbing perch and the archer-fish. The well-known goldfish is a native of China.

Population. — Asia is mainly peopled by races belonging to two great ethnographic types, the Caucasic or fair type, and the Mongolic or yellow. To the former belong the Aryan or Indo-European, and the Semitic races, both of which mainly inhabit the southwest of the continent; to the latter belong the Malays and Indo-Chinese in the southeast, as well as the Mongolians proper (Chinese, etc.), occupying nearly all the rest of the continent. To these may be added certain races of doubtful affinities, as the Dravidians of southern India, the Cingalese of Ceylon, the Ainos of Yesso, and some negro-like tribes called Negritos, which inhabit Malacça and the interior of several of the islands of the Eastern Archipelago. The total population is estimated at about 800,000,000, or more than half that of the whole world.

History.—Asia is generally regarded as the cradle of the human race. It possesses the oldest historical documents, and next to the immediately contiguous kingdom of Egypt, the oldest historical monuments in the world. The Old Testament contains the oldest historical records which we have of any nation in the form of distinct narrative. The period at which Moses wrote was probably 1,500 or 1,600 years before the Christian era. His and the later Jewish writings confine themselves almost ex-

clusively to the history of the Hebrews; but in Babylonia, as in Egypt, civilization had made great advances long before this time. The earliest seat of the Aryan race was probably on the banks of the Oxus. Hence, perhaps from the pressure of the Mongolian tribes to the north, they spread themselves to the southeast and southwest, finally occupying northern In-dia, Persia, and other parts of Western Asia, and spreading into Europe, perhaps about 2000-1500 B. c. In China authentic history extends back probably to about 1000 B. C., with a long preceding period of which the names of dynasties are preserved without chronological arrangement, The kingdoms of Assyria, Babylonia, Media, and Persia, alternately predominated in Southwestern Asia. In regard to the history of these monarchies much light has been obtained from the decipherment of the cuneiform inscriptions. The arms of the Pharaohs extended into Asia, but their conquests there were short-lived. From Cyrus (B. c. 559), who extended the empire of Persia from the Indus to the Mediterranean, while his son. Cambyses, added Egypt and Lybya to it, to the conquest of Alexander (B. c. 330), Persia was the dominant power in Western Asia. Alexander's great empire became broken up into separate kingdoms, which were finally absorbed in the Roman Empire, and this ulti-mately extended to the Tigris. Soon after the most civilized portions of the three continents had been reduced under one empire, the great event took place which forms the dividing line of history-the birth of Christ and the spread of Christianity. In A. D. 226 a protracted struggle began between the newer Persian Empire and the Romans, which lasted till the advent of Mohammed and the conquests of the Arabians. Persia was the first great conquest of Moham med's followers. Syria and Egypt soon fell before their arms, and within forty years of the celebrated flight of Mohammed from Mecca (the *Hejira*), the sixth of the caliphs, or successors of the Prophet, was the most power-ful sovereign of Asia. The Mongols next be-came the dominant race. In 999 Mahmud, whose father, born a Turkish slave, became governor of Ghazni, conquered India, and es-lablished his rule. The dynasty of the Seljuk Tatars was established in Aleppo, Damascus, Iconium, and Kharism, and was distinguished for its struggles with the Crusaders. Othman, an emir of the Seljuk sultau of Iconium, established the Ottoman Empire in 1300. About 1220 Genghis Khan, an independent Mongol chief, made himself master of Central Asia. conquered Northern China, overran Turkestan, Afghanistan, and Persia; his successors took Bagdad and extinguished the caliphate. In Asia Minor they overthrew the Seljuk dynasty. One of them, Timur or Tamerlane, carried fire and sword over Northern India and Western Asia, defeated and took prisoner Bajazet, the descendant of Othman (1402), and received tribute from the Greek emperor. The Ottoman Empire soon recovered from the blow inflicted by Timur, and Constantinople was taken and the Eastern Empire finally overthrown by

the Sultan Mohammed II in 1453. China recovered its independence about 1368 and was again subjected by the Manchu Tatars (1618-45), soon after which it began to extend its empire over Central Asia. Siberia was conquered by the Cossacks on behalf of Russia (1580-84). The same country effected a settlement in the Caucasus about 1786, and has since continued to make steady advances into Central Asia. The discovery by the Portuguese of the passage to India by the Cape of Good Hope led to their establishment on the coast of the peninsula (1498). They were speedily followed by the Spanish Dutch. French, and British. The Spanish, Dutch, French, and British. The struggle between the two last powers for the supremacy of India was completed by the destruction of the French settlements (1760-65). France has recently acquired an extensive territory in Farther India. At present the forms of government in Asia range from the primitive rule of the nomad sheik to the despotism of China. India has been brought by Britain directly under European influence, and Japan is freely modeling her institutions on those of the West.

Asia, Central, a designation loosely given to the regions in the center of Asia east of the Caspian, also called Turkestan, and formerly Tartary. The eastern portion belongs to China. the western now to Russia. Russian Central Asia comprises the Kirghiz Steppe (Uralsk, Turgai, Akmolinsk, Semipalatinsk, etc.), and what is now the government-general of Turkestan, besides the territory of the Turkomans, or Transcaspia and Merv. Russia has thus absorbed the old khanate of Khokand and part of Bokhara and Khiva, and controls the vassal territories of Bokhara and Khiva, the southern boundary being the Persian and Afghan frontiers.

Asia Minor, the most westerly portion of Asia, being the peninsula lying w. of the Upper Euphrates, and forming part of Asiatic Turkey. It forms an extensive plateau, with lofty mountains rising above it, the most extensive ranges being the Taurus and Anti-Taurus, which border it on the s. and s.e., and rise to over 10,000 ft. There are numer-ous salt and fresh-water lakes. The chief rivers are the Kizil-Irmak (Halys), Sakaria (Sangarius), entering the Black Sea; and the Sarabat (Hermus) and Menderes (Mæander). entering the Ægean. The coast regions are generally fertile, and have a genial climate: the interior is largely arid and dreary. Valuable forests and fruit-trees abound. Smyrna is the chief town; Anatolia is an equivalent name

Askabad', the administrative center of the Russian province of Transcaspia, situated in the Akhal Tekke oasis, and occupied by Skobeleff in January, 1881, after the sack of Geok Tepé. Its distance from Merv is 232 mi., from Herat 388 mi.

As'kew, ANNE (1521-1546), a victim of religious persecution. She was a daughter of Sir William Askew of Lincolnshire, and was married to a wealthy neighbor named Kyme, who, irritated by her Protestantism, drove her from

#### Asmannshausen

his house. In London she spoke against the dogmas of the old faith, and was condemned to death as a heretic.

As' mannshausen (-hou-zn), a Prussian village on the Rhine, in the district of Wiesbaden, celebrated for its wine. Many prefer the red wine of Asmannshausen to the best Burgundy, but it retains its merits for three or four years only.

**Asnières** (än-yär), a town on the Seine, of from 6,000 to 7,000 inhabitants, a favorite boating resort with the Parisians.

Asp (Aspic), a species of viper found in Egypt, resembling the cobra de capello or spectacle-serpent of the East Indies, and having a very venomous bite. When approached or disturbed it elevates its head and body, swells out its neck, and appears to stand erect to attack the aggressor. Hence the ancient Egyptians believed that the asps were guardians of the spots they inhabited, and the figure of this reptile was adopted as an emblem of the protecting genius of the world. The balancing motions made by it in the endeavor to maintain the erect attitude have led to the employment of the asp as a dancing serpent by the African jugglers. Cleopatra is said to have committed suicide by means of an asp's bite. The name asp is also given to a viper common on the continent of Europe.

Aspar'agus, a plant, the young shoots of which, cut as they are emerging from the ground, are a favorite culinary vegetable. In Greece, and especially in the southern *steppes* of Russia and Poland, it is found in profusion; and its edible qualities were esteemed by the ancients. It is mostly boiled and served with-

Asparagus. a-Upper end of stem, showing leaves. b-Young shoot.

out admixture, and eaten with butter and salt. The plants should remain three years in the ground before they are cut; after which, for ten or twelve years, they will continue to afford a regular annual supply. The beds are protected by straw or litter in winter.

## Asphalt

Aspa'sia, a celebrated lady of ancient Greece, b. at Miletus, in Ionia, but passed a great part of her life at Athens, where her house was the general resort of the most distinguished men in Greece. She won the affection of Pericles, who united himself to Aspasia as closely as was permitted by the Athenian law, which declared marriage with a foreign woman illegal. She had a son by Pericles, who was legitimated (B. c. 430) by a special decree of the people.

As' pen, or trembling poplar, a species of poplar indigenous to Britain and to most mountainous regions throughout Europe and Asia. It is a beautiful tree of rapid growth and extremely hardy, with nearly circular-toothed

Branch of Aspen. a-Catkin.

leaves, smooth on both sides, and attached to footstalks so long and slender as to be shaken by the slightest wind; wood, light, porous, soft, and of a white color, useful for various purposes.

Aspen, Pitkin co., Colo., situated on Castle Creek at an elevation of 7,700 ft. above the sea level, 60 mi. w. by s. of Leadville. It is in the center of a rich lead and silver mining country. Railroads: D. & R. G., and Colo. Midland. Pop. est. 1897, 9,500.

As'pern and Esslingen (es'ling-en), two villages east of Vienna, and on the opposite bank of the Danube; celebrated as the chief contested positions in the bloody but undecisive battle fought between the Archduke Charles and Napoleon I, May 21 and 22, 1809, when it was estimated that the Austrians lost a third of their army, and the French no less than half.

Asphalt, Asphal'tum, the most common variety of bitumen: also called mineral pitch. Asphalt is a compact, glossy, brittle, black or brown mineral, which breaks with a polished fracture, melts easily with a strong, pitchy odor when heated, and when pure burns without leaving any ashes. It is found in the earth in many parts of Asia, Europe, and America, and in a soft or liquid state on the surface of the Dead Sea, which from this circumstance was called Asphaltites. It is of organic origin, the asphalt of the great Pitch Lake of Trinidad being derived from bituminous shales, containing vegetable remains in the process of transformation. Asphalt is produced artificially in making coal gas. Dur-

ing the process much tarry matter is evolved and collected in retorts. If this be distilled, naphtha and other volatile matters escape, and asphalt is left behind. The asphaltum is dug out of the lake with mattocks and picks, molded into buckets, and taken directly to the vessel for shipmen. Crude asphaltum cannot be used in paving streets but must be put through a refining process which consists principally of a slow application of heat and precipitation. It takes three tons of the crude material to make two tons of refined asphalt. The first step in the refining process is to place the asphaltum in great tanks and melt it down. It is necessary that the material be stirred continually during this process. A certain proportion of the residuum of petroleum is put into the asphaltum to act as a flux and melt the substance at a lower temperature than it otherwise would melt; thus all of the oils in the asphaltum are saved. This mixture when done is called the "paving cement." While this process is going on, sharp, clean sand is being heated to about 300 degrees in large revolving drums. This sand is mixed in a certain proportion with the above mixture, to both of which is then added a certain proportion of carbonate of lime. The three substances are then mixed by means of a number of iron arms revolving at a very high speed. The whole mixture, known as a "street mixture," is then taken to the street to be laid as pavement.

Before the street is ready for the asphalt there must be done a certain amount of preliminary work. The street must be carefully graded to within eight or nine inches of the proposed finished surface. It is necessary that the sub-grade be very solid and rolled with a steam roller. Upon this foundation is laid a six-inch bed of hydraulic cement concrete, made of cement, clean, sharp sand, and broken stone. This, too, must be well rammed broken stone. This, too, must be well rammed and rolled. Upon the efficiency of this preliminary work depends the value of the pave-ment when completed. The asphalt is usually laid on in two courses; the first, a cushion coat and then a surface coat. The asphalt "street mixture" is applied when it is at a temperature of about 250 or 300 degrees. The cushion coat is usually from one-half to one inch thick, and the surface coat is thick enough to make the entire sheet of asphalt two and one-half inches thick. The hot mixture is dumped into the street and spread evenly from curb to curb with hot rakes. Iron tampers and smoothers, also heated, smooth and finish the surface, which is then rolled with a handroller, then a five-ton, and last with a ten-ton roller. The street mixture contains from 13 to 20 per cent. of asphaltic cement, from 82 to 65 per cent. of clean, selected sand, and from 5 to 15 per cent. of pulverized carbonate of lime. The surface coat is sprinkled with a small amount of hydraulic cement before the heavy rollers are passed over it.

Asphalte (or Asphalt) Rock, a limestone Impregnated with bitumen, found\_ in large quantities in various localities in Europe, as

•

in the Val de Travers, Neuchâtel, Switzerland; in the department of Ain in France; in Alsace, Hanover, Holstein, Sicily, etc. These rocks contain a variable quantity of bitumen (from 7 or 8 to 20 or 30 per cent.) naturally dif-fused through them. The Val de Travers asphalt was discovered in 1710. Since then other asphalte-rocks, as well as artificial preparations made by mixing bitumen, gas-tar, pitch, or other materials, with sand, chalk, etc., have been brought into competition with it. From 1880 to 1890, inclusive, there were 6,803,054 sq. yds. of Trinidad asphalt paving laid in the U.S.

Asphodel, a genus of plants, consisting of perennials, with fasciculated fleshy roots, flowers arranged in racemes, six stamens inserted at the base of the perianth, a sessile almost spherical ovary with two cells, each containing two ovules; fruit a capsule with three cells, in each of which there are, as a rule, two seeds. They are fine garden plants, native of Southern Europe. The king's spear has yellow flowers, blossoming in June. Another species, which attains a height of 5 ft., is cultivated in Algeria and elsewhere, its tubercles yielding a very pure alcohol, and the residue, together with the stalks and leaves,

being used in making pasteboard and paper. Asphyx'ia, literally, the state of a living animal in which no pulsation can be perceived, but the term is more particularly applied to a suspension of the vital functions from causes hindering respiration. The normal accompaniments of death from asphyxia are dark fluid blood, a congested brain and exceedingly congested lungs, the general engorgement of the viscera, and an absence of blood from the left cavities of the heart while the right cavities and pulmonary artery are gorged. The restoration of asphyxiated persons has been successfully accomplished at long periods after apparent death. The attempt should be made to maintain the heat of the body and to secure the inflation of the lungs as in the case of the apparently drowned.

As' pinwall. See Colon.

.

As' pirator, an instrument used to promote the flow of a gas from one vessel into another by means of a liquid. The simplest form of aspirator is a cylindrical vessel containing water, with a pipe at the upper end which communicates with the vessel containing the gas, and a pipe at the lower end also, with a stop-cock and with its extremity bent up. By allowing a portion of the water to run off by the pipe at the lower part of the aspirator, a measured quantity of air or other gas is sucked into the upper part.

Aspromon'te, a mountain of Italy in the s.w. of Calabria, where Garibaldi was wounded and taken prisoner with the greater part of his army, in August, 1862. As'rael, the Mohammedan angel of death,

who takes the soul from the body.

Ass, a species of the horse genus, supposed by Darwin to have sprung from the wild variety found in Abyssinia; by some writers to be a descendant of the *onager*, or wild ass, inhabiting the mountainous deserts of Tartary,

## Assam

etc.; and by others to have descended from the kiang or djiggetai of s.w. Asia. Both in color and size the ass is exceedingly variable, ranging from dark gray and reddish brown to white, and from the size of a Newfoundland dog in North India to that of a good-sized horse. In the s.w. countries of Asia and in Egypt, in some districts of Southern Europe, as in Spain, and in Kentucky and Peru, great attention has been paid to selection and interbreeding, with a result no less remarkable

#### The Ass.

than in the case of the horse. Thus in Syria there appear to be four distinct breeds: a light and graceful animal used by ladies, an Arab breed reserved for the saddle, an ass of heavier build in use for plowing and draft purposes, and the large Damascus breed. The male ass is mature at two years of age, the female still earlier. The teeth of the young ass follow the same order of appearance and renewal as those of the horse. The life of the ass does not usually exceed thirty years. It is in general much healthier than the horse, and is maintained in this condition by a smaller quantity and coarser quality of food; it is superior to the horse in its ability to carry heavy burdens over the most precipitous roads, and is in no respect its inferior in intelligence. The skin is used as parchment to cover drums, etc., and in the East is made into shagreen. The hybrid offspring of the horse and the female ass is the hinny, that of the ass and the mare is the mule; but the latter is by far the larger and more useful animal. Asses' milk, long celebrated for its sanative qualities, more closely resembles that of a woman than any other. It is very similar in taste, and throws up an equally fluid cream, which is not convertible into butter.

Assam', a chief province of British India; area 49,004 sq. mi. The climate is marked by great humidity, and malarious diseases are common in the low grounds; otherwise it is not unhealthy. The whole province, except

## Assaying

the cultivated area, may be designated as forest, the trees including teak, sal, sissoo, the date and sago palm, the areca palm (the betelnut tree), the Indian fig-tree, etc. The article of most commercial importance is tea, the yield of which is now over 60,000,000 lbs. annually. Other crops raised are rice, Indian corn, pulse, oil-seeds, sugar-cane, hemp, jute, potatoes, etc. In the jungles and forests roam herds of elephants, the rhinoceros, tiger, buffalo, leopard, bear, wild hog, jackal, fox, goat. and various kinds of deer. Among serpents are the python and the cobra. Pheasants, partridges, snipe, wild peacock, and many kinds of water-fowl abound. Coal, petroleum, and limestone are found in abundance, iron is smelted to a small extent, gold-dust is met with, lime is exported to Bengal. Pop. 4,881,-426, about 3,062,000 of whom are Hindus, 1.317,000 Mohammedans, 7,000 Christians. In 1826 Assam became a possession of Britain. The largest town is Sylhet (pop. 14,000).

Assass'ins, an Asiatic order or society having the practise of assassination as its most distinctive feature, founded by Hassan Ben Sabbah, a dai or missionary of the heterodox Mohammedan sect, the Ismaelites. The society grew rapidly in numbers, and in 1090 the Persian fortress of Alamut fell into their hands. Other territories were added, and the order became a recognized military power. Upon a select band fell the work of assassination, to which they were stimulated by the intoxicating influences of hashish. From the epithet hashishim (hemp-caters) which was applied to the order, the European word assassin has been derived. Hassan, after a long and prosperous reign, died in 1124. Most of his successors died violent deaths at the hands of relatives or dependents. After withstanding the sultans Noureddin and Saladin, and making themselves feared by the Crusaders, the Assassins were overcome by the Tatar leader, Hulaku. The last chief, Rokneddin, was killed for an act of treachery subsequent to his capture, and his death was followed by a general massacre of the assassins, in which 12,000 perished. Dispersed bands led a roving life in the Syrian mountains, and it is alleged that in the Druses and other small existing tribes their descendants are still to be found.

**Assaye** (Assye) (as-si'), a village in Southern India, in Hyderabad, where Wellington gained a famous victory in 1803. The victory, however, cost him more than a third of his men.

Assaying, the estimation of the amount of pure metal, and especially of the precious metals, in an ore or alloy. In the case of silver the assay is either by the dry or by the wet process. The dry process is called *cupellation* from the use of a small and very porous cup, called a *cupel*, formed of well-burned and finely ground bone-ash made into a paste with water. The cupel, being thoroughly dried, is placed in a fire-clay oven about the size of **a** drain-tile, with a flat sole and arched roof, and with slits at the sides to admit air. This oven, called a *muffle*, is set in a furnace, and when it is at a red heat the assay, consisting of a smali

weighed portion of the alloy wrapped in sheet-lead, is laid upon the cupel. The heat causes the lead to volatilize or combine with the other metals, and to sink with them into the cupel, leaving a bright globule of pure metallic silver, which gives the amount of silver in the alloy operated on. In the wet process the alloy is dissolved in nitric acid, and to the solution are added measured quantities of a solution of common salt of known strength, which precipitates chloride of silver. The which precipitates chloride of silver. operation is concluded when no further precipitate is obtained on the addition of the salt solution, and the quantity of silver is calculated from the amount of salt solution used. An alloy of gold is first cupeled with lead as above, with the addition of three parts of silver for every one of gold. After the cupellation is finished, the alloy of gold and silver is beat en and rolled out into a thin plate, which is curled up by the fingers into a little spiral or cornet. This is put into a flask with nitric acid, which dissolves away the silver and leaves the cornet dark and brittle. After washing with water the cornet is boiled with stronger nitric acid to remove the last traces of silver, well washed, and then allowed to drop into a small crucible, in which it is heated, and then it is weighed. The assay of gold, therefore, consists of two parts: cupellation, by which inferior metals (except silver) are removed; and quartation, by which the added silver and any silver originally present are got rid of. The quantity of silver added has to be regulated to about three times that of the gold. If it be more the cornet breaks up, if it be less the gold protects small quantities of the silver from the action of the acid. Where, as in some gold-manufactured articles, these methods of assay cannot be applied, a streak is drawn with the article upon a touchstone, consisting of coarse-grained Lydian quartz saturated with bituminous matter, or of black ba-salt. The practised assayer will detect approximately the richness of the gold from the color of the streak, which may be further subjected to an acid test.

Assignats (ås-ë-nyà), the name of the na-tional paper currency in the time of the French Revolution. Assignats to the value of \$80,000,000 were first struck off by the Constituent Assembly, with the approbation of the king, April 19, 1790, to be redeemed with the proceeds of the sale of the confiscated goods of the church. August 27 of the same year, Mirabeau urged the issuing of \$400,000,-000 of new assignats, which caused a dispute in the assembly. Vergasse and Dupont, who saw that the plan was an invention of Clavière for his own enrichment, particularly distinguished themselves as the opponents of the Mirabeau's exertions, however, were scheme. seconded by Péthion, and \$160,000,000 more were issued. They were increased by degrees to \$9,115,600,000, and their value rapidly declined. In the winter of 1702-93 they lost 30 per cent., and in spite of the law to compel their acceptance at their nominal value they continued to fall till in the spring of 1796

they had sunk to one three-hundred-and-fortyfourth their nominal value. This depreciation was due partly to the want of confidence in the stability of the government, partly to the fact that the coarsely executed and easily counterfeited assignats were forged in great numbers. They were withdrawn by the Directory from the currency, and at length redeemed by mandats at one thirtieth of their nominal value.

Assinibol'a, the smallest of the four districts into which a portion of the northwestern territories of Canada was divided in 1882. Some coal is mined. Area 89,535 sq. mi.; pop. 1891, 30,374. Capital, Regina, on the Canadian Pacific railway, which intersects the district.

Assiniboine, a river of Canada, which flows through Manitoba and joins the Red River at Winnipeg, about 40 mi. above the entrance of the latter into Lake Winnipeg, after a somewhat circuitous course of about 500 mi. from the west and northwest. Steamers ply on it for over 300 mi.

Assisi (às-sē'sē), a small town in Italy, in the province of Umbria, 20 mi. n. of Spoleto, the see of a bishop, and famous as the birthplace of St. Francis d'Assisi. The splendid church built over the chapel where the saint received his first impulse to devotion, is one of the finest remains of mediæval Gothic architecture.

Association of ideas, the term used in psychology to comprise the conditions under which one idea is able to recall another to consciousness. Recently some psychologists have been disposed to classify these conditions under two general heads; the law of contiguity, and the law of association. The first states the fact that actions, sensations, emotions, and ideas, which have occurred together, or in close succession, tend to suggest each other when any one of them is afterward presented to the mind. The second indicates that present actions, sensations, emotions, or ideas tend to recall their like from among previous experiences. Other laws have at times been enunciated, but they are reducible to these; thus, the "law of contrast or contrariety" is properly a case of contiguity. On their physical side the principles of association correspond with the physiological facts of re-excitation of the same nervous centres, and in this respect they have played an important part in the endeavor to place psychology upon a basis of positive science. The laws of association, taken in connection with the law of relativity, are held by many to be a complete exposition of the phenomena of intellect.

**Assouan** (às-sö-án') (or Essouan), a town of Upper Egypt, on the east bank of the Nile, below the first cataract. The granite quarries of the Pharaohs, from which were procured the stones for the great obelisks and colossal statues of ancient times, are in the neighborhood. Pop. about 6,000; trade in dates, senna, etc.

Assump'sit, in common law, an action to recover compensation for the non-performance of a *parole* promise; that is, a promise not contained in a deed under seal. Assumpsits are of two kinds, *express* and *implied*. The former are where the contracts are actually made in word or writing; the latter are such as the law implies from the justice of the case; e.g., employment to do work implies a promise to pay.

**Assyr'ia** (the Asshur of the Hebrews, Athurd of the ancient Persians), an ancient monarchy in Asia. Area about 100,000 sq. mi.; surface partly mountainous, hilly, or undulating, partly a portion of the fertile Mesopotamian plain. The numerous remains of ancient habitations show how thickly this vast flat must have once been peopled; now, for the most part, it is a mere wilderness. The chief cities of Assyria in the days of its prosperity were Nineveh, the site of which is marked by mounds opposite Mosul (Nebi Yunus and Koyunjik), Calah or Kalah Sherghat), Sargina (Khorsabad), and Arbela (Arbil).

Much light has been thrown on the history of Assyria by the decipherment of the cuneiform inscriptions obtained by excavation. The assertion of the Bible that the early inhabitants of Assyria went from Babylon is in. conformity with the traditions of later times, and with inscriptions on the disinterred Assyrian monuments. For a long period the country was subject to governors appointed by the kings of Babylon, but about B. c. 1500 it became independent. About the end of the fourteenth century its king, Shalmaneser, is said to have founded the city of Kalakh (or Calah); his son, Tiglath-ninip, conquered the whole of the valley of the Euphrates. The five following reigns were chiefly occupied by wars with the Babylonians. About 1120 Tiglath-Pileser I, one of the greatest of the sovereigns of the first Assyrian monarchy, ascended the throne, and carried his conquests to the Mediterranean on the one side and to the Caspian and the Persian Gulf on the other. At his death there ensued a period of decline, which lasted over 200 years. Under Assur-nazir-pal, who reigned from 884 to 859 B. c., Assyria once more advanced to the position of the leading power in the world, the extent of his kingdom being greater than that of Tig-lath-Pileser. The magnificent palaces, temples, and other buildings of his reign prove the advance of the nation in wealth, art, and luxury. In 859 he was succeeded by his son Shalmaneser II, whose career of conquest was equally successful. He reduced Babylon to a state of vassalage, and came into hostile contact with Benhadad and Hazael of Damascus, and with Ahab and Jehu of Israel, from whom he exacted tribute, as also from the kings of Tyre and Sidon. The old dynasty came to an end in the person of Assurnirari II, who was driven from the throne by a usurper, Tiglath-Pileser, in 745, after a struggle of some years. No sooner was this able ruler firmly seated on the throne than he made an expedition into Babylonia, followed by another to the east in 744. A year later he de-feated the confederate princes of Armenia, Syria, etc., and advancing against Syria, over-

threw the ancient kingdoms of Damascus and Hamath, and placed his vassal Hosea on the throne of Samaria. A protracted campaign in Media (737-735), another in Armenia, and the expedition into Syria mentioned in 2 Kings 16, are among the most important events of the latter years of his reign. Tiglath-Pileser carried the Assyrian arms from Lake Van on the north to the Persian Gulf on the south, and from the confines of India on the east to the Nile on the west. He was, however, driven from his throne by Shalmaneser IV (727), who blockaded Tyre for five years, invaded Israel, and besieged Samaria, but died before the city was reduced. His successor, Sargon (722-705), a usurper, claimed descent from the ancient Assyrian kings. After taking Samaria, he overthrew the combined forces of Elam (Susiana) and Babylon. The revolted Armenians had also more than once to be put In 710 Merodach-Baladan was driven down. out of Babylonia by Sargon, after holding it for twelve years as an independent king, and being supported by the rulers of Egypt and Palestine; his allies were also crushed, Judah was overrun, and Ashdod leveled to the ground. Sargon latterly crossed over and took Cyprus. He was murdered, being succeeded by Sennacherib, one of his younger sons, in 705. Sennacherib at once had to take up arms against Merodach Baladan, who had again obtained possession of Babylon. He defeated Hezekiah and his Egyptian and Ethiopian allies, and forced him to pay tribute, after which he returned to Assyria to overawe the Babylonians, Elamites, and the northern hill tribes. In 681 he was murdered by his two sons, Adrammelech and Sharezer, but they were defeated by their brother, Esarhaddon, who then mounted the throne, fixed his residence at Babylon, and made it his capital. Egypt was reduced to a state of vassalage, the Ethiopian ruler, Tirhakah, being driven out and the land divided into twenty separate kingdoms. In 652 a general insurrection broke out, headed by Sammughes, governor of Babylonia, and including Babylonia, Egypt, Palestine, and Arabia. Egypt was the only power, however, which regained its independence. Though the king's character was marked by cruelty and sensuality, he was a zealous patron of the arts and learning. He died in 625, and was succeeded by his son, Assur-emid-ilin (or Sarakos), under whom Babylon definitely threw off the Assyrian yoke. The capital, Nineveh, was captured and burned by the allied forces of the Medes and Babylonians, about 607 or 606 B.c. Assyria now fell partly to Media, partly to Babylonia, and afterward formed with Babylonia one of the satrapies of the Persian Empire. In 312 B.c. it became part of the kingdom of the Seleucidæ; later on it came under Parthian rule, and was more than once a Roman possession. For a long period it was under the caliphs of Bagdad. In 1638 the Turks wrested it from the Persians, and it has continued under their dominion since that date.

The original inhabitants of Assyria and

## Assyria

Babylonia are known as Accadians (or Sumerians). They belonged to the Turanian or Ural-Altaic race, and were, therefore, of the same stock as that from which the Finns, Turks, and Magyars have descended. In early times a Semitic race of people spread themselves over the country, and mingled with or supplanted the original inhabitants, while their language took the place of the Accadian, the latter becoming a dead language. These later Assyrians were thus akin to the Hebrews, Phœnicians, and modern Arabians. Their language differed little from the Babylonian, and both retained traces of the influence of the earlier Accadian. Assyrian is closely allied to Hebrew and Phœnician, and changed little throughout the 1,500 years during which we can trace it in the inscriptions. It continued to be written with the cuneiform or arrowheaded character down to the third century B. C. The greater part of the Assyrian literature was stamped in minute characters on baked bricks, the subjects comprising hymns to the gods, mythological and epic poems, and works on history, chronology, astrology, law, etc. After Assur, the chief god, came twelve chief deities, including Anu, the father of the gods: Bel, the lord of the world: Hea, the lord of the sea; Sin, the moon-god; Shamas, the sun-god; Istar, a powerful goddess with various attributes; Ninip, god of hunting (the man-bull); Nergal, god of war (the man-

The God Nergal (British Museum).

lion): etc. A number of spirits, good and evil, presided over the minor operations of nature. There were set forms regulating the worship of all the gods and spirits, and prayers to each were inscribed on clay tablets with blanks for the names of the persons using them.

The Assyrians were far advanced in art and industry, and in civilization in general. They constructed large buildings, especially palaces of brick, burned or sun-dried, stone, alabaster slabs for lining and adorning the walls internally and externally, and timber for pillars and roofs. These alabaster slabs were elaborately sculptured with designs serving to throw much light on the manners and customs of the people. The palaces were raised on high terraces, and often comprised a great number of apartments; there were no windows, light being obtained by carrying the walls up to a

#### Assyriology

certain height and then raising on them pillars to support the roof and admit light and air. The Assyrian sculptures, as a rule, were in relief, figures in the full round being the exception. More than three quarters of the reliefs are of warlike scenes; hunting scenes are also favorite subjects. The vestiges of Assyrian painting consist chiefly of fragments of stucco and glazed tiles. In these, traces of Egyptian influence are to be found, but the Assyrian figure type is for the most part of a more voluptuous and vigorous fullness than the Egyptian. They understood and applied the arch; constructed tunnels, aqueducts, and drains; used the pulley, the lever, and the roller; engraved gems in a highly artistic way; understood the arts of inlaying, enameling, and overlaying with metals: manufactured porcelain, transparent and colored glass; were acquainted with the lens; and possessed vases, jars and other dishes, bronze and ivory ornaments, bells, gold earrings and bracelets of excellent design and workmanship. Their household furniture also gives a high idea of their skill and taste. The cities of Nineveh, Assur, and Arbela had each their royal observatories, superintended by astronomers-royal, who had to send in their reports to the king twice a month. At an early date the stars were numbered and named; a calendar was formed, in which the year was divided into twelve months (of thirty days each), called after the zodiacal signs; but as this division was found to be inaccurate an intercalary month was added every six years. The week was divided into seven days, the seventh being a day of rest; the day was divided into twelve periods of two hours each, each of these being subdivided into sixty minutes, and these again into sixty seconds. Eclipses were recorded from a very remote epoch, and their recurrence roughly determined. The principal astronomical work, called the *Illumination of Bel*, was inscribed on seventy tablets, and went through numerous editions, one of the latest being in the British Museum. It treats among other things of comets, the polar star, the conjunction of the sun and moon, and the motions of Venus and Mars.

Assyriology, the department of knowledge which deals with Assyrian antiquities and history, is entirely a modern study. Until 1842 the materials for Assyrian history were derived from the Jewish records of the Old Testament and from such comparatively late writers as Herodotus and Ctesias. In 1843-46 M. Botta, the French consul at Mosul, made the first explorations at Koyunjik and Khorsabad, and the objects thus obtained were transported to the Louvre. In 1845 and in 1849 valuable researches were conducted by Mr. Layard, and subsequently continued by the British Museum trustees. Later researches were instituted by the proprietors of the Daily Telegraph, and then by the government, in which Mr. George Smith met with considerable success. More recently Mr. Rassam has carried on the work of discovery. In the decipherment and translation of the cuneiform inscriptions among the most distinguished names are those of Sir Henry Rawlinson, Mr. H. Fox Talbot, Mr. George Smith, M. Jules Oppert, Dr. Schrader, Dr. Hincks, Rev. A. H. Sayce, Mr. Le Page Renouf, Prof. Terrien de la Couperie, Mr. Boscawen, and Mr. Pinches.

Astar'te, a Syrian goddess, probably corresponding to the Semele of the Greeks and the Ashtaroth of the Hebrews, and representing the productive power of nature. She was a moon-goddess. Some regard her as corresponding with Hera (Juno), and others with Aphrodite.

As'ter, a genus of plants, comprehending several hundred species, mostly natives of North America, although others are widely distributed. Many are cultivated as ornamental plants. Asters generally flower late in the season, and some are hence called Michaelmas or Christmas Daisies. The China Aster is a very showy annual, of which there are many varieties.

Aste'rla, a name applied to a variety of corundum, which displays an opalescent star of six rays of light when cut with certain precautions; and also to the *cat's-eye*, which consists of quartz, and is found especially in Ceylon.

Ås'teroids (or Planetoids), a numerous group of very small planets revolving round the sun between the orbits of Mars and Jupiter, re-markable for the eccentricity of their orbits and the large size of their angle of inclination to the ecliptic. The diameter of the largest is not supposed to exceed 450 mi., while most of the others are very much smaller. They number over 270, and new members are being constantly discovered. Ceres, the first of them, was discovered Jan. 1, 1801, and within three years more Pallas, Juno, and Vesta were The extraordinary smallness of these seen. bodies, and their nearness to each other, gave rise to the opinion that they were but the fragments of a planet that had formerly existed and had been brought to an end by some catastrophe. For nearly forty years investigations were carried on, but no more planets were discovered till Dec. 8, 1845, when a fifth planet in the same region was discovered. The rapid succession of discoveries that followed was for a time taken as a corroboration of the disruptive theory, but the breadth of the zone occupied makes the hypothesis of a shattered planet more than doubtful. Their mean distances from the sun vary between 200,000,000 and 300,000,000 mi.; the periods of revolution, between 1,191 days (Flora) and 2,868 (Hilda). Their eccentricities and inclinations are on the average greater than those of the earth, but their total mass does not exceed one fourth that of the earth.

Asthma (ast'ma), difficulty of respiration returning at intervals, with a sense of stricture across the chest and in the lungs, a wheezing, hard cough at first, but more free toward the close of each paroxysm, with a discharge of mucus, followed by a remission. Asthma is essentially a spasm of the muscular tissue which is contained in the smaller bronchial tubes. It generally attacks persons advanced in years, and seems, in some instances, to be hereditary. The exciting causes are various—accumulation of blood or viscid mucus in the lungs, noxious vapors, a cold and foggy atmosphere, or a close, hot air, flatulence, accumulated fæces, violent passions, organic diseases in the thoracic viscera, etc. By far the most important part of the treatment consists in the obviating or removing the several exciting causes. It seldom proves fatal except as inducing dropsy, consumption, etc. **Asti** (ås' tě), a town of Northern Lialy, prov-

Asti (ås' të), a town of Northern Italy, province of Alessandria, 28 mi. e.s.e. of Turin. In the Middle Ages it was one of the most powerful republics of Northern Italy. It was the birthplace of Alfieri, the poet, whose statue adorns the principal square. A favorite wine is produced in the neighborhood. Pop. 17.340.

Astig' matism, a malformation, congenital or accidental, of the lens of the eye, in consequence of which the individual does not see objects in the same plane, although they may really be so. It is due to the degree of convexity of the horizontal and vertical meridians being different, so that corresponding rays, instead of converging into one point, meet at two foci.

Astor, JOHN JACOB (1763-1848), an American capitalist, b. near Heidelberg, Germany; d. at New York. In 1783 he emigrated to the U. S., settled at New York, and became extensively engaged in the fur trade. In 1811 the settlement of Astoria, founded by him, near the mouth of the Columbia River, was formed to serve as a central depot for the fur trade between the lakes and the Pacific. He subsequently engaged in various speculations, and died worth \$20,000,000, leaving \$400,000 to found the Astor Library in New York. This institution is contained in a splendid building, enlarged in 1859 at the cost of his son, and comprises about 260,000 volumes. His descendants are the principal ground landlords of the city of New York. Astor, WILLIAM (1792-1875), sou of John

Astor, WILLIAM (1792-1875), sou of John Jacob Astor, carried on the enormous business interests of his father and is said to have left \$50,000,000. He added \$200,000 to his father's bequest for a public library. He was known as the *landlord of New York*, from the extent of his property in that city.

Astor, WILLIAM WALDORF, b. 1848, son of J. J. Astor. Elected to state legislature, 1877, and to state senate in 1870. Was envoy and minister plenipotentiary to Italy, 1882-85. He inherited the greater part of the enormous Astor estate in 1890. He is now living in England.

Astoria, Clatsop co., Ore., U. S., on the Columbia River, with numerous salmon-canning establishments. Pop. 7,071.

Astrabad', a town of Persia, capital of a province of the same name on the Caspian. It was formerly the residence of the Kajar princes, the ancestors of the present Persian dynasty. It is very unhealthy, and has been called the *City of the Plague*. Pop. est. 16,500.

Astræ'a, in Greek mythology, the daughter of Zeus and Themis, and goddess of justice. During the Golden Age she dwelt on earth, but on that age passing away she withdrew from the society of men and was placed among the stars, where she forms the constellation Virgo. The name was given to one of the asteroids, discovered in 1845. It revolves around the sun in 1,511.10 solar days, and is about 2‡ times the distance of the earth from the sun.

Astrag'alus, the upper bone of the foot supporting the tibia; the huckle, ankle, or sling bone. It is a strong, irregularly shaped bone, and is connected with the others by powerful ligaments.

Astrakhan (ås-trå-hån'), a Russian city, capital of government of same name. The manufactures are large and increasing, and the fisheries (sturgeon, etc.) very important. It is the chief port of the Caspian, and has regular steam communication with the principal towns on its shores. Pop. 57,704, composed of various races. The government has an area of 85,000 sq. mi. It consists almost entirely of two vast *steppes*, separated from each other by the Volga, and forming for the most part arid sterile deserts. Pop. 766,840.

Astrakhan, a name given to sheep-skins with a curled, woolly surface obtained from a variety of sheep found in Bokhara, Persia, and Syria; also a rough fabric with a pile in imitation of this.

Astrin' gent, a medicine which contracts the organic textures and canals of the body, thereby checking or diminishing excessive discharges. The chief astringents are the mineral acids, alum, lime-water, chalk, salts of copper, zinc, iron, lead, silver; and among vegetables, catechu, kino, oak-bark, and galls.

Astrol'ogy, literally, the science or doc-trine of the stars. The name was formerly used as equivalent to astronomy, but is now restricted in meaning to the pseudo-science which pretends to enable men to judge of the effects and influences of the heavenly bodies on human and other mundane affairs, and to foretell future events by their situations and conjunctions. As usually practised the whole heavens, visible and invisible, was divided by great circles into twelve equal parts, called houses. As the circles were supposed to remain immovable every heavenly body passed through each of the twelve houses every twenty-four hours. The portion of the zodiac contained in each house was the part to which chief attention was paid, and the position of any planet was settled by its distance from the boundary circle of the house, measured on the ecliptic. The houses had different names and different powers, the first being called the house of life, the second the house of riches, the third of brethren, the sixth of marriage, the eighth of death, and so on. The part of the heavens about to rise was called the ascendant, the planet within the house of the ascendant being bird of the ascendant. The different aspects of the planets were of great importance. To cast a person's nativity (or draw his horoscope) was to find the position of the heavens at the in-

stant of his birth, which being done, the astrologer, who knew the various powers and influences possessed by the sun, the moon, and the planets, could predict what the course and termination of that person's life would be. The temperament of the individual was ascribed to the planet under which he was born, as saturnine from Saturn, jozial from Jupiter, mercurial from Mercury, etc., words which are now used with little thought of their original meaning. The virtues of herbs, gems, and medicines were supposed to be due to their ruling planets.

Astron'omy is that science which investigates the motions, distances, magnitudes, and various phenomena of the heavenly bodies. That part of the science which gives a description of the motions, figures, periods of revolution, and other phenomena of the heavenly bodies is called *descriptive astronomy*; that part which teaches how to observe the motions, figures, periodical revolutions, distances, etc., of the heavenly bodies, and how to use the necessary instruments, is called practical astronomy; and that part which explains the causes of their motions, and demonstrates the laws by which those causes operate, is termed physical astronomy. Recent years have added two new fields of investigation which are full of promise for the advancement of astronomical science. The first of these-celestial photography-has furnished us with invaluable light-pictures of the sun, moon, and other bodies, and has recorded the existence of myriads of stars invisible even by the best telescopes; while the second, spectrum analysis, reveals to us a knowledge of the physical constituents of the universe, telling us for instance that in the sun (or his atmosphere) there exist many of the elements familiar to us on the earth. It has also been applied to the determination of the velocity with which stars are approaching to, or receding from, our system; and to the measurement of movements taking place within the solar atmospheric envelopes. From analysis of some of the unresolved nebulæ the inference is drawn that they are not starswarms but simply cosmical vapor; whence a second inference results favorable to the hypothesis of the gradual condensation of nebulæ, and the successive evolutions of suns and systems.

The most remote period to which we can go back in tracing the history of astronomy refers us to a time about 2500 B. C., when the Chinese are said to have recorded the simultaneous conjunction of Saturn, Jupiter, Mars, and Mercury with the moon. This remarkable phenomenon is found, by calculating back-ward, to have taken place 2460 B.c. Astronomy has also an undoubtedly high antiquity in India. The mean annual motion of Jupiter and Saturn was observed as early as 3062 years B. C.; tables of the sun, moon, and planets were formed, and eclipses calculated. In the time of Alexander the Great, the Chaldeans or Babylonians had carried on astronomical observations for 1,900 years. They regarded comets as bodies traveling in extended orbits,

## Astronomy

and predicted their return; and there is reason to believe that they were acquainted with the true system of the universe. The priests of Egypt gave astronomy a religious character; but their knowledge of the science is testified to only by their ancient zodiacs and the position of their pyramids with relation to the cardinal points. It was among the Greeks that Thaastronomy took a more scientific form. les of Miletus (b. 639 B.C.) predicted a solar eclipse, and his successors held opinions which are in many respects wonderfully in accordance with modern ideas. Pythagoras (500 B. C.) promulgated the theory that the sun is the center of the planetary system. Great progress was made in astronomy under the Ptolemies, and we find Timochares and Aristyllus employed about 300 B. c. in making useful planetary observations. But Pristarchus of Samos (b. 267 B.C.) is said, on the authority of Archimedes, to have far surpassed them, by teaching the double motion of the earth around its axis and around the sun. A hundred years later Hipparchus determined more exactly the length of the solar year, the eccentricity of the ecliptic, the precession of the equinoxes, and even undertook a catalogue of the stars. It was in the second century after Christ that Claudius Ptolemy, a famous mathematician of Pelusium in Egypt, propounded the system that bears his name; viz., that the earth was the center of the universe, and that the sun, moon, and planets revolved around it in the following order: nearest to the earth was the sphere of the moon; then followed the spheres of Mercury, Venus, the Sun, Mars, Jupiter, and Saturn; then came the sphere of the fixed stars; these were succeeded by two crystalline spheres and an outer sphere named the primum mobile or first motion, which last was again circumscribed by the calum empyreum, of a cubic shape, wherein happy souls found their abode. The Arabs began to make scientific astronomical observations about the middle of the eighth century, and for 400 years they prosecuted the science with assiduity. Ibn-Yunis (1000 A. D.) made important observations of the disturbances and eccentricities of Jupiter and Saturn. In the sixteenth century Nicholas Copernicus, b. in 1473, introduced the system that bears his name, and which gives to the sun the central place in the solar system, and shows all the other bodies, the earth in-cluded, revolving around him. This arrangement of the universe came at length to be generally received on account of the simplicity it substituted for the complexities and contradictions of the theory of Ptolemy. The observations and calculations of Tycho Brahe, a Danish astronomer, b. in 1546, continued over many years, were of the highest value, and claim for him the title of regenerator of practical astronomy. His assistant and pupil, Kepler, b. in 1571, was enabled, principally by the aid he received from his master's labors, to arrive at those laws which have made his name famous: 1, That the planets move, not in circular, but in elliptical orbits, of which the sun occupies a focus. 2, That

the radius vector, or imaginary straight line joining the sun and any planet, moves over equal spaces in equal times. 3, That the squares of the times of the revolutions of the planets are as the cubes of their mean distances from the sun. Galileo, who died in 1642, advanced the science by his observations and by the new revelations he made through his telescopes, which established the truth of the Copernican theory. Newton, b. in 1642, carried physical astronomy suddenly to comparative perfection. Accepting Kepler's laws as a statement of the facts of planetary motion he deduced from them his theory of gravitation. The science was enriched toward the close of the eighteenth century by the dis-covery by Herschel of the planet Uranus and its satellites, the resolution of the Milky Way into myriads of stars, and the unraveling of the mystery of nebulæ and of double and triple stars. The splendid analytical re-searches of Lalande, Lagrange. Delambre, and Laplace mark the same period. The nineteenth century opened with the discovery of the first four minor planets: and the exist-ence of another planet (Neptune) more distant from the sun than Uranus, was, in 1845, simultaneously and independently predicted by Levertier and Adams. Of late years the sun has attracted a number of observers, the spectroscope and photography having been especially fruitful in this field of investigation. From recent transit observations the former calculated distance of the sun has been corrected, and is now given as 92,560,000 mi. An interesting recent discovery is that of the two satellites of Mars. The existence of an intra-Mercurial planet, which has been named Vulcan, has not yet been verified. Much valuable work has of late been accomplished in ascertaining the parallax of fixed stars.

The objects with which astronomy has chiefly to deal are the earth, the sun, the moon, the planets, the fixed stars, comets. nebulæ, and meteors. The stellar universe is composed of an unknown host of stars, many millions in number, the most noticeable of which have been formed into groups called constellations. The nebulæ are cloud-like patches of light scattered all over the heavens. Some of them have been resolved into star-clusters, but many of them are but masses of incandescent gas. A favorite theory regarding the fixed stars is that they form a system to which our sun belongs, and that many of the nebulæ are similar systems situated far outside of our own. The fixed stars preserve, at least to unaided vision, an unalterable relation to each other, because of their vast distance from the Their apparent movement from east earth. to west is the result of the earth's revolution on its axis in twenty-four hours from west to east. The planets have not only an apparent, but also a real and proper motion, since, like our earth, they revolve around the sun in their several orbits and periods. The nearest of these bodies to the sun-unless the hypothetical Vulcan really exists — is Mercury. Venus, the second planet from the sun, is the bright-

est and most beautiful of all the planets. The Earth is the first planet accompanied by a sat-ellite or moon. Mars, the next planet, has two satellites, as already mentioned. Its surface has a variegated character, and the existence of land, water, snow, and ice has been assumed. The Asteroids, of which over 270 have been observed, form a broad zone of small bodies circulating in the space between Mars and Jupiter. Jupiter, the largest planet of the system, has four satellites, discovered by Galileo, and is marked by dark bands or belts on each side of the equator. Saturn, with his eight moons, and his broad thin rings with edges turned toward the planet, is, perhaps, the most striking telescopic object in the heavens. Uranus-discovered by Herschel in 1781-is accompanied by four satellites. Neptune, the farthest removed from the sun, has one satellite, the motion of which is retrograde. Besides the planets, quite a number of comets are known to be members of the solar system. The physical constitution of these bodies is still one of the enigmas of astronomy. The observation of meteors has recently attracted much attention. They most frequently occur in the autumn, and have been supposed to be Moon, Planet, Comets. See articles, Earth, Sun, Moon, Planet, Comet, Stars, Mercury, Venus, Mars, Jupiter, Baturn, Asteroids. Astu'ria (or The Asturias), a Spanish prin-

Astu'ria (or The Asturias), a Spanish principality, now forming the province of Oviedo, on the north coast of Spain; an Alpine region, with steep and jagged mountain ridges, valuable minerals, luxuriant grazing lands, and fertile, well-watered valleys. The hereditary prince of Spain has borne since 1388 the title of Prince of the Asturias.

Asty' ages (-jēz), the last king of the Medes, (593-558 B.C.), deposed by Cyrus, an event which transferred the supremacy from the Medes to the Persians.

Asuncion (ä-soon'sē-on) (or Nuestra Señora de la Asuncion), the chief city of Paraguay. It was founded in 1536 on the feast of the Assumption. Its trade is mostly in the yerba tea, hides, tobacco, oranges, etc. It was taken and plundered by the Brazilians in 1860, and some of the leading buildings still remain in a half-ruined condition. A railway runs for a short distance into the interior. Pop. 24,838.

Atacama (å-tå-kä'må), a desert region on the west coast of South America belonging to Chile. It forms the chief mining district of Chile, there being here rich silver mines, while gold is also found as well as argentiferous lead, copper, nickel, cobalt, and iron; with guano on the coast. The northern portion, till recently, belonged to Bolivia. The Chilean prov. of Atacama has an area of 43,180 sq. mi., and a pop. of 66,067.

Ataca' mite, a mineral consisting of a combination of the protoxide and chloride of copper, occurring abundantly in some parts of South America, as at Atacama, whence it has its name. It is worked as an ore in South America, and is exported to England.

Atahual' pa, the last of the Incas, succeeded

his father in 1529 on the throne of Quito, while his brother Huascar obtained the kingdom of Peru. They soon made war against each other, when the latter was defeated, and his kingdom fell into the hands of Atahualpa. The Spaniards, with Pizarro at their head, invaded Peru, and advanced to Atahualpa's camp. Atahualpa was captured, and despite the payment of a vast ransom in gold, was executed (1533).

Atalan 'ta, in the Greek mythology, a famous huntress of Arcadia. She was to be obtained in marriage only by him who could outstrip her in a race, the consequence of failure being death. One of her suitors obtained from AphrodItö (Venus) three golden apples, which he threw behind him, one after another, as he ran. Atalanta stopped to pick them up, and was not unwillingly defeated. There was another Atalanta belonging to Bœotia, who cannot very well be distinguished, the same stories being told about both.

**Ataxy** (Ataxia), in medicine, irregularity in the animal functions, or in the symptoms of a disease. See *Locomotor ataxy*.

Atchafalay'a ("Lost Water"), a river of the U. S., an outlet of the Red River which strikes off before the junction of that river with the Mississippi, flows southward, and enters the Gulf of Mexico by Atchafalaya Bay. Its length is 250 mi.

Atchison, Atchison co., Kan., on the Missouri, about 20 mi. from Kansas City, an important railway center with an increasing trade. Pop. 18,102. A'te, among the Greeks, the goddess of

A'te, among the Greeks, the goddess of hate, injustice, crime, and retribution, daughter of Zeus according to Homer, but of Eris (Strife) according to Hesiod.

Atesh'ga (the place of fire), a sacred place of the Guebres or Persian fire-worshipers, on the peninsula of Apsheron, on the w. coast of the Caspian, visited by large numbers of pilgrims, who bow before the sacred flames which issue from the bituminous soil.

Athabas'ca, a river, lake, and district of Canada. LAKE ATHABASCA, or Lake of the Hills, is about 190 mi. s.s.e. of the Great Slave Lake, with which it is connected by means of the Slave River, a continuation of the Peace. It is about 200 mi. in length from east to west, and about 35 mi. wide at the broadest part, but gradually narrows to a point at either extremity. The district of ATHABASCA, formed in 1882, lies immediately e. of British Columbia, and n. of Alberta. Area about 122,000 sq. mi. It is intersected by the Athabaska and the Peace Rivers, and as yet has a scanty population. The name is also given to a family of Indians.

Athali'ah, daughter of Ahab, king of Israel, and wife of Joram, king of Judah. After the death of her son Ahaziah, she opened her way to the throne by the murder of forty-two princes of the royal blood. She reigned six years; in the seventh the high priest Jehoiada placed Joash, the young son

of Ahaziah, who had been secretly preserved, on the throne of his father, and Athaliah was slain. See 2 Kings 8:9, 11.

Ath'elney, formerly an island in the midst of fens and marshes, now drained and cultivated, in Somersetshire, England, about 7 mi. s.e. of Bridgewater. Alfred the Great took refuge in it during a Danish invasion, and afterward founded an abbey there.

Ath'elstan, King of England, b. 895, d. 941, succeeded his father, Edward the Elder, in 925. He was victorious in his wars with the Danes of Northumberland and the Scots, by whom they were assisted. After a single overthrow of his enemies at Brunanburgh he governed in peace and with great ability.

Athe'na (or Athene), a Greek goddess, the representative of the intellectual powers; the daughter of Zeus (Jupiter) and Metis. According to the legend, before her birth Zeus swallowed her mother, and Athena afterward sprang from the head of Zeus. She slew Pallas and Enceladus. In all representations she is the symbol of the thinking faculty, the god-dess of wisdom, science, and art. As a warrior she is represented completely armed, her head covered with a gold helmet. As the goddess of peaceful arts she appears in the dress of a Grecian matron. To her insignia belong the Ægis, the Gorgon's head, the round Argive buckler. All Attica, but particularly Athens, was sacred to her, and she had numerous temples there.

Athenæ'um, the temple of Athena (or Minerva), at Athens, frequented by poets, learned men, and orators. The same name was given at Rome to the school which Hadrian established on the Capitoline Mount for the promotion of literary and scientific studies. In modern times the same name is given to literary clubs and establishments connected with the sciences.

Ath'ens, anciently the capital of Attica and center of Greek culture, now the capital of the kingdom of Greece. It is situated in the central plain of Attica, about 4 miles from the Saronic Gulf (or Gulf of Ægina), an arm of the Ægean Sea running in between the mainland and the Peloponnesus. It is said to have been founded about 1550 B.C. by Cecrops, the mythical Pelasgian hero, and to have borne the name Cecropia until under Erechtheus it received the name of Athens in honor of Athenē. The Acropolis, an irregular oval crag 150 ft. high, with a level summit 1,000 ft. long by 500 in breadth, was the original nucleus of the city. The three chief eminences near the Acropolis -the Areopagus to the northwest, the Pnyx to the southwest, and the Museum to the south of the Pnyx-were thus included within the city boundary as the sites of its chief public buildings. On the east ran the Ilissus and on the west the Cephissus, while to the south-west lay three harbors, Phalerum, the Piræus, and Munychia. At the height of its prosperity the city was connected with its harbors by three massive walls. The architectural de-velopment of Athens may be dated from the rule of the Pisistratides (560-510 B.C.), who are

## Athens

credited with the foundation of the temple of the Olympian Zeus, completed by Hadrian seven centuries later, the erection of the Pythium and of the Lyceum; also the Academy and the building of the Agora, Senate-house, Tholus, and Prytanium. With the foundation of Athenian democracy under Clisthenes, the Pnyx or place of public assembly, with its semicircular area and cyclopean wall, first became of importance, and a commencement was made to the Dionysiac theater (theater of Dionysus, or Bacchus) on the south side of the Acropolis. After the destruction wrought by the Persians in 480 B.C., Themistocles reconstructed the city upon practical lines and with a larger area, enclosing the city in new walls 71 miles in circumference, erecting the north wall of the Acropolis, and developing the maritime resources of the Piræus; while Cimon added to the southern fortifications of the Acropolis, planted the Agora with trees, laid out the Academy, and built the Theseum. Under Pericles the highest point of artistic development was reached. An Odeium was erected on the east of the Dionysiac theater for the recitations of rhapsodists and musicians; and with the aid of the architects, lotinus and Mnesicles, and of the sculptor Phidias, the Acropolis was perfected. Covering the whole of the western end rose the Propyleea, of Pentelic marble and consisting of a central portico with two wings in the form of Doric temples. In the interval between the close of the Peloponnesian war and the battle of Chæronea few ad-ditions were made. Then, however, the long walls and Piræus, destroyed by Lysander, were restored by Conon, and under the orator Lycurgus the Dionysiac temple was completed, the Panathenaic stadium commenced, and the choragic monuments of Lysicrates and Thrasyllus erected. Later on Ptolemy Philadelphus gave it the Ptolemæum near the Theseum, Attalus I, the stoa northeast of the Agora. Eu-menes II, that near the great theater, and Antiochus Epiphanes carried on the Olympium. Under the Romans it continued a flourishing city, Hadrian in the second century adorning it with many new buildings. But after a time Christian zeal, the attacks of barbarians, and robberies of collectors made sad inroads among the monuments. About 420 A.D. paganism was totally annihilated at Athens, and when Justinian closed even the schools of the philosophers, the reverence for buildings associated with the names of the ancient deities and heroes was lost. The Parthenon was turned into a church of the Virgin Mary, and St. George stepped into the place of Theseus. Finally, in 1456, the place fell into the hands of the Turks. The Parthenon became a mosque, and in 1687 was greatly damaged by an explosion at the siege of Athens by the Venetians. Enough, however, remains of it and of the neighboring structures to abundantly attest the splendor of the Acropolis; while of the other buildings of the city, the Theseum and Horologium, or Temple of the Winds, are admirably preserved, as also are the Pnyx, Panathenaic stadium, etc. Soon after the

commencement of the war of liberation in 1821, the Turks surrendered Athens, but captured it again in 1826-27. It was then abandoned until 1830. In 1835 it became the royal residence, and made rapid progress. The modern city mostly lies northward and eastward from the Acropolis. Among the principal buildings are the royal palace, the university, the academy, public library, theater, and observatory. The university was opened in 1836, and has 1,400 students. There are valuable museums, in particular the National Museum and that in the Polytechnic School. These are constantly being added to by excavations. There are four foreign archeeological institutes, the French, German, American, and British. Street railroads have been made in the principal streets, and the city is connected by railway (6 miles) with its port, the Piræus. Pop. 85,000.

Athens, Athens co. O., on the Hocking River, the seat of the Ohio University, which was founded in 1804.

Athens, Clark co., Ga., on the Oconee River, is the seat of the Georgia University, which was founded in 1801. Pop. 81,700.

Athletes (ath'lēts), combatants who took part in the public games of Greece. The profession was an honorable one; tests of birth, position, and character were imposed and crowns, statues, special privileges, and pensions were among the rewards of success.

Athol, Worcester co., Mass., on Miller River; large manufactures of woolen and boots and shoes; 28 mi. from Worcester. Pop. 6,318.

Athletic Sports .- Although this term is undoubtedly derived from the ancients, the derivation does not exactly indicate its present meaning, inasmuch as our modern athletes are distinctly defined to be amateurs, in contradistinction to professionals. In fact the former pursue the agonistic art, and should be styled "agonistics," if we may be allowed to invent such a word, rather than athletes. How the pastime came to be thus named in Britain some thirty years ago, it is hard to say. Till about 1860, all exercises wherein the feet played the principal part were rightly styled "pedestrianism." Up to that period all prizes, whether contended for by amateurs or professionals, were invariably in money. As the practise of the pastime, however, rapidly spread among the former, it was naturally found they were loth to compete on the same terms with, and for similar trophies as, the latter. Hence arose the modern definition of an amateur athlete; viz., "any person who has never competed in an open competition, or for public money, or for admission money, or with professionals for a prize, public money, or admission money; nor has ever at any period of his life taught or assisted in the pursuit of athletic exercises, as a means of livelihood; nor is a mechanic, artisan, or laborer." The moment this definition was brought into force a wide barrier arose between the two classes, and amateurs ceased to compete for money prizes among themselves, or against professionals,

on any terms, unless they were willing to forfeit their status.

Athor (Hathor or Het-her), an Egyptian goddess, identified with Aphroditë (or Venus). Her symbol was the cow bearing on its head the solar disc and hawk-feather plumes. Her chief temple was at Denderah. From her the third month of the Egyptian year derived its name. A'thos (now Hagion Oros or Monte Santo,

that is, Holy Mountain), a mountain 6,700 ft. high in European Turkey, terminating the most eastern of the three peninsulas jutting into the Archipelago. The name, however, is frequently applied to the whole peninsula, which is about 30 mi. long by 5 broad. It is covered with forests, and plantations of olive, vine, and other fruit trees. The Persian fleet under Mardonius was wrecked here in 493 B. C., and to avoid a similar calamity Xerxes caused a canal, of which traces may yet be seen, to be cut through the isthmus that joins the peninsula to the mainland. On the peninsula there are situated about twenty monasteries and a multitude of hermitages, which contain from 6,000 to 8,000 monks and hermits of the order of St. Basil. The libraries of the monasteries are rich in literary treasures and manuscripts. Every nation belonging to the Greek Church has here one or more monasteries of its own, which are annually visited by pilgrims. The various religious communities form a species of republic, paying an annual tribute of nearly \$20,000 to the Turks, and governed by a synod of twenty monastic deputies and four presidents, meeting weekly. At the present day no Mohammedan, except the Aga Bostanji, who acts as an intermediary between the monks and the sultan, can settle on the peninsula. The revenue of the community is derived from pilgrims, and from a considerable trade in amulets, rosaries, crucifixes, images, and wooden furniture.

Atit'lan, a lake and mountain of Central America in Guatemala. The lake is about 24 mi. long and 10 broad; the mountain is an active volcano 12,160 ft. high.

Atkinson, EDWARD, b. at Brookline, Mass., 1827. He has written extensively on economic subjects, and is considered a high authority on questions of this character. He has written several articles on the silver question in the U. S.

Atian'ta, Fulton co., Ga., is an important railway center; carries on a large trade in grain, paper, cotton, flour, and especially tobacco, and possesses flour mills, paper mills, iron works, etc. Here are Atlanta University for colored male and female students, a theological college, a medical college, etc. Atlanta suffered severely during the Civil War. Pop. 70,256.

Atlan'tes (or Telamones), in architecture, male figures used in place of columns or pilasters for the support of an entablature or cornice. Female figures so employed are termed caryatides.

Atlantic City, Atlantic co., N. J., on Atlantic Ocean, 60 mi. s.e. of Philadelphia. Railroads: West Jersey; Camden & Atlantic; and Atlantic City. Surrounding country agricultural. It is a winter and summer health and pleasure resort, and has an elevated board walk 40 ft. wide and 4 mi. long. Pop. est. 1897, 23,000.

Atlantic Ocean, the vast expanse of sea lying between the west coasts of Europe and Africa and the east coasts of North and South America, and extending from the Arctic to the Antarctic Ocean; greatest breadth, between the west coast of Northern Africa and the east coast of Florida, 4,150 mi.; least breadth, between Norway and Greenland, 930 mi.; superficial extent, 25,000,000 sq. mi. The principal inlets and bays are Baffin's and Hudson's Bays, the Gulf of Mexico, the Caribbean Sea, the North Sea (or German Ocean), the Bay of Biscay, and the Gulf of Guinea. The principal islands north of the equator are Iceland, the Faroe and British Islands, the Azores, Canaries, and Cape Verd Islands, Newfoundland, Cape Breton, and the West India Islands; and south of the equator. Ascension, St. Helena, and Tristan da Cunha.

The great currents of the Atlantic are the Equatorial Current (divisible into the Main, Northern, and Southern Equatorial Currents), the Gulf-stream, the North African and Guinea Current, the Southern Connecting Current, the Southern Atlantic Current, the Cape Horn Current, Reunel's Current, and the Arctic Current. The current system is primarily set in motion by the trade-winds which drive the water of the intertropical region from Africa toward the American coasts. The Main Equatorial Current, passing across the Atlantic, is turned by the S. American coast, along which it runs at a rate of 30 to 50 miles a day, till, having received part of the North Equatorial Current, it enters the Gulf of Mexico. Issuing thence between Florida and Cuba under the name of the Gulf-stream, it flows with a gradually expanding channel nearly parallel to the coast of the U.S. It then turns northeastward into the mid-Atlantic, the larger proportion of it passing southward to the east of the Azores to swell the North African and Guinea Current created by the northerly winds off the Portuguese coast. The Guinea Current, which takes a southerly course, is divided into two on arriving at the region of the northeast trades, part of it flowing east to the Bight of Biafra and joining the South African feeder of the Main Equatorial, but the larger portion being carried westward into the North Equatorial drift. Rennel's Current, which is possibly a continuation of the Gulf-stream, enters the Bay of Biscay from the west, curves round its coast, and then turns northwest toward Cape Clear. The Arctic Current runs along the east coast of Greenland (being here called the Greenland Current), doubles Cape Farewell, and flows up toward Davis's Strait; it then turns to the south along the coasts of Labrador and the U.S., from which it separates the Gulf-stream by a cold band of water. Immense masses of ice are borne south by this current from the Polar seas. In the interior of the North Atlantic there is a large area comparatively free

from currents, called the Sargasso Sea, from the large quantity of sea-weed (of the genus Sargassum) which drifts into it. A similar area exists in the South Atlantic. In the South Atlantic, the portion of the Equatorial Current which strikes the American coast below Cape St. Roque flows southward at the rate of from 12 to 20 miles a day along the Brazil coast under the name of the Brazil Current. It then turns eastward and forms the South Connecting Current, which, on reaching the South African coast, turns northward into the Main and Southern Equatorial Currents. Besides the surface currents, an under current of cold water flows from the poles to the equator, and an upper current of warm water from the equator toward the poles.

The greatest depth yet discovered is north of Porto Rico, in the West Indies, namely 27.-360 feet. Cross-sections of the North Atlantic between Europe and America show that its bed consists of two great valleys lying in a north and south direction, and separated by a ridge, on which there is an average depth of 1,600 or 1,700 fathoms, while the valleys on either side sink to the depth of 3,000 or 4,000 fathoms. A ridge, called the Wyville-Thomson Ridge, with a depth of little more than 200 fathoms above it, runs from near the Butt of Lewis to Iceland, cutting off the colder water of the Arctic Ocean from the warmer water of the Atlantic. The South Atlantic, of which the greatest depth yet found is over 3,000 fathoms, resembles the North Atlantic in having an elevated plateau or ridge in the centre with a deep trough on either side. The saltness and specific gravity of the Atlantic gradually diminish from the tropics to the poles, and also from within a short distance of the tropics to the equator. In the neighborhood of the British Isles the salt has been stated at one thirty-eighth of the weight of the water. The North Atlantic is the greatest highway of ocean traffic in the world. It is also a great area of submarine communication, by means of the telegraphic cables that are laid across its bed.

Atiantic Telegraph.-J. J. Craven's experiment in 1847 led to the laying of a gutta-percha cable between New York and Jersey City, 1848. In 1850 an experimental line was laid across the English Channel, followed (1851) by a permanent cable. The plan to connect a line of fast steamers with a cable carried across the Island of St. Johns was next at-tempted. The New York, Newfoundland, & London Telegraph Co. began operations to connect St. Johns, Newfoundland, with telegraphic lines in the U. S. and British America. The first attempt to lay a cable (1855) across the Gulf of St. Lawrence failed. Another at-tempt (1856) succeeded. The idea of carrying the cable across the ocean originated with Mr. Cyrus W. Field of New York (1854). Mr. Field went to London (1856) and in face of many difficulties, organized the first Atlantic Telegraph Co., himself subscribing more than one fourth the capital, \$1,750,000. To this company were given all the privileges con-

ferred on the old company. The govern-ments of Great Britain and the U.S. gave substantial aid, and furnished ships for laying the cable. The Niagara and Agamemnon sailed west from Valentia, Ireland, Aug. 7, 1857, each bearing 1,250 mi. of the cable. The Niagara paid her portion out as she went. On August 11, 280 mi. out, the cable snapped, the end sinking in 2,000 fathoms of water, and the ships returned to Portsmouth. The same ships left Valentia again, June 10, 1858, for a second trial, submersion to begin in mid-ocean, one ship going east, the other west. On the 29th a double break occurred, 144 mi. of cable being lost. Even directors now lost faith. Still they prosecuted the work. July 29 the cable was again lowered in mid-ocean, this time with success. The Agamemnon ar-rived at Valentia, Ireland, August 6, and the Niagara at Trinity Bay, N. F. about the same time, both having successfully lowered their portion of the cable. August 17 the following message was flashed through the ocean: "Europe and America are united by telegraph. Glory be to God in the highest; on earth peace and good-will toward men." The Newfoundland station was connected with the general telegraph system of America, and the station at Valentia with the general system of Europe. This cable continued in good working order until Sept. 1, 1858.

From 1858-1864 Mr. Field was busy raising new capital. The Telegraph Construction and Maintenance Co. was formed. This company constructed cable much thicker and more costly than the other. The Great Eastern was enlisted in the laying, and steamed away from Valentia, July 23, 1865. The cable snapped, August 2, and the end sunk in 2,000 fathoms of water 1,064 mi. from land. Dredging to bring up the end proved unavailing and the Great Eastern returned. A new capital was raised and a new cable weighing 500 pounds per mi. less was made. July 13, 1866, the *Great Eastern* again left Valentia accompanied by the steamers Terrible, Midway, and Albany. The route chosen was midway be-tween the cables of 1858 and 1865. Success attended this attempt and the Great Eastern reached Heart's Content, N. F., July 27. The end of the 1865 cable was raised September 1, spliced with additional lengths, and laid to Heart's Content. Thus a second line of communication was established between America and Ireland. These two cables have been kept in good working order, and the heavy expenditures have yielded good dividends.

Atlan tis, an island which, according to Plato, existed in the Atlantic over against the Pillars of Hercules (Straits of Gibraltar), was the home of a great nation, and was finally swallowed up by the sea. The legend has been accepted by some as fundamentally true; but others have regarded it as the outgrowth of some early discovery of the New World.

At'las, an extensive mountain system in North Africa, starting near Cape Nun on the Atlantic Ocean, traversing Morocco, Algiers, and Tunis, and terminating on the coast of the Mediterranean; divided generally into two parallel ranges, running w. to e., the Greater Atlas lying toward the Sahara and the Lesser Atlas toward the Mediterranean. The principal chain is about 1,500 mi. long, and the principal peaks rise above or approach the line of perpetual congelation; Miltsin in Morocco being 11,500 feet high, and another peak in Morocco 11,500 feet high. The highest elevations are perhaps over 13,000 feet. Silver, antimony, lead, copper, iron, etc., are among the minerals. The vegetation is.chiefly European in character, except on the low grounds and next the desert.

Atlas, in Greek mythology, the name of a Titan whom Zeus condemned to bear the vault of heaven. The same name is given to a collection of maps and charts, and was first used by Gerard Mercator in the sixteenth century, the figure of Atlas bearing the globe being given on the title-pages of such works.

At'mosphere, primarily the gaseous envelope which surrounds the earth; but the term is applied to that of any orb. The atmosphere of the earth consists of a mass of gas extending to a height variously estimated at from 45 to 212 mi., and pressing on every part of the earth's surface with a pressure of about 15 (14.73) lbs. per sq. in. The existence of this atmospheric pressure was first proved by Torricelli, who thus accounted for the rush of a liquid to fill a vacuum, and who, working out the idea, produced the first barometer. The the idea, produced the first barometer. average height of the mercurial column, counterbalancing the atmospheric weight at the sea-level, is a little less than 30 in.; but the pressure varies from hour to hour, and roughly speaking, diminishes geometrically with the arithmetical increase in altitude. Of periodic variations there are two maxima of daily pressure occurring, when the temperature is about the mean of the day, and two minima, when it is at its highest and lowest respectively; but the problems of diurnal and seasonal oscillations have yet to be fully solved. The pressure upon the human body of average size is no less than 14 tons, but as it is ex-erted equally in all directions no inconvenience is caused by it. It is customary to take the atmospheric pressure as the standard for measuring other fluid pressures; thus the steam pressure of 30 lbs. per sq. in. on a boiler is spoken of as a pressure of two atmospheres.

The atmosphere, first subjected to analysis by Priestley and Scheele in the latter part of the eighteenth century, consists of a mixture of oxygen and nitrogen in the almost constant proportion of 20.81 volumes of oxygen to 79.10 volumes of nitrogen, or, by weight, 23.01 parts of oxygen to 76.99 of nitrogen. The gases are associated together, not as a chemical compound, but as a mechanical mixture. Upon the oxygen present depends the power of the atmosphere to support combustion and respiration, the nitrogen acting as a diluent to prevent its too energetic action. Besides these gases, the air contains aqueous vapor in variable quantity, ozone, carbonic acid gas, traces of ammonia, and, in towns, sulphuretted hydrogen and sulphurous acid gas. After thunderstorms, nitric acid is also observable. In addition to its gaseous constituents the atmosphere is charged with minute particles of organic and inorganic matter.

Atmospheric Electricity, the electricity manifested by the atmosphere, and made sensibly observable in the lightning flash.

Atmospheric Railway. See Pneumatic Dispatch.

Atomic Theory, a theory as to the existence and properties of atoms; especially, in chemistry, the theory accounting for the fact that in compound bodies the elements combine in certain constant proportions, by assuming that all bodies are composed of ultimate atoms, the weight of which is different in different kinds of matter. It is associated with the name of Dalton, who systematized and extended the imperfect results of his predecessors. On its practical side the atomic theory asserts three Laws of Combining Proportions: 1, the Law of Constant or Definite Proportions, teaching that in every chemical compound the nature and proportion of the constituent elements are definite and invariable; thus, water invariably consists of 8 parts by weight of oxygen to 1 part by weight of hydrogen; 2, the Law of Combination in Multiple Proportions, according to which the several proportions in which one element unites with another invariably bear toward each other a simple relation; thus, 1 part by weight of hydrogen unites with 8 parts by weight of oxygen to form water, and with 16 parts (i. e.,  $8 \times 2$ ) of oxygen to form peroxide of hydrogen; 3, the Law of Combination in Reciprocal Proportions, that the proportions in which two elements combine with a third also represent the proportions in which, or in some simple multiple of which, they will themselves combine; thus, in olefant gas, hydrogen is present with carbon in the proportion of 1 to 6; and in carbonic oxide, oxygen is present with carbon in the proportion of 8 to  $\hat{0}$ , 1 to 8 being also the proportions in which hydrogen and oxygen combine with each other. The theory that these proportional numbers are, in fact, nothing else but the relative weights of atoms so far accounts for the phenomena that the existence of these laws might have been predicted by the aid of the atomic hypothesis long before they were actually dis-covered by analysis. In themselves, however, the laws do not prove the theory of the existence of ultimate particles of matter of a certain relative weight; and although many chemists, even without expressly adopting the atomic theory itself, have followed Dalton in the use of the terms atom and atomic weight, in preference to proportion, combining proportion, equivalent, and the like, yet in using the word atom it should be held in mind that it merely denotes the proportions in which elements unite. These will remain the same whether the atomic hypothesis which suggested the employment of the term be true or false. Dal-ton supposed that the atoms of bodies are spherical, and invented certain symbols to represent the mode in which he conceived they might combine.

**Atoms**, according to the hypothesis of some philosophers, the primary parts of elementary matter not further divisible. The principal theorists of antiquity upon the nature of atoms were Moschus of Sidon, Leucippus (510 B. C.), Democritus, Epicurus, and Lucretius. These philosophers explained all phenomena on the theory of the existence of atoms possessing various properties and motions, and are hence sometimes called Atomists. Among the moderns, Gassendi illustrated the doctrine of Epicurus. Descartes formed from this his system of the vortices. Newton and Boerhaave supposed that the original matter consists of hard, ponderable, impenetrable, inactive, and immutable particles, from the variety in the composition of which the variety of bodies originates. According to Boscovich every atom is an indivisible point possessing position, mass, and potential force or capacity for attraction and repulsion. Upon the discovery of Helmholtz that a vortex in a perfect liquid possesses certain permanent characteristics, Sir W. Thomson has based a theory that atoms are vortices in a homogeneous, incompressible, and frictionless fluid. As to chemical atoms. see Atomic Theory.

Atreus (at'rūs), in Greek mythology, a son of Pelops and HippodamIa, grandson of Tantälus and progenitor of Agamemnon. He succeeded Eurystheus, his father-in-law, as king of Mycēnæ, and in revenge for the seduction of his wife by his brother Thyestes gave a banquet at which the latter partook of the flesh of his own sons. Atreus was killed by Ægisthus, a son of Thyestes. The tragic events connected with this family furnished materials to some of the great Greek dramatists.

At'rophy, a wasting of the flesh due to some interference with the nutritive processes. It may arise from a variety of causes, such as permanent, oppressive, and exhausting passions, organic disease, a want of proper food or of pure air, suppurations in important organs, copious evacuations of blood, saliva, semen, etc., and it is also sometimes produced by poisons; for example, arsenic, mercury, lead, in miners, painters, gilders, etc. In old age the whole frame except the heart undergoes atrophic change, and it is of frequent occurrence in infancy as a consequence of improper, unwholesome food, exposure to cold, damp, or impure air, etc. Single organs or parts of the body may be affected irrespective of the general state of nutrition; thus local atrophy may be superinduced by palsies, the pressure of tumors upon the nerves of the limbs, or by artificial pressure, as in the feet of Chinese ladies.

At'ropos, the eldest of the Fates, who cuts the thread of life with her shears.

Att'aius, the names of three kings of ancient Pergamus, 241–133 B. c., the last of whom bequeathed his kingdom to the Romans. They were all patrons of art and literature.

At'tar, in the East Indies, a general term for a perfume from flowers; in Europe, gener-

# Attenuation

ally used only of the attar or otto of roses, an essential oil made from the hundred-leaved or cabbage rose, damask rose, or musk rose, etc., 100,000 roses yielding only 180 grains of attar. Cashmere, Shiraz, and Damascus are celebrated for its manufacture, and there are extensive rose farms in the valley of Kezanlik in Roumelia and at Ghazipur in Benares. The oil is at first greenish, but afterward it presents various tints of green, yellow, and red. It is concrete at all ordinary temperatures, but becomes liquid about  $84^{\circ}$  F. It is frequently adulterated with the oils of rhodium, sandalwood, and geranium, with the addition of camphor or spermaceti.

Atten 'uation, in brewing, the change which takes place in the saccharine wort during fermentation by the conversion of sugar into alcohol and carbonic acid, with diminution of specific gravity.

Attic, an architectural term variously used. An *Attic base* is a peculiar kind of base, used by the ancient architects in the Ionic order, and by Palladio and some others in the Doric. An *Attic story* is a low story in the upper part of a house rising above the main portion of the building. In ordinary language an attic is an apartment lighted by a window in the roof.

At'tica, a state of ancient Greece, the capital of which, Athens, was once the first city in the world. Now a province of Greece. Pop. 185,364.

At 'ticus, TrTUS POMPONIUS (109-32 B. C.), a Roman of great wealth and culture. He so identified himself with Greek life and literature as to receive the surname Atticus. Sulla and the Marian party, Cæsar and Pompey, Brutus and Antony, were alike friendly to him, and he was in favor with Augustus. Of his close friendship with Cicero proof is given in the series of letters addressed to him by Cicero.

At' tila, the famous leader of the Huns, was the son of Mundzuk, and the successor, in conjunction with his brother Bleda, of his uncle Rhuas. The rule of the two leaders extended over a great part of Northern Asia and Europe, and they threatened the Eastern Empire, and twice compelled the weak Theodosius II to purchase an inglorious peace. Attila caused his brother Bleda to be murdered, 444, and in a short time extended his dominion over all the peoples of Germany. Attila died on the night of his marriage with Hilda (or Ildico), 453, either from the bursting of a blood-vessel or by her hand. The description that Jornandes has left us of him is in keeping with his Kalmuck-Tartar origin. He had a large head, a flat nose, broad shoulders, and a short and ill-formed body; but his eyes were brilliant, his walk stately, and his voice strong and well-toned

Attieborough, Bristol co., Mass. Pop. 15,-260.

Attrac'tion, the tendency of all material bodies, whether masses or particles, to approach each other, to unite, and to remain united. It was Newton that first adopted the theory of a universal attractive force, and determined its laws. When bodies tend to come together from sensible distances the tendency is termed either the attraction of gravitation, magnetism, or electricity, according to circumstances; when the attraction operates at insensible distances it is known as adhesion with respect to surfaces; as cohesion with respect to the particles of a body; and as affinity when the particles of different bodies tend together. It is by the attraction of gravitation that all bodies fall to the earth when unsupported.

At'tribute in philosophy, a quality or property of a substance, as whiteness or hardness. A substance is known to us only as a congeries of attributes. In the fine arts an attribute is a symbol regularly accompanying and marking out some personage. Thus the caduceus, purse, winged hat, and sandals are attributes of Mercury, the trampled dragon of St. George.

Attwood, GEORGE (1745-1807), an English mathematician, best known by his invention, called after him Attwood's Machine, for verifying the laws of falling bodies. It consists essentially of a freely moving pulley over which runs a fine cord with two equal weights suspended from the ends. A small, additional weight is laid upon one of them, causing it to descend with uniform acceleration. Means are provided by which the added weight can be removed at any point of the descent, thus allowing the motion to continue from this point onward with uniform velocity.

Aube (5b), a northeastern French department. Area 2,351 sq. mi.; pop. 257,374. The surface is undulating and watered by the Aube, etc. The n. and n.w. districts are bleak and infertile, the southern districts remarkably fertile. A large extent of ground is under forests and vineyards, and the soil is admirable for grain, pulse, and hemp. The chief manufactures are worsted and hosiery. Troyes is the capital. The river Aube, which gives name to the department, rises in Haute-Marne, flows n.w., and after a course of 113 mi. joins the Seine.

Auber (ö-bär), Daniel François Esprit (1782-1871), a French operatic composer. He was originally intended for a mercantile career, but devoted himself to music, studying under Cherubini. His first great success was his opera La Bergére Châtclaine, produced in 1820. In 1822 he had associated himself with Scribe as librettist, and other operas now followed in quick succes-Chief among them were Masuniello sion. or La Muette de Portici (1828), Fra Diarolo (1830), Lestocq (1834), L'Ambassadrice (1836), Le Domino Noir (1837), Les Diamants de la Couronne (1841), Marco Spada (1853), La Fiancie du Roi de Garbe (1864). Despite his success in Masaniello, his peculiar field was comic opera, which, bearing strongly the stamp of French national character, won him a high place.

Auburn, Cayuga co., N. Y., on Owasco outlet, 2 mi. n. of Owasco Lake. Railroads: N. Y. C., & H. R. Ry.; Lehigh Valley (Auburn division). Industries: agricultural machinery and implements, three flouring mills,

#### Auburn

two iron foundries, two woolen mills, three shoe factories, carpet and bicycle factories, and a number of others. Located at Auburn is one of the three state prisons, which was built in 1817, and the Auburn Theological Seminary. The town was first settled in 1792 and became a city in 1848. Pop. est. 1897, 30,000

Auburn, Androscoggin co., Me., a commercial center on Androscoggin river. Pop. 12,500.

Aubusson (ô-bü-sôn), a town of the interior of France, dep. Creuse, celebrated for its carpets. Pop. 6,723.

**Auch** ( $(\delta sh)$ , a town of s. w. France, capital of dep. Gers; the seat of an archbishop, with one of the finest Gothic cathedrals in France; manufactures linens, leather, etc. Pop. 9,670.

Auck land, a town of New Zealand, situated on Waitemata Harbor, one of the finest harbors of New Zealand. It has a large trade, there being connection with the chief places on the island by rail, and regular communication with the other ports of the colony, Australia, and Fiji by steam. It was formerly the capital of the colony. Pop., including suburbs, 57,048. The provincial district of Auckland forms the northern part of North Island, with an area of 36,000 sq. mi; pop. 112,000. The surface is very diversified; volcanic phenomena are common, including geysers, hot lakes, etc.; rivers are numerous; wool, timber, kauri-gum, etc., are exported. Much gold has been obtained in the Thames Valley and elsewhere.

Auction is a public sale to the party offering the highest price where the buyers bid upon each other, or to the bidder who first accepts the terms offered by the vendor where he sells by reducing his terms until some one accepts them. The latter form is known as a *Dutch Auction*. A sale by auction must be conducted in the most open and public manner possible; and there must be no collusion on the part of the buyers. Puffing or mock bidding to raise the value by apparent competition is illegal.

Aude (od), a maritime department in the s. of France. Area 2,437 sq. mi. The wines, especially white, bear a good name; olives and other fruits are also cultivated. The manufactures are varied; the trade is facilitated by the Canal du Midi. Carcassonne is the capital; other towns are Narbonne and Castelnaudary. Pop. 332,080. The river Aude rises in the eastern Pyrenees, and flowing nearly parallel to the Canal du Midi falls into the Mediterranean, after a course of 130 mi.

Au'diphone, an acoustic instrument by means of which deaf persons are enabled to hear. It consists essentially of a fan-shaped plate of hardened caoutchouc, which is bent to a greater or less degree by strings, and is very sensitive to sound-waves. When used the up edge is pressed against the upper front teeth, with the convexity outward, and the sounds being collected are conveyed from the teeth to the auditory nerve without passing through the external ear.

Auditorium Building, Chicago. This building includes the Auditorium which has a permanent seating capacity of over 4,000, which can be increased for conventions, etc., to about 8,000. It has the most costly stage and organ in the world, recital hall with a seating capacity of over 500; the business portion with stores and 136 offices; tower observatory to which the public are admitted; the U.S. signal service occupies the 17th, 18th, and 19th floors of the tower; the hotel has 400 guest rooms and a dining room 175 ft. long, a banquet hall, on which \$30,000 was expended for decorating, built of steel trusses, spanning 120 ft. over the Auditorium. This building was started in January, 1887, and finished in October, 1889. It covers It covers about one and a half acres, and has a street frontage of 710 ft. The height of the main building is 145 ft., total height of tower 270 ft. The entire weight of the building is 110,000 tons. There are 25 mi. of gas and water pipe, 230 mi. of electric wire and cable, 11 mi. of steel cable for moving scenes on the stage. electric dynamos and hydraulic motors, and

26 hydraulic lifts for moving stage platforms. Audran (ö-drän), a family of celebrated French engravers. The most noted were Gerard (1640-1703); Benoît (1661-1721); Claude pere (1592-1677); Claude fils (1640-84); Germain (1631-1710): Jean (1667-1756).

Au'dubon, JOHN JAMES (1780-1851), an American naturalist of French extraction. He was educated in France, and studied painting under David. In 1798 he settled in Pennsylvania, but having a great love for ornithology, he set out, in 1810, with his wife and child, descended the Ohio, and for many years roamed the forests in every direction drawing the birds which he shot. In 1826 he went to England, exhibited his drawings in Liverpool, Manchester, and Edinburgh, and finally published them in an unrivaled work of doublefolio size, with 435 colored plates of birds the size of life (The Birds of America, 4 vols., 1827-39), with an accompanying text (Ornithological Biography, 5 vols., 8 vo., partly written by Prof. Macgillivray). On his final return to America he labored with Dr. Bachman on a finely illustrated work entitled The Quadrupeds of America (1843-50, 3 vols.). He d. at New York.

Auerbach (ou'ér-bäk), BERTHOLD (1812-1882), a distinguished German author of Jewish extraction. He abandoned the study of Jewish theology in favor of philosophy, publishing in 1836 his Judaism and Modern Literature and a translation of the works of Spinoza with critical biography. His later works were tales or novels and his Village Tales of the Black Forest, as well as others of his writings, have been translated into several languages. Other works: Barfüssell; Joseph im Scance; Edelweiss; Auf der Höhe; Das Landhaus am Rhein; Waldfried; Brinitta.

Augeas (a-je'as), a fabulous king of Elis, in Greece, whose stable contained 3,000 oxen, and had not been cleaned for thirty years. Hercules undertook to clear away the filth in one day in return for a tenth part of the cattle, and executed the task by turning the river Alphõus through it. Augeas, having broken the bargain, was deposed and slain by Hercules.

Augite (a'jit) (or Pyroxene), a mineral of the hornblende family, an essential component of many igneous rocks, such as basalt, greenstone, and porphyry, A transparent green variety found at Zillerthal, in the Tyrol, is used in jewelry.

Augsburg (ougz'burh), a city of Bavaria, renowned commercial center in the Middle Ages, and is still an important emporium of south German and Italian trade. Industries: cotton spinning and weaving, dyeing, woolen manufacture, machinery and metal goods, books and printing, chemicals, etc. The Emperor Augustus established a colony here about 12 B. c. In 1276 it became a free city, and besides being a great mart for the commerce between the north and south of Europe it was a great center of German art in the Middle Agres. It early took a conspicuous part in the Reformation. In 1806 it was incorporated in Bavaria. Pop. 65,476.

Augur, Christopher Colon, b. 1821, in New York, graduated at West Point in 1843, served in the Mexican War and on the frontier, and was made a brigadier-general of volunteers in November, 1861. He fought at Cedar Mountain and at the siege of Port Hudson, and received the brevet of major-general for dis-tinguished services in the field in 1865. In 1885 he was retired under the rule.

Au'gurs, a board or college of diviners who, among the Romans, predicted future events and announced the will of the gods from the occurrence of certain signs. These consisted of signs in the sky, especially thunder and lightning; signs from the flight and cries of birds; from the feeding of the sacred chickens; from the course taken or sounds uttered by various quadrupeds or by serpents; from accidents or occurrences, such as spilling the salt, sneezing, etc. The answers of the augurs, as well as the signs by which they were governed, were called auguries, but bird-predictions were properly termed auspices. Nothing of consequence could be undertaken without consulting the augurs, and by the mere utterance of the words alio die ("meet on another day") they could dissolve the assembly of the people and annul all decrees passed at the meeting.

Au'gust, the eighth month from January. It was the sixth of the Roman year, and hence was called Sextilis till the Emperor Augustus affixed to it his own name.

Augusta (ou-gus'tà) (or Agos'ta), a seaport

in the s.e. of Sicily, 12 mi. n. of Syracuse. It exports salt, oil, honey, etc. Pop. 13.286. Augusta, Kennebec co., Me., on Kennebec river, 6 mi. n. of Gardiner. Railroads: Maine Central & Augusta, Hallowell & Gardiner Electric road. Industries: large cotton mills, sash and door factories, lumber, and fiber. Surrounding country agricultural. The town was first settled in 1754. It was an Indian trading post in 1628, known as Cushnoe, and in 1754 it became an outport of the Plymouth Company, known as Fort Western. The town

was incorporated as Hallowell in 1771, and the name changed to Harrington in 1797, and the same year the name was changed to Augusta. Augusta was made the capital of Maine in 1827 and became a city in 1849. Pop. est. 1897, 13,000.

Augusta, Richmond co., Ga., on the left bank of the Savannah River, 231 mi. from its mouth; well built, and connected with the river by high-level canals; an important manufacturing center, having cotton mills, machine shops, and railroad works. etc. Pop, 33,300.

Au'gustine, AURELIUS AUGUSTINUS, ST. (354-430), a renowned father of the Christian Church. He was a man of great enthusiasm, powerful intellect, and wielded a powerful influence. His writings are partly autobiographical, partly polemical, homiletic, or exegetical.

Au'gustine (or Austin, St.), the Apostle of the English, flourished at the close of the sixth century, was sent with forty monks by Pope Gregory I to introduce Christianity into Saxon England, and was kindly received by Ethelbert, king of Kent, whom he converted, baptizing 10,000 of his subjects in one day. In acknowledgment of his tact and success Augustine received the archiepiscopal pall from the pope. with instructions to establish twelve sees in his province, but he could not persuade the British bishops in Wales to unite with the new

English Church. He d. in 604 or 605. Augus'tulus, ROMULUS, the last of the Western Roman emperors; reigned for one year (475-76), when he was overthrown by Odoacer and banished.

Augus'tus, CAIUS JULIUS CÆSAR OCTAVI-ANUS, originally called Caius Octavius, Roman emperor, was the son of Caius Octavius and Atia, a daughter of Julia, the sister of Julius Cæsar. He was b. 63 B. c., and d. A. D. 14. He returned to Rome to claim Cæsar's property and avenge his death, and now took, according to usage, his uncle's name with the surname Octavianus. He got himself chosen consul in 43. Soon after the first triumvirate was formed between him and Antony and Lepidus, and this was followed by the conscription and assassination of 300 senators and 2,000 knights of the party opposed to the triumvirate. Next year Octavianus and Antony defeated the republican army under Brutus and Cassius at Philippi. The victors now divided the Roman world between them. Octavianus getting the West, Antony the East, and Lepidus Africa. Sextus Pompeius, who had made himself formidable at sea, had now to be put down; and Lepidus, who had hitherto retained an appearance of power, was deprived of all authority (B. c. 36) and retired into private life. Antony and Octavianus now shared the empire between them; but while the former, in the East, gave himself up to a life of luxury, and alienated the Romans by his alliance with Cleopatra and his adoption of Oriental manners, Octavianus skillfully cultivated popularity, and soon declared war ostensibly against the queen of Egypt. The naval victory of Actium, in which the fleet of Antony and Cleopatra was defeated,

made Octavianus master of the world, B. c. 31. He returned to Rome B. c. 29, celebrated a splendid triumph, and caused the Temple of Janus to be closed in token of peace being restored. Gradually all the highest offices of state, civil and religious, were united in his hands, and the new title of Augustus was also assumed by him, being formally conferred by the senate in B. c. 27. Under him successful wars were carried on in Africa and Asia (against the Parthians), in Gaul and Spain, in Pannonia, Dalmatia, etc.; but the defeat of Varus by the Germans under Arminius with the loss of 3 legions, A. D. 9, was a great blow to him in his old age. He adorned Rome in such a manner that it was said, "He found it of brick, and left it of marble." The people erected altars to him, and, by a decree of the senate, the month Sextilis was called Augustus (our August). Vergil and Horace were befriended by him, and their works and those of their contemporaries are the glory of the Augustan Age. His death, which took place at Nola, plunged the empire into the greatest grief. He was thrice married, but had no son, and was succeeded by his stepson Tiberius, whose mother, Livia, he had married after prevailing on her husband to divorce her.

Augustus II (1670-1733) (or FREDERICK-AUGUSTUS I), elector of Saxony and king of Poland, second son of John George III, elector of Saxony, b. at Dresden, d. at Warsaw, Poland. He succeeded his brother in the electorate in 1694, and the Polish throne having become vacant, in 1696, by the death of John Sobleski, Augustus presented himself as a candidate for it and was successful. He joined with Peter the Great in the war against Charles XII of Sweden. In 1704 he was deposed, and two years later formally resigned the crown to Stanislaus I. In 1709, after the defeat of Charles at Pultowa, the Poles recalled Augustus, who united himself anew with Peter. The death of Charles XII put an end to the war, and Augustus concluded a peace with Sweden. Augustus now gave himself wholly up to voluptuousness and a life of pleasure. The Poles yielded but too readily to the example of their king, and the last years of his reign were characterized by boundless luxury and corruption of manners. The Countess of Königsmark bore him the celebrated commander Marshal Saxe (Maurice of Saxony).

Augustus III (1606–1763) (or FREDERICK-AUGUSTUS II), elector of Saxony and king of Poland, son of Augustus II, b. at Dresden, succeeded his father as elector in 1733, and was chosen king of Poland through the influence of Austria and Russia. He distinguished himself by the splendor of his feasts and the extravagance of his court. During the first Silesian war he formed a secret alliance with Austria. The consequence was that during the second Silesian war Frederick the Great of Prussia pushed on into Saxony, and occupied the capital, from which Augustus fied. By the peace of Dresden, 1745, he was reinstated in the possession of Saxony. In 1756 he was involved anew in a war against Prussia. When Frederick declined his proposal of neutrality he left Dresden, and entered the camp at Pirna, where 17,000 Saxon troops were assembled. Frederick surrounded the Saxons, who were obliged to surrender, and Augustus fied to Poland. On the threat of invasion by Russia he returned to Dresden, where he died. His son, Frederick Christian, succeeded him as elector of Saxony, and Stanislaus Poniatowski as king of Poland.

Auk, a name of certain swimming birds, . including the great auk, the little auk, the puffin, etc. The genus auks proper, contains only two species, the great auk and the razor-bill. The great auk or gair-fowl, a bird about 3 feet in length, used to be plentiful in northerly regions, and also visited the British shores, but has become extinct. Some seventy skins, about as many eggs, with bones representing perhaps a hundred individuals, are preserved in various museums. Though the largest species of the family, the wings were only  $\theta$  inches from the carpal joint to the tip, totally useless for flight, but employed as fins in swimming, especially under water. The tail was about 3 inches long; the beak was high, short, and compressed; the head, neck under each eye, and most of the under parts white. Its legs were placed so far back as to cause it to sit nearly upright. The razor-bill is about 15 inches in length, and its wings are sufficiently developed to be used for flight. Thousands of these birds are killed on the coast of Labrador for their breast feathers which are warm and elastic.

Aulic, in the old German Empire, one of the two supreme courts of the German Empire, the other being the court of the imperial chamber. It had not only concurrent jurisdiction with the latter court, but in many cases exclusive jurisdiction, in all feudal processes and in criminal affairs, over the immediate feudatories of the emperor and in affairs which concerned the imperial government. The title is now applied in Germany in a general sense to the chief council of any department,—political, administrative, judicial, or military.

Au'lis, in ancient Greece, a seaport in Bœotia, on the strait called Euripus, between Bœotia and Eubœa. See *Iphigenia*.

Bectia and Eubeea. See Iphigenia. Aumale (ô-mäl), a small French town, department of Seine Inférieure, 35 mi. n.e. of Rouen, which has given titles to several notables in French history. JEAN D'ARCOURT, eighth COUNT D'AUMALE, fought at Agincourt, and defeated the English at Gravelle (1423). CLAUDE II, DUC D'AUMALE, one of the chief instigators of the Massacre of St. Bartholomew, was killed 1573. CHARLES DE LORRAINE, DUC D'AUMALE, was an ardent partizan of the League in the politico-religious French wars of the sixteenth century. HENRI-EUGENE-PHILIPPE LOUIS D'ORLEANS, DUC D'AUMALE, son of Louis Philippe, king of the French, b. in 1822. In 1847 he succeeded Marshal Bugeaud as governor general of Algeria, where he had distinguished himself in the war against Abd-el-Kader. After the revolution of 1848 he retired to England; but he returned to France in 1871, and was elected a member of the assembly; became inspector-general of the army in 1879, and was expelled along with the other royal princes in 1886. He is author of a *History of the House of Condé*, several pamphlets, etc.

Aurangabad', a town of India, in the territory of the Nizam of Haidarabad, 175 mi. from Bombay. It contains a ruined palace of Aurengzebe and a mausoleum erected to the memory of his favorite wife. It was formerly a considerable trading center, but its commercial importance decreased when Haidarabad became the capital of the Nizam. Pop. 20,-500.

Aure'lian, LUCIUS DOMITIUS AURELIANUS (212-275), emperor of Rome, of humble origin, rose to the highest rank in the army, and on the death of Claudius II (270) was chosen emperor. He delivered Italy from the barbarians, and conquered the famous Zenobia, queen of Palmyra. He followed up his victories by the reformation of abuses, and the restoration throughout the empire of order and regularity. He lost his life by assassination, when heading an expedition against the Persians.

Aure' ilus Antoni' nus, MARCUS(121-180 A.D.), often called simply Marcus Aurelius, Roman emperor and philosopher, son-in-law, adopted son, and successor of Antoninus Pius, succeeded to the throne 161. Brought up and instructed by Plutarch's nephew, Sextus, the orator Herodes Atticus, and L. Volusius Mecianus, the jurist, he had become acquainted with learned men, and formed a particular love for the Stoic philosophy. A war with Parthia broke out in the year of his accession, and did not terminate till 166. In 169 Verus died, and the sole command of the war devolved on Marcus Aurelius, who prosecuted it with the utmost rigor, and nearly exterminated the Marcomanni. After this victory the Marcomanni, the Quadi, as well as the rest of the barbarians, sued for peace. The sedition of the Syrian governor Avidius Cassius, with whom Faustina, the empress, was in treasonable communication, called off the emperor from his conquests, but before he reached Asia the rebel was assassinated. Aurelius returned to Rome, after visiting Egypt and Greece, but soon new incursions of the Marcomanni compelled him once more to take the field. He defeated the enemy several times, but was taken sick at Sirmium, and d. at Vindobona (Vienna). His only extant work is the Meditations, written in Greek, and which has been translated into most modern lan-Aurelius was one of the best emguages. perors ever Rome saw, although his philosophy and the magnanimity of his character did not restrain him from the persecution of the Christians, whose religious doctrines he was led to believe were subversive of good government.

Au'rengzebe (-zeb) ("ornament of the

throne"), one of the greatest of the Mogul emperors of Hindustan, b. in October, 1618 or 1619. In his twentieth year he raised a body of troops by his address and good fortune, and obtained the government of the Deccan. He murdered his relatives one after the other, and in 1659 ascended the throne. Two of his sons, who endeavored to form a party in their own favor, he caused to be arrested and put to death by slow poison. He conquered Golconda and Bijapur, and drove out, by degrees, the Mahrattas from their country. After his death the Mogul Empire declined.

Auriliac ( $\bar{v}$ -rē-yāk), a town of France, capital of the dep. Cantal, in a valley watered by the Jordanne, about 270 mi. s. of Paris, well built, with wide streets; copper works, paper works, manufactures of lace, tapestry, leather, etc. Pop. 13,727.

**Aurochs** (g'roks), a species of wild bull or buffalo, the *urus* of Cæsar, *bison* of Pliny, the European bison, *Bos* or *Bonassus Bison* of modern naturalists. This animal was once abundant in Europe, but were it not for the protection afforded by the emperor of Russia to a few herds which inhabit the forests of Lithuania it would soon be extinct.

Auro'ra, in classical mythology, the goddess of the dawn, daughter of Hyperion and Theia, and sister of Helios and Selēnē(Sun and Moon). She was represented as a charming figure, "rosy-fingered," clad in a yellow robe, rising at dawn from the ocean and driving her chariot through the heavens. Among the mortals whose beauty captivated the goddess, poets mention Orion, Tithônus, and Cephălus.

Aurora, Kane co., Ill., on Fox River, 38 mi. w. of Chicago. Railroads: C., B. & Q.; C. & N. W.; and E. J. & E. R. R. Industries: railroad shops, one flouring mill, five iron foundries, one cotton mill, stove works, two corset factories, and one carriage factory. Surrounding country agricultural. The settlement was first known as McCarty's Mills, the name "Aurora" being adopted late in 1837. A post-office was first established in 1837, with Burr Winton as postmaster. The first church organization was the M. E. in 1837. First school taught in spring of 1836, and first bridge built the same year. Aurora Beacon, established in 1846, and still flourishing, oldest paper in this section. The site of Aurora was once included in an Indian reservation. When Joseph McCarty arrived in April, 1834, he found a large Pottawatomie village on the west bank of the river, the head of the tribe being the noted chief Waubonsie. The first physician, Dr. Daniel Eastman, came in 1835. Joseph G. Stolp, still a resident, settled in 1837, and that fall built a wool-carding shop. He became a heavy manufacturer of woolen goods, continuing until 1886. Aurora became a city in 1857. Pop. est. 1897, 25,000.

Auro'ra Borea'ils, a luminous meteoric phenomenon appearing in the north, most frequently in high latitudes, the corresponding phenomenon in the southern hemisphere being called Aurora Australis, and both being also called Polar Light, Streamers, etc. The northern aurora has been far the most observed and studied. It usually manifests itself by streams of light ascending toward the zenith from a dusky line of cloud or haze a few degrees above the horizon, and stretching from the north toward the west and east, so as to form an arc with its ends on the horizon, and its different parts and rays are constantly in motion. Sometimes it appears in detached places; at other times it almost covers the whole sky. It assumes many shapes and a variety of colors, from a pale red or yellow to a deep red or blood color; and in the northern latitudes serves to illuminate the earth and cheer the gloom of the long winter nights. The appearance of the aurora borealis so exactly resembles the effects of artificial electricity that there is every reason to believe that their causes are identical. When electricity passes through rarefied air it exhibits a diffused luminous stream which has all the characteristic appearances of the aurora, and hence it is highly probable that this natural phenomenon is occasioned by the passage of electricity through the upper regions of the atmosphere. The influence of the aurora upon the magnetic needle is now considered as an ascertained fact, and the connection between it and magnetism is further evident from the fact that the beams or coruscations issuing from a point in the horizon west of north are frequently observed to run in the magnetic meridian. What are known as magnetic storms are invariably connected with exhibitions of the aurora, and with spontaneous galvanic currents in the ordinary telegraph wires; and this connection is found to be so certain that, upon remarking the display of one of the three classes of phenomena, we can at once assert that the other two are also observable. The aurora borealis is said to be frequently accompanied by sound, which is variously described as resembling the rustling of pieces of silk against each other, or the sound of wind against the flame of a candle. The aurora of the southern hemisphere is quite a similar phenomenon to that of the north.

Ausculta' tion, a method of distinguishing the state of the internal parts of the body, particularly of the thorax and abdomen, by observing the sounds arising in the part, either through the immediate application of the ear to its surface, or by applying the stethoscope to the part, and listening through it. Auscultation may be used with more or less advantage in all cases where morbid sounds are produced, but its general applications are: the auscultation of respiration; the auscultation of the voice; auscultation of coughs; auscultation of sounds foreign to all these, but sometimes accompanying them; auscultation of the actions of the heart; obstetric auscultation. The parts when struck also give different sounds in health and disease.

Aus' pices, among the ancient Romans were strictly omens or auguries derived from birds, though the term was also used in a wider sense. Nothing of importance was done without taking the auspices, which, however, simply showed whether the enterprise was likely to result successfully or not, without supplying any further information. Magistrates possessed the right of taking the auspices, in which they were usually assisted by an augur. Before a war or campaign a Roman general always took the auspices, and hence the operations were said to be carried out "under his auspices." See Augurs.

Aus'sig, a town in Bohemia, near the junction of the Bila with the Elbe, 42 mi. n.n.w. of Prague; has large manufactures of woolens, chemicals, etc. Pop. 16,524.

Aus'ten, JANE (1775-1817), English novelist. Her principal novels are, Sense and Sensibility; Pride and Prejudice; Mansfield Park; Emma; Northanger Abbey; and Persuasion. Her novels are marked by ease, nature, and a complete knowledge of the domestic life of the English middle classes of her time.

Aus' terlitz, a town with 3,452 inhabitants, in Moravia, 10 mi. e. of Brünn, famous for the battle of Dec. 2, 1805, fought between the French (70,000 in number) and the allied Austrian and Russian armies (95,000). The decisive victory of the French led to the Peace of Pressburg between France and Austria.

Pressburg between France and Austria. Aus'tin, capital of the state of Texas. There is a state university and other institutions, and a splendid capitol built of red granite. Pop. 15,400.

Austin, JOHN (1790-1859), an English writer on jurisprudence. From 1826 to 1835 he filled the chair of jurisprudence at London University. His fame rests solely on his great works: The Province of Jurisprudence Determined (1832), and Lectures on Jurisprudence (1861-63).

Australasia, a division of the globe usually regarded as comprehending the islands of Australia, Tasmania, New Zealand, New Caledonia, the New Hebrides, the Solomon Islands, New Ireland, New Britain, the Admiralty Islands, New Guinea, and the Arru Islands, besides numerous other islands and island groups. Area 3,239,199 sq. mi.; pop. 1891, 4,285,297. It forms one of three portions into which some geographers have divided Oceania, the other two being Malaysia and Polynesia.

Australia (old-name, New Holland), the largest island in the world, a seagirt continent, lying between the Indian and Pacific oceans, s.e. of Asia. It is separated from New Guinea on the north by Torres Strait, from Tasmania on the south by Bass Strait. It is divided into two unequal parts by the

#### Australia

Tropic of Capricorn, and consequently belongs partly to the South Temperate, partly to the Torrid Zone. It is occupied by five British colonies; namely, New South Wales, Victoria, and Queensland in the east; South Australia in the middle, stretching from sea to sea; and Western Australia in the west. Their area and pop. are as follows (but authorities differ as to the areas):---

,	Area in	
	sq. mi.	Pop.
New South Wales	310,700	1,134,207
Queensland	668.497	398,718
Western Australia	1,060,000	49,782
	8,030,771	3,033,166

Sydney, the capital of N. S. Wales; Melbourne, the capital of Victoria; Adelaide, the capital of S. Australia; and Brisbane, the capital of Queensland, are the chief towns.

Although there are numerous spacious harbors on the coasts, there are few remarkable indentations; the principal being the Gulf of Carpentaria on the n., the Great Australian Bight, and Spencer's Gulf, on the s. The chief projections are Cape York Peninsula and Arnhem Land in the n. Parallel to the n.e. coast runs the Great Barrier Reef for 1,000 miles. In great part the e. coast is bold and rocky, and is fringed with many small islands. Part of the s. coast is low and sandy, and part presents cliffs several hundred feet high. The n. and w. coasts are generally low, with some elevations at intervals.

The interior, so far as explored, is largely composed of rocky tracts and barren plains with little or no water. The whole continent forms an immense plateau, highest in the east, low in the center, and with a narrow tract of land usually intervening between the elevated area and the sea. The base of the table-land is granite, which forms the surface-rock in a great part of the southwest, and is common in the higher grounds along the east side. Secondary (cretaceous) and tertiary rocks are largely developed in the interior. Silurian rocks occupy a large area in South Australia, on both sides of Spencer Gulf. The mountainous region in the southeast and east is mainly composed of volcanic, silurian, carbonaceous, and carboniferous rocks yielding good coal. No active volcano is known to exist, but in the southeast there are some craters only recently extinct. The highest and most extensive extinct. mountain system is a belt about 150 mi. wide skirting the whole eastern and southeastern border of the continent, and often called in whole or in part the Great Dividing Range, from forming the great watershed of Australia. A part of it, called the Australian Alps, in the southeast, contains the highest summits in Australia: Mount Kosciusko (7,175 ft.), Mount Clarke (7,256), and Mount Townshend (7,353). West of the Dividing Range are extensive plains or downs admirably adapted for pastoral purposes. The deserts and scrubs, which occupy large areas of the interior, are a characteristic feature of Australia. The former are destitute of vegetation, or are clothed only with a coarse spiny grass that affords no sustenance to cattle or horses; the latter are composed of a dense growth of shrubs and low trees, often impenetrable till the traveler has cleared a track with his ax.

The rivers of Australia are nearly all subject to great irregularities in volume, many of them at one time showing a channel in which there is merely a series of pools, while at another they inundate the whole adjacent country. The chief is the Murray, which, with its affluents, the Murrumbidgee, Lachlan, and Darling, drains a great part of the interior west of the Dividing Range, and falls into the sea on the south coast (after entering Lake Alexandrina). Its greatest tributary is the Darling, which may even be regarded as the main stream. On the east coast are the Hunter, Clarence, Brisbane, Fitzroy, and Burdekin; on the west, the Swan, Murchison, Gascoyne, Ashburton, and De Grey; on the north, the Fitzroy, Victoria, Flinders, and Mitchell. The Australian rivers are of little service in facili-Many of tating internal communication. them lose themselves in swamps or sandy wastes of the interior. A considerable river of the interior is Cooper's Creek, or the Barcoo, which falls into Lake Eyre, one of a group of lakes on the south side of the continent having no outlet, and accordingly salt. The principal of these are Lakes Eyre, Torrens, and Gairdner, all of which vary in size and saltness according to the season. Another large salt lake of little depth, Lake Amadeus, lies a little west of the center of Australia. Various others of less magnitude are scattered over the interior.

The climate of Australia is generally hot and dry, but very healthy. In the tropical portions there are heavy rains, and in most of the coast districts there is a sufficiency of moisture, but in the interior the heat and drought are extreme. Considerable portions now devoted to pasturage are liable at times to suffer from drought. At Melbourne the mean temperature is about  $56^{\circ}$ , at Sydney about  $63^{\circ}$ . The southeastern settled districts are at times subject to excessively hot winds from the interior, which cause great discomfort, and are often followed by a violent cold wind from the south ("southerly bursters"). In the mountainous and more temperate parts snow-storms are common in winter (June, July, and August).

Australia is a region containing a vast quantity of mineral wealth. Foremost come its rich and extensive deposits of gold, which, since the precious metal was first discovered in 1851, have produced a total of more than \$1,350,000,000. The greatest quantity has been obtained in Victoria, but New South Wales and Queensland have also yielded a considerable amount. Probably there are rich stores of gold as yet undiscovered. Australia also possesses silver, copper, tin, lead, zinc, antimony, mercury, plumbago, etc., in abundance, besides coal (now worked to a considerable extent in New South Wales) and iron. Various precious stones are found, as the garnet, ruby, topaz, sapphire, and even the diamond. Of building stone there are granite, limestone, marble, and sandstone.

The Australian flora presents peculiarities which mark it off by itself in a very decided manner. Many of its most striking features have an unmistakable relation to the general dryness of the climate. The trees and bushes have for the most part a scanty foliage, presenting little surface for evaporation, or thick leathery leaves well fitted to retain moisture. The most widely spread types of Australian vegetation are the various kinds of gum-tree, the shea-oak, the acacia or wattle, the grass-tree, many varieties of Proteaceæ, and a great number of ferns and tree ferns. Of the gum tree there are found upward of 150 species, many of which are of great value. Individual specimens of the "peppermint" have been found to measure from 480 to 500 ft. in height. As timber trees the most valuable members of this genus are the red-gum, the timber of which is hard, dense, and almost indestructible. A number of the gum-trees have deciduous bark. The wattle or acacia includes about 300 species, some of them of considerable economic value, yielding good timber or bark for tanning. The most beautiful and most useful is that known as the golden wattle, which in spring is adorned with rich masses of fragrant yellow blossom. Palms -of which there are 24 species, all except the cocoa palm peculiar to Australia-are confined to the n. and e. coasts. In the "scrubs' already mentioned hosts of densely inter-twisted bushes occupy extensive areas. The mallee scrub is formed by a species of dwarf eucalyptus, the mulga scrub by a species of thorny acacia. A plant which covers large areas in the arid regions is the spinifex or porcupine grass, a hard, coarse, and excessively spiny plant, which renders traveling difficult, wounds the feet of horses, and is utterly uneatable by any animal. Other large tracts are occupied by herbs or bushes of a more valuable kind, from their affording fodder. Foremost among those stands the salt-bush. Beautiful flowering plants are numerous. Australia also possesses great numbers of turf-forming grasses, such as the kangaroo-grass, which survives even a tolerably protracted drought. The native fruit-trees are few and unimportant, and the same may be said of the plants yielding roots used as food; but exotic fruits and vegetables may now be had in the different colonies in great abundance and of excellent quality. The vine, the olive, and mulberry thrive well, and quantities of wine are now produced. The cereals of Europe and maize are extensively cultivated, and large tracts of country, particularly in Queensland, are under the sugar-cane.

The Australian fauna is almost unique in its character. Its great feature is the nearly total absence of all the forms of mammalia which abound in the rest of the world, their place being supplied by a great variety of marsupials —these animals being nowhere else found, ex-

cept in the opossums of America. There are about 110 kinds of marsupials (of which the kangaroo, wombat, bandicoot, and phalangers or opossums, are the best known varieties), over 20 kinds of bats, a wild dog (the dingo), and a number of rats and mice. Two extraordinary animals, the platypus, or water-mole of the colonist (Ornithorhynchus), and the porcupine ant-eater (Echidna) constitute the lowest order of mammals (Monotremata), and are confined to Australia. Their young are produced from eggs. Australia now possesses a large stock of the domestic animals of Britain, which thrive there remarkably well. The breed of horses is excellent. Horned cattle and sheep are largely bred, the first attaining a great size, while the sheep improve in fleece and their flesh in flavor. There are upward of 650 different species of birds, the largest being the emu, or Australian ostrich, and a species of cassowary. Peculiar to the country are the black swan, the honcy-sucker, the lyre bird, the brush turkey, and other moundbuilding birds, the bower birds, etc. The parrot tribe preponderate over most other groups of birds in the continent. There are many reptiles, the largest being the alligator, There found in some of the northern rivers. are upward of 60 different species of snakes, some of which are very venomous. Lizards, frogs, and insects are also numerous in various parts. The seas, rivers, and lagoons abound in fish of numerous varieties, and other aquatic animals, many of them peculiar. Whales and seals frequent the coasts. On the n. coasts are extensive fisheries of trepang, much visited by native traders from the Indian Archipelago. Some animals of European origin, such as the rabbit and the sparrow, have developed into real pests in several of the colonies.

The natives belong to the Australian negro stock, and are sometimes considered the lowest as regards intelligence in the whole human family, though this is doubtful. At the census of 1881 they were believed to number about 31,700, exclusive of those in the unexplored parts. They are of a dark-brown or black color, with jet-black curly but not woolly hair, of medium size, but inferior muscular development. In the settled parts of the continent they are inoffensive, and rapidly dying out. They have no fixed habitations; in the summer they live almost entirely in the open air, and in the more inclement weather they shelter themselves with bark erections of the rudest con-struction. They have no cultivation and no domestic animals. Their food consists of such animals as they can kill, and no kind of living creature seems to be rejected-snakes, lizards, frogs, and even insects being eaten, often half raw. They are ignorant of the potter's art. In their natural condition they wear little or no clothing. They speak a number of different languages or dialects. The women are re-garded merely as slaves, and are frightfully maltreated. They have no religion; they practise polygamy, and are said to sometimes resort to cannibalism, but only in exceptional circumstances. They are occasionally em-

ployed by the settlers in light kinds of work, and as horse-breakers; but they dislike continuous occupation, and soon give it up. The weapons of all the tribes are generally similar, consisting of spears, shields, boomerangs, wooden axes, clubs, and stone hatchets. Of these the boomerang is the most singular, being an invention confined to the Australians.

Each of the colonies is quite independent of the others, having a governor, administration, and (except Western Australia) a parliament of its own. The governors are appointed by the queen, and all acts passed by the colonial legislatures must receive the royal assent. Each parliament consists of two houses corresponding to the British House of Lords and House of Commons, the lower house being elected by manhood suffrage. Each governor is assisted by a ministry, and the machinery of government resembles that of the home country. The aggregate annual revenue of the colonies is about \$100,000,000, the annual expenditure several millions more. The public debt is over \$500,000,000. The colonies have a considerable defensive force of militia and volunteers, also a number of gunboats, torpedo-boats, etc., besides which there is always a squadron of British men-of-war on the Australian station. It is probable that in time the colonies may be united into one dominion as has been the case in Canada. In 1885 a measure was passed by the imperial parliament to enable the whole of the Australasian colonies to federate. So far the colonies of Victoria, Queensland, Tasmania, Western Australia, and Fiji have taken advantage of the act, and the first meeting of the Federal Council took place in January, 1886. There is no established church in any of the colonies. The denomination which numbers most adherents is the English (or Anglican) Church, next to which come the Roman Catholics, Presbyterians, and Methodists. Education is well provided for, instruction in the primary schools being in some cases free and compulsory, and the higher education being more and more attended to. There are flourishing universities in Melbourne, Sydney, and Adelaide. Newspapers are exceedingly numerous, and period-icals of all kinds are abundant. There is as yet no native literature of any distinctive type, but names of Australian writers of ability both in prose and poetry are beginning to be known beyond their own country.

Pastoral and agricultural pursuits and mining are the chief occupations of the people, though manufactures and handicrafts also employ large numbers. For sheep-rearing and the growth of wool the Australian colonies are unrivalled, and while the production of gold has considerably decreased that of wool is constantly on the increase. The great bulk of the wool exported goes to Britain, which in the last two or three years has received over 300,000,000 lbs. from the Australian colonies annually. The commerce is rapidly extending, and becoming every year more important to Britain, whence the colonists derive their chief supplies of manufactured

goods in return for wool, gold, and other produce. Next to wool come gold, tin, copper, wheat, preserved meat, and tallow, hides and skins, cotton, tobacco, sugar, and wine as the most important items of export. The chief imports consist of textile fabrics, haberdashery and clothing, machinery and metal goods. There are upward of 7,000 miles of railway in actual use or in course of construction, and about 34,000 miles of telegraph. The longest telegraph line is that running northward across the continent from Adelaide. The two chief routes for mails between Britain and the Australian colonies are by way of the Suez Canal. and by San Francisco across the American continent. The coinage is the same as in the mother country. Banks and banking offices are numerous, including post-office or other savings banks for the reception of small sums.

It is doubtful when Australia was first discovered by Europeans. Between 1531 and 1542 the Portuguese published the existence of a land which they called Great Java, and which corresponded to Australia, and probably the first discovery of the country was made by them early in the sixteenth century. The first authenticated discovery is said to have been made in 1601, by a Portuguese named Manoel Godinho de Eredia. In 1606 Torres, a Spaniard, passed through the strait that now bears his name, between New Guinea and Between this period and 1628 a Australia. large portion of the coast line of Australia had been surveyed by various Dutch navigators. In 1664 the continent was named New Holland by the Dutch government. In 1688 Dampier coasted along part of Australia, and about 1700 explored a part of the w. and n. w. coasts. In 1770 Cook carefully surveyed the e. coast, named a number of localities, and took possession of the country for Britain. He was followed by Bligh in 1789, who carried on a series of observations on the n.e. coast, adding largely to the knowledge already obtained of this new world. Colonists had now arrived on the soil, and a penal settlement was formed (1788) at Port Jackson. In this way was laid the foundation of the future colony of New South Wales. The Moreton Bay district (Queensland) was settled in 1825; in 1835 the Port Philip district. In 1851 the latter district was erected into a separate colony under the name of Victoria. Previous to this time the colonies both of Western Australia and of South Australia had been founded—the former in 1829, the latter in 1836, The latest of the colonies is Queensland, which only took an independent existence in 1859. The discovery of gold in abundance took place in 1851, and caused an immense excitement and great influx of immigrants. The population was then only about 350,000, and was slowly increasing; but the discovery of the precious metal started the country on that career of prosperity which has since been almost uninterrupted. Convicts were long sent to Australia from the mother country, but transportation to New South Wales practically ceased in

## Austria

1840, and the last convict vessel to West Australia arrived in 1868. Altogether about 70,000 convicts were landed in Australia (besides almost as many in Tasmania).

The record of interior exploration forms an interesting part of Australian history. This has been going on since early in the century, and is yet far from complete. There is still a large area of the continent of which little or nothing is known, comprising especially a vast territory belonging to Western Australia, and a portion of South Australia. Among the men who have won fame in the field of Australian exploration are Oxley (1817-23), who partly explored the Lachlan and Macquarie, discovered the Brisbane, etc.; Hume and Hovell (1824), who crossed what is now the colony of Victoria from north to south; Cunningham (1827), who discovered the Darling Downs; Sturt (1828-29), who examined the Macquarie, part of Darling, and the Murrumbidgee, which he traced to the Murray, sailing down the latter to Lake Alexandrina, in 1814 penetrating to near the middle of the continent from the south; Mitchell (1831-36) made extensive explorations in N. S. Wales and Victoria; M'Millan (1839) explored and traversed Gippsland; Eyre (1840) traveled by the coast from Adelaide to King George's Sound; Leichhardt in 1844-45 traveled from Brisbane to Port Essington, discovering fine tracts of territory and the numerous rivers flowing into the Gulf of Carpentaria; in 1848 he was lost in the northern interior, in attempting to cross Australia from east to west, and nothing further regarding his fate has been discovered; Kennedy (1848) was killed in exploring Cape York Peninsula; A. C. Gregory (1855-56) explored part of northwestern Australia, and crossed from that to the Brisbane district, an important exploring journey; M'Douall Stuart (1859-60-62) crossed the continent from south to north and back again nearly in the line of the present overland telegraph; Burke, Wills, Gray, and King (1860-61) crossed from Melbourne to the Gulf of Carpentaria, but Burke, Wills, and Gray perished on the return journey; F. T. Gregory (1861) ex-plored the region of the Ashburton, Fortesque, and other rivers of n. w. Australia; Warburton (1873) traveled with camels from the center of the continent to the n. w. coast; J. Forrest (1874) made an important journey in Western Australia: Giles (1874-76) explored central Western Australia; Favenc (1878-79) traveled from Brisbane to Port Darwin; A. Forrest (1879) explored part of northern Australia; Mills (1883) traversed with camels a considerable stretch of new ground in Western Australia; Winnicke (1883-84), also with camels, explored and mapped about 40,000 sq. mi. of the unknown interior; Lindsay (1885-86) traveled n. w. from Lake Eyre, and then n. w. to the Gulf of Carpentaria. He had hoped to find traces of Leichhardt, but was unsuccessful. Various subsequent explorations have also been made.

Austria (that is, Eastern Empire, or Austria-Hungary), an extensive duplex monarchy in

Central Europe, inhabited by several distinct nationalities, and consisting of two semi-independent countries, each with its own parliament and government, but with one common sovereign, army, and system of diplomacy, and also with a common parliament. The Austrian Empire now has a total area of about 240,-000 sq. mi., and is bounded s. by Turkey, the Adriatic, and Italy; w. by Switzerland, Bavaria, and Saxony; n. by Prussia and Russian Poland; and e. by Russia and Roumania. On the shores of the Adriatic, along the coasts of Dalmatia, Croatia, Istria, etc., lies its only sea frontage, which is of comparatively insignificant extent. Besides the two great divisions of Austria proper, or "Cisleithan" Austria and Hungary or "Transleithan" Austria, the Aus-tro-Hungarian monarchy is divided into a number of governments or provinces, as follows :-

AUSTRIAN PROVINCES.—Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Carniola, Trieste, Görz, Gradiska, Istria, Tyrol, Vorarlberg, Bohemia, Moravia, Silesia, Galicia, Bukowina, and Dalmatia.

HUNGARIAN PROVINCES.—Hungary, Transylvania, Croatia, Slavonia, and Fiume.

The est. pop. in 1890 was 40,464,808. The largest cities are Vienna, Budapest, Prague, Lemberg, Gratz, Brunn, Szegedin, Trieste. Cracow. Bosnia, and Herzegovina, formerly Turkish, but now under the administration of Austria, have an area of 19,728 sq. mi.; pop. 1,336,091.

The prevailing character of the Austrian dominions is mountainous or hilly, the plains not occupying more than a fifth part of the whole surface. The loftiest ranges belong to the Alps, and are found in Tyrol, Styria, Salzburg. and Carinthia, the highest summits being the Ortlerspitzen (12.814 ft.) on the western boundary of Tyrol, and the Grosslockner (12,300) on the borders of Salzburg, Tyrol, and Carinthia. Another great range is that of the Carpathians, bounding Hungary on the north. The most extensive tracts of low or flat land, much of which is very fertile, occur in Hungary, Galicia, and Slavonia, the great Hungarian plain having an area of 36,000 sq. mi. They stretch along the courses of the rivers, of which the chief are the Danube, with its tributaries (the Save, the Drave, the Theiss, the Maros, the Waag, the March, the Raab. the Inn); also the Elbe and Moldau and the Dniester. The Danube for upward of 800 mi. is navigable for pretty large vessels; the tributaries also are largely navigable. The lakes are numerous and often picturesque, the chief be-ing Lake Balaton or the Plattensee. The climate is exceedingly varied, but generally good. The principal products of the north are wheat, barley, oats, and rye; in the center vines and maize are added; and in the south olives and various fruits. The cereals grow to perfection, Hungarian wheat and flour being celebrated. Other crops are hops, tobacco. flax, and hemp. Wine is largely made, but the wines are inferior on the whole, with ex-

ception of a few kinds, including Tokay. The forests cover 70,000 sq. mi., or one third of the productive soil of the empire. Sheep and cattle are largely reared. Wild deer, wild swine, chamois, foxes, lynxes, and a species of small black bear are found in many districts, the fox and lynx being particularly abundant. Herds of a small native breed of horses roam wild over the plains of Hungary. In mineral productions Austria is very rich, possessing, with the exception of platinum, all the useful metals, the total annual value of the mineral products of the Austrian Empire being estimated at upward of \$60,000,000, the principal being coal, salt, and iron.

Manufactures are in the most flourishing condition in Bohemia, Moravia, Silesia, and Lower Austria; less so in the eastern provinces, and insignificant in Dalmatia, Buko-wina, Herzegovina, etc. Among the enost important manufactures are those of machinery and metal goods, Austria holding a high place for the manufacture of musical and scientific instruments, gold and silver plate, and jewelry; of stone and china-ware, and of glass, which is one of the oldest and most highly developed industries in Austria; of chemicals; of sugar from beet; of beer, spirits, etc., and especially the manufactures of woolen, cotton, hemp, and fiax. The manufacture of tobacco is in a state monopoly. Tanning is carried on to a great extent, and in the production of gloves (in Vienna and Prague), Austria stands next to France.

In addition to the general import and export trade Austria carries on a very con-siderable amount of business in the transit of goods through her territory. In 1889 the total value of imports into Austria-Hungary was 589,000,000 florins; of exports, 766,000,000 florins; the value of imports in 1890, 610,000,000 florins; exports, 771,-000,000 florins. Among imports are cotton and other fibers, textile goods and yarn, metals, machinery, drugs, chemicals, oils, fats, hides, skins, etc. The chief exports are cereals, animals, metallic goods, woven fabrics, pottery, and glass manufactures. Nearly two thirds of the commerce is with Germany, next in importance being the trade with Roumania, Italy, and Russia. The exports direct to the United Kingdom in 1890 were \$8,641,685; the imports of British produce thence, \$6,416,045; these mounts do not include indirect experts and amounts do not include indirect exports and imports through other countries. The staple export to the United Kingdom is corn and The chief imports from it are cotfiour. ton manufactures, machinery, and metals, woolen goods, fish, etc. The mercantile woolen goods, fish, etc. The mercantile navy of Austria has a total burden of about 325,000 tons. The principal ports are Trieste, Pola. and Fiume. There are about 14,000 miles of railway open. Accounts are kept in gulden or florins of 100 kreutzers each, the florin being nominally=fifty cents. Practically the chief medium of exchange is banknotes. The Austrian centner or hundredweight =1231 lbs. avoirdupois; the metze, the largest

dry measure = 1.7 bushel; the *eimer* = 14.94 wine gallons; the *joch* of land = 1.43 acres.

None of the European states except Russia exhibits such a diversity of race and language as the Austrian Empire. The Slavs-who differ greatly, however, among themselves in language and civilization — amount to above 16,000,000, or 45 per cent. of the total population, and form the great mass of the population of Bohemia, Moravia, Carniola, Galicia, Dalmatia, Croatia, and Slavonia, and northern Hungary, and half the population of Silesia and Bukowina. The Germans, about 9,000,000, form almost the sole population of the archduchy of Austria, Salzburg, the greatest portion of Styria and Carinthia, almost the whole of Tyrol and Vorarlberg, large portions of Bohe-mia and Morarlberg, large portions of Bohemia and Moravia, the whole of west Silesia, etc.; and they are also numerous in Hungary and Transylvania. The Magyars or Hungarians (6,300,000) form the bulk of the inhabitants of the kingdom of Hungary and eastern Transylvania. Of the Italic or western Romanic stock there are about 700,-000, and in the southeast about 2,500,000 of the Roumanian or eastern Romanic stock. The number of Jews is above 1,000,000; and there are other races, such as the Gypsies (150,000), who are most numerous in Hun-gary and Transylvania, and the Albanians in Dalmatia and the adjacent parts. The population, generally speaking, decreases in density from west to east.

The state religion of Austria is the Roman Catholic, but the civil power exercises supreme control in all ecclesiastical matters. In 1890 there were in the Austrian portion of the monarchy 18,934,000 Roman Catholics, 2,814,000 Greek Catholics united to the Roman Church, 493,542 non-united, 436,000 Protestants, and 1,143,000 Jews. In Hungary and Transylvania there were 6,478,731 Roman Catholics, 1,486,903 Greek united, and 1,931,-276 non-united, 3,139,758 Protestants, and 624,-680 Jews.

The intellectual culture of the people is highest in the German provinces, but in some of the other provinces the illiterates number as many as 80 to 90 per cent. Yet for a number of years attendance on the elementary schools has been compulsory on all children from their sixth to the end of their twelfth year; and there are higher schools on which attendance is compulsory for young people of thirteen to fifteen years (not elsewhere educated). There are numerous gymnasia and "real-schools," the gymnasia being intended chiefly to prepare pupils for the universities, while in the real-schools a more practical end is kept in view, and modern languages and physical science form the groundwork of the educational course; also agricultural, commercial, industrial, art, music, and other special schools. There are eleven universities: viz., in Vienna, Prague (2), Budapest, Gratz, Cracow, Lemberg, Innsbruck, Klausenburg, Agram, and Czernowitz. Most of these have four faculties—Catholic theology, law and politics, medicine, and philosophy.

The ruler of the Austro-Hungarian monarchy has the title of emperor so far as concerns his Austrian dominions, but he is only king of Hungary. All matters affecting the joint interests of the two divisions of the empire, such as foreign affairs, war, and finance, are dealt with by a supreme body known as the Delegations-a parliament of 120 members, one half of whom are chosen by and represent the legislature of German-Austria, and the other half that of Hungary. The legislative center of the Austrian division of the empire is the Reichsrath, or council of the realm, consisting of an upper house (Herrenhaus), composed of princes of the imperial family, nobles with the hereditary right to sit, archbishops, and life-members nominated by the emperor; a lower house (Abgeordnetenhaus) of 353 elected There are seventeen provincial deputies. diets or assemblies, each provincial division having one. In the Hungarian division of the empire the legislative power is vested in the king and the diet or Reichstag conjointly, the latter consisting of an upper house or house of magnates and of a lower house or house of representatives, the latter elected by all citizens of full age paying direct taxes to the amount of \$4 a year. The powers of the Hungarian Reichstag correspond to those of the Reichsrath of the Cisleithan provinces. There Reichsrath of the Cisleithan provinces. being three distinct parliaments in the empire, there are also three budgets: viz., that for the whole empire, that for Cisleithan, and that for Transleithan Austria. A small por-tion of the imperial revenue of Austria is de-rived from customs and other sources, 70 per cent. of the remainder being made up by the Cisleithan and 30 per cent. by the Transleithan divisions of the empire.

Military service is obligatory on all citizens capable of bearing arms who have attained the age of twenty. The period of service is twelve years, of which three are passed in the line, seven in the reserve, and two in the landwehr. The army numbers over 290,000 men (including officers) on the peace-footing and over 1,500-000 on the war-footing. The most important portion of the Austrian navy comprises 12 iron-clads, of from 5 to 14-inch armor, the largest having a tonnage of over 7,000, and carrying 27-ton guns; besides gun-boats, torpedo vessels, and other vessels, mostly small and intended for coast defense. The crews number about 10,000 officers and men.

History. — In 791 Charlemagne drove the Avars from the territory between the Ens and the Raab, and united it to his empire under the name of the *Eastern Mark* (that is, March or boundary land); and from the establishment by him of a margravate in this new province the present empire took its rise. On the invasion of Germany by the Hungarians it became subject to them from 900 till 955, when Otho I, by the victory of Augsburg, reunited a great part of this province to the German Empire, which by 1043 had extended its limits to the Leitha. The margravate of Austria was

hereditary in the family of the counts of Babenberg (Bamberg) from 982 till 1156, in which year the boundaries of Austria were extended so as to include the territory above the Ens, and the whole was created a duchy. The territory was still further increased in 1192 by the gift of the duchy of Styria as a fief from the Emperor Henry VI, Vienna being by this time the capital. The male line of the house of Bamberg became extinct in 1246, and the Emperor Frederick II declared Austria and Styria a vacant flef, the hereditary property of the German emperors. In 1282 the emperor Rudolph granted Austria, Styria, and Ca-rinthia, to his two sons, Albert and Rudolph. The former became sole ruler (duke), and since then Austria has been under the still reigning house of Hapsburg. Albert, who was an energetic ruler, was elected emperor in 1298, but was assassinated in 1308. The first of his successors we need specially mention. was Albert V, son-in-law of the Emperor Sigismund. He assisted Sigismund in the Hussite wars, and was elected after his death king of Hungary and of Bohemia, and German emperor (1438). Ladislaus, his posthumous son, was the last of the Austrian line proper, and its possessions devolved upon the collateral Styrian line in 1457; since which time the house of Austria furnished an unbroken succession of German emperors.

In 1453 the Emperor Frederick III, a member of this house, had conferred upon the country the rank of an archduchy before he himself became ruler of all Austria. His son, Maximilian I, by his marriage with Mary, the surviving daughter of Charles the Bold, united the Netherlands to the Austrian dominions. After the death of his father in 1493 Maximilian was made emperor of Germany, and transferred to his son Philip the government of the Netherlands. He also added to his paternal inheritance Tyrol, with several other territories, particularly some belonging to Bavaria, and acquired for his family new claims to Hungary and Bohemia. The marriage of his son Philip to Joanna of Spain raised the house of Hapsburg to the throne of Spain. Philip, however, d. in 1506, and the death of Maximilian in 1519 was followed by the union of Spain and Austria; his grandson (the eldest son of Philip), Charles I, king of Spain, being elected em-peror of Germany as Charles V. Charles thus became the greatest monarch in Europe, but in 1521 he ceded to his brother Ferdinand all his dominions in Germany. Ferdinand I, by his marriage with Anna, the sister of Louis II, king of Hungary, acquired the kingdoms of Hungary and Bohemia. with Moravia, Silesia, and Lusatia, the appendages of Bohemia. To oppose him the waywode of Transylvania, John Zapolya, sought the help of the sultan, Solyman II, who appeared in 1529 at the gates of Vienna, but was compelled to retreat. In 1535 a treaty was made by which John von Zapolya was allowed to retain the royal title and half of Hungary, but after his death new disputes arose, and Ferdinand maintained the possession of Lower Hungary only

by paying Solyman the sum of 30,000 ducats annually (1562). In 1556 Ferdinand obtained the imperial crown, when his brother Charles laid by the scepter for a cowl. He died in 1564, leaving his territories to be divided among his three sons.

Maximilian II, the eldest, succeeded his father as emperor, obtaining Austria, Hungary, and Bohemia; Ferdinand, the second son, received Tyrol and Hither Austria; and Charles, the youngest, obtained Styria, Carinthia, Carniola, and Gorz. Maximilian d. in 1576, and was succeeded on the imperial throne by his eldest son Rudolph II, who had already been crowned king of Hungary in 1572, and king of Bo-hemia in 1575. Rudolph's reign was dis-tinguished by the war against Turkey and Transylvania; the persecutions of the Prot-estants, who were driven from his domin-ions; the cession of Hungary in 1608; and in 1611 of Bohomic and his barediary cetter in 1611 of Bohemia and his hereditary estates in Austria to his brother Matthias. Matthias. who succeeded Maximilian on the imperial throne, concluded a peace with the Turks, but was disturbed by the Protestant Bohemians, who took up arms in defense of their religious rights, thus commencing the Thirty Years' War. After his death in 1619 the Bohemians refused to acknowledge his successor, Ferdinand II, until after the battle of Prague in 1620, when Bohemia had to submit, and was deprived of the right of choosing her king. Lutheranism was strictly forbidden in all the Austrian dominions. Hungary, which revolted under Bethlem Gabor, prince of Transylvania, was, after a long struggle, subdued. During the reign of Ferdinand III (1637-57), successor of Ferdinand II, Austria was continually the theater of war; Lusatia was ceded to Saxony in 1635; and Alsace to France in 1648, when peace was restored in Germany by the Treaty of Westphalia.

The emperor, Leopold I, son and successor of Ferdinand III, was victorious through the talents of Eugene in two wars with Turkey; and Vienna was delivered by Sobieski and the Germans from the attacks of Kara Mustapha in 1683. In 1687 he united Hungary to Transylvania, and in 1699 restored to Hungary the country lying between the Danube and the Theiss. It was the chief aim of Leopold to Theiss. secure to Charles, his second son, the inheritance of the Spanish monarchy, and in 1701, upon the victory of French diplomacy in the appointment of the grandson of Louis XIV, the War of the Spanish Succession began. Leopold d. in 1705, but Joseph I, his eldest son, continued the war. As he d. without children in 1711, his brother Charles was elected emperor, but was obliged to accede in 1714 to the Peace of Utrecht, by which Austria received the Netherlands, Milan, Mantua, Naples, and Sardinia. In 1720 Sicily was given to Austria in exchange for Sardinia. This monarchy now embraced over 190,000 sq. mi.; but its power was weakened by new wars with Spain and France. In the peace concluded at Vienna (1735 and 1738) Charles VI was forced to cede Naples and Sicily to Spain and part of Milan to the king of Sardinia, and in 1730, by the Peace of Belgrade, he was obliged to transfer to the Porte, Belgrade, Servia, etc., partly in order to secure the succession to his daughter Maria Theresa by the Pragmatic Sanction. He d. in 1740.

On the marriage of Maria Theresa with Stephen, the duke of Lorraine (the dynasty henceforth being that of Hapsburg-Lorraine), and her accession to the Austrian throne, the empire was threatened with dismemberment. Frederick II of Prussia subdued Silesia; the elector of Bavaria was crowned in Lintz and Prague, and in 1742 chosen emperor under the name of Charles VII; Hungary alone supported the heroic and beautiful queen. Charles, however, d. in 1745, and the husband of Theresa was crowned emperor of Germany as Francis I; but a treaty concluded in 1745 confirmed to Frederick the possession of Silesia, and by the Peace of Aix-la-Chapelle, 1748, Austria was obliged to cede the duchies of Parma, Piacenza, and Guastalla to Philip, Infant of Spain, and several districts of Milan to Sardinia. To recover Silesia, Maria Theresa formed an alliance with France, Russia, Saxony, and Sweden, and entered upon the Seven Years' War; but by the Peace of Hubertsberg, 1763, Silesia was recognized as Prussian territory. On the death of Francis I in 1765, Joseph II, his eldest son, was appointed to assist his mother in the government and elected emperor of Germany. The partition of Poland (1772) gave Galicia and Lodomeria to Austria, which also obtained Bukowina from the Porte in 1777, At the death of the empress in 1780 Austria contained 235,000 sq. mi., with a pop. est. 24,000,000.

The liberal home administration of the empress was continued and extended by her successor, Joseph II, who did much to further the spread of religious tolerance, education, and the industrial arts. The Low Countries, however, revolted, and he was unsuccessful in the war of 1788 against the Porte. His death took place in 1790. He was succeeded by his eldest brother, Leopold II, under whom peace was restored in the Netherlands, and in Hungary, and also with the Porte. On the death of his sister and her husband, Louis XVI, of France, he formed an alliance with Prussia, but died in 1792, before the French Revolutionary War broke out.

His son, Francis II, succeeded, and was elected German emperor, by which time France had declared war against him as king of Hungary and Bohemia. In 1705, in the third division of Poland, West Galicia fell to Austria, and by the Peace of Campo-Formio (1797) she received the largest part of the Venetian territory as compensation for her loss of Lombardy and the Netherlands. In 1709 Francis, in alliance with Russia, renewed the war with France until 1801, when the Peace of Lunéville was concluded. In 1804 Francis declared himself hereditary emperor of Austria as Francis I, and united all his states under the name of the Empire of Austria, immediately taking up arms once more

:

with his allies, Russia and Great Britain, against France. The war of 1805 was terminated by the Peace of Pressburg (Dec. 26), by which Francis had to cede to France the remaining provinces of Italy, as well as to give up por-tions of territory to Bavaria, Würtemberg, and Baden, receiving in return Salzburg and Berchtesgaden. After the formation of the Confederation of the Rhine (July 12, 1806) Francis was forced to resign his dignity as emperor of Germany, which had been in his family more than 500 years. A new war with France in 1809 cost the monarchy 42,380 sq. mi. of territory and 3,500,000 subjects. Napoleon married Maria Louisa, daughter of the emperor, and in 1812 concluded an alliance with him against Russia. But in 1813 Francis again declared war against France, and formed an alliance with Britain, Russia, Prussia, and Sweden against his son-in-law. By the Congress of Vienna (1815) Austria gained Lombardy and Venetia, and recovered, together with Dalmatia, the hereditary territories which it had been obliged to cede.

In the troubled period following the French Revolution of 1830 insurrections took place in Modena, Parma, and the Papal States (1831-32), but were suppressed without much difficulty; and though professedly neutral during the Polish insurrections Austria clearly showed herself on the side of Russia, with whom her relations became more intimate as those between Great Britain and France grew more cordial. The death of Francis I (1835) and accession of his son Ferdinand I made little change in the Austrian system of government, and much discontent was the consequence. In 1846 the failure of the Polish insurrection led to the incorporation of Cracow with Austria. In Italy the declarations of Pio Nono in favor of reform increased the difficulties of Austria, and in Hungary the opposition under Kossuth and others assumed the form of a great constitutional movement. In 1848, when the expulsion of Louis Philippe shook all Europe, Metternich found it impossible any longer to guide the helm of the state, and the government was compelled to admit a free press and the right of citizens to arms. Apart from the popular attitude in Italy and in Hungary, where the Diet declared itself permanent under the presidency of Kossuth, the insurrection made equal progress in Vienna itself, and the royal family, no longer in safety, removed to Innsbruck. After various ministerial changes the emperor abdicated in favor of his nephew, Francis Joseph; more vigorous measures were adopted, and Austria, aided by Russia, reduced Hungary to submission.

The year 1855 is memorable for the Concordat with the pope, which put the educational and ecclesiastical affairs of the empire entirely into the hands of the Papal See. In 1850 the hostile intentions of France and Sardinia against the possessions of Austria in Italy became so evident that she declared war by sending an army across the Ticino; but after disastrous defeats at Magenta and Solferino she was compelled to cede Milan and the n.w. portion of Lombardy to Sardinia. In 1864 she joined with the German states in the spoliation of Denmark, but a dispute about Schleswig-Holstein involwed her in a war with her allies (1866), while at the same time Italy renewed her attempts for the recovery of Venice. The Italians were defeated at Custozza and driven back across the Mincio; but the Prussians, victorious at Königgrätz (or Sadowa), threatened Vienna. Peace was concluded with Prussia on August 23, and with Italy on October 3, the result of the war being the cession of Venetia through France to Italy and the withdrawal of Austria from all interference in the affairs of Germany.

Since 1866 Austria has been occupied chiefly with the internal affairs of the empire. Hungarian demands for self-government were finally agreed to, and the empire of Austria divided into the two parts already mentioned -the Cisleithan and the Transleithan. This settlement was consummated by the coronation of the Emperor Francis Joseph I, at Budapest, as king of Hungary, on the 8th of June, 1867. In the same year the Concordat of 1855 came up for discussion, and measures were passed for the re-establishment of civil marriage, the emancipation of schools from the domination of the church, and the placing of different creeds on a footing of equality. The fact of the Austro-Hungarian dominions comprising so many different nationalities has always given the central government much trouble, both in regard to internal and to external affairs. In regard to the "Eastern Question," for instance, the action of Austria has been hampered by the sympathies shown by the Magyars for their blood relations, the Turks, while the Slavs have naturally been more favorable to Russia. During the war between Russia and Turkey in 1877-78 Austria remained neutral: but at its close, in the middle of 1878, it was decided, at the Congress of Berlin, that the provinces of Bosnia and Herzegovina should in future be administered by Austria-Hungary instead of Turkey. Recently there has been a likelihood of Austria being involved in hostilities with Russia in connection with the "Eastern Question;" and in February, 1888, a treaty between Austria and Germany was published, by which each agreed to assist the other in the case of an attack by Russia.

Autom aton, a self-moving machine performing actions like those of a living being, and often shaped like one. The walking statues of Dædalus, the flying dove of Archytas, the brazen head of Friar Bacon, the iron fly of Regiomontanus, the door-opening figure of Albertus Magnus, the parading knights of the clock presented to Charlemagne by Harun al Rashid, the toy carriage and attendants constructed by Camus for Louis XIV, the flute player, tambour player, and duck of Vaucanson, and the writing child of the brothers Droz are among the more noteworthy of traditional automata.

Au'totype, a species of photographic print. A tin sheet of gelatin on paper is rendered sensitive to light by treatment with bichromate of potash, and then exposed under an ordinary photographic negative. The portions of gelatin affected by the light become insoluble, the remainder of the gelatin is then washed away, and the picture remains reproduced in the gelatin, there being slight elevations and depressions corresponding with the distribution of light and shade. This may be printed from, but it is more often made use of to obtain electrotypes or other reverses, from which impressions can more easily be taken.

Autum (ö-tun), a town, southeastern France, department of Saône-et-Loire. It has two Roman gates of exquisite workmanship, the ruins of an amphitheater and of several temples, the cathedral of St. Lazare, a fine Gothic structure of the eleventh century; manufactures of carpets, woolens, cotton, velvet, hosiery, etc. Pop. 11,462.

Auvergne (ö-vär-nyė), a province, central France, now merged into departments Cantal and Puy-de-Dôme, and an arrondissement of Haute-Loire. The Auvergne Mountains, separating the basins of the Allier, Cher, and Creuse from those of the Lot and Dordogne, contain the highest points of central France: Mount Dor, 6, 188 ft.; Cantal, 6,093 ft., and Puy-de-Dôme, 4,800 ft. The number of extinct volcances and general geologic formation make the district one of great scientific interest. The minerals include iron, coal, copper, and lead, and there are warm and cold mineral springs. Auvergne contributes a large supply to the labor markets of Paris and Belgium, there being in Paris alone some 50,000 Auvergnats.

Auxerre ( $\delta$ -s $\tilde{s}r$ ), a town, France, department of Yonne, 110 mi. s.e. of Paris. Principal edifices: a fine Gothic cathedral, unfinished; the abbey of St. Germain, with curious crypts; and an old episcopal palace, now the Hôtel de Prefecture. It manufactures woolens, hats, casks, leather, earthenwarz, violin strings, etc.; trade, chiefly in wood and wines, of which the best known is white Chablis. Pop. 15,497.

Av'alanches, large masses of snow or ice precipitated from the mountains, and distinguished as wind or dust avalanches, when they consist of fresh-fallen snow whirled like a dust storm into the valleys; as sliding avalanches, when they consist of great masses of snow sliding down a slope by their own weight; and as glacier or summer avalanches, when ice-masses are detached by heat from the high glaciers. Avalanches have been divided into four classes: 1, Powdery avalanches, in which the snow and ice break up into powder, forming a kind of silver cloud, sparkling like quicksilver, and This making a noise like distant thunder. kind is more dangerous by reason of the commotion produced in the air than by its weight or power to overwhelm. 2, Creeping avalanches. The mass of snow being disengaged moves down a more gentle slope, as on an inclined plane, and so is sluggish in its course. 3, Glacier avalanche, consisting of a large mass of ice detached from the glacier above, which descends to the valley. This is the least dangerous kind, and is more common in summer. 4, The avalanche proper, which is the most dangerous of all, and consists of vast accumulations of snow set free from above, which increase in force as they descend, overthrowing houses, tearing up trees, burying villages, and swallowing up forests, cattle, and human beings. Avalanches are sometimes of immense size; two which fell in the Alpine districts of Italy, in 1885, contained 45,000 and 250,000 tons of snow respectively.

Av'alon, a sort of fairy land or elysium mentioned in connection with the legends of King Arthur, being his abode after disappearing from the haunts of men; called also Avilion. The name is also identified with Glastonbury, and has been given to a peninsula of Newfoundland.

Avatar' (more properly Avatara), in Hindu mythology, an incarnation of the Deity. Of the innumerable avatars the chief are the ten incarnations of Vishnu, who appeared successively as a fish, a tortoise, a boar, etc.

Avelline ( $\dot{a}$ -vel-le'n $\bar{e}$ ), a town in Southern Italy, capital of the province of Avellino, 20 mi. e. of Naples, the seat of a bishop. Avellino nuts were celebrated under the Romans. Pop. 16,376. Area of the prov. 1,400 sq. mi.; pop. 419,688.

A've **Flari'a** ("Hail, Mary"), the first two words of the angel Gabriel's salutation (Luke 1:28), and the beginning of the very common Latin prayer to the Virgin in the Catholic Church. Its lay use was sanctioned at the end of the twelfth century, and a papal edict of 1326 ordains the repetition of the prayer thrice each morning, noon, and evening, the hour being indicated by sound of bells called the Ave Maria or Angelus Domini.

Av'erage, in maritime law, any charge or expense over and above the freight of goods, and payable by their owner. General acerage is the sum falling to be paid by the owners of ship, cargo, and freight, in proportion to their several interests, to make good any loss or expense intentionally incurred for the general safety of ship and cargo; e. g., throwing goods overboard, cutting away masts, port dues in cases of distress, etc. Particular acerage is the sum falling to be paid for unavoidable loss when the general safety is not in question, and therefore chargeable on the individual owner of the property lost. A policy of insurance generally covers both general and particular average, unless specially excepted.

Aver'ill, WILLIAM WOODS, b. 1832, in Cameron, N. Y. He was graduated at the U. S. Military Academy in 1855, and served in garrison at Carlisle, Pa., for two years. Later he went to the frontier to fight the Indians. He was in the battle of Bull Run. Averill was appointed colonel of the third Pennsylvania cavalry, and commanded the cavalry defenses before Washington with the Army of the Potomac, 1863. He made a series of cavalry raids in Virginia. Later he had sundry skirmishes with the Confederates with some success, but met with no disaster. In 1865 he

## Avernus

resigned. From 1866 to 1869 he was U.S. consul-general in the British Provinces of N. A.

Aver' nus, a lake, now called Lago d'Averno, in Campania, Italy, between the ancient Cumæ and Puteoli, about 8 mi. from Naples. It occupies the crater of an old volcano, and is in some places 180 feet deep. Formerly the gloom of its forest surroundings and its mephitic exhalations caused it to be regarded as the entrance to the infernal regions. It was the fabled abode of the Cimmerians, and especially dedicated to Proscrpine.

Averroes (1120-1225 ?), a noted Arabian philosopher. Averroes regarded Aristotle as the greatest of all philosophers, and devoted himself so largely to the exposition of his works as to be called among the Arabians the Interpreter. He wrote a compendium of medicine, and treatises on theology, philosophy, jurisprudence, etc.

Aver'sa, a town of southern Italy, 7 mi. n. of Naples, in a beautiful vine and orange district, the seat of a bishop, with a cathedral and various religious institutions, and an excellently conducted lunatic asylum. Andreas of Hungary, husband of Queen Joanna I, was strangled in a convent here, Sept. 18, 1345. Pop. 21,510.

Aveyron (å-vå-rön), a department of France. The climate is cold, and agriculture is in a backward state, but considerable attention is paid to sheep-breeding. It is noted for its "Roque-fort cheese." It has coal, iron, and copper mines, besides other minerals. Area 3,340 sq.

mi.; capital, Rhodez; pop. 415,826. Av'lary, a building or enclosure for keeping, breeding, and rearing birds. Aviaries appear to have been used by the Persians, Greeks, and Romans, and are highly prized in China. In England they were in use at least as early as 1577, when William Harrison refers to "our costlie and curious aviaries." An aviary may be simply a kind of very large cage; but the term usually has a wider scope than this. The zoological collections in several American parks are noticeable for their fine aviaries.

Avicen'na (or Ebn-Sina) (980-1037), an Arabian philosopher and physician. At the age of twenty-one he wrote an encyclopedia of the sciences, but of his one hundred works the best known is the Canon Medicina, which was still in use as a text-book at Louvain and Montpellier in the middle of the seventeenth century

Avigilano (a-věl-yä'nö), a town of Southern Italy, prov. Potenza. Pop. 13,057.

Avignon (à-vē-nyōn), an old town of s. e. France, capital of department Vaucluse. It is an archbishop's see, and has a large and ancient cathedral on a rock overlooking the town, the immense palace in which the popes resided (now barracks), and other old build-The silk manufacture and the rearing ings. of silkworms are the principal employments in the district. Here Petrarch lived several years, and made the acquaintance of Laura, whose tomb is in the Franciscan church. From 1309 to 1376 seven popes in succession, from Clement V to Gregory XI, resided in

this city. After its purchase by Pope Clement VI in 1348 Avignon and its district continued, with a few interruptions, under the rule of a vice-legate of the pope, till 1791, when it was formally united to the French Republic. Pop. 41,007

Avila (ä'vē-lå), town of Spain, capital of province of Avila, a modern division of Old Castile. See of a bishop suffragan, with fine cathedral. Once one of the richest towns of Spain. Principal employment in the town, spinning; in the province, breeding sheep and cattle. Pop. town 9,199; province 187-211.

Avogad'ro's Law, in physics, asserts that equal volumes of different gases at the same pressure and temperature contain an equal number of molecules.

Avoirdupois (a-ver'du-pois)(from old French, lit. "goods of weight"), a system of weights used for all goods except precious metals, gems, and medicines, and in which a pound contains 16 ounces, or 7,000 grains, while a pound troy contains 12 ounces, or 5,760 grains.

Av'ola, a seaport on the east of Sicily, with a trade in almonds, sugar, etc. Pop. 12,540.

A'von, the name of several smaller rivers in England of which the most famous rises in Leicestershire, flows past Shakespeare's birth-

place, Stratford, and falls into the Severn. Av'oset, a bird about the size of a lapwing. The bill is long, slender, elastic, and bent upward toward the tip, the legs long, the feet

The Common Avoset.

webbed, and the plumage variegated with black and white. The bird feeds on worms black and white. and other small animals which it scoops up from the mud of the marshes and fens that it frequents. It is found in Europe, Asia, Africa, and America; but the American species is slightly different from the other.

Ax, a well-known tool for cutting or chopping wood, consisting of an iron head with an arched cutting edge of steel, which is in line with the wooden handle of the tool, and not at right angles to it as in the adze.

The process of making axes is briefly as fol-ws: The raw material is brought into the lows: factory in great rough and rusty iron bars. It is put into the forges and heated until it is a

rich red. The workmen withdraw it by means of tackle and feed it between the rollers of a complicated machine, which cuts the bars into lengths double that of the ax, and shapes the metal in the general form of two axes placed butt to butt, and finally doubles the pieces together around a mold, thus leaving a loop in the middle for the helve-hole. The ax is then put into a furnace fired with gas, and raised to a white heat; thence it is carried to the base of a great tilt-hammer, which drops down upon it with terrific force, welding the folds together with a single blow. The ax is again taken to the furnace and heated red hot. It is then taken in hand by a workman who rasps its edges with a sharp saw to take off the jagged fringe of iron which still clings to it. Thus the iron part of the ax, that is, all of the butt and most of the blade, is complete. The steel for the knife-edge is heated at the furnace and then stamped into the desired shape by a die press. The two parts are now ready to be put together. A groove is cut into the forward edge of the iron butt and the steel knife-edge inserted. The whole ax is then heated and welded together with the great hammer. The blade of the ax has yet to be tempered, and this is the most important part of the work. The latest method of tempering is to dip the steel ax-blade into a pot of molten lead, and when sufficiently hot, to transfer it quickly into a vat of cold water. An experienced inspector then tests the blade to find out whether or not it is too brittle or not brittle enough. If it will not stand the test it is thrown aside, and the whole process must be gone over again. If the ax fulfills the requirements of the inspector it goes to the grindingroom, where it is smoothed, ground, and polished and put in shape for use.

Axis, the straight line, real or imaginary, passing through a body or magnitude, on which it revolves, or may be supposed to revolve; especially a straight line with regard to which the different parts of a magnitude, or several magnitudes, are symmetrically arranged; e.g. the axis of the world, the imaginary line drawn through its two poles.

In botany the word is also used, the stem being termed the ascending axis, the root the descending axis.

In analomy the name is given to the second vertebra from the head, that on which the *atlas* moves.

Axle, a bar of iron or wood which supports a carriage or wagon and is supported on wheels, in the hubs of which its ends are inserted. Axles of railway cars do not revolve in the hubs of the wheels, but are keyed in them, and journals are turned on the portions outside the wheel. The manufacture of car axles is an interesting process. The enormous weight which falls upon a car or locomotive axle requires that they be made of the strongest iron obtainable. Axles under loaded freight cars for example must support a constant load of about ten tons, while the oscillation and vibration of the car, which sometimes throws the whole weight upon on eside, requires that the

axle be exceedingly strong. Axles as usually manufactured are made of scrap iron and muckbar iron. The scrap iron used in making axles consists of old bridge rods, old axles, and arch bars. These scraps before brought into the mill are cut into four-foot lengths by powerful shears. These four-foot pieces are put into a furnace with a slow fire where the rust and dirt are burned off, thus preventing any impurities in the welding. The pieces are assorted into piles of sufficient size to make an axle of given dimensions. The piles are then put into the heating furnace, three or four at a time, and heated to the welding point. A pair of huge tongs suspended from a crane by a heavy chain is swung around by a workman, and attached to the projecting end of one of the piles of iron, which by this time has been heated sufficiently to cause the different pieces to stick together. The mass is then swung around under the steam hammer. This hammer weighs about two tons. It is put in operation, and the hammer man takes hold of the end of the tongs, and after each blow of the hammer, changes the position of the iron so that no two blows will strike in exactly the same place. As soon as the iron becomes a little cool it is put back into the furnace and another piece is taken out and hammered in the same way. For the first hammering, when the slabs are being made, a flat hammer-block and hammer is used. After this a concave hammer face and hammerblock are substituted to give the correct shape of the axle. During the process of the hammering, the correct diameter is determined by means of a guage. After both ends of the axle have been finished it is swung on to a skid made of two steel rails and allowed to cool. It is important that any pieces of steel be kept out of the axle in the welding. When the axle is thoroughly cooled it is lifted from the steel rails by means of tongs, and placed into a machine which cuts it off into the correct Then the axle is centered by having length. a small hole bored in exactly the center of each end, and is taken to the finishing room. The finishing process consists in putting the axle into a lathe and turning off some of the metal at each end so as to make a smooth surface for the bearings and wheel hub. The axle is now ready to have the wheels mounted on it. The wheels are pressed on to the axle by a powerful hydraulic press, and so accurate is the fit that it is said the union is stronger than if the wheel and axle had been heated and welded together.

Steel cannot be welded readily, and the method of making steel axles is somewhat different from that of making iron axles. Either Bessemer or open-hearth steel is used in steel axles. The steel is first melted and poured from the converters into ingots, which are then passed through rollers and brought down to pieces about six or seven inches square. The pieces are then heated in the furnace and pounded down to the correct form and diameter under the steam hammer in the same manner as an iron axle. Steel axles are not

-14

### Aye-aye

considered as good as iron on account of the danger of blow-holes forming in the interior of These blow-holes are made when the axle. the steel is being poured into the ingots and no amount of rolling or pounding will close them up, nor is there any way of telling when these holes occur inside of an axle until it breaks in service. The methods of working steel, however, are being greatly improved, and it will probably not be long until it will entirely replace iron for axles. Axles weigh from 350 to 425 pounds and at present are worth when made about \$8.50 each. Locomotive axles are much larger and heavier and weigh about 800 pounds each and have a diameter at the middle of seven or eight inches. Whenever an axle breaks it is usually in the journal near the wheel pit.

Aye-aye (1-1), an animal of Madagascar, so called from its cry, now referred to the lemur family. It is about the size of a hare, has large flat ears and a bushy tail, large eyes, long sprawling fingers, the third so slender as

#### Aye-Aye.

to appear shrivelled; color, musk-brown, mixed with black and gray ash. It feeds on grubs and fruits, and in its habits is nocturnal.

**Ayesha** (a-yesh'a) (610-678), daughter of Abu-Bekr and favorite wife of Mohammed, the Arabian prophet.

Ayr (kr), a town of Scotland, capital of Ayrshire. William the Lion built a castle here in 1197 and constituted it a royal burgh in 1202; and the parliament which confirmed Robert Bruce's title to the crown sat in Ayr. One of its bridges, opened in 1879, occupies the place of the "New Brig" of Burns's Brigs of Ayr, the "Auld Brig" (built 1252) being still serviceable for foot traffic. Carpets and lace curtains are manufactured. The house in which Robert Burns was born stands within 14 miles of the town, between it and the church of Alloway ("Alloway's auld haunted kirk"), and a monument to him stands on a height between the kirk and the bridge over the Doon. Pop. 23,835. Ayrshire has an area of 1.149 sq. mi. The surface is irregular, and a large portion of it hilly, but much of it is fertile. Coal and iron are abundant; and there are numerous collieries and iron-works. Limestone and freestone abound. Agriculture and dairy husbandry are extensively practised; the Ayrshire cows are celebrated as milkers. Woolen manufactures are extensive, particularly carpets, bonnets, and worsted shawls, produced in great quantities at Kilmarnock and other places. Pop. 226,283.

Aytoun, WILLIAM EDMONDSTOUNE (1813-1865), a Scotch poet and prose writer. In 1848 he published a collection of ballads entitled *Lays of the Scottish Cavaliers*, which has proved the most popular of all his works. In 1858 he edited a critical and annotated collection of the ballads of Scotland.

Aza'lea, a genus of plants, belonging to the heaths, remarkable for the beauty and fragrance of their flowers, and distinguished from

Flowering Branch of Azalea.

the rhododendrons chiefly by the flowers having five stamens instead of ten. Many beautiful rhododendrons with desiduous leaves are known under the name of *azalea* in gardens. Azaleas are common in North America. An Asiatic species is famous for the stupefying effect which its honey is said to have produced on Xenophon's army. is also common in gardens and shrubberies; and another is a brilliant greenhouse plant.

Azamgarh, a town of India, N. W. Provinces, capital of dist. of same name. Pop. 19,-450. The district has an area of 2,550 sq. mi.; a pop. of 1,728,625.

Azerbijan (à-zer-bī-jän'), a province of Persia. Area 30,000 sq. mi.; pop. est. at 750,000. It consists generally of lofty mountain ranges, some of which rise to a height of between 12,000 and 13,000 ft. Agricultural products: wheat, barley, maize, fruit, cotton, tobacco, and grapes. Horses, cattle, sheep, and camels are reared in considerable numbers. Chief minerals: iron, lead, copper, salt, saltpeter, and marble. Tabreez is the capital. On the n. w. frontier is situated Mount Ararat.

Azof, Sea of, an arm of the Black Sea, with which it is united by the Straits of Kertch (or Kaffa); length about 170 mi., breadth about 80 mi.; greatest depth not more than 8 fathoms. The w. part, called the Putrid Sea, is separated from the main expanse by a long sandy belt called Arabat, along which runs a military road. The sea teems with fish. The Don and other rivers enter it, and its waters are very fresh.

Azores (a-zörz' or a-zö'res) (or Western Islands), a group belonging to and 900 mi. west of Portugal, in the North Atlantic Ocean. They are nine in number, and form three distinct groups — a n. w., consisting of Flores and Corvo; a central, consisting of Terceira, São Jorge, Pico, Fayal, and Graciosa; and a s. e., consisting of Sao Miguel (or St. Michael) and Santa Maria. The total area is about 900 sq. mi.; São Miguel (containing the capital, Ponta Delgada), Pico, and Terceira are the largest. The islands are volcanic and subject to earthquakes, and are conical, lofty, precipitous, and picturesque. The most remarkable summit is the peak of Pico, about 7,600 feet high. There are numerous hot springs. They are covered with luxuriant vegetation, and diversified with woods, corn-fields, vineyards, lemon and orange groves, and rich open pastures. The mild and somewhat humid climate, combined with the natural fertility of the soil, brings all kinds of vegetable products rapidly to perfection. The climate is recommended as suitable for consumptive patients. The Azores were discovered by Cabral about 1431, shortly after which date they were taken possession of and colonized by the Portuguese. When first visited they were uninhabited, and had scarcely any other animals except birds, particularly hawks,

to which, called in Portuguese *açores*, the islands owe their name. Pop. 270,000.

Az'tecs, a race of people who settled in Mexico early in the fourteenth century, ultimately extended their dominion over a large territory, and were still extending their supremacy at the time of the arrival of the Spaniards, by whom they were speedily subjugated. Their most celebrated ruler was Montezuma, who was reigning when the Spaniards arrived, about the middle of the fifteenth century. Although ignorant of the horse, ox, etc., they had a considerable knowledge of agriculture, maize and the agave being the chief produce. In metal work, feather work, weaving and pottery they possessed a high degree of skill. To record events they used hieroglyphics; and their lunar calendars were of unusual accuracy. Two special deities claimed their reverence: Hintzilopochtli, the god of war, propitiated with human sacrifices; and Quetzalcoal, the beneficent god of light and air, with whom at first the Aztecs were disposed to identify Cortez. Their temples, with large terraced pyramidal bases, were in the charge of an exceedingly large priesthood, with whom lay the education of the young. As a civilization of apparently independent origin, yet closely resembling in many features the archaic Oriental civilizations, the Aztec civilization is of the first interest. See Mexico.

**B** is the second letter and the first consonant in the English and most other alphabets. It is a mute and labial, pronounced solely by the lips, and is distinguished from p by being sonant, that is, produced by the utterance of voice as distinguished from breath.

In music B is the seventh note of the model diatonic scale, or scale of C. It is called the leading note, as there is always a feeling of suspense when it is sounded until the keynote is heard.

**Ba'al** (Bel), a Hebrew and general Semitic word signifying simply lord, and applied to many different divinities. In Hosea 2:16 it is applied to Jehovah himself, while Baalberith (the Covenant-lord) was the god of the Shechemites, and Baal-zebub (the Fly-god) the idol of the Philistines at Ekron.

**Baalbek'**, a place in Syria, at the foot of Antilibanus, 40 mi. from Damascus, famous for its magnificent ruins. Of these the chief is the temple of the Sun, built either by Antoninus Pius or by Septimius Severus. Some of the blocks used in its construction are 60 ft. long by 12 ft. thick. Near it is a temple of Jupiter, of smaller size though still larger than the Parthenon at Athens. It became a Roman colony under Julius Cæsar, was garrisoned by Augustus, and acquired renown under Trajan as the seat of an oracle. It was sacked by the 'Arabs in 748, and more completely pillaged by Tamerlane in 1401; it sank into decay. The destruction was completed by an earthquake in 1759.

**Bab' bage**, CHARLES (1792-1871), an eminent English mathematician and inventor of the calculating machine. As early as 1812 he conceived the idea of calculating numerical tables by machinery, and in 1823 he received a grant from government for the construction of such a machine. After a series of experiments Babbage abandoned the undertaking in favor of an analytical engine, worked with cards like the Jacquard loom; but the project was never completed. The incompleted machine is now in the South Kensington Museum.

**Babbit-metal**, a soft metal resulting from alloying together certain proportions of copper, tin, and zinc or antimony, used with the view of as far as possible obviating friction in the bearings of journals, cranks, axles, etc., invented by Isaac Babbit (1799-1862), a goldsmith of Taunton, Mass.

**Babcock,** ORVILLE E. (1835-1884); b. in Franklin, Vt. He graduated at West Point, served during the whole of the Civil War, and served as aide-de-camp to General Grant. Colonel Babcock acted as Grant's secretary 1869-71, when he was appointed superintendent of buildings in the District of Columbia. In 1876 he was indicted for complicity in the whiskyring frauds, but was acquitted.

# Baboon

**Babel**, Tower of, a structure in the plain of Shinar, Mesopotamia, commenced by the descendants of Noah subsequent to the deluge. It has commonly been identified with the great temple of Belus (or Bel) that was one of the chief edifices in Babylon, and the huge mound called Birs Nimrud is generally regarded as its site, though another mound, which to this day bears the name of Babil, has been assigned by some as its site. Babel means literally "gate of God."

**Bab-el-Mandeb** ("gate of tears," from being dangerous to small craft), a strait, 15 mi. wide, between the Indian Ocean and the Red Sea, formed by projecting points of Arabia in Asia, and Abyssinia in Africa. The island of Perim is here.

**Ba'ber** (1483-1530), first grand Mogul, the founder of the Mogul dynasty in Hindustan. He was sovereign of Cabul. He several times invaded Hindustan, and in 1525 killed Sultan Ibrahim, the last Hindu emperor of the Afghan race. He made many improvements, social and political, in his empire, and left a valuable autobiography.

**Ba' boon**, a common name applied to a division of old-world apes and monkeys. They have

Sacred Baboon.

elongated, abrupt muzzles like a dog, strong tusks or canine teeth, usually short tails, cheekpouches, small, deep eyes with large eyebrows and naked callosities on the buttocks. Their hind and fore feet are well proportioned, so that they run easily on all fours, but they do not maintain themselves in an upright posture with facility. They are generally of the size of a moderately large dog, but the largest, the mandrill, is, when erect, nearly of the height of a man. They are almost all African, ugly, sullen, flerce, and gregarious, defending themselves by throwing stones, dirt, etc. They live

# BACTERIA.

1. Tubercle Bacillus (Bacillus Tuberculosis, Koch). 2. Streptococcus Pyogenes. 3. Bacillus Anthracis, with Spores. 4. Spirillum Obermeiri in blood of relapsing fever. 5. Comma Bacillus of Asiatic Cholera. 6. Micrococcus Tetragenus (Saprophytic). • • • • •

ments of the men are made in accordance with the numbers turned up by the dice. It is said to have been invented in the tenth century.

**Bacon**, DELIA (1811-1859), born in Ohio. She was a talented woman, who sought to prove that Francis Bacon was the author of the Shakespearean plays,

Ba'con, FRANCIS, Lord Verulam, Viscount St. Albans (1561-1626), known generally by Pope's characterization as "the wisest, bright-est, meanest of mankind." Queen Elizabeth playfully styled him her "young Lord Keeper." He studied at Trinity College, Cambridge, where, it is said, he acquired his hatred of Aristotelianism, and began to sketch his own scheme of philosophy. Leaving college, he went to Paris. There he occupied himself with diplomacy and scientific investigation until 1580, when the death of his father recalled him to England. His bright talents excited the alarm of his uncle, Lord Burleigh, then Premier, who saw in him a most formidable rival to his own son Robert. Although B. then paid court to Burleigh's rival, Essex, the latter was not powerful enough to prevent him from being defeated in his contest in 1594 for the attorney-generalship. To make up for this defeat, Essex presented B. with an estate at Twickenham worth \$10,000 a year. Yet B. is found as the chief persecutor of Essex, both by pen and tongue, for conspiracy against the queen, and although various attempts have been made to explain this away, it is impossible to acquit him of ingratitude. B., who had entered Parliament as member for Middlesex in 1595, rose rapidly in the reign of James I. He was knighted in 1603, became attorney-general in 1613, in which office he also shows himself in an unfavorable light, as countenancing the torture of an old clergyman of the name of Peacham by the rack; Keeper of the Great Seal in 1617, and in 1619, Lord Chancellor, with the title of Lord Veru-lam. Next year he was made Viscount St. Albans. It seems undoubted that B. abused the high position he had now attained, by taking advantage of his judicial functions to in-crease his revenues. The scandal became so great, that neither the king nor his favorite Villiers, to whom he had truckled in the most abject manner, could shield him from popular indignation; a parliamentary inquiry was in-stituted in 1621; B. confessed to twenty-three acts of corruption, and was sentenced to a fine of \$200,000, to be confined in the Tower during the king's pleasure, and to be banished for life from the court, and from public employment. Although the fine was remitted, and the imprisonment only lasted two days, B. never returned to public life, but on a pension of \$6,000 a year devoted himself to literature and science. His death took place in 1626, the common story being that he caught a chill while endeavoring to test the power of snow to preserve flesh. His debts amounted to \$110.000.

His intimacy with every department of human knowledge except mathematics is marvelous; while few writers have been more eloquent, more imaginative, or more witty. He will be best remembered as, "if not absolutely the father of the Inductive Philosophy, in the sense of the inventor of the method of interrogating nature by experiment and observation, the popularizer of that philosophy." Of late years an attempt has been made to ascribe to Bacon the authorship of the Shakespearean plays. Ingenious as some of the arguments have been, the balance of probability remains against such a theory.

**Bacon**, LEONARD (1802-1881), b. in Detroit, Mich. He graduated at Yale in 1820, and in 1825 was ordained pastor of the First Congregational church of New Haven, which pastorate he held until his death. He was professor of didactio theology in Yale, 1806-1871. Dr. Bacon edited *The Christian Spectator*, wrote for the *New Englander*, and founded and edited the *Independent* (1847).

**Bacon**, LEONARD WOOLSEY, b. 1830, in New Haven, Conn., son of the foregoing. He graduated at Yale in 1850, and studied theology at Andover and medicine at Yale. He served as pastor of churches in New York and Connecticut, and has written much for the religious press.

Bacon, ROGER (1214-1294), an English monk, and one of the most profound and original thinkers of his day. He first entered the University of Oxford, and went afterward to that of Paris, where he received the degree of Doctor of Theology. About 1250 he returned to England, entered the order of Franciscans, but having incurred the suspicion of his ecclesiastical superiors on a charge of practising "black art" or magic, he was sent to Paris and kept in confinement for ten years. Having been set at liberty, in 1278 he was again thrown into prison, where he remained for at least ten vears. His most important work is his Opus Majus, where he discusses the relation of philosophy to religion, and then treats of language, metaphysics, optics, and experimental science. He was intimately acquainted with geography and astronomy.

Bactería (Gr., Bakterion, a little staff), are minute unicellular vegetable organisms which multiply by transverse division. They are spherical, oval, rod-like, or spiral in shape and are devoid of chlorophyll, owing to the absence of which they are forced to lead a saprophytic life (obtaining nutrition from dead organic matter); or a parasitic life (obtaining nutriment from living matter). The rôle played in nature by the saprophytic bacteria is a very important one. Through their presence the highly complicated tissues of dead animal and vegetable matter are resolved into the simple compounds (carbonic acid, water, and ammonia) in which form they may be taken up and appropriated as nutrition by the more highly organized members of the vegetable kingdom. It is through this ultimate production of carbonic acid, water, and ammonia. as end-products in the process of decomposition and fermentation of the dead animal and vegetable tissues, that the demands of

growing vegetation for these compounds are supplied. Saprophytes must be looked upon in the light of "benefactors," without which existence would be impossible. With the parasites, on the other hand, the conditions are far from analogous. Through their activities there is constantly a loss to both the animal and vegetable kingdom. Their host must be a living body in which exist conditions favorable to their development and from which they appropriate substances necessary to the health of the organism to which they have found access; at the same time they eliminate substances as products of their nutrition that are directly poisonous to the tissues in which they are growing. For the growth of bacteria, organic matter of a neutral or slightly alkaline reaction, in the presence of moisture and a suitable temperature (41.9° F.-118.4° F.) is necessary. Some bacteria flourish in an atmosphere of oxygen, while to others the presence of this gas is a detriment, hence bacteria are divided into anærobic (not living in oxygen) and perobic (living in oxygen).

The principal forms of bacteria are:-

1. Micrococci.

2. Bacilli.

3. Spirilla.

The micrococci are small oval or round bodies which grow and multiply in various ways so that by their development we have formed the staphylococci (cocci in bunches). the streptococci (cocci in chains), diplococci (cocci in pairs), tetrads (cocci in fours), sarsing (cocci in squares, cubes, etc.). The most common of these micrococci are the pus microbes staphylococcus, golden, lemon-colored, and white, and the streptococcus. The bacilli are minute rodshaped organisms, and varied as to length, breadth, and thickness. The bacillus tuberculosis, the bacillus typhosis, and the bacillus anthracis are common examples of this form of microbe.

The spirilla are minute spiral or commashaped germs which sometimes present letter S curves and sometimes appear as though they were bacilli. Examples of this form are Spirillum Asiaticæ Choleræ and spirillum of Finkler-Prior.

'An important feature of certain bacteria is their power of spore formation, a process by which an organism is enabled to enter a state in which it resists influences deleterious to its growth. It is this property which renders certain germs so harmful, as in this state they resist chemical and physical agents that easily destroy life, even resisting the action of a temperature of 212º F. for several hours. The bacillus anthracis is a noticeable example of this. Certain bacteria possess the property of motility. The propelling power are hairlike appendages, called flagellie, projecting from various parts of the body-wall. This motility is an important point in bacteriologic diagnosis, and is possessed pre-eminently by the bacillus typhosis.

Bacteria are found everywhere (in air, soil, water, clothing, surface of bodies, mucous membrane, etc.), and they multiply so rapidly that, it has been estimated, one bacillus in 24 hours will produce 164 millions.

By their growth bacteria produce certain poisons, called *ptomaines* (saprophytic) and *tozalbumins* (parasitic). This action producing ptomaines is the cause of the numerous deaths reported from eating ice cream, sausage, and other substances. As an example of the poisonous effect of the tox-albumins we have the *bacillus diphtheria*, which acts by its toxine in producing the condition known as "intoxication."

For the artificial cultivation of bacteria in the laboratory certain media are used. As to the method of their preparation nothing need now be said, suffice it to say that the general media are gelatin, agar-agar, bouillon, glucose-agar, litmus milk, potato, blood-serum. Special media are used in certain cases as some germs grow feebly or not at all on one general culture ground. An example of a special medium is human blood-serum in the artificial cultivation of the gonococcus.

After the preparation of the media, it must be made perfectly sterile. This is accomplished by submitting it to the action of live steam for half an hour on three successive days. The object of this "fractional sterilization" is to kill the successive crops of spores as they develop, as a single steaming will not accomplish this purpose.

Having rendered our media sterile, we are in a condition to study bacteria systematically and thoroughly.

This in brief is as follows:----

1. At the post-mortem or during life a specimen is obtained from the selected site (scraping from mucous membrane in diphtheretic throat). This specimen is inoculated on a tube containing sterile agar-agar. This tube is then placed in an incubator and kept at a temperature of  $97^{\circ}$  F. for about 24 hours, at the end of which time an extensive growth of bacteria (if any be present) will be noticed.

2. Our next step will be to isolate in pure culture the various germs which have grown out upon the agar-agar tube in No. 1. This pure culture is obtained by inoculating from the original agar-agar tube, a tube of nutrient bouillon. From this bouillon tube we now inoculate with 2 drops of the nutrient bouillon. 2 sterile agar-agar tubes, the one from the This agar-agar should be melted and other. cooled down to a temperature of 113° F. prior to inoculation with the nutrient bouillon culture. After the agar-agar has been inoculated, it is poured out into flat Petri dishes, in order to enlarge the surface and separate the colo-nies which will subsequently develop. These Petri dishes are then placed in the incubator at a temperature of 97° F. (if we use agar-agar as plate media), of 68° F. (if we use plain gelatin) and kept for 24 hours. At the end of this time we notice separate colonies developed on the surface or in the substance of the culture medium.

3. The next step in the examination is the inoculation, on to a new sterile agar-agar tube, of a specimen from each of the varying colonies developed on the agar-agar plate. This is then incubated, and we have as the result a pure culture of each separate organism obtained from the original inoculation.

4. The next step consists in cultivating the germ artificially upon the various laboratory media. This is done by inoculating with a specimen from our pure culture each of the media in turn, and subjecting them to incubation for 24 hours.

5. Having examined the cultural peculiarities of the microbe, we examine the germ itself in microscopic section. For this purpose we use both stained preparations and the unstained hanging drop. The common laboratory staining agents are the aniline coloring agents such as carbol fuchsin, methylene blue, gentian violet, etc.

6. Our final step in the identification of a bacterium is the inoculation of an animal with a pure culture of the germ under observation. The casual development must be noted with regularity and precision; symptoms must be studied carefully, and if we succeed in producing the disease, with which we know or suspect the original person or animal to have died, we have positive evidence that we have isolated, cultivated, and inoculated the germ causing the original disease.

These are the successive steps in the study of a microbe, and by this method Koch, its promulgator, succeeded in proving that the *Bacillus Tuberculosis* was the specific causal agent in the disease tuberculosis. Numerous infective diseases exist, for which the special causal agent has, as yet, not been discovered; but just as soon as we can start with a disease and by successive steps proceed to the production of the same disease in a susceptible animal, then can we say that the specific causal agent for that disease has been discovered.

These are the general principles underlying the study of bacteria as a whole, but certain specific cases must be considered in which the technique, although it may be carried out in this way, is generally altered to suit the conditions. The consideration of specific bacteriology will be based on the work done in the Laboratory of the Department of Health of Chicago. In this laboratory examinations are made of water (as regards its typhoid tendencies), of suspected diphtheretic cases, of cases of supposed tuberculosis, of cases suspected to be cholera in times of epidemic, and of many other cases coming under the notice of this department in its effort to insure the best general health possible.

In examination cases of supposed tuberculosis of lungs (consumption), a specimen of sputum is obtained from the patient to be examined. One of the white cheesy masses found in it is selected for the future examination. A portion of this mass is placed upon a clean cover glass (a very thin glass section), and is spread out over the surface of this glass in as fine a film as possible. This film is allowed to dry in the air and is then passed three or four times through a flame in order to fix it to the

glass by coagulating the albumen. Having dried and fixed the film, the staining agent (Ziehl's carbol-fuchsin solution) is placed, drop by drop, upon the film. The solution is now heated to boiling several times, more being added as evaporation takes place; and is then washed off with a five-per-cent. solution of sulphuric acid, after which it is treated with ninety-five per cent. alcohol and water until the color entirely disappears. We now place upon the color slip a solution of methylene blue, and allow it to remain unheated about two minutes. This blue solution is then washed off in water, and the preparation is then ready to be mounted and examined microscopically. The peculiarity of this method consists in the fact that while all the bacteria present in the original specimen of sputum are stained.by the red carbol-fuchsin solution, all but the bacillus tuberculosis part with their color upon the subsequent treatment with sulphuric acid and alcohol. On adding the methylene blue the germs, decolorized by acid and alcohol, will take up the blue color, and our microscopical picture will be a very beautiful contrast of red and blue coloration. The bacillus tuberculosis, if present, appears as a bright red, while all else will appear blue. This is a posi-tive sign of tuberculosis. The only germs which have this peculiar reaction are, besides the one already discussed the Smegma bacillus, the bacillus of syphilis, and the bacillus of leprosy. Certain peculiarities are found in their reactions which enable us, by staining process and by knowing the source of the specimen, to substantiate a diagnosis of tuberculosis.

Examination for the bacillus of Typhoid Fever (water analysis in general). It is very rarely that the Bacillus Typhosis itself is found in bacteriological examination of water, but as there are present in the normal intestine of man certain bacteria which can be recognized readily by examination, their presence will prove the contamination of water by intestinal contents, and as such the water can be considered an object of suspicion and as a possible source of typhoid contagion. We first obtain the specimen of water, being careful to avoid contamination from any source other than the one under question. We make plate cultures of specimens of this water, using 1, 2, 3, 5, or 10 drops of the water in each plate. Duplicate plates are to be made, one upon gelatin, to be kept at room temperature, and the other upon agar-agar, to be kept in the incubator at 97° F. We then note the number of colonies by certain counting methods, 100 to the cubic centimeter of water being a safe limit. As few bacteria grow at a temperature of 97° F., if we obtain any growth on the agar-agar plates we can be reasonably certain that some polluting germ is present. However, this is by no means certain. The growth should be studied in all its cultural peculiarities, should be inoculated into animals, and all the general bacteriologic principles applied to it. In the case of the Bacillus Typhosis and its co-habitator, the Bacillus Coli Communis, we can get no results upon animals, as none have been found susceptible

#### Bacteria

to their action. A solution known as Parietti's fluid (a mixture of hydrochloric acid and alcohol) is used as a method of diagnosing pollution by germs belonging to group of Coli Communis. By this method we inoculate a tube with the germ, and then add a few drops of this Parietti's fluid. If we get no growth, we can be sure there are none of the color group present; if a growth is observed, we can be tolerably certain of the presence of some member of this group. Hence this is a negative test. We will not enter into the cultural peculiarities and methods of recognizing the Bacillus Coli Communis, and Bacillus Typhosis; suffice it to say that by methods pursued, contamination by intestinal contents can be noted both bacteriologically and chemically by presence of chlo-rides, nitrates, and nitrites. Contamination by Asiatic cholera germs can be recognized by cultural peculiarities and by inoculation experi-ments. Typhoid Fever germs can be recognized in the urine and feces of a typhoid patient about the tenth day by ordinary methods. A comparatively late method of diagnosis of typhoid fever by bacteriological methods is found in the Widol method. This consists in the addition to the blood of the suspected typhoid patient of a few drops of fresh bouillon culture of typhoid bacilli. If the patient has typhoid fever we will notice, on examining the specimen in the hanging drop under the microscope. that the actively motile typhoid germs are beginning to clump and to lose their motion, until finally they become perfectly passive. The scientific value of this method has as yet not been definitely settled by statistics, but everything seems to point toward its great usefulness as a diagnostic agent. The bacteriological value of typhoid examinations can hardly be overestimated, as contamination may come through air, water, milk, soil, and there is reported a remarkable case of an epidemic of typhoid fever arising from consumption of oysters fattened in brackish water.

Examination of throat in cases of supposed diphtheria. A scraping is made (from one of the whitish plaques on the surface of the mucous membrane of the throat) with a cotton swab. This swab is then rubbed over the surface of a sterile tube or box of Loeffler's bloodserum mixture. It is then to be placed in an incubator or, in the absence of such a contrivance, the test tube may be fastened into the axillary space of the patient and left for 24 hours. At the end of this time the growth which appears on the surface may be examined microscopically. A film of the growth is made on a cover glass in the ordinary way and is then stained for two minutes with a solu-This solution is tion of methylene blue. washed off in water, and the specimen is then mounted and examined. The diplitheria bacillus, if present, presents a peculiar and characteristic appearance. Various bizarre forms, such as club-shaped, dumb-bell, lanceshaped, alternately stained and unstained segments, etc., are noticed so that the germ is easily recognized by its peculiarly characteristic segmentation in staining.

Numerous other examinations could be mentioned, but it is not the purpose of this article to deal completely with the subject. It is sufficient to state that the work done in the Chicago Laboratory is more important than it appears, as it is here that the daily examination of the water supply of the city is made, and it is here that the probable rise and decline of epidemics are noted. It is important to remember that to a more intimate acquaintance with the biological activities of the unicellular vegetable micro-organisms, modern hygiene owes much of its value, and our knowledge of infectious diseases has reached the position it now occupies.

The study of bacteriology may be said to have had its beginning with the observations of Leeuwenhock in the year 1675. In this year he published the fact that he had seen, by means of a lens of his own construction, living motile animalcules in a drop of rain water. Extending his work to the examination of sea water, well water, contents of the intestinal canal of frogs, birds, etc., he found objects that differentiated themselves, the one from the other, by size, shape, and peculiarity of movement. From a study of his work there can be no doubt that he had discovered the bodies now recognized as bacteria. А universal belief in the causal relation of these animalcules to disease arose, and in conse-quence there was developed a "germ mania." Following this line scientists continued to work, and we find, through the researches of Pasteur, of Pollender, of Davaine and others, the old doctrine of *Contagium animatum* re-ceiving attention. The conclusion necessarily drawn from the work as to the origin of these bodies, is that omne vivum ex vivo. The work of Rindfleisch, Klebs, Orth, Eberth, Koch, and others, shows a gradual advance along scientific lines, so that with Koch in 1881, we have our foundation stone of bacteriology solidly laid. Koch proved in that year that distinct varieties of infection, as evidenced by anatomical changes, are due in many cases to the activities of particular specific organisms, and that by proper methods it is possible to isolate these organisms, in pure culture, to cultivate them indefinitely, to reproduce the conditions by inoculation of these pure cultures into susceptible animals and by continuous inoculation from an infected to a healthy animal to continue the R. W. WEBSTER. disease at will.

**Bactria'na** (or Bactria), a country of ancient Asia, south of the Oxus and reaching to the west of the Hindu Kush. It is often regarded as the original home of the Indo-European races. A Græco-Bactrian kingdom flourished about the third century **B**. c., but its history is obscure.

**Ba'cup**, a borough of England, in Lancashire, 18 mi. n. of Manchester. The chief manufacturing establishments are connected with cotton spinning and power-loom weaving; there are also iron works, Turkey-red dyeing works, and in the neighborhood numerous coalpits and immense stone quarries. Pop. 23, 498.

**Badajoz** (bà-dà-hōth') (anc. Pax Augusta), the fortified capital of the Spanish province of Badajoz. Pop. 481,508. During the Peninsular War, Badajoz was besieged by Marshal Soult, and taken in March, 1811. It was twice attempted by the English, on May 5 and 29, 1811, and was besieged by Wellington on March 16, and taken April 6, 1812. Pop. town, 27,270.

**Badakshan'**, a territory of Central Asia, tributary to the Ameer of Afghanistan. The chief town is Faizabad. The inhabitants profess Mohammedanism. Pop. 500,000.

**Badeau**, ADAM, American soldier, b. 1831, in New York. He served on General Grant's staff and retired with a brigadier general's brevet in the regular army. From 1869 to 1881 he was secretary of legation and consul general at London, and accompanied General Grant on his trip round the world (1877-78). He published Mültary History of Ulysses S. Grant (1807-81) and Grant in Peace (1886).

Baden (bä'den), GRAND-DUCHY OF, one of the more important states of the German Empire. It is divided into four districts: Constance, Freiburg, Karlsruhe, and Mannheim; has an area of 5,824 sq. mi., and a pop. of 1,601,255. It is mountainous, being traversed to a considerable extent by the lofty plateau of the Schwarzwald or Black Forest, which attains its highest point in the Feldberg (4,904 ft.). The hilly parts, especially in the east, are cold and have a long winter, while the valley of the Rhine enjoys the finest climate of Germany. The principal minerals worked are coal, salt, iron, zinc, and nickel. The number of mineral springs is remarkably great, and of these not a few are of great celebrity. The vegetation is peculiarly rich, and there are magnificent forests. The cereals comprise wheat, oats, barley, and rye. Potatoes, hemp, tobacco, wine, and sugar-beet are largely pro-Several of the wines, both white and k in the first class. Baden has long duced. red, rank in the first class. been famous for its fruits also. Of the total area 42 per cent. is under cultivation, 37 per cent. under forest, and 17 per cent. under meadows and pastures. The manufactures are important. Among them are textiles, tobacco and cigars, chemicals, machinery, pottery ware, jewelry (especially at Pforzheim), wooden clocks, confined chiefly to the districts of the Black Forest, musical boxes and other musical toys. The capital is Carlsruhe, about 5 mi. from the Rhine; the other chief towns are Mannheim, Freiburg-im-Breisgau, with a Roman Catholic university; Baden and Heidelberg. Baden has warm mineral springs, which were known and used in the time of the Romans. Heidelberg has a university (Protestant), founded in 1386, the oldest in the present German Empire. The railways have a length of 850 mi., and are nearly all state property. In the time of the Roman Empire southern Baden belonged to the Roman\_province of Rhætia. Under the old German Empire it was a margravate, which in 1533 was divided into Baden-Baden and Baden-Durlach, but reunited in 1771. The title of grand duke was conferred by Napoleon in 1806, and in the same year Baden was extended to its present limits. In 1870 Baden took an active part in the Franco-Prussian war, and became a member of the German Empire, Nov. 15, 1871. The executive power is vested in the grand duke, the legislative in a house of legislature, consisting of an upper and lower chamber. The revenue and expenditure are each usually about \$10,000,000.

**Baden** (or Baden-Baden, to distinguish it from other towns of the same name; German, *Bad*, a bath), a town and watering-place, Grand-duchy of Baden, 18 mi. s.s.w. Carlsruhe, built in the form of an amphitheater on a spur of the Black Forest. Baden has been celebrated from the remotest antiquity for its thermal baths. It has many good buildings, and a castle, the summer residence of the grand-duke. Pop. 13,884,

**Baden**, a town of Austria, 15 mi. s.w. of Vienna. It has numerous hot sulphurous springs, used both for bathing and drinking, and very much frequented. Pop. 11,262. It is generally known as Baden bei Wein.

**Baden**, a small town of Switzerland, canton Aargau, celebrated for its hot sulphurous baths, which attract many visitors. Pop. 4,020.

**Badger** (baj'er), a plantigrade, carnivorous mammal, allied both to the bears and to the weasels, of a clumsy make, with short, thick legs, and long claws on the forefeet. The The common badger (Melee-vulgaris) is as large as a middling sized dog, but much lower on the legs, with a flatter and broader body, very thick, tough hide, and long, coarse hair. It inhabits the north of Europe, Asia, and America, burrows, is indolent and sleepy, feeds by night on vegetables, small quadru-peds, etc. Its fiesh may be eaten, and its hair is used for artists' brushes in painting. The American badger belongs to a separate genus. Badger baiting, or drawing the badger, was a barbarous sport formerly practised, generally as an attraction to public-houses of the lowest sort. A badger was put in a barrel, and one or more dogs were put in to drag him out. When this was effected he was returned to his barrel, to be similarly assailed by a fresh set. The badger usually made a most determined and savage resistance.

**Badrinath** (-ät'), a peak of the main Himalayan range, in Garhwál District, Northwestern Provinces, India, 23,210 ft. above the sea. On one of its shoulders at an elevation of 10,400 ft. stands a noted temple of Vishnu, which some years attracts as many as 50,000 pilgrims.

**Baffin**, WILLIAM (1584-1622), an English navigator, famous for his discoveries in the Arctic regions; in 1616 ascertained the limits of Baffin's Bay which is on the n.e. coast of North America between Greenland and the islands that lie on the n. of the continent. He was killed at the siege of Ormuz, in the East Indies.

**Bagatelle**', a game played on a long, flat board covered with cloth like a billiard-table, with spherical balls and a cue or mace. At the end of the board are nine cups or sockets of just sufficient size to receive the balls. Nine balls are used, generally one black, four white, and four red, the distinction between white and red being made only for the sake of variety.

**Bagdad'**, capital of a Turkish pashalic of the same name (70,000 sq. mi., 1,000,000 inhabitants), in the southern part of Mesopotamia (now Irak Arabi). The greater part of it lies on the eastern bank of the Tigris which is crossed by a bridge of boats; old Bagdad was on the western bank of the river. Manufactures: leather, silks, cottous, woolens, carpets, etc. Steamers ply on the river between Bagdad and Bassorah, and the town exports wheat, dates, galls, gum, mohair, carpets, etc., to Europe. Bagdad is inhabited by Turks, Arabs, Persians, Armenians, Jews, etc., and a small number of Europeans. Est. pop. over 100,000. The Turks compose three fourths of the whole population. The city has been frequently visited by the plague, and in 1831 was nearly devastated. Bagdad was founded in 762, and is the scene of many of the tales of the *Arabian Nights*.

**Bagehot,** WALTER (1820-1877), an English economist. For seventeen years he edited the London *Economist*. He was a recognized authority on economic questions and wrote many treatises on banking, the coinage and the history of the money market.

**Baghelkand**, a tract of country in central India, occupied by a collection of native states (Rewah being the chief), under the governor general's agent for central India. Area 11,323 sq. mi.; pop. 1,512,595.

**Bagirmi** (bà-gir'mē) (or Baghermi), a Mohammedan negro state in Central Africa. situated between Bornu and Waday, to the s.

of lake Tchad. It is mostly a plain; has an area of about 56,000 sq. mi. and about 1,-500,000 inhabitants. The people are industrious, and have attained to a considerable pitch of civilization.

Bagpipe, 8 musical windinstrument of very great antiquity, having been used among the ancientGreeks, and being ล favorite instrument over Europe generally in the fifteenth

century. It still continues in use among the country people of Poland, Italy, the south of France, and in Scotland and Ireland. Though now often regarded as the national instrument of Scotland, especially Celtic Scotland, it is only Scottish by adoption, being introduced into that country from England. It consists of a leathern bag, which receives the air from the mouth, or from bellows; and of pipes, into which the air is pressed from the bag by the performer's elbow. In the common or Highland form one pipe plays the melody; of the three others two are in unison with the lowest A of the chanter, and the third and longest an octave lower, the sound being produced by means of reeds.

Baha'ma Islands (or Lucayos), a group of islands in the West Indies, forming a colony belonging to Britain, lying n. e. of Cuba, and s. e. of the coast of Florida. The principal islands are Grand Bahama, Great and Little Abaco, Andros Islands. New Providence, Eleuthera, San Salvador, Great Exuma, Watling Is-land, Long Island, Crooked Island, Acklin Is-land, Mariguana Island, Great Inagua. Of the whole group about twenty are inhabited, the most populous being New Providence, which contains the capital, Nassau, the largest being Andros. Total area 5,450 sq. mi. The soil is a thin but rich vegetable mold, and the principal product is pineapples, which form the most important export. Other fruits are also grown, with cotton, sugar, maize, yams, groundnuts, cocoanuts, etc. Sponges are obtained in large quantity and are exported. The currency is English, but American coins circulate freely. The islands are a favorite winter resort for those afflicted with pulmo-nary diseases. Watling Island is now by best authorities believed to be same as Guanahani, the land first touched on by Columbus (Oct. 12, The 1492) on his first voyage of discovery. first British settlement was made on New Providence toward the close of the seven-teenth century. A number of American Tories settled in the islands after the Revolution. Pop. 47,565, including 14,000 whites.

**Bahi'a** (bà-ē'à) formerly San Salvador, a town of Brazil, on the Bay of All Saints, province of Bahia. It was founded in 1549, and is the oldest town in Brazil, of which it was capital until 1763. In 1874 it was placed in telegraphic communication with Europe. The harbor is one of the best in S. A.; and the trade, chiefly in sugar, cotton, coffee, tobacco, hides, piassava, and tapioca, is very extensive. Pop. 80,000. The province (area 164,649 sq. mi.; pop. 1,821,089) has much fertile land, both along the coast and in the interior.

Bahia Honda (Port. "deep bay"), a seaport of northern Cuba, 60 mi. w. s. w. of Havana. Pop. 4,823.

**Bahrein** (bä'rīn) **Islands**, a group of islands in the Persian Gulf, in an indentation on the Arabian coast. The principal island usually called Bahrein, is about 27 mi. in length and 10 in breadth. The principal town is Menamah (or Manama); pop. 3,500. The Bahrein Islands are chiefly noted for their pearl fisheries.

which were known to the ancients, and which employ in the season about 400 boats with from 8 to 20 men in each. Total pop. est. 40,000.

**Baise** (bi'é), an ancient Roman wateringplace on the coast of Campania, 10 mi. w. of Naples. Many of the wealthy Romans had country houses at Baise, which Horace preferred to all other places. It became notorious for the vicious lives of its inhabitants. Ruins of temples, baths, and villas still attract the attention of archeeologists.

**Baikal** (bi'kål), a large fresh-water lake in Eastern Siberia. Area 14,000 sq. mi. It is surrounded by rugged and lofty mountains; contains seals, and many fish, particularly salmon, sturgeon, and pike. Its greatest depth is over 4,000 ft., and the seal and sturgeon fisheries are important industries. It is frozen over in winter.

**Balley,** JAMES MONTGOMERY (1841—), American journalist, b. in Albany, N. Y., edited the *Danbury News*, to which he contributed numerous articles which for a time had great vogue. He was known by his signature as "The Danbury Newsman."

**Balley**, PHILIP JAMES, English poet, b. at Basford, Nottingham, 1816. His most remarkable poem, *Festus*, was published in 1839. In 1877 it had reached a tenth edition in England and had been even more read and admired in America.

**Baillie**, JOANNA (1762-1851), a Scottish authoress, b. at Bothwell, Lanarkshire. She wrote several series of plays. Her only plays performed on the stage were a tragedy entitled *The Family Legend*, brought out at EdinBurgh under the patronage of Sir Walter Scott; and *De Montfort*, brought out by John Kemble.

**Bailly**, JEAN SYLVAIN (1736–1793), first an artist, then astronomer, was b. in Paris. Chosen president of the National Assembly, 1789, and mayor of Paris, July 15, he labored with energy and assiduity to keep the citizens from starvation and revolt. Discords showed themselves in the Assembly and throughout the nation. Finally it became his duty to order the National Guard to fire on the insurgent rabble in the Champs-de-Mars. In November, 1791, he resigned his office. When the Revolution grew more furious and hysterical, he was arrested and guillotined.

**Bally,** FRANCIS (1774–1844), English astronomer. He published Tables for the Purchasing and Renewing of Leases, The Doctrine of Interest and Annuities, The Doctrine of Life Annuities and Assurances, and an epitome of universal history. On retiring from business in 1825, he turned his attention to astronomy, and became one of the founders of the Astronomical Society.

**Baily's Beads**, a phenomenon attending eclipses of the sun, the unobscured edge of which appears discontinuous and broken immediately before and after the moment of complete obscuration. It is classed as an effect of irradiation.

Bain, ALEXANDER, a Scotch writer on mental philosophy and education, was b. at Aberdeen in 1818. He was educated at Marischal College, Aberdeen; subsequently held official posts in London; and in 1860 was appointed professor of logic and English in Aberdeen University, a post which he held till his resignation in 1881.

Bainbridge, WILLIAM (1774-1833), American naval officer. When the U. S. navy was reorganized in 1798 he was appointed lieutenant commandant. In 1800 he commanded the frigate *George Washington*, which carried to Algiers the commercial tribute then levied by the dey of that country. In 1801 Bainbridge was captain of the Essex, which cruised in the Mediterranean. In 1803 in the U.S. war with Tripoli, he commanded the frigate Philadelphia under Commodore Preble, and while chasing a blockade-runner his vessel grounded on a reef and was scuttled and surrendered. The captain and his 315 men were kept as prisoners until the peace in June, 1805. He sailed from Boston, 1812, in command of a squadron comprising the Constitution, Essex, and Hornet. On December 26, off the coast of Brazil, he captured the British frigate Java, of forty-nine guns, for which achievement Congress distributed among the crew \$50,000 as prize money, voted the commodore a gold medal, and to each of his officers a silver one. In 1815 Bainbridge commanded the Mediterranean squadron.

**Bairam** (bi'ram), the Easter of the Mohammedans, which follows immediately after the Ramadan or Lent (a month of fasting), and lasts three days. Sixty days after this first great Bairam begins the lesser Bairam. They are the only two feasts prescribed by the Mohammedan religion.

**Baird,** HENRY CAREY, b. 1825, near Philadelphia. He became a publisher, and has written several works on economic subjects and the currency. He joined the Greenback party in 1875.

**Baird,** SPENCER FULLERTON (1823-1887), American naturalist. He was long assistant secretary, and latterly secretary of the Smithsonian Institution, Washington, and was also chief government commissioner of fish and fisheries. He wrote much on natural history, his chief works being, *The Birds of North America* (in conjunction with John Cassin); *The Mammals of North America; Review of American Birds in the Smithsonian Institution;* and (with Messrs. Brewer and Ridgeway) *History of North American Birds*.

**Baireuth** (bi'roit), a town of Bavaria, on the Red Main, 41 mi. n.e. of Nürnberg. The principal edifices, the old and the new palace, are the opera house, the gymnasium, and the national theater. Industries: cotton spinning, sugar refining, musical instruments, sewing machines, leather, brewing, etc. Pop. 24,556.

**Baja** (bü'yà), a market town of Hungary, district of Bacs, on the Danube, with a trade in grain and wine, and a large annual hog fair. Pop. 19.241.

**Bajazet** (bå-yå-zet') (or Bayasid I) (1389– 1409), Turkish emperor, who, in 1389, having strangled his brother Jacob, succeeded his father Murad (or Amurath). From the rapidity of his conquests he received the name of Ilderim, the Lightning. In three years he subjected Bulgaria, part of Servia, Macedonia, Thessaly, and the states of Asia Minor, and besieged Constantinople for ten years, defeating Sigismund and the allied Hungarians, Poles, and French, in 1395. The attack of Timur (Tamerlane) on Natolia, in 1400, saved the Greek Empire, Bajazet being defeated and taken prisoner by him near Ancyra, Galatia, 1402.

**Bajazet II** (1447-1512), sultan of the Turks. He inoreased the Turkish Empire by conquests on the n.w. and in the e., and ravaged the coasts of the Christian states on the Mediterranean, to revenge the expulsion of the Moors from Spain.

**Baker**, SIR SAMUEL WHITE (1821-1893), a distinguished English traveler. In 1861 began his African travels, which lasted several years, in the Upper Nile regions, and resulted, among other discoveries, in that of Albert Nyanza Lake in 1864, and of the exit of the White Nile from it. In Africa he encountered Speke and Grant after their discovery of the Victoria Nyanza. In 1869 he returned to Africa as head of an expedition sent by the khedive of Egypt to annex and open up to trade a large part of the newly explored country, being raised to the dignity of pasha. He returned in 1873, having finished his work, and was succeeded by General Gordon. His writings include: *The Rifte and the Hound in Ceylon; Eight Years' Wanderings in Ceylon; The Albert Nyanza, etc.; The Nile Tributaries of Abyssinia; Ismailia; A Narrative of the Expedition to Central Africa; Cyprus as I Save It;* and *Cast up by the Sea.* 

Narrative of the Expedition to Central Africa; Cyprus as I Saw It; and Cast up by the Sea. **Bake' well**, ROBERT (1726 - 1795), a famous English agriculturist, b. at Dishley, Leicestershire. He devoted himself to improving the breeding of cattle and sheep, aiming principally at producing the greatest weight of carcass with the smallest amount of feeding, and is to be regarded as the initiator of the system of scientific breeding.

Baking Powder, a mixture of bicarbonate of soda and tartaric acid, usually with some flour added. The water of the dough causes the liberation of carbonic acid, which makes the bread "rise." The process of manufacturing baking powder has grown to be an enor-mous enterprise in the U.S. The acid ordinarily used in baking powder is cream of tartar. This is obtained from lees of wine and argals, both of which are by-products of the manufac-ture of wine. This is obtained after the wine has been allowed to stand in the cellar and is the fine substance which settles to the bottom in the casks. The wine is drawn off, leaving this pinkish mass known as lees of wine. contains about 25 per cent. of cream of tartar. Formerly the lees were sold for fertilizers and the argals were burned for lampblack, but since baking powder has come into general use the demand for both has become great. These products are brought to the factory from France, Italy, and Spain, and after being crushed to a fine powder, are boiled in huge

copper tanks. As the solution cools, the cream of tartar crystallizes on the side of the tank and the other impurities either remain in the solution or form a precipitate in the bottom. The crystals, which are of a faded brown color, are scraped off, redissolved, and discolored by passing through a filter of animal coal. The crystals, after this process, are white and almost perfectly pure and ready for use in the baking powder manufactory. With the soda and starch it is then brought to the chemical laboratory and analyzed. The process of manufacturing begins on the top floor, where the crystals of cream of tartar are fed into the hopper of a grinding machine from which it comes out as fine white powder. It is sifted through a number of bolting screens, then barreled and placed along with the soda and starch. In the floor are three trapdoors, one for the cream of tartar, one for the soda, and one for the starch. Below the floor are three bins, which narrow to funnels, the mouths of which are covered with draw slides. Under each spout is a weighing scale over which runs a truck track, which continues on around over two traps in the floor. The truck is put under the cream of tartar spout and filled with just the proper amount and is then dumped into a bin below, then a certain amount of soda and starch is added in the same manner. The starch is added as a filler to separate the particles of cream of tartar and soda and aids in preventing a chemical combination until water is added. The ingredients are then thoroughly mixed and samples are placed in small boxes and sent to the laboratory for analysis. The powder is then put in boxes, labeled and ready for the market. Instead of cream of tartar, alum and alum-ammonia are extensively used as the acid element. They are less expensive but the law in several states prohibits their use. Ammonia may be de-tected in baking powder by mixing a portion with water and boiling thoroughly for a few minutes. If there is ammonia it may be detected by the smell in the rising steam. Alum may be detected by placing some of the pow-der in a glass of cold water. If there is no effervescence, alum powder is present.

**Baku** (bä-kö'), a Russian port on the western shore of the Caspian. The naphtha or petroleum springs of Baku have long been known; and the Field of Fire, so called from emitting inflammable gases, has long been a place of pilgrimage with the Guebres or Fire-worshipers. About 400 oil wells are in operation. Some of the wells have had such an outflow of oil as to be unmanageable. Baku is the station of the Caspian fleet, is strongly fortified, and has a large shipping trade: Pop. 107.761.

and has a large shipping trade: Pop. 107,761. Bakunin, MICHAEL (1814-1878), the founder of Nihilism, born of a noble Russian family, became associated with a band of students who studied German philosophy. Among these were Herzen, Turgenieff, the novelist, and Belinski. He went to Berlin in 1841, was expelled from that city and from various continental capitals as a revolutionist, and participated in the insurrection at Dresden in 1848.

Digitized by Google

He spent eight years in prisons in Austria and Russia, was banished to Siberia in 1856, and escaped from there in an American vessel. He joined the staff of Herzen's revolutionary organ, the Kolokol, in London, but his ideas were too far advanced for his associates. He quarreled with Karl Marx and Mazzini. He went to Switzerland, where he preached Nihilism, and died suddenly at Berne. He demanded the entire abolition of the state as a state, the absolute equalization of individuals, and the extirpation of hereditary rights and of religion, his conception of the next stage of social progress being purely negative and annihilatory.

**Balaam** (bā'lam), a heathen seer, invited by Balak, king of Moab, to curse the Israelites, but compelled by miracle to bless them instead (Numbers 22-24). In another account he is represented as aiding in the perversion of the Israelites to the worship of Baal, and as being, therefore, slain in the Midianitish war (Numbers 31; Joshua 13).

**Balaklava** (ba-là-klä'và), a small seaport in the Crimea, 8 mi. s. s. e. Sebastopol. In the Crimean War it was captured by the British, and a battle took place here October, 1854, wherein the Russians were defeated. In this contest occurred the "Charge of the Light Brigade" rendered famous by Tennyson's poem.

Balance, an instrument employed for ascertaining and determining the quantity of any substance equal to a given weight. Balances are of various forms; in that most commonly used a horizontal beam rests so as to turn easily upon a certain point known as the center of motion. From the extremities of the beam, called the centers of suspension, hang the scales, and a slender metal tongue midway between them, and directly over the center of motion, indicates when the beam is level. The characteristics of a good balance are: 1, that the beam should rest in a horizontal position when the scales are either empty or loaded with equal weights; 2, that a very small addition of weight put into either scale should cause the beam to deviate from the level, which property is denominated the sensibility of the balance; 3, that when the beam is deflected from the horizontal position by inequality of the weights in the scales, it should have a tendency speedily to restore itself and come to rest in the level, which property is called the *stability* of the balance. To secure these qualities the arms of the beam should be exactly similar, equal in weight and length, and as long as possible; the centers of gravity and suspension should be in one straight line, and the center of motion immediately above the center of gravity; and the center of motion and the centers of suspension should cause as little friction as possible. The center of motion ought to be a knife-edge; and if the balance requires to be very delicate, the centers of suspension ought to be knife-edges also. For purposes of accuracy, balances have occasionally means of raising or depressing the center of gravity, of regulating the length of the arms, etc., and the whole apparatus is not unfrequently enclosed in a glass case, to prevent the heat from expanding the arms unequally, or currents of air from disturbing the equilibrium.

Of the other forms of balance, the Roman balance, called *steelyard*, consists of a lever moving freely upon a suspended fulcrum, the shorter arm of the lever having a scale or pan attached to it, and the longer arm, along which slides a weight, being graduated to indicate quantities. It is com-monly used for weighing loaded carts, for luggage at railway stations, etc. A variety of this, the Danish balance, has the weight fixed at the end of the lever, the fulcrum being movable along the graduated index. The spring-balance shows the weight of articles by the extent to which they draw out or compress a spiral spring. It is of service where a high degree of exactness is not required, and finds application in the dynamometer for measuring the force of machinery. An extremely ingenious balance, used in the mint and the Bank of England for weighing "blanks" and sovereigns, distributes them automatically into three compartments according as they are light, heavy, or the exact weight.

Balance of Power, a political principle which first came to be recognized in modern Europe in the sixteenth century, though it appears to have been also acted on by the Greeks in ancient times in preserving the relations between their different states. The relations between their different states. object in maintaining the balance of power is to secure the general independence of nations as a whole, by preventing the aggressive attempts of individual states to extend their territory and sway at the expense of weaker countries. The first European monarch whose ambitious designs induced a combination of other states to counteract them, was the Emperor Charles V; similar coalitions being formed in the end of the seventeenth century, when the ambition of Louis XIV excited the fears of Europe, and a century later against the exorbitant power and ag-gressive schemes of the first Napoleon. More recently still we have the instance of the Crimean War, entered into to check the ambition of Russia. Of late years there has been a marked tendency among British politicians to decry and impugn the principle of the balance of power, as calculated only to propagate a system of mutual hostility, and retard the cause of progress, by the expenditure both of money and life thus occasioned. There can be no doubt, however, that to the carrying out of this principle the independence of some of the smaller and weaker European states is fairly attributable.

**Bal'aton** (or Plattensee), a lake of Hungary, 55 mi. s.w. of Pesth; length 50 mi.; breadth, 3 to 10 mi.; area about 390 sq. mi. Of its thirty-two feeders the Szala is the largest, and the lake communicates with the Danube by the rivers Sio and Sarviz. It abounds with a species of perch.

**Baibo'a**, VASCO NUNEZ DE (1475-1517), one of the early Spanish adventurers in the New

World. Having dissipated his fortune, he came to America, and was at Darien with the expedition of Francisco de Enciso in 1510. An insurrection placed him at the head of the colony, but rumors of a western ocean and of the wealth of Peru led him to cross the isthmus. On Sept. 25, 1513, he saw for the first time the Pacific, and after annexing it to Spain, and acquiring information about Peru, returned to Darien. Here he found himself supplanted by a new governor, Pedrarias Davila, with much consequent grievance on the one side, and much jealousy on the other. Balboa submitted, however, and in the following year was appointed viceroy of the South Sea. Davila was apparently reconciled to him, and gave him his daughter in marriage, but shortly after had him beheaded on a charge of intent to rebel. Pizarro, who afterward completed the discovery of Peru, served under Balboa.

**Balch,** GEORGE B., b. 1821, in Tennessee. He entered the navy in 1837; was many years on foreign service and participated in the attack on Vera Cruz. He served in the South Atlantic squadron during the Civil War and commanded the *Pawnee*. He became commodore, 1872, rear admiral, 1878, and was superintendent of the naval academy until 1879. He was placed on the retired list in 1883.

**Balder** (or Baldur), a Scandinavian divinity, represented as the son of Odin and Frigga, beautiful, wise, amiable, and beloved by all the gods. He is believed to be a personification of the brightness and beneficence of the sun.

Baidness, loss of the hair, complete or partial, usually the latter, and due to various causes. Most commonly it results as one of the changes belonging to old age, due to wasting of the skin, hair sacs, etc. It may occur as a result of some acute disease, or at an unusually early age, without any such cause. In both the latter cases it is due to defective nourishment of the hair, owing to lessened circulation of the blood in the scalp. The best treatment for preventing loss of hair seems to consist in such measures as bathing the head with cold water and drying it by vigorous rubbing with a rough towel and brushing it well with a hard brush. Various stimulating lotions are also recommended, especially those containing cantharides. But probably in most cases senile baldness is unpreventable. When extreme scurfiness of the scalp accompanies loss of the hair an ointment that will clear away the scurf will prove beneficial.

**Baldwin 1** (1172-1206), emperor of Constantinople. His courage and conduct in the fourth crusade led to his unanimous election as Emperor of the East after the capture of Constantinople by the French and Venetians in 1204. Baldwin marched on Adrianople against Greek revolutionists. but was taken prisoner and d. in captivity.

**Baldwin II** (1217-1270), fifth and last Latin emperor of Constantinople. During his minority John de Brienne was regent, but on his assuming the power himself the empire fell to pieces. In 1261 Constantinople was taken, and Baldwin retired to Italy. **Baidwin I,** king of Jerusalem, reigned 1100–18, having assumed the title which his elder brother Godfrey de Bouillon had refused. BALDWIN II, his cousin and successor, reigned from 1118-31. During his reign the reduction of Tyre and institution of the order of Templars took place. BALDWIN III, king of Jerusalem from 1143 to 1162, was son and successor of Foulques of Anjou. He devoted himself to the hopeless task of improving the kingdom and establishing the Christian chivalry in the East.

**Baldwin**, CHARLES H. (1822-1888), b. in New York City. He entered the navy in 1839, became a lieutenant in 1853, commander in 1862, and captain in 1869. He served in the Mexican War, being stationed on the west coast. He was in command of one of the steamers of the mortar flotilla when Farragut's fleet passed forts St. Phillip and Jackson in 1862, and at the attack of Vicksburg in June, 1862.

the attack of Vicksburg in June, 1862. **Baldwin**, HENRY, LL.D. (1779-1844), b. at New Haven, Conn. He was elected to Congress several times from the state of Pennsylvania, and in 1830 was appointed a judge of the Supreme Court of the U.S.

**Baldwin**, MATTHIAS W. (1796–1866), b. in New Jersey. He is given credit for having constructed the first locomotive in America, the "*Ironsides*," and for making several improvements in locomotives.

**Baldwin**, ROGER SHERMAN, LL.D.(1793-1863), an American statesman, b. in New Haven, Conn. He became governor of his native state in 1844, and was sent to the U. S. Senate in 1847, He was associated with J. Q. Adams in the famous Amistad trial in 1841.

Balear'ic Islands, a group of five islands, southeast of Spain, including Majorca, Minorca, Iviza, and Formentera. The popular derivation of the ancient name, Baleares, has reference to the repute of the inhabitants for their skill in slinging, in which they distinguished themselves both in the army of Hannibal, and under the Romans, by whom the islands were annexed in 123 B. c. They were taken by James I, king of Arragon, 1220-34, and constituted a kingdom, which in 1375 was united to Spain. The islands now form a Spanish province, with an area of 1,860 sq. mi., and 312,503 inhabitants.

**Baleen'**, the term applied to the horny plates attached to the palate of the whalebone whales, and which constitute the "whalebone" of commerce. The baleen plates are arranged in a double row on the palate, and depend into the cavity of the mouth of the whale. The length of the largest plates averages from 10 to 14 feet; while in number about 200 plates exist on each side of the mouth. The huge fringe acts as a kind of sieve or strainer in serving to prevent substances of large bulk from gaining access to the throat, and also in entangling the minute forms upon which the whale feeds.

**Balfe,** MICHAEL WILLIAM (1808–1870), a British musician, was b. in Dublin. When only sixteen he conducted the orchestra at Drury Lane Theater. He afterward studied

music in Italy. In 1845 he was made conductor of the Italian Opera, Covent Garden. His principal works are operas. The bestknown are, The Bohemian Girl (1844), and The Rose of Castile (1857). His latest productions were Satanella, The Puritan's Daughter, Blanche de Nevers, and The Sleeping Queen.

Bal' four, RIGHT HON. ARTHUR JAMES, M. P., a noted English statesman of the present day, was b. in 1848, and in 1856, succeeded his father in the estate of Whittinghame, Haddingtonshire. He was educated at Eton and Trinity College, Cambridge, and in 1874 was returned to Parliament as Conservative member for Hetford. Public attention was soon drawn to him by his quickness of perception and readiness in debate, and he has now become one of the most effective speakers in the House. From 1878 to 1880 he was private secretary to his uncle, Lord Salisbury, foreign secretary in Lord Beaconsfield's ministry, and he accompanied that nobleman to the Berlin Congress. On the accession to power of Mr. Gladstone, in 1880, he for a time formed one of Lord Randolph Churchill's "Fourth Party," and in 1882 fiercely assailed the government on the Kilmainham Treaty question. At the election of 1885 he was returned for East Manchester, a seat which he still retains. He was appointed president of the Local Government Board in 1885, secretary for Scotland in 1886. on the death of W. H. Smith, in 1897-91. On the death of W. H. Smith, in 1891, he be-came first lord of the treasury and leader of the House, offices which he held until the resignation of Lord Salisbury in 1892. In 1895 appeared his work, entitled *The Founda*tions of Belief, which excited considerable public attention and interest.

**Balfour,** FRANCIS MAITLAND (1851-1882), brother of the foregoing. He published a work on *Elements of Embryology*, was elected fellow of his college at the age of twenty-three, and fellow of the Royal Society four years later. He was a most promising scientist.

**Balfour',** SIR JAMES, lord president of the Court of Session, and son of Sir Michael Balfour, of Pittendreich, in Fifeshire, was one of the most dubious politicians of the Reformation period in Scotland. He, however, succeeded in achieving considerable personal and professional success, attaining in the end the lord presidentship of the Court of Session. He d. in 1583.

**Balfour**, JOHN HUTTON (1808–1884), a distinguished Scotch botanist. He established the Botanical Society of Edinburgh, was professor of botany in Glasgow University, and a fellow of the Royal Society. He was for thirty years dean of the medical faculty of the University of Edinburgh.

**Baifroosh'** (or Barfurush'), a town, Persia, province of Mazanderan, about 12 mi. from the Caspian, a great emporium of the trade between Persia and Russia. Pop. est. 50,000.

Ba'li, an island of the Indian Archipelago, e. of Java, belonging to Holland; area about 2,260 sq. mi. Principal products: rice, cocoa, coffee, indigo, cotton, etc. It is divided into eight provinces under native rajahs, and forms one colony with Lombok, the united population being 863, 725, of whom 300,000 may belong to Bali.

**Bai'ioi** (or Ballibi), JOHN DE, of Barnard Castle, Northumberland, father of king John Baliol, a great English or Norman baron in the reign of Henry III. In 1263 he laid the foundation of Balliol College, Oxford, which was completed by his widow Devorguila (or Devorgilla). His son, John Baliol, became temporary king of Scotland. He d. 1269.

Bal' iol (1249-1315) (or Balliol), JOHN, king of Scotland. On the death of Margaret, Baliol claimed the vacant throne by virtue of his descent from David, Earl of Huntingdon, brother to William the Lion. Robert Bruce opposed Baliol; but Edward I's decision was in favor of Baliol. Irritated by Edward's harsh exercise of authority, Baliol concluded a treaty with France, then at war with England; but after the defeat at Dunbar he surrendered his crown into the hands of the English monarch. He was sent with his son to the Tower, but in 1297 obtained liberty to retire to his Norman estates, where he died. His son, Edward, in 1332, landed in Fife with an armed force, and having defeated a large army under the regent Mar, got himself crowned king, but was driven

out in three months. **Baik'an** (Arab. "high ridge;" anciently Hæmus. "the wintry or snowy mountains"), the most eastern branch of the great Alpine system of Central Europe, extends from the plain of Sophia to the Black Sea, separating Bulgaria from Rumili, and forming the watershed between the Danube and the Maritza. Tchar-dagh (9,700 ft.) in the w. part, is its highest peak. The B. is crossed by 6 roads, over as many passes, the most important of which is the Porta Trajani, which forms the overland route between Vienna and Constantinople. As a political boundary it divides Bulgaria from Eastern Roumelia.

Baikan Free States: Bulgaria, Eastern Roumelia. Roumania, and Servia.

**Balkash**' (or Balkhash) (bål-*k*åsh'), a salt lake in Russian Central Asia, area 8,500 sq. mi., depth nowhere more than 80 ft.

**Balkfi** (bälk or bäl $\hbar$ ), a city in the north of Afghanistan, in Afghan Turkestan, at one time the emporium of the trade between India, China, and Western Asia. In 1220 It was sacked by Genghis Khan, and again by Timur in the fourteenth century. A new town has risen up an hour's journey n. of the old, the residence of the Afghan governor, with a population of about 25,000.

**Bal'kis**, the Arabian name of the Queen of Sheba who visited Solomon. She is the central figure of innumerable Eastern legends and tales.

**Ball**, Game of. Ball-playing was practised by the ancients, and old and young amused themselves with it. The Phæacian damsels are represented in the Odyssey as playing it to the sound of music, and Horace represents Mæcenas as amusing himself thus in a journey. In the Greek gymnasia, the Roman baths, and in many Roman villas, a *sphæristerium* (a place

appropriated for playing ball) was to be found; the games played being similar to those indulged in at the present day. In the Middle Ages the sport continued very popular both as an indoor and outdoor exercise, and was a favorite court pastime until about the end of the eighteenth century. In England foot-ball and tennis are mentioned at an early date, and a favorite game prior to the English revolution was one in which a mall or mallet was used, hence the name pall-mall for the game and the place where it was played. The most popular modern forms are Crickat, Base ball, Foot ball, Golf, Lawn-tennis, and Polo (which see).

**Ball**, JOHN, an itinerant preacher of the fourteenth century, excommunicated about 1367 for promulgating "errors, schisms, and scandles against the pope, archbishops, bishops, and clergy." He was one of the most active promoters of the popular insurgent spirit which found vent under Wat Tyler in 1381.

**Ball**, SIR ROBERT STAWELL, a British astronomer, was b. in Dublin, July 1, 1840, and studied at Trinity College. In 1865 he was appointed Lord Rosse's astronomer at Parsonstown; in 1873 Professor of Applied Mathematics at the Royal Irish College of Science; and in 1874 Professor of Astronomy at Dublin, aud Astronomer Royal for Ireland. He has published several works on mechanics and astronomy as, The Story of the Hearens, In Starry Realms, and In the High Hearens, besides many articles in various magazines.

Ball, THOMAS (1819 —). American sculptor, born in Charlestown. Mass. He studied in Europe, and in 1865 settled in Florence. Among his works are the equestrian statue of Washington at Boston, the Webster statue in Central Park, New York, and the Emancipation group at Washington, D. C.

Bal'lad, a term loosely applied to various poetic forms of the song type, but in its most definite sense a poem in which a short narrative is subjected to simple lyrical treatment. The ballad is probably one of the earliest forms of rhythmic poetic expression, constituting a species of epic in miniature, out of which by fusion and remolding, larger epics were sometimes shaped. As in the folk-tales, so in the ballads of different nations, the resemblances are sufficiently numerous and close to point to the conclusion that they have often had their first origin in the same primitive folk-lore or popular tales. But in any case, excepting a few modern literary ballads of a subtler kind, they have been the popular expression of the broad human emotions clustering about some strongly outlined incidents of war, love, crime, superstition, or death. It is probable that in the Homeric poems fragments of older ballads are embedded; but the earliest ballads, properly so called, of which we have record were the ballistea or dancing songs of the Romans, of the kind sung in honor of the deeds of Aurelian in the Sarmatic War by a chorus of dancing boys. In their less specialized sense of lyric narratives, their early popularity among the Teutonic race is evidenced by the testimony of Tacitus, of the Gothic historian Jornandes, and the Lombard historian Paulus Diaconus; and many appear to have been written down by order of Charlemagne and used as a means of education. Of the ballads of this period, however, only a general conception can be formed from their traces in conglomerates like the Niebelungenlied; the more artificial productions of the Minnesänger and Meistersänger overlying the more popular ballad until the fifteenth century, when it sprang once more into vigorous A third German ballad period was inilife. tiated by Bürger under the inspiration of the revived interest in the subject shown in Great Britain and the publication of the Percy Reliques; and the movement was sustained by Herder, Schiller, Goethe, Heine, Uhland, and others. The earlier German work is, however, of inferior value to that of Scandinavia, where, though comparatively few manuscripts have survived, and those not more than three or four centuries old, a more perfect oral tradition has rendered it possible to trace the original stock of the twelfth century.

Of the English and Scottish ballads anterior to the thirteenth century there are few traces beyond the indication that they were abundant, if indeed anything can be definitely asserted of them earlier than the fourteenth century. Among the oldest may be placed The Little Guest of Robin Hood, Hugh of Lincoln, Sir Patrick Spens, and the Battle of Otterbourn. In the fifteenth century specimens multiplied rapidly; ballad-making became in the reign of Henry VIII a fashionable amusement, the king himself setting the example; and though in the reign of Elizabeth ballads came into literary disrepute and ballad singers were brought under the law, yet there was no apparent check upon the rate of their produc-tion. Except perhaps in the n. of England and s. of Scotland, there was, however, a marked and increasing tendency to vulgarization as distinct from the preservation of popu-lar qualities. The value of the better ballads was lost sight of in the flood of dull, rhythmless, and frequently scurrilous verse. The modern revival in Britain dates from the publication of Ramsay's Evergreen and Tea-Table Miscellany (1724-27) and of the selection made by Bishop Percy from his seventeenth-century MS. (1765), a revival not more important for its historic interest than for the influence which it has exercised upon all subsequent poetry.

The threefold wave discernible in German, if not in British, ballad history, is equally to be traced in Spain, which alone among the Latinized countries of Europe has songs of equal age and merit with the British historic ballads. The principal difference between them is, that for the most part the Spanish romance is in trochaic, the British ballad in iambic meter. The ballads of the Cid date from about the end of the twelfth and beginning of the thirteenth century; and then followed an interval of more elaborate production, a revival of ballad interest in the sixteenth cen-

tury, a new declension, and finally a modern and still persisting enthusiasm.

The French poetry of this kind never reached any high degree of perfection, the romance, farce, and lyric flourishing at the expense of the ballad proper. Of Italy much the same may be said, though Sicily has supplied a great store of ballads; and nearly all the Portuguese poetry of this kind is to be traced to a Spanish origin. The Russians have lyrico-epic poems, of which some, in old Russian, are excellent, and the Servians are still in the ballad-producing stage of civilization. Modern Greece has also its store of ballads, to which Madame Chenier called attention in the middle of last century. Both in Greece and Russia and in the Pyrenees the old habit of improvising song as an accompaniment to dance still exists.

**Bal'iantyne**, JAMES (1772–1833), the printer of Sir W. Scott's works. Successively a solicitor and a printer in his native town, at Scott's suggestion he removed to Edinburgh, where the high perfection to which he had brought the art of printing, and his connection with Scott, secured him a large trade. His firm was involved in the bankruptcy of Constable & Co., by which Scott's fortunes were wrecked, but Ballantyne was continued by the creditors' trustee in the literary management of the printing house.

Ballantyne, ROBERT M. (1825-1894), a prolific British writer of tales for boys. His experiences acquired in the backwoods of Rupert's Land, among the fur-traders and Red Indians, in the Bell Rock Lighthouse, in a visit to the Cape, have all been utilized in producing sound, wholesome, and interesting tales.

**Ball' arat**, a city and gold field of the colony of Victoria, Australia, 96 mi. w. n. w. of Melbourne. B. was the scene of one of the earliest gold discoveries in Victoria, in June, 1851, and is still the principal gold-producing district of the colony. Quartz mining is now the leading feature of the district, and auriferous reefs are remuneratively worked at a depth of 900 and 1,000 ft. The town of B. consists of two distinct municipalities, B. East and B. West, with an aggregate population of 44,766. It has iron-foundries, breweries, and distilleries, several flour mills, and other factories. It is connected by railway with Melbourne.

**Ball-cock**, a kind of self-acting stop-cock, opened and shut by means of a hollow sphere or ball of metal attached to the end of a lever connected with the cock. Such cocks are often employed to regulate the supply of water to cisterns. The ball floats on the water in the cistern by its buoyancy, and rises and sinks as the water rises and sinks, shutting off the water in the one case and letting it on in the other.

**Ball-flower,** an architectural ornament resembling a ball placed in a circular flower, the three petals of which form a cup round it; usually inserted in a hollow molding, and generally characteristic of the Decorated Gothic style of the fourteenth century.

Bal'ilol College, Oxford, was founded about 1263 by John Balliol (or Baliol) of Barnard Castle, Durham, and Devorgilla, his wife (parents of John Balliol, king of Scotland). There are a large number of valuable scholarships and exhibitions, including the Snell exhibitions, fourteen in number, held by students from Glasgow University.

**Ballis' tic Pendulum,** an apparatus invented by Robins, toward the close of the eighteenth century, for ascertaining the velocity of military projectiles, and consequently the force of fired gunpowder. A piece of ordnance is fired against bags of sand supported in a strong case or frame suspended so as to swing like a pendulum. The arc through which it vibrates is shown by an index, and the amount of vibration forms a measure of the force or velocity of the ball.

**Balloon**, a gas-tight bag or envelope, generally pear-shaped when inflated with hydrogen-, coal-, or other gas, from which a car or basket is suspended from netting, used for purposes of ascension in free air. The balloon is provided with a suitable valve, operated by a rope which is within reach of the person in the car, by which the gas is permitted to escape when it is desired to descend to the earth. Bags filled with sand are carried in the car, and the *Aeronaut*, or balloonist, empties the sand bag when he desires to rise to a higher altitude. Balloons generally are made of a strong silk. Hot-air balloons use heated air instead of gas for inflation.

Following are some of the principal events in the developments of balloons: 1757, Galien of Avignon wrote on aerostation; 1767, Dr. Black of England ascertained that a light envelope filled with hydrogen gas would as-cend; 1785, hot-air balloon invented by Stephen and Joseph Montgolfler, paper manufactur-ers at Annonay, near Lyons, France. In June of that year, a captive hot-air balloon was made to ascend over 2,000 yds. August 27, a hydrogen balloon made by two brothers by the name of Roberts, under the superintendence of M. Charles, professor of natural philosophy, Paris, was sent up from the Champs de Mars, Paris. This balloon remained in the air three quarters of an hour, fell in a field 15 mi. distant from the place of ascension. Peasants were so terrifled at the appearance of the balloon that they tore it to shreds. September 19, Joseph Montgolfier repeated his former experiment at Versailles. The balloon carried, in a basket suspended from the bag, a sheep, a cock, and duck, the first of living creatures to navigate in the air. October 15, M. Francois Pilatre de Rozier, a young French naturalist, ascended in a captive balloon, the first man to make a balloon ascension. November 21, de Rozier and the Marquis d'Arlandes made the first ascension in a free balloon. The result was successful. This was a fire balloon. December 1, MM. Charles and Robert ascended in Paris, in a balloon inflated with hydrogen gas. Professor Charles invented the balloon valve at the top, and suspended the car from a hoop attached to netting. The first balloon ascension in America was made in Philadel-phia soon after the Montgolfier experiment.

The balloon consisted of 45 small hydrogen balloons, and James Wilcox, a carpenter, made the first ascension.\_ In 1794 balloons were introduced into the French army and used for making observations at the battles of Liege, and Fleurus, and the sieges of Mentz and Ehrenbreitstein. Guy Lussac, a celebrated French chemist, in 1804, reached an altitude of 23,040 ft., and carried up instruments for making scientific observations of the character and properties of the atmosphere at great heights. In 1820 Charles Green, in England, introduced the practise of inflating balloons with illuminating gas. Messrs. Holland, with illuminating gas. Messrs. Holland, Green, and Mason, in 1836, ascended from London in a balloon of 85,000 cu. ft. ca-pacity, and made a voyage of 500 mi. In 1852 Henri Giffard, a young French engineer, built an elongated balloon, filled with coal gas, driven by an aerial screw propeller actuated by a steam engine. September 24, he made an ascension. He was able to make a change in direction in spite of the wind, and this was the first navigable balloon propelled by a motor. Wise, the celebrated American bal-loonist, made an ascension from St. Louis in 1859 and landed in Jefferson co., N. Y., having traveled a distance of 1,150 miles. In 1872 Dupuy de Lome, chief naval constructor of the French government, tested a navigable balloon, in which the propeller was actuated by 14 men in the car. The experiment was fairly successful. The first electrical navigable balloon was built and tested in 1883. Built by Gas-ton Tissandier of France. The apparatus was driven by a Siemens motor weighing 99 pounds, actuated by a primary bichromate of potash battery, weighing 517 pounds, capable of developing 14 horse power for 24 hours. The screw was 9.18 ft. in diameter with two arms. and rotated at 180 revolutions a minute. First ascension made October 8, and the aeronaut succeeded in sailing against the wind and performing several evolutions. The aeronautical establishment of the French war department built an electrical navigable balloon which was the first that ever returned to its moorings after ascending. It was constructed in 1884 under the superintendence and according to the plans of Renard and Krebs, French army officers. The elongated balloon was 165 t. in length and 27<sup>1</sup>/<sub>4</sub> ft. in diameter, and the screw was placed in front. This *air ship*, named *La France*, had a car 105 ft. long. The electric motor was of 9 horse power, and the screw, of two arms, was 27 ft. in diameter. Aug. 9, 1894, a trial was made. The air ship proved perfectly manageable, made a speed of 104 mi. an hour, and was returned to its landing. Other trials proved that the air ship was a navigable balloon. Balloons were used for ob-servation by General McClellan during the Civil War, and he organized a balloon corps. The first woman to make a balloon ascension was Madam Thible, a French woman, who, June 4, 1784, ascended from Lyons in a fireballoon. She is said to be the only woman who ever ascended in a fire balloon. Count Zambeccari was the first balloonist to lose his life.

He made an ascension in a fire-balloon from Bologna, and was compelled to jump from his car because of his balloon catching fire. He was instantly killed. The first parachute descent was made by a dog, which Blanchard, in 1785, carried up with him in a balloon. The dog descended safely. Andre Jaques Garnerin, Oct. 22, 1797, was the first man to safely descend from a balloon in a parachute.

The largest balloon ever made is said to have been the balloon constructed in 1864 by M. Eugene Godard. Its capacity was nearly half a million cubic feet. The air in this fire balloon was heated by an 18-ft. stove, weighing with the chimney, 980 pounds. This fur-nace was fed with straw, and the "car" consisted of a gallery surrounding it. Two ascents of this balloon were made from Cremorne Gardens, on July 20, and July 28, 1864. The "Gáant," Nadar's colossal balloon, contained 215,363 cubic ft. of gas, and raised 35 persons at one time. This balloon was also remarkable as having attached to it a regular two-story house for a car. Its ascent on Sun-day, Oct. 18, 1863, was witnessed by nearly half a million persons. After passing over the eastern part of France, Belgium, and Holland, the "Gaant" suffered a disastrous descent in Hanover on the day after it started on its perilous journey. In 1873 a balloon of 400,000 ft. of cubic capacity was made to enable Mr. Wise to cross the Atlantic, but it unfortu-nately burst. The longest distance traveled in a balloon in the shortest time was 1,150 mi. in 24 hours, by Messrs. Wise and La Mountain, the route taken being from St. Louis, in the direction of New York.

**Balloon-fish**, a curious tropical fish that can inflate itself so as to resemble a ball.

**Bal** lot, voting by, signifies literally voting by means of little balls (called by the French ballottes), usually of different colors, which are put into a box in such a manner as to enable the voter, if he chooses, to conceal for whom or for what he gives his suffrage. The method is adopted by most clubs in the election of their members—a white ball indicating assent, a black ball dissent. Hence, when an applicant is rejected, he is said to be blackballed. The term voting by ballot is also applied in a general way to any method of secret voting, as. for instance, when a person gives his vote by means of a ticket bearing the name of the candidate whom he wishes to support. In this sense vote by ballot is the mode adopted in electing the members of legislative assemblies in most countries, as well as the members of various other bodies. In ancient Greece and Rome the ballot was in common use. In the U.S. the ballot was in use in early colonial times, and was made compulsory in the constitutions of New Jersey, Pennsylvania, and all other states. The Australian ballot system. originated within ten years in the British colonies, has recently been adopted by law in sev-eral of the U.S. By a carefully contrived system of secluding each voter at the polls, and marking and folding the ballots, it claims to

secure greater secrecy and honesty than any other method of voting.

**Ballyme'na**, a town, Ireland, county Antrim, 22 mi. from Belfast, with a considerable trade in linens and linen yarns, the manufacture of which is carried on to a great extent. Pop. 8,655.

**Baim**, a fragrant perennial herb belonging to the order Labiatæ, a native of the south of Europe and Western Asia, and naturalized in a few places in England, has long been cultivated in gardens. The stems and leaves are still occasionally used in medicine as a gentle stimulant and tonic, and were formerly in high repute. The taste is somewhat austere and slightly aromatic. The quantity of essential oil, on which its whole qualities depend, is not more than sufficient to communicate a pleasant flavor to the infusion. A variety of the common catmint, with a smell like that of balm, is often mistaken for it. Moldavian Balm is a native of Eastern Europe, Siberia, etc. Bastard Balm, a native of the south of England and of many parts of Europe, is a very beautiful plant, which when dried has a delightful fragrance, and retains it long.

Baimaceda, JOSE MANUEL (1840-1891), Chilean statesman, early distinguished as a political orator; advocated in Congress separation of church and state; as premier, in 1884, introduced civil marriage; elected president in 1886. A conflict with the Congressional party, provoked by his alleged crueities and official dishonesty, resulted in Balmaceda's exile and suicide.

**Baim of Gilead**, the exudation of a tree, a native of Arabia Felix, and also obtained from another closely allied species. The leaves of the former tree yield when bruised a strong aromatic scent; and the balm of Gilead of the shops, or balsam of Mecca or of Syria, is obuained from it by making an incision in its trunk. It has a yellowish or greenish color, a warm, bitterish, aromatic taste, and an acidulous fragrant smell. It is valued as an odoriferous unguent and cosmetic.

**Baimor al Castle**, the Highland residence of Victoria, Queen of England, beautifully situated on the s. bank of the Dee, in the county of, and 45 mi. w. of Aberdeen. It stands in the midst of fine and varied mountain scenery, is built of granite in the Scottish baronial style, has been recently (1888) enlarged, and has a massive and imposing appearance. The estate, which is the queen's private property, extends to 25,000 acres, mostly deer forest.

**Baisa**, a kind of raft or float used on the coasts and rivers of Peru and other parts of South America for fishing, for landing goods and passengers through a heavy surf, and for other purposes where buoyancy is chiefly wanted. It is formed generally of two inflated seal skins, connected by a sort of platform on which the fisherman, passengers, or goods are placed.

**Baisam**, an aromatic, resinous substance, flowing spontaneously or by incision from certain plants. A great variety of substances pass under this name. But in chemistry the term is confined to such vegetable juices as consist of resins mixed with volatile oils, and yield the volatile oil on distillation. The resins are produced from the oils by oxidation. A balsam is thus intermediate between a volatile oil and a resin. It is soluble in alcohol and ether, and capable of yielding benzoic acid. The balsams are either liquid or more or less solid; as, for example, the balm of Gilead, and the balsams of Copiapo, Peru, and Tolu. Benzoin, dragon's-blood, and storax are not true balsams, though sometimes called so. The balsams are used in perfumery, medicine, and the arts.

Balsam Fir, the balm of Gilead fir.

**Balta**, a Russian town, government of Podolia. 115 mi. n.n.w. of Odessa. Pop. 32,558.

**Baltic,** Battle of the, the defeat of the Danish fleet at Copenhagen by Sir Hyde Parker and Nelson in 1801.

**Baltic Provinces,** a term commonly given to the Russian governments of Courland, Livonia, and Esthonia. Area 201,526 sq. mi.; pop. 6, 450.835.

Baltic Sea, an inland sea or large gulf connected with the North Sea, washing the coasts of Denmark, Germany, Russia, and Sweden. Area 171,743 sq. mi. A chain of islands separates the southern part from the northern, or Gulf of Bothnia. In the northeast the Gulf of Finland stretches far into Russia, and separates Finland from Esthonia; the Gulf of Riga washes the shores of the three Russian governments of Courland, Livonia, and Esthonia; while the Gulf of Danzig is an inlet on the Prussian coast. The water of the Baltic is colder and clearer than that of the ocean; it contains a smaller proportion of salt, and the ice obstructs the navigation three or four months in the year. More than 250 rivers run into the Baltic, which has a large trade, and numbers among its more important harbors the cities of Copenhagen, Viel, Danzig, Memel, Riga, Cronstadt, and Stockholm. The Sleswig-Holstein Canal, near Kiel, forms a method of access to the North Sea. The Sound, the Great and the Little Belt, lead from the Kattegat into the Baltic.

**Bal'timore,** Baltimore co., Md. on the n. side of the Patapsco, 14 mi. above Chesapeake Bay. Baltimore takes its name from Lord Baltimore, the founder of Maryland; it was first laid out as a town in 1729, and was erected into a city in 1797. It is well built, chiefly of brick, and is known as the "monumental city," from the public monuments which adorn it, the principal being the Washington Monument. Among its buildings are the city hall, built in Renaissance style, of white marble with a tower and dome rising 240 feet; the Peabody Institute, containing a library, art gallery, etc.; the Maryland Institute; the custom-house: the post-office: the U. S. court-house and jail, the Johns Hopkins Hospital, the Roman Catholic cathedral, etc. The chief educational institution, now one of the most important in the States, is the Johns

### Baltimore

by its founder (whose name it bears). The University of Maryland is one of the oldest medical schools in the U. S., established in 1812. Industries: ship-building; manufactures of iron, wool, cotton, pottery, etc.: sugarrefining, distilling, tanning, the making of agricultural implements, canning oysters, and fruits, etc. As a flour market Baltimore is an important center; and it does an immense trade in exporting tobacco and other products. The harbor is very extensive, and has been much improved. Pop. 434,439.

much improved. Pop. 434,439. **Baltimore**, GEORGE CALVERT, LORD (1580-1632), b. in Yorkshire. He was for some time secretary of state to James I, but this post he resigned in 1624 in consequence of having become a Roman Catholic. Notwithstanding this he retained the confidence of the king, who in 1625 raised him to the Irish peerage, his title being from Baltimore, a fishing village of Cork. He had previously obtained a grant of land in Newfoundland, but as this colony was much exposed to the attacks of the French he left it, and obtained another patent for Maryland. He died before the charter was completed, and it was granted to his son Cecil, who deputed the governorship to his brother Leonard (1606-47).

**Baltimore Bird** (or oriole), an American bird, nearly allied to the starlings. It is a mi-

### Baltimore Orlole.

gratory bird, and is known also by the names of "golden robin," "hang-bird," and "firebird." It is about 7 inches long; the head and upper parts are black; the under parts of a brilliant orange hue. It builds a pouch-like nest, very skillfully constructed of threads deftly interwoven, suspended from a forked branch and shaded by overhanging leaves. It feeds on insects, caterpillars, beetles, etc. Its song is a clear, mellow whistle.

**Baluchistan** (ba-lö'chi-stän), a country in Asia, consists of the districts of Quetta and Bolan. Area 160,000 sq. mi.; pop. est. at 400,-000. The general surface of the country is rugged and mountainous, with some extensive intervals of barren, sandy deserts, and there is a general deficiency of water. The country is almost entirely occupied by pastoral tribes under semi-independent sirdars or chiefs. The Khan of Khelat is nominal ruler of the whole land, and in 1877 concluded a treaty with Britain, in virtue of which he has become a feudatory of the Empress of India. The right had already been secured of occupying at pleasure the mountain passes between Khelat and Afghanistan; but the new treaty places the whole country at the disposal of the British government for all military and strategical purposes. Khelat is the capital, and Quetta, a town in the northeast, is the principal city.

Balzac (bal-zak), HONOREDE (1799-1850), a celebrated French novelist, b. at Tours. Before completing his twenty-fourth year he had published a number of novels under various noms de plume, but the success attending all was very indifferent; and it was not till 1829, by the publication of Le Dernier Chouan, a tale of La Vendée, and the first novel to which Balzac appended his name, that the attention of the public was drawn to the extraordinary genius of the author. A still greater popularity at-tended his *Physiologie de Mariage*, a work full of piquant and caustic observations on human nature. He wrote a large number of novels, all marked by a singular knowledge of human nature and distinct delineation of character. but apt to be marred by exaggeration. A collected edition of his works under the title In Comédie Humaine was published in 45 volumes.

**Bamba**, a district of the Congo, w. coast of Africa, lying to the south of the river Ambriz. It is thickly populated, and is rich in gold, silver, copper, salt, etc.

**Bambar' ra**, a negro kingdom of Central Africa. on the Joliba (or Upper Niger), first visited by Mungo Park. The country is generally very fertile, producing wheat, rice, maize, yams, etc. The inhabitants belong to the Mandingo race, and are partly Mohammedans. Excellent cotton cloth is made. The capital is Sego. Pop. est. at 2.000,000.

**Bam'berg**, a town of Germany, Bavaria. It is the seat of a Catholic archbishop: the cathedral, founded in 1004, is one of the finest churches in Germany. The royal library contains 100,000 volumes and valuable MSS. Bamberg carries on a large trade; its industries are cotton spinning, tobacco manufacture, brewing, etc. Pop. 38,815.

**Bambino** (bam-bē'no) (Ital., an infant), the figure of our Saviour represented as an infant in swaddling clothes. The Santissimo Bambino in the church of Ara Ceeli at Rome, a richly decorated figure carved in wood, is believed to have a miraculous virtue in curing diseases. Bambinoes are set up for the adoration of the faithful in many places in Catholic countries.

**Bambocciades** (bam-boch-ādz') pictures, generally grotesque. of common, rustic, or low life. such as those of Peter Van Laar, a Dutch painter of the seventeenth century, who on account of his deformity was called *Bamboccio* (cripple). Teniers is the great master of this style.

**Bamboo'**, the common name of the arborescent grasses belonging to the genus Bambusa.

### Bambook

There are many species, belonging to the warmer parts of Asia, Africa, and America, and growing from a few feet to as much as 100 ft., requiring much moisture to thrive properly. The best-known species is common in tropical and sub-tropical regions. From the creeping underground rhizome, which is long, thick, and jointed, spring several round jointed stalks, which send out from their joints several shoots, the stalks also being armed at their joints with one or two sharp, rigid spines, The oval leaves, 8 or 9

Bamboo. a.-upper portion of the stem with foliage. b.-root stem. c.-section of stem.

inches long, are placed on short footstalks. The flowers grow in large panicles from the joints of the stalk. Some stems grow to 8 or 10 inches in diameter, and are so hard and durable as to be used for building purposes. The smaller stalks are used for walking sticks, flutes, etc.; and indeed the plant is used for innumerable purposes in the East Indies, China, and other Eastern countries. Cottages are almost wholly made of it; also, bridges, boxes, water pipes, ladders, fences, bows and arrows, spears, baskets, mats, paper, masts for boats, etc. The young shoots are pickled and eaten, or otherwise used as food. The seeds of some species are also eaten. The bamboo is imported into Europe and America as a paper material as well as for other purposes. Bambook', a country in Western Africa.

**Bambook'**, a country in Western Africa. The natives are Mandingoes, mostly professed Mohammedans ruled by independent chieftains, most of whom acknowledge the supremacy of France. Gold and ivory are exchanged for European goods.

# Banana

**Bam' ian**, a valley and pass of Afghanistan, the latter at an elevation of 8,496 feet, the only known pass over the Hindu Kush for artillery

The Largest of the Figures at Bamian.

and heavy transport. The valley is one of the chief centers of Buddhist worship, and contains five remarkable colossal statues from two to three hundred feet high, carved in the rocks, and other ancient monuments.

**Ban**, anciently, a title given to the military chiefs who guarded the eastern marches of Hungary, now the title of the governor of Croatia and Slavonia, a division of the kingdom of Hungary. A province over which a ban is placed is called *banat*.

**Bana**<sup>i</sup> na, a plant of the genus *Musa*. It is originally indigenous to the East Indies, and

an herbaceous plant with an underground stem. The apparent stem, which is some-

### Banana

times as high as 30 feet, is formed of the closely compacted sheaths of the leaves. The leaves are 6 to 10 feet long and 1 or more broad, with a strong midrib, from which the veins are given off at right angles; they are used for thatch, basket-making, etc., besides yielding a useful fiber. The spikes of the flowers grow nearly 4 feet long, in bunches, covered with purple-colored bracts. The fruit is 4 to 10 or 12 inches long, and 1 inch or more in diameter; it grows in large bunches, weighing often from 40 to 80 pounds. The pulp is soft and of a luscious taste; when ripe it is eaten raw or fried in slices. The banana is cultivated in tropical and sub-tropical countries, and is an important article of food. Manilla hemp is the product of a species of banana.

**Bana'na**, an African port, belonging to the Congo Free State, situated at the mouth of the river Congo.

**Banana-bird**, a pretty bird, a native of the West Indies and the warmer parts of America. It is a lively bird, easily domesticated, tawny and black in color, with white bars upon the wings.

**Banbury** (ban'be-ri), a town of England, in Oxford, long celebrated for its cheese, its cakes, and its ale. Pop. 12,768.

**Banca**, an island belonging to the Dutch East Indies, between Sumatra and Borneo, pop. 62,000, of which a considerable proportion are Chinese. It is celebrated for its excellent tin, of which the annual yield is above 4,000 tons; but it produces nothing else of any importance.

Bancroft, GEORGE (1800–1891), American istorian, b. at Worcester, Mass. He entered historian, b. at Worcester, Mass. He entered Harvard 1813 and graduated 1817. Studied history and philology at Göttengen 1818. Re-ceived degree Ph. D. 1820. He attended the lectures of Hegel at Berlin, and while traveling on the continent formed the acquaintance of eminent scholars, among them Savigny, Schlosser, and Goethe. After returning to America he taught for a time, then entered politics, and was made collector of customs at Boston. While lecturing on German litera-ture he continued his literary labors and published (1834-41) The History of the Colonization of the United States. Later this work was embodied in his larger history of *The United* States of North America. He was secretary of the navy under Polk (1845), and established the naval school at Annapolis. He was ambassador to England (1846). He published (1852), History of the Revolution in North America, from material collected while in England. His oration in honor of Abraham Lincoln, delivered 1866, is of historic value. He was minister to Russia (1867), and to the North German Confederation (1868). In 1871 he was accredited to the German empire. For many years he was an eminent contributor to *The North American Review.* While secretary of the navy he gave the order to take possession of California in case of war with Mexico. He was secretary of war one month, and gave the order to march

into Texas. His last public address was given at Washington, D. C., April 27, 1886. Bancroft, HUBERT HOWE (1832 -----), Amer-

**Bancroft**, HUBERT HOWE (1832 — ), American historian, b. in Ohio, went to California in 1852, and engaged in the publishing business. He acquired a magnificent library of books relating to the history of the Pacific Coast, and in 1875 published in five volumes his work on *The Native Races of the Pacific States*. In 1882 he published the first volume of his *History of the Pacific States*. He has written on the Spanish missions of California and the vigilance committees.

**Ban'croft**, RICHARD (1544-1610), an English prelate, entered the church, and rose rapidly during the reign of Elizabeth till he obtained the see of London in 1597. James I made him Archbishop of Canterbury on the death of Whitgift.

**Bandage**, a surgical wrapper of some kind applied to a limb or other portion of the body

to keep parts in position, exert a pressure, or for other purpose. To be able, to apply a bandage suitably in the case of an accident is a highly useful acc om pl is hm en t, which through the teaching of ambulance surgery now so common, may be easily acquired. See Surgery.

Boller Bandage.

**Banda Islands**, a group belonging to

Holland, Indian Archipelago. They are beautiful islands, of volcanic origin, yielding quantities of nutmeg. Goenong Api, or Fire Mountain, is a cone-shaped volcano which rises 2,320 feet above the sca. Pop. 6,700.

**Bandan'na,** a variety of silk handkerchief having a uniformly dyed ground, usually of bright red or blue, ornamented with white or yellow circular, lozenge-shaped, or other simple figures produced by discharging the ground color.

**Ban' dicoot**, the largest known species of rat, attaining the weight of 2 or 3 lbs..and the length, including the tail, of 24 to 30 in. It is anative of India, and is very abundant in Ceylon. Its flesh is said to be delicate and to resemble young pork, and is a favorite article of diet with the coolies. It is destructive to rice fields and gardens. The name is also given to a family of Australian marsupials. The most common species, the long-nosed bandicoot, measures about 14 ft. from the tip of the snout to the origin of the tail, and in general appearance bears a considerable resemblance to a large, overgrown rat.

**Baneberry**, a European plant, local in England, with a spike of white flowers and black, poisonous berries. Two American species are considered remedies for rattlesnake bite.

considered remedies for rattlesnake bite. Banff (bamf), county town of Banffshire, Scotland, a seaport on the Moray Firth at the

# Bangalore

mouth of the Deveron. It is well built, carries on some ship-building, and has a rope and sail work, a brewery, etc., with a fishing and shipping trade. Pop. 7,598. The county has an area of 686 sq. mi. Little wheat is raised, the principal crops being barley, oats, turnips, and potatoes. Fishing is an important industry; as is also the distilling of whisky. Pop. 64,107.

**Bangalore'**, a town of Hindustan, capital of Mysore, and giving its name to a considerable district in the east of Mysore state. The town stands on a healthy plateau 3,000 ft. above sea-level, has a total area of nearly 14 sq. mi., and is one of the pleasantest British stations in India. In the old town stands the fort, reconstructed by Hyder Ali in 1761, and taken by Lord Cornwallis in 1791. There are manufactures of silks, cotton cloth, carpets, gold and silver lace, etc. Pop. 180,366. The Bangalore district has an area of nearly 3,000 sq. mi., of which more than half represents cultivable land. Pop. 802,904.

Bangkok' (or Bankok), the capital of the kingdom of Siam. The inner city occupies an island surrounded with walls and bastions, and contains the palace of the king and other important buildings. A large portion of the population dwell in boats or wooden houses erected on bamboo rafts moored in the river, and forming a floating town. Houses in the European style are beginning to be erected, and among other advances recently made are the introduction of the telegraph and telephone, gas, fire-engines, and omnibuses. The exports consist chiefly of rice, sugar, silk, cotton, tobacco, pepper, sesame, ivory, aromatic wood, cabinet woods, tin, hides, etc.; and the imports consist chiefly of British cotton, woolen, and other goods. Pop. 350,000.

**Ban gor**, a city of North Wales, in Caernarvonshire. Since the construction of the Menai Bridge, Bangor has risen into some importance as a popular resort; its principal trade is in the export of slates from the neighboring quarries. Pop. 12,261.

**Ban** gor, a port of Penobscot co., Maine, on the w. side of Penobscot River, a flourishing and pleasantly situated town, and one of the largest lumber depots in the world. The river is navigable to the town for vessels of the largest size. Pop. 19, 103.

**Bangweo'lo**, lake in South Africa, the southernmost of the great lake reservoirs of the Congo, discovered by Livingstone in 1868, an oval-shaped shallow sheet of water, said to be 150 mi. in length along its greater axis from e. to w., and about 75 mi. in width, but its exact limits are uncertain.

**Ban'ian** (or Ban'yan), Indian trader or merchant, one engaged in commerce generally, but more particularly one of the great traders of Western India, as in the seaports of Bombay, Kurrachee, etc., who carry on a large trade by means of caravans with the interior of Asia, and with Africa by vessels. They form a class of the Vaisya caste, wear'a peculiar dress, and are strict in the observance of fasts and in abstaining from the use of flesh. Hence --Banian days, days in which sailors in the navy had no flesh meat served out to them. Banian days are now abolished, but the term is still applied to days of poor fare.

**Ban' jarmassin**, a district and town in the s.e. of Borneo, under the government of the Dutch. Exports: pepper, benzoin, bezoar, rattans, dragon's-blood, birds'-nests, etc.; im ports: rice, salt, sugar, opium, etc. Pop. of the district, 864,360.

**Ban** jo, a stringed instrument, the favorite musical instrument of the negroes of the Southern states. It is six stringed, has a body like a tambourine and neck like a guitar, and is played by stopping the strings with the fingers of the left hand and twitching or striking them with the fingers of the right. The upper or octave string, however, is never stopped.

stopped. Banks and Banking.— The definition of the word bank, etymologically considered, is a bench—its derivation is the Italian word banco —a bench upon which the Italian money dealers keep their money piled. This, at least, is the general acceptation of the term. Other authorities, and not without a show of reason, claim that the word is derived from the old German banck, which, however, has two meanings; one a pile and the other a bench. That the meaning of the word as applied to a heap or pile, is the origin of our modern term bank, is to a certain extent substantiated by the fact that among the early Italian bankers any aggregation of capital was termed a Monte. Thus to quote the words of Mr. Macleod:—

"At this time the Germans were masters of "At this time the Germans were masters of a great part of Italy, and the German word banck, meaning a heap, came to be used as synonymous with Monte, and was Italianized into Banco, and the public loans were called indifferently Monti or Banchi." The public pawn banks in France and Italy are still called Monte. This was also the interpretation given to the word during the colonial days of this country.

Professor Summer says in his History of Banking in the United States: "The sense of bank would be best expressed by batch, because it was applied to the mass of bills provided for and loaned out at one time, under one act of legislation." And again, "The first bank in that Colony (Rhode Island) was for £30,000 issued in 1715 for ten years."

Banking, in its modern sense, was not unknown to the earlier civilizations. Excavations at Babylon have revealed tablets showing the records of a bank account as early as 600 B.C. Rome, however, can be called the birthplace of banking. Cicero in his letters speaks of bills of exchange, and a number of banking terms then in vogue are used in the same sense at the present day. The principles underlying our present system have come down to us from the days of imperial Rome without change or The Crusades of the Middle modification. Ages were mainly instrumental in the development of banking in the earlier Italian Republics, and the demands of the times gave birth to the banking firms of the Medici and the

Pitti; the princely houses which at the same time presided over the destinies of state and controlled the marts of trade. The Bank of Venice, the Bank of St. George at Genoa, and the Bank of Amsterdam are the oldest banks in history, and while not strictly banks in the modern acceptation of the term, they were the forerunners of the magnificent institutions which now control the destinies of commerce. The Bank of England owes its origin to the exigencies of the time when it was founded, and its present strength and powers of usefulness are the results of a development toward which all classes, from the philosopher to the mechanic, have contributed a share.

The modern understanding of the functions of a bank is that it is an institution used for the purpose of distributing capital where it can be made productive. Its sole purpose is supposed to be that of facilitating commerce between individuals, communities, and nations. The following description of the workings of the Bank of England, and the joint stock banks of London, may be aptly taken as an illustration: "Money is collected in the country districts by local banks, such of it as can be used is loaned at home, while the balanceand this comprises generally the larger portion of such funds-is remitted to London to be held there as a reserve. Money is remitted by foreign countries for the purchase of commodities which have no other mart, or is attracted by a higher rate of interest. Thus a steady stream pours in from all parts and accumulates in the one center until active employment for it is found; and thus has London developed into the money market, not only of England, but of the world. The money from agricultural districts is loaned in the indus-The money from France is trial regions. loaned in South America, but London acts as the broker."

A similar process is at work in every large city where commercial relations are established. The wants of the individual, the business man, the corporation, the municipality, are all supplied by the local banking institutions collecting the money from many sources, primarily for the purposes of safe-keeping, and then as remuneration for its services, exacting a charge from borrowers commensurate with the value of the money and the extent of the risk incurred in loaning it.

Each country has a different system of banking. In the continental countries of Europe the center institution is generally a state bank with the privilege of issuing notes, and is surrounded by minor institutions which follow out distinct lines of business. In England we find the Bank of England and that wonderful group of joint stock banks showing deposits for an aggregate sum of \$2,800,000,000, while in the U.S. the national banking system, and the so-called state banks-i. e., banks deriving their charter from the respective states in which they are located-hold their sway.

Banks in the U.S.-The first U.S. Bank was chartered in 1791. Previous to this time

there were three banks in the U.S. with an aggregate capital of \$2,000,000; the Bank of North America, chartered by Congress in 1780, and by Pennsylvania in the following year, with a capital of \$400.000; the Bank of Massachusetts in 1784; the Bank of New York in the same year. The U. S. Bank charter was limited to 1811, or twenty years from date of issue. Its capital was \$10,000,000, and the government retained the right to subscribe one fifth; \$5,700,000 to be held in Philadelphia and the remainder to be distributed among the branches. Headquarters were to be at Philadelphia, and the bank had twenty directors. All the stock was sold in 1802 at a premium. The bank was not rechartered; it was opposed as unconstitutional, as in the hands of foreigners, and injurious to local banks. Owing largely to this failure to re-charter, specie payments were suspended in 1814. In 1816 President Madison approved the bill chartering a U.S. Bank with a capital of \$35,000,000, of which the government subscribed \$7,000,000, and citizens the rest. This charter was limited to twenty years. The government funds were kept on vears. deposit at this bank. President Jackson opposed the bank, and when the bank asked for a renewal of its charter in 1831, the act was passed by Congress, but was vetoed by the president. Pennsylvania rechartered the bank thirteen days before the original charter expired. It was known as the U.S. Bank of Pennsylvania. It suspended specie payment in 1837 and again in 1839, and a final suspension was made in 1840-41. It proved a total loss to the shareholders. New York adopted a banking system in 1838, and Ohio adopted the safety fund system. The first clearing house in America was established in 1853 in New York. At the beginning of the Civil War in 1861, there were 1,600 state banks having a gross aggregate capital of \$429,000,000, with 10,000 different kinds of notes in circulation. A national bank system was devised by Secretary Chase, and in 1863 Congress made paper currency and the banking laws of the country uniform. State banks were forced to surrender their charters and become national banks. In 1870 the circulation of the national banks was limited to \$354,000,000, secured by deposit of government bonds with the treasurer. This limitation has since been repealed: 2,572 of the state banks still exist having a total capital of \$208,564,841. Following is the number of national banks in the twenty principal cities of the Union: New York, 47; Chicago, 19; St. Louis, 8: Boston, 56; Albany, 6; Brooklyn, 5; Philadelphia, 45; Pittsburg, 26: Baltimore, 19; Washington, 11; New Orleans, 10; Louisville, 10; Cincinnati, 13; Cleveland, 10: Detroit, 8; St. Paul, 6; Minneapolis, 6; Kansas City, 10; Omaha, 9: and San Francisco, 2. These banks are obliged to keep a reserve of 25 per cent. of deposits. The total amount of resources of all the national banks in operation in 1885 was \$2,-432,900,000; in 1896 \$3,263,700,000; total specie, coin and coin certificates held by national banks in October, 1896, was \$200,808,632.47. Banks, Savings, See Savings Banks.

JOHN E. GARDIN.

Banki'va Fowl, a fowl living wild in Northern India, Java, Sumatra, etc., believed to be the original of our common domestic fowls.

**Bankrupt**, a person whom the law does or may take cognizance of as unable to pay his debts. Properly it is of narrower signification than insolvent, an insolvent person simply being unable to pay all his debts. In England up till 1861 the term bankrupt was limited to an insolvent trader, and such traders were on a different footing from other insolvent persons, the latter not getting the same legal relief from their debts. In all civilized communities laws have been passed regarding bankruptcy. At present bankruptcy in Eng-land is regulated by the Bankruptcy Act of 1883, which has as its essential feature the intervention of the Board of Trade at all stages of the bankruptcy, with the object of obtaining full official supervision and control. In America Congress has the power of legislating upon bankruptcy and upon two occasions has done so. A federal statute in force suspends all state laws on bankruptcy. There is now no federal statute in operation, but the Torrey bankruptcy bill is before Congress. Several of the states have bankruptcy laws in operation, the northern or commercial states favoring such enactments and the southern objecting to this kind of legislation.

Banks, JOSEPH (1743-1820), a noted British naturalist. He was chosen a member of the Royal Society in 1766, and soon after went to Newfoundland and Hudson's Bay to collect plants. In 1768, with Dr. Solander, a Swedish gentleman, pupil of Linnæus, and then assistant librarian at the British Museum, he accompanied Cook's expedition as naturalist. In 1772 he visited Iceland along with Dr. Sol-ander, and during this voyage the Hebrides were examined, and the columnar formation of the rocks of Staffa first made known to naturalists. In 1777 Banks was chosen president of the Royal Society, in 1781 was made a baronet, and in 1795 received the order of the He wrote only essays, papers for Bath. learned societies, and short treatises. He bequeathed his collections to the British Museum.

Banks, THOMAS (1735-1805), an English sculptor. He studied sculpture in the Royal Academy and in Italy. On leaving Italy he spent two unsatisfactory years in Russia, and then returned to England, where he was soon after made an academician. Among his works was a colossal statue of Achilles Mourning the Loss of Briseis in the hall of the British Institution, and the monument of Sir Eyre Coote in Westminster Abbey.

Banks, NATHANIEL PRENTISS (1816- ), an American soldier, b. at Waltham, Mass. Learned the trade of a machinist, and became first a lecturer, then a local newspaper editor, studied law, then representative in the legislature, governor of Massachusetts, speaker in U. S. Congress 1856-57, and general of volunteers in 1862. His first military effort was made at the battle of Winchester, where he was attacked by the forces of "Stonewall" Jackson. Later General Banks was placed in command of the defenses of Washington, while preparations were being secretly made to send a strong expedition by sea to New Orleans. He was assigned to command this expedition, which sailed from New York in November and December. On reaching New Orleans he succeeded Gen. B. F. Butler in command. In July the news of the surrender of Vicksburg was received, and on the ninth of that month the garrison of Port Hudson, 6,000 in number, capitulated to the investing forces of General Banks. In the early part of the following year the army of General Banks was joined by 10,000 men, under Gen. A. J. Smith. The united forces advanced as far as Sabine Cross Roads. Here the Federals were met by the Confederate forces under Gen. Richard Taylor, and driven back to Pleasant Hill; but on the following day, when the Confederates saw fit to renew the attack, they were repelled. The Federal army then retired to the Mississippi River. In May, 1864, General Banks was relieved of his command, resigned his commission, and returned to his native state, where he was biennially elected to Congress by his former constituents until 1877, failing only in 1872. For a long time General Banks was chairman of the committee on foreign relations. He afterward served as U. S. marshal for Massachusetts, and was again elected to Congress in 1888 from the fifth Massachusetts district as a Republican.

Banksia, a North American species of pine

Banksia.

A.-shoot; B.-single flower enlarged; C.-in section.

tree growing around Hudson's Bay, about 25 ft. high.

Bann, Upper and Lower, two rivers in the n. of Ireland, the former rising in the mountains of Mourne, county Down, and after flowing 38 mi. in a n. direction, falling into Lough Neagh, the latter being the outlet of Lough Neagh, and falling into the Atlantic Ocean 4 mi. below Coleraine, after a course of nearly 40 mi.

Ban'natyne Club, a literary society instituted in Edinburgh (1823) by Sir Walter Scott 7.

(its first president). David Laing (secretary till its dissolution in 1805), Archibald Constable, and Thomas Thomson. It started with thirtyone members, subsequently extended to 100, having as its object the printing of rare works on Scotch history, literature, geography, etc. It derived its name from George Bannatyne (1545-1609), the collector of the famous MSS of early Scottish poetry.

**Bannockburn**, a village of Scotland, in Stirlingshire, 2 mi. s.e. Stirling, famous for the decisive battle in which King Robert Bruce of Scotland defeated Edward II of England, on June 24, 1314. It has manufactures of woolens, such as tartans, carpets, etc. Pop. 3,374.

**Bannu**, a district in the Punjab, Hindustan, on the nortwestern frontier. Area 3,868 sq. mi.; pop. 332,577, of whom nearly half are Afghans.

**Banquette** (bang-ket'), in fortification, the elevation of earth behind a parapet, on which the garrison or defenders may stand. The height of the parapet above the banquette is usually about 4 feet 6 inches; the breadth of the banquette from 2½ or 3 feet to 4 or 6 feet according to the number of ranks to occupy it. It is frequently made double; that is, a second is made still lower.

**Banshee'** (Benshi'), a weird hag, believed in Ireland and some parts of Scotland to attach herself to a particular house, and to appear or make her presence known by wailing before the death of one of the family.

**Ban'tam**, a residency occupying the whole of the w. end of the island of Java. It formed an independent kingdom, governed by its own sultan, till 1683, and the Dutch exercised suzerainty with brief intermission until its formal incorporation by them at the beginning of the present century. It produces rice, coffee, sugar, cinnamon, etc. Serang is its capital. The town Bantam was the first Dutch settlement in Java (1505), and for some time their principal mart, though now greatly decayed.

**Ban'tam Fowl**, a small but spirited breed of domestic fowl, first brought from the East Indies, supposed to derive its name from Bantam in Java. Most of the sub-varieties have feathered legs; but these are not to be preferred. In point of color the black and nankeen varieties take the palm. A well-bred bantam does not weigh more than a pound.

**Ban'try, a** small seaport town near the head of Bantry Bay, county Cork, Ireland. The bay, one of three large inlets at the s. w. extremity of Ireland, affords an unsurpassed anchorage.

**Bantu** (bān-tö'), the ethnological name of a group of African races, including the Kaffirs, Zulus, Bechuanas, the tribes of the Loango, Congo, etc., but not the Hottentots.

**Banx'ring**, a quadruped belonging to the Insectivora, or insect-eaters, inhabiting the Indian Archipelago, bearing some resemblance externally to a squirrel, but having a long, pointed snout. They live among trees, which they ascend with great agility.

Ban'yan (or Ban'ian), a tree of India, of

### Baobab

the fig genus. The most peculiar feature of this tree is its method of throwing out from the horizontal branches, supports which take root as soon as they reach the ground, enlarge into trunks, and extending branches in their turn, soon cover a prodigious extent of ground. A celebrated banyan-tree has been known to shelter 7,000 men beneath its shade. The wood is soft and porous, and from its white, glutinous juice bird-lime is sometimes prepared. Both juice and bark are regarded by the Hindus as valuable medicines. One of the largest banyan trees known to exist has been discovered on one of the Howe Islands, 300 miles from Port Macquarie, in Australia.

Banyan Tree.

and the space it covers is nearly seven acres. Five acres is the area covered by a banyantree growing on the banks of the river Narbudda, in the Province of Guzerat, India. It is distinguished by the name of Cubbeer Burr, which was given it in honor of a famous saint. High floods have at various times swept away parts of this extraordinary tree, but what remains is nearly 2,000 ft. in circumference, measured round the principal stems; the overhanging branches not yet struck down cover a much larger space. The large trunks of this tree amount to 350, and the smaller ones exceed 3,000, every one of which is constantly sending forth branches and hanging roots to form other trunks. It is said that 7,000 persons find ample room to repose under its shade.

**Ba'obab** (or Monkey-bread Tree), a tree, the only known species of its genus, which was named after the naturalist Adanson. It is one of the largest of trees, its trunk sometimes attaining a diameter of 30 feet; and as the profusion of leaves and drooping boughs sometimes almost hides the stem, the whole forms a hemispherical mass of verdure 140 to 150 feet in diameter and 60 to 70 feet high. It is a native of Western Africa, and is found also in Abyssinia; it is cultivated in many of the warmer parts of the world. The roots are of extraordinary length, a tree 77 feet in girth having a tap-root 110 feet in length. The leaves are deep green, divided into five une-

# Baptism

qual parts lanceolate in shape, and radiating from a common center. The flowers resemble the white poppy, having snowy petals and violet-colored stamens: and the fruit, which is large and of an oblong shape, is said to taste like gingerbread, with a pleasant acid flavor. The wood is pale-colored, light, and soft. The tree is liable to be attacked by a fungus which, vegetating in the woody part. renders it soft and pithlike. By the negroes of the

Baobab Tree.

West Coast these trunks are hollowed into chambers, and dead bodies are suspended in them. There they become perfectly dry and well preserved, without further preparation or embalming. The pulverized leaves constitute *kalo*, which the natives mix with their daily food to diminish excessive perspiration, and which is even used by Europeans in fevers and diarrheas. The expressed juice of the fruit is used as a cooling drink in putrid fevers, and also as a seasoning for various foods.

Baptism, a rite which is generally thought to have been usual with the Jews even before Christ, being administered to proselytes. From this baptism, however, that of St. John the Baptist differed, because he baptized Jews also as a symbol of the necessity of perfect purification from sin. Christ himself never baptized, but directed his disciples to administer this rite to converts (Matt. 28: 19); and baptism, therefore, became a religious ceremony among Christians, taking rank as a sacrament with all sects which acknowledge sacraments. In the primitive church the person to be baptized was dipped in a river or in a vessel, with the words which Christ had ordered, generally adopting a new name to further express the change. Sprinkling, or, as it was termed, *clinic* baptism, was used only in the case of the sick who could not leave their beds. The Greek church and Eastern schismatics retained the custom of immer-

# Barbara

sion; but the Western church adopted or allowed the mode of baptism by pouring or sprinkling, since continued by most Protestants. This practise can be traced back certainly to the third century, before which its existence is disputed. Since the Reformation there have been various Protestant sects called Baptists, holding that baptism should be administered only by immersion, and to those who can make a personal profession of faith.

**Bap' tists**, a Protestant sect, distinguished by their opinions respecting the mode and subjects of baptism. With regard to the mode, they maintain the necessity of immersion.

**Barabin'zians**, a rude, uncultivated tribe of Tatars, subsisting chiefly on the produce of their herds and on fish supplied by the lakes of the Baraba steppe.

**Baraguey-d'hilliers** (bå-rå-gå-dël-yå), Louis (1764-1812), a distinguished French general under the first Empire. He joined the army of Italy, and took Bergamo and Venice, of which he became governor. He took part in the expedition to Egypt, served in the campaigns in Germany and Spain, and commanded a division of the great army in the Russian campaign of 1812. Napoleon ordered him to return to France as under arrest, but, overcome with grief and fatigue, he died at Berlin on the way. His son Achille (1795-1878), was a distinguished soldier in the Crimean and Austrian wars.

**Barb**, a horse of the Barbary breed, introduced by the Moors into Spain, and of great speed, endurance, and docility.

Barba' does (or Barbados), the most eastern of the West Indies Islands, first mentioned in 1518, and occupied by the British in 1625. Area 166 sq. mi.; capital, Bridgetown; pop. 20,996. The island is more densely peopled than almost any spot in the world, the popula-tion being 182,306. The climate is very hot, though moderated by the constant tradewinds; and the island is subject to dreadful hurricanes. The black low-land soil gives great returns of sugar in favorable seasons. The chief exports, besides sugar, are molasses and rum; imports: rice, salt meat, corn, butter, flour, etc. Barbadoes has a considerable transit trade, being in some measure the central mart for all the Windward Islands. It is the headquarters of the British forces in the West Indies. There is a railway across the The island, also tramways, telephones, etc. island forms a distinct government under a governor, an executive and a legislative council, and a house of assembly.

**Barbadoes Cherry**, the pleasant, tart, fieshy fruit of a West Indian tree 15 ft. high.

**Barbadoes Gooseberry**, the fruit of a West Indian species of cactus.

**Bar' bara**, St., according to the legend belonged to Nicomedia, in Asia Minor, and was beheaded by her father for having turned Christian, he being immediately thereafter struck dead by lightning. She is invoked in storms, and is considered the patron saint of artillerists.

### Barbarian

**Barbarian**, a name given by the Greeks and afterward by the Romans to every one who spoke an unintelligible language; and hence coming to connote the idea of *rude*, *illiterate*, *uncivilized*. This word, therefore, did not always convey the idea of something odious or savage; thus Plautus calls Nævius a barbarous poet, because he had not written in Greek; and Cicero terms illiterate persons without taste "barbarians."

**Barbarossa**, a surname given to Frederick I, of Germany.

**Barbarossa** ("red-beard"), the name of two famous Turkish corsairs of the sixteenth century, who ravaged the shores of the Mediterranean, and established themselves in Algiers. The elder of the brothers, Aruch (or Horuk), was killed in 1518; the younger and more notorious, Hayyraddin, who captured Tunis, died in 1546.

Bar'bary, a general name for the most northerly portion of Africa, comprising Morocco, Fez, Algeria, Tunis, and Tripoli (includ-ing Barca and Fezzan). The principal races are: the Berbers, the original inhabitants, from whom the country takes its name; the Arabs who conquered an extensive portion of it during the times of the caliphs; the Bedouins, Jews, Turks, and the French colonists of Algeria, etc. The country which was prosperous under the Carthaginians, was, next to Egypt, the richest of the Roman provinces, and the Italian states enriched themselves by their intercourse with it. In the fifteenth century, however, it became infested with adventurers who made the name of Barbary corsair a terror to commerce, a condition of things finally removed by the French occupation of Algeria.

**Barbary** Ape, a species of ape, or tailless monkey, with greenish-brown hair, of the size of a large cat, remarkable for docility, also called the *magot*. It is common in Barbary and other parts of Africa, and some used to live formerly on Gibraltar Rock, being the only European monkey, though probably not indigenous. It has been the "showman's ape" from time immemorial.

**Bar' becue**, a word of West Indian origin, meaning a hog, or other large animal, roasted whole. In the southern states the word is used to signify any jollification or especially a political festivity.

**Barbel**, a genus of fresh-water fishes of the carp family, distinguished by the four fleshy

filaments growing from the lips, two at the nose and one at each corner of the mouth, forming the kind of beard to which the genus owesits name. The barbel is common in Eu-

#### Barberry

ropean rivers, and runs in weight from 9 to 20 lbs. It gives good sport to the angler, but its flesh is very coarse.

Barber, one whose occupation is to shave or trim the beard, or cut and dress hair. The practise of surgery was formerly a part of the craft, and by an act of Henry VIII, the Company of Barbers was incorporated with the Company of Surgeons-the company being then known as the Barber-surgeons-with the limitation, however, that the surgeons were not to shave or practise "barbery," and the barbers were to perform no higher surgical operation than blood-letting and tooth-drawing. This continued till the time of George II. The signs of the old profession-the pole which the patient grasped, its spiral decoration in imitation of the bandage, and the basin to catch the blood-are still sometimes retained. The barbers' shops, always notorious for gossip, were in some measure the news-centers of classic and mediæval times.

**Barberini** (bår-be-rë'në), a celebrated Florentine family, which, since the pontificate of Maffeo Barberini (Urban VIII, 1623 to 1644), has occupied a distinguished place among the nobility of Rome. During his reign he seemed chiefly intent on the aggrandizement of his three nephews, of whom two were appointed cardinals, and the third Prince of Palestrina.

**Bar' berry**, a genus of shrubs, the common barberry having bunches of small, beautiful red berries, somewhat oval; serrated and

Barberry. a.-Flowering branch; b.-Fruit.

pointed leaves; thorns, three together, upon the branches; and hanging clusters of yellow flowers. The berries nearly approach the tamarind in respect of acidity, and when boiled with sugar make an agreeable preserve, rob, or jelly. They are also used as a dry sweetmeat, and in sugarplums or comfits; are pickled with vinegar, and are used for the garnishing of dishes. The bark is said to have medicinal properties, and the inner bark

#### Barberton

and roots with alum yield a fine yellow dye. The shrub was originally a native of eastern countries, but is now generally diffused in Europe, as also in North America. Numerous other species belong to America and Asia.

**Bar'berton**, the chief mining center of De Kaap gold fields, Transvaal, about 80 mi. from Lydenburg, and 150 to 160 mi. from Delagoa Bay. Pop. about 4,000.

**Bar'bets**, a family of climbing birds with a thick conical beak, having tufts of bristles at its base. Their wings are short and their flight somewhat heavy. They have been divided into three subgenera: The *barbicans*, inhabiting India and Africa, and feeding chiefly on fruit: the *barbets* proper, found in America and Africa, and nearly related to the woodpeckers; and the *puff-birds*, inhabiting America, and feeding on insects.

**Barbette** (bår-bet'), an elevation of earth behind the breastwork of a fortification, from which the artillery may be fired over the parapet instead of through an embrasure. A barbette carriage is a carriage which elevates a gun sufficiently high to permit its being fired over the parapet.

over the parapet. **Barbuda** (bar-bo'da), one of the West Indies, annexed by Britain in 1628; about 15 mi. long and 8 wide: lying n. of Antigua; pop. 800. It is flat, fertile, and healthy. Corn, cotton, pepper, and tobacco are the principal produce, but the island is only partially cleared for cultivation. It is a dependency of Antigua. **Bar'ca**, a division of North Africa, between

**Bar'ca**, a division of North Africa, between the Gulf of Sidra and Egypt, a vilayet of the Turkish Empire, capital Bengazi. It formed a portion of the ancient Cyrenaica, and from the time of the Ptolemies was known as Pentapolis from its five Greek cities. The exports are grain and cattle, with ostrich feathers and ivory from the interior. Next to Bengazi the seaport of Derna is the chief town. The pop. probably does not exceed 300,000.

**Barcarolle** (-rol'), a species of song sung by the barcaruoli, or gondoliers of Venice, and hence applied to a song or melody composed in imitation.

Barcelona (bar-thel-o'na), one of the largest cities of Spain, chief town of the province of Barcelona, and formerly capital of the kingdom of Catalonia; situated on the northern portion of the Spanish Mediterranean coast. It is divided into the upper and lower town; the former modern, regular, stone-built, the latter old, irregular, brick-built. The principal manufactures are cottons, silks, woolens, machinery, paper, glass, chemicals, stoneware, soap; exports: manufactured goods, wine and brandy, fruit, oil, etc.; imports: coal, textile fabrics, machinery, cotton, fish, hides, silks, timber, etc. The city contains a university, several public libraries, a museum, a large arsenal, cannon foundry, etc. Barcelona was, until the twelfth century, governed by its own count, but was afterward united with Arragon. In 1640, with the rest of Catalonia, it placed itself under the French crown; in 1652 it submitted again to the Span-ish government; in 1697 it was taken by the

French, but was restored to Spain at the Peace of Ryswick. Pop. 272,481. The province has an area of 2,968 sq, mi.; pop. 902,970. It is generally mountainous, but well cultivated, and among the most thickly peopled in Spain.

**Barcelona**, a town of Venezuela, near the mouth of the Neveri River, founded in 1671. Pop. 12,785.

**Barciay, ROBERT** (1648-1690), the celebrated apologist of the Quakers, b. at Gordonstown, Moray, Scotland, and educated at Paris, where he became a Roman Catholic. Later he became a Quaker. He published writings to rectify public sentiment in regard to the Quakers. In his travels with William Penn and George Fox through England, Holland, and Germany, to spread the opinions of the Quakers, he was received everywhere with the highest respect.

**Bar-cochba** (bår-ko $\hbar$ 'bå), SIMON, a Jewish impostor, who pretended to be the Messiah, raised a revolt, and made himself master of Jerusalem about 132 A. D., and of about fifty fortified places. Bar-cochba perished in the assault of Jerusalem by the Romans three years after, about 135.

Bard, one of an order among the ancient Celtic tribes, whose occupation was to compose and sing verses in honor of the heroic achievements of princes and brave men, generally to the accompaniment of the harp. Their verses also frequently embodied religious or ethical precepts, genealogies, laws, etc. Their exist-ence and function was known to the Romans two centuries B.C.; but of the Gallic bards only the tradition of their popularity survives. The first Welsh bards of whom anything is extant are Taliesin, Aneurin, and Llywarch, of the sixth century. Edward I is said to have hanged all the Welsh bards as promoters of sedition. The Cambrian Society was formed in 1818 for the preservation of the remains of the ancient literature. The revived Eisteddfodan, or bardic festivals, have been so far exceedingly popular.

**Bardwan'** (or Burdwan'), a division of Bengal, upon the Hugli, comprising the six districts of Bardwan, Hugli, Howrah, Midnapur. Bankura, and Birbhum. Area 13,855 sq. mi; pop. 7,393,954. The district Bardwan has an area of 2,697 sq. mi., and a pop. of 1,391,823. Apart from its products (rice, grain, hemp, cotton, indigo, etc.), it has a noted coal field of about 500 sq. mi. in area, with an annual output of about half a million tons. The town of Bardwan has a fine palace of the Maharajah and a pop. of 34,080.

**Barége** (ba-rāzh'), a light, open tissue of silk and worsted, or cotton and worsted, for women's dresses, originally manufactured near Baréges.

**Bareges** (ba-rāgh), a watering-place, s. of France, dep. Hautes-Pyrénées, about 4,000 ft. above the sea, celebrated for its thermal springs which are frequented for rheumatism, scrofula, etc. The place is hardly inhabited except in the bathing season, June to September.

**Bareilly** (ba-rā'li), a town of Hindustan in 16

the N. W. Provinces, capital of a district of same name. On the outbreak of the Indian mutiny the native garrison took possession of the place, but it was retaken by Lord Clyde in May, 1858. Pop. 121,039. The district has an area of 2.982 so. mi.: pop. 1.040.691.

Barham, RICHARD HARRIS (1788-1845), the author of 2,082 sq. mi.; pop. 1,040,691. Barham, RICHARD HARRIS (1788-1845), the author of the *Ingoldsby Legends*. In 1802 by a coach accident his right arm was crippled for life. He was ordained in 1813, and in 1821 was appointed a minor canon of St. Paul's. He published several novels, and with the commencement of *Bentley's Miscellany* in 1837, he began his inimitable burlesque metrical tales under the nom de plume of Thomas Ingoldsby, which at once became popular from their droll humor, fine irony, and varied and whimsical rhymes.

**Bari** (bär'ē), a seaport, South Italy, on a small promontory of the Adriatic, capital of the province Terra di Bari. It was a place of importance as early as the third century B. C., and has been thrice destroyed and rebuilt. The present town, though poorly built for the most part, has a large Norman castle, a fine cathedral and priory, etc. It manufactures cotton and linen goods, hats, soap, glass, and liquors: has a trade in wine, grain, almonds, oil, etc., and is now an important seaport. Pop. 63,366. The province has an area of 2,280 sq. mi., and is fertile in fruit, wine, oil, etc.; pop. 723,730.

**Bari**, a negro people of Africa, dwelling on both sides of the White Nile, and having Goudokoro as their chief town. They practise agriculture and cattle-rearing. Their country was conquered by Sir Samuel Baker for Egypt. **Baril'ia**, the commercial name for the im-

pure carbonate and sulphate of soda imported from Spain and the Levant. It is the Spanish name of a plant, from the ashes of which and from those of others of the same genus the crude alkali is obtained. On the shores of the Mediterranean the seeds of the plants from which it is obtained are regularly sown near the sea, and these, when at a sufficient state of maturity, are pulled up, dried, and burned in bundles in ovens or in trenches. The ashes, while hot, are continually stirred with long poles, and the saline matter they contain forms, when cold, a solid mass, almost as hard as stone. To obtain the carbonate of soda it is only requisite to lixiviate the barilla in boiling water, and evaporate the solution. British barilla or kelp is a still more impure alkali obtained from burning seaweeds. Soda is now obtained for the most part from common salt.

**Ba'ring Brothers,** the name of a noted British banking firm, the founders of which were Francis and John B., sons of a German named John B., who settled in England in the first half of the eighteenth century. The now celebrated house was established in 1770. Francis B., who was a strong adherent of William Pit, was made a baronet by that minister in 1793. He was succeeded by his eldest son, Sir Thomas B. Sir Francis's second son. Alexander, was in 1353 created Lord Ashburton. Sir Thomas d. in 1848, and was succeeded by his son, Sir Francis Thorn-hill B., who was M. P. for Portsmouth from 1826 to 1865. Under successive Whig governments he held the offices of lord of the treasury, secretary to the treasury, chancellor of the exchequer, and first lord of the admiralty. In January, 1866, he was created Baron Northbrook. He d. in the following September. He was succeeded by his son, the pres-ent Lord Northbrook. Thomas B., M. P. (b. 1800), uncle of the present lord, devoted himself to commerce, and was universally known for many years as the leading partner in the great mercantile firm of B. Brothers. He d. Nov. 18, 1873. Edward Charles B., the then head of the firm, was. in 1885, raised to the peerage as Baron Revelstoke. In 1890, very large amounts being invested in South American securities which had become depreciated, and were not readily realizable, the firm became seriously embarrassed, but by the assistance of a guarantee by the Bank of England and the other principal banks, they were enabled to surmount their difficulties, and thus prevent a commercial catastrophe, the far-reach-ing and ruinous consequences of which no one could estimate. A reconstruction of the firm

then took place. Baring-Gouid (bā-ring-gold'), SABINE, English clergyman and author, b. at Exeter 1834. Educated at Cambridge, he has held several livings in the English church, being now rector of Lew Trenchard, Devon. Among his works are: Iceland, its Scenes and Sagas; Curious Myths of the Middle Ages; The Origin and Development of Religious Belief; Lives of the Saints; Village Sermons; besides the novels: Mehalah. John Herring, Richard Cable, the Gaverocks, etc.; and short stories or novelettes.

**Ba'rium**, the metallic basis of baryta, which is an oxide of barium. It is only found in compounds, such as the common sulphate and carbonate, and was isolated by Davy for the first time in 1808. It is a yellow, malleable metal, which readily oxidizes, decomposes water, and fuses at a low temperature. Its nitrate and chlorate are used in pyrotechny.

nitrate and chlorate are used in pyrotechny. Bark, the exterior covering of the stems of exogenous plants. It is composed of cellular and vascular tissue, is separable from the wood, and is often regarded as consisting of four layers: 1, epidermis or cuticle, which, however, is scarcely regarded as a part of the true bark; 2, the epiphlaum or outer cellular layer of the true bark or cortex; 3, the mesophlaum or middle layer, also cellular; 4, an inner vascular layer, the liber or endophlaum, commonly called bast. Endogenous plants have no true bark. Bark contains many valuable products, as gum, tannin, etc.; cork is a highly useful substance obtained from the epiphlocum; and the strength and flexibility of bast make it of considerable value. Bark used for tanning is obtained from oak, hemlock-spruce, species of acacia growing in Aus-tralia, etc. Angostura bark, Peruvian or cinchova, cinnamon, cascarilla, etc., are useful barks.

**Bark**, Peruvian, is the bark of various species of trees of the genus *Cinchona*, found in many parts of S. A. but more particularly in Peru, and having medicinal properties. It was formerly called *Jesuit's bark*, from its having been introduced into Europe by Jesuits. Its medicinal properties depend upon the presence of *quinine*, which is now extracted from the bark, imported, and prescribed in place of nauseous mouthfuls of bark.

**Bar-le-duc** (bar-l-duk), a town of n. e. France. capital of dep. Meuse, with manufactures of cotton and woolen stuffs, leather, confectionery, etc. Pop. 18,761.

**Barlet' ta**, a seaport in South Italy, province of Bari, on the Adriatic, with a fine Gothic cathedral; it has a considerable export trade in grain, wine, almonds, etc. Pop. 34,775.

**Bar ley**, the name of several cereal plants of the genus *Hordeum*, order *Gramines* (grasses), yielding a grain used as food and also for making mait, from which are prepared beer, porter, and whisky. Barley has been known and cultivated from remote aniquity, and beer was made from it among the

Barley.

Egyptians. The species principally cultivated are two-rowed barley; four-rowed barley; and six-rowed, of which the small variety is the sacred barley of the ancients. Some of these are called *bere or bigg*. In North America the extent of it as a crop is comparatively small, being in Canada, however, relatively greater than in the U. S., and the Canadian barley is of very high quality. In 1895 the U. S. produced about 87,000,000 bushels of barley. Barley is better adapted for cold climates than any other grain, and some of the coarser varieties are cultivated where no other cereal can be grown. Some species of the genus are mere grasses. Pot or Scotch barley is the grain deprived of the husk in a mill. Pearl barley is the grain polished and rounded and deprived of husk and pellicle. Patent barley is the farina obtained by grinding pearl barley. *Barley-water*, a decoction of pearl barley, is used in medicine as possessing emollient, diluent, and expectorant qualities.

**Barley-sugar**, pure sugar melted and allowed to solidify into an amorphous mass without crystallizing.

**Bar'low**, Joel (1754-1812), an American poet, politician, and pamphleteer. After an active and changeful life as chaplain, lawyer, editor, land-agent, lecturer, and consul, he went to Paris and acquired a fortune. On his return to America he was appointed minister plenipotentiary to France (1811), but died near Cracow on his way to meet Napoleon. His principal poem, *The Columbiad*, dealing with American history from the time of Columbus, was published in 1807.

**Barlow**, SAMUEL LATHAM MITCHELL (1826-89), b. in Granville, Mass. At the age of fourteen years he entered a law office, and after studying seven years he set up in business for himself. A trip to Europe in behalf of an Illinois railway, in the year the firm was started brought him \$50,000. The act by which he gained his widest fame was the lawsuit which expelled Jay Gould from the control of the Erie railway after the death of James Fisk, Jr. Mr. Barlow was elected one of the directors of the road under the new management, and was retained as its private counsel. Mr. Barlow was a Democrat, but never held any political office.

**Bar' mecides** (-sidz), a distinguished Persian family, whose virtues and splendor form a favorite subject with Mohammedan poets and historians. Two eminent members of this family were Khaled-ben-Barmek, tutor of Harunal-Rashid, and his son, Yahya, grand vizier of Harun.

**Bar' mecide's Feast**, a phrase proverbial for a feast on imaginary dainties, and originating in the story of the barber's sixth brother, in the *Arabian Nights*.

**Bar'men**, a German city in the Prussian Rhine Province, government of Düsseldorf, and forming a continuation of the town of Elberfeld, in the valley of Barmen. It has extensive ribbon and other textile manufactures: also dye-works, manufactures of chemicals, metal wares, buttons, yarns, iron, machines, pianos, organs, soap, etc. Pop. 116,144.

**Bar' mabas,** the surname given by the apostles to Joses, a fellow laborer of Paul, and, like him, ranked as an apostle. He is said to have founded at Antioch the first Christian community, to have been first bishop of Milan, and to have suffered martyrdom at Cyprus.

Bar' nacle, the name of a family of marine crustaceous animals. They are enveloped by a mantle and shell, composed of five principal valves and several smaller pieces, joined together by a membrane attached to their circumference; and they are furnished with a long, flexible, fleshy stalk or peduncle, provided with muscles, by which they attach themselves to ships' bottoms, submerged timber, etc. They feed on small marine animals. brought within their reach by the water and secured by their tentacula. Some of the

# Barnacle Goose

larger species are edible. According to an old fable these animals produced barnacle geese.

**Barnacle Goose**, a summer visitant of the northern seas, in size rather smaller than the common wild goose, and having the forehead and cheeks white, the upper body and neck black. A fable asserts that the crustaceans called barnacles changed into geese, and various theories have been framed to account for its origin. The Brent Goose is also sometimes called the Barnacle Goose, but the two should be discriminated.

**Barnardo**, THOMAS J., a British philanthropist, founder of the Barnardo Homes for homeless children, where they receive an industrial training, are saved from a possible career of crime, and enabled to achieve an honorable position in life. Dr. Barnardo has also under his direction many separate institutions in the United Kingdom and the colonies, a house for babies, a hospital for children, an immigration depôt in Ontario, and an industrial farm in Manitoba. Dr. Barnardo was born in Ireland, did yeoman service in a cholera epidemic in London, and has been happily termed "The Father of the Don't-live-nowheres."

**Bar' net**, a town of England, in Herts, 11 mi. from London, where was fought in 1471 a battle between the Yorkists and Lancastrians, resulting in the defeat of the latter and the death of Warwick, Edward IV being thus established on the throne. Pop. 4,563.

Barney, JOSHUA (1759-1818), American naval officer. When the American Revolution began Barney was appointed master's mate of the sloop Hornet, fitted out in Baltimore, and in November, 1775, joined Commodore Hop-kins's squadron at Philadelphia. After the fleet had captured New Providence and the Bahamas, it returned to Philadelphia, and Barney was transferred to the sloop Wasp. He was afterward transferred to the frigate Virginia as first officer. After five months confinement in a prison-ship in New York, he was exchanged, and again captured, when he was sent for imprisonment to England, but escaped in the undress uniform of a British officer. Eventually he found his way back to Philadelphia, where he was placed in command of the ship Hyder Ali. While convoying a fleet of merchantmen down the Delaware River he captured the British ship General Monk, after an engagement of twenty-six minutes. Though only twenty-three years of age, he was promoted by Congress to the rank of commodore, and received from the state of Pennsylvania a gold-hilted sword. In the War of 1812 Barney was appointed commander of the gunboat flotilla, organized for the defense of Chesapeake Bay. On Aug. 26, 1814, at the battle of Bladensburg he did all the fighting of that day. Here he was wounded and taken prisoner, exchanged six weeks later, and at once resumed his command. For his services at this battle the city of Washington voted him an elegant sword.

**Barns' ley**, a town of England, W. Riding of Yorkshire. Its staple industries are the manufacture of linens, iron, and steel, and there are

## Barnum

numerous collieries in the neighborhood. Pop. 35,427.

Barnum, PHINEAS TAYLOR (1810-1891), American showman, b. at Bethel, Conn. His father was tailor, farmer, and tavernkeeper in turn. At thirteen young Barnum was employed in a country store; and about five years afterward, went largely into the lottery business. When only nineteen he married clandestinely, and then moved to Danbury, where he edited The Herald of Freedom, and was imprisoned sixty days for a libel. In 1834 he removed to New York, where hearing of Joice Heth, the reputed nurse of General Washington, he bought her for \$1,000, and with the aid of wholesale advertising, exhibited her to considerable profit. He continued in the show business from 1836 to 1839, but reduced again to poverty, he sold Bibles, exhibited negro dancers, and wrote for newspapers, until in 1841 he bought Scudder's American Museum in New York, which he raised at once to prosperity by exhibiting a Japanese mermaid. made of a fish and monkey, a white negress, a woolly horse, and finally a noted dwarf (Charles S. Stratton of Bridgeport), styled Gen. Tom Thumb, whom he exhibited in Europe in 1844. In 1847 he offered Jenny Lind \$1,000 a night for 150 nights, and received \$700,000-the concert tickets being sold at auction, in one case as high as \$650 for a single ticket. He built a villa at Bridgeport, in imitation of the Brighton Pavilion, and engaged in various speculations. one of which-a clock factory-made him bankrupt. Settling with his creditors in 1857. he engaged anew in his career of audacious enterprises, and made another fortune. In 1866 he was a candidate for a seat in Congress. but was unsuccessful. His Autobiography (1854, since greatly enlarged) has the merit at least of frankness. In 1865 he published The Humbugs of the World; in 1869, Struggles and Triumphs; and in 1883, Money-getting. In 1868 he relinquished the business of showman, resuming it. however, in 1871, when he organized a museum, menagerie, circus, etc., which required 500 men and horses to transport it through the country. For his hippodrome in New York he purchased for \$165,000 from Messrs. Sanger, London, in 1874, a duplicate of the whole plant for the pageant "Congress of Monarchs." His "Greatest Show on Earth " required 100 railway cars for its conveyance, every one of which was his own property. In 1879 he estimated the number of his patrons up to date as 90,000,000. In 1882 the receipts in a single day for his Great Show when in Boston amounted to over \$15,-000; for ten days, over \$105,000. In 1882 he purchased for \$10,000 from the London Zoological Society the elephant "Jumbo." Mr. Barnum had his own statue prepared while he was alive. The statue is of bronze, about 7 ft. in height, and represents him seated in a great arm-chair. It was made in Europe, on his personal order, and, on arrival in America, in 1887. from Bremen, was packed away in one of the great storage warehouses of New York, with instructions that no one should be permitted to see it until after his death.

**Baro'da**, a non-tributary state, but subordinate to the Indian government; situated in the north of the Bombay presidency. It consists of a number of detached territories in the province of Guzerat, and is generally level, fertile, and well cultivated, producing luxuriant crops of grain, cotton, tobacco, opium, sugar-cane, and oil-seeds. There is a famous breed of large white oxen used as draught cattle. Area 8,226 sq. mi.; pop. 2,415,396. Baroda, the capital, is the third city in the Bombay presidency. Pop. 116,420 (including troops in the adjoining cantonment).

**Barometer**, an instrument for determining atmospheric pressure. Experimenting with a closed tube filled with mercury inverted in a cup of the same metal, Torricelli noted that the pressure of the atmosphere supports a column of mercury 30 inches high. Pascal repeated and verified the experiment (1645). Perrier (1656) discovered that the height of the mercury varied with the weather. The cistern barometer consists of a glass tube 33 inches long, bore one third inch. The tube, hermetically sealed at the top, curves up at the bottom terminating in a glass bulb open to the atmosphere. Purified mercury fills the tube, and a scale marks the height of the column. In general, the rising of the mercury presages fair weather, and its falling the contrary, a great and sudden fall being the usual presage of a storm.

The siphon barometer consists of a bent tube, generally of uniform bore, having two unequal legs, the longer closed, the shorter open. A sufficient quantity of mercury having been introduced to fill the longer leg, the instrument is set upright, and the mercury takes such a position that the difference of the levels in the two legs represents the pressure of the atmosphere. In the best siphon barometers there are two scales, one for each leg, the divisions on one being reckoned upward, and on the other downward from an intermediate zero point, so that the sum of the two readings is the difference of levels of the mercury in the two branches.

The wheel barometer is the one that is most commonly used for domestic purposes. It is far from being accurate, but it is often preferred for ordinary use on account of the greater range of its scale, by which small differences in the height of the column of mercury are more easily observed. It usually consists of a siphon barometer, having a float resting on the surface of the mercury in the open branch, a thread attached to the float passing over a pulley, and having a weight as a counterpoise to the float at its extremity. As the mercury rises and falls, the thread and weight turn the pulley, which again moves the index of the dial.

The mountain barometer is a portable mercurial barometer with a tripod support and a long scale for measuring the altitude of mountains. To prevent breakage, through the oscillations of such a heavy liquid as mercury, it is usually carried inverted, or it is furnished with a movable basin and a screw, by means of which the mercury may be forced up to the top of the tube. For delicate operations, such as the measurement of altitudes, the scale of the barometer is furnished with a nonius or vernier, which greatly increases the minuteness and accuracy of the scale. In exact barometric observations two corrections require to be made, one for the depression of the mercury in the tube by capillary attraction, the other for temperature, which increases or diminishes the bulk of the mercury. In regard to the measurement of heights the general rule is to subtract the ten-thousandth part of the observed altitude for every degree of Fahrenheit above 320.

In the aneroid barometer, as its name implies (Gr. a, not, neros, liquid), no fluid is employed. the action being dependent upon the susceptibility to atmospheric pressure shown by a flat circular metallic chamber from which the air has been partially exhausted, and which has a flexible top and bottom of corrugated metal plate. By an ingenious arrangement of springs and levers the depression or elevation of the surface of the box is registered by an index on the dial, by which means it is also greatly magnified, being given in inches to correspond with the mercurial barometer. Aneroids are, however, generally less reliable than mercurial barometers, with which they should be frequently compared.

**Barque** (bärk), a three-masted vessel of which the foremast and mainmast are squarerigged, but the mizzenmast has fore-and-aft sails only.

**Barquesimeto** (bår-kā-sē-mā'tō), a city in the north of Venezuela, capital of the province of Barquesimeto. Pop. 31,476. It was founded in 1522, named New Segovia, and destroyed by earthquake in 1812.

**Bar'ra'** (or Bar), a small kingdom in Africa. near the mouth of the Gambia. The Mandingoes, who form a considerable part of the inhabitants, are Mohammedans and the most civilized people on the Gambia. Pop. 200,000. The coast here belongs to Great Britain.

**Barra**, an island of the Outer Hebrides, w. coast of Scotland, belonging to Inverness-shire. On the w. coast the Atlantic, beating with all its force, has hollowed out vast caves and fissures. Large herds of cattle and flocks of sheep are reared on the island. Pop. 2,365: area 348 sq. mi.

**Barrackpur** (pör'), a town and military cantonment, Hindustan, on the left bank of the Hugli, 10 miles n.n.e. of Calcutta. Here occurred the first outbreak of the Indian mutiny. Pop. 56,627.

**Barranquilla** (bår-rån-kēl'yå), a town of South America. in Colombia, on a branch of the river Magdalena, near its entrance into the Caribbean Sea, connected by rail with the seaport Sabanilla. Pop. 11,595.

**Barras** (bá-rii), PAUL FRANÇOIS JEAN NICH-OLAS, Comte de (1755-1829), member of the French national convention and of the executive directory. After serving in the army in India and Africa he joined the revolutionary party and was a deputy. He took part in the attack upon the Bastile and upon the Tuileries, and voted for the death of Louis XVI. On Feb. 4, 1795, he was elected president of the convention, and on Oct. 5, Barras for a second time received the chief command of the forces of the convention. From 1797 he governed absolutely until June 13, 1799, when Siéyès entered the directory, and in alliance with Bonaparte procured his downfall. He afterward resided at Brussels, Marseilles, Rome, and Montpellier under surveillance, returning to Paris only after the restoration of the Bourbons. His memoirs were suppressed and seized, but were published recently.

Barre, Washington co., Vt., the seat of Goddard Seminary. Pop. 6,812.

**Barren Grounds,** a large tract in the n.w. territories of Canada, extending northward from Churchill River to the Arctic Ocean between Great Bear and Great Slave Lake and Hudson's Bay. It largely consists of swamps, lakes, and areas of bare rock with dwarf birches and willows in certain parts. The reindeer and musk-ox are among the animals.

**Barrett**, LAWRENCE, actor, b. 1838, in Paterson, N. J. He made his *début* at Detroit, Mich., in 1853, as "Murad," in the drama of the *French Spy*. In 1856 he appeared at Burton's theater in New York City, as "Sir Thomas Clifford," in *The Hunchback*. In 1861, at the beginning of the Civil War, Mr. Barrett for a time served as a captain of a company of Massachusetts infantry. Retiring from the army, he again acted in Washington, Philadelphia, and New York City. In the lastnamed place he was advanced to performing "Othello" to the "Iago" of Edwin Booth. In 1867 he first appeared as a star actor in San Francisco. Returning to New York City, he played with Mr. Booth in alternate parts at Booth's theater. During 1873-74 he starred in the large cities of the Union, and in 1875 renewed his connections with Booth in New York City. Later he appeared in *King Lear, Yorick's Lore*, and Boker's *Francesca da Rimini*. For some years he traveled through the U. S. in company with Mr. Booth. Mr. Barrett has visited Europe several times.

**Barrier Reef**, a coral reef which extends for 1,260 mi. off the n.e. coast of Australia, at a distance from land ranging from 10 to 100 mi. In sailing from Sydney through Torres Straits vessels have the choice of the inner and outer routes; the former, though narrow, gives a channel of about 12 fathoms deep throughout, and protected from the sea by the reefs themselves; the outer channel is less accurately surveyed and still dangerous.

**Barrios**, JUSTO RUFINO (1835-1885), a Guatemalan statesman. His rule as president was wise and beneficent and included a projected union of the Central American Republics. He was killed in battle with Salvadorean troops.

**Barron**, JAMES (1769–1851), American naval officer. As a boy he became connected with seamanship, was made lieutenant in the navy in 1798, captain in 1799, and made commodore, in command of the *Chesapeake*, 1807. He sailed

out and was met by the British frigate Leopard, whose captain demanded the surrender of several alleged British deserters from among the American crew. To this demand Barron demurred, and the Leopard opened fire, killing three and wounding eighteen of the Chesapeake's men. The American ensign was hauled down, and the alleged deserters were carried away on the British vessel. The British government promptly repudiated the action of the captain of the *Leopard*, the deserters were restored, and a monetary indemnity paid to our government. Barron thereafter was tried by court-martial and suspended from rank and pay for five years. On the expiration of this term he was kept on shore duty. In 1820 Commodore Decatur was challenged by Barron to fight a duel, in which Decatur was killed, and Barron wounded.

**Bar'row**, a river in the s. e. of Ireland, province Leinster. It is next in importance to the Shannon, and is navigable for vessels of 200 tons for 25 mi. above the sea.

**Bar'row-in-Fur'ness**, a seaport and parliamentary borough of Lancashire. England. Its prosperity is due to the mines of red hematite iron-ore which abound in the district, and to the railway rendering its excellent natural harbor available. It has several large docks; besides graving-docks, a floating-dock capable of receiving vessels of 3,000 tons, a large timber pond, etc. There is an extensive trade in timber, cattle, grain, and flour: and iron-ore and pig-iron are largely shipped. It has numerous blast-furnaces, and one of the largest Bessemersteel works in the world. Besides iron-works a large business is done in ship-building, the making of railway wagons, and rolling stock, ropes, sails, bricks, etc. Pop. 51,712.

**Bar'rows**, mounds of earth or stones raised to mark the resting-place of the dead, and distinguished, according to their shape, as *long*, *boxl*, *bell*, *cone*, *broad* barrows. The practise of barrow-burial is of unknown antiquity and almost universal. barrows being found all over America, Europe, in Northern Africa, Asia Minor, Afghanistan, and Western India. In barrows of later date the remains are generally enclosed in a stone cist. Frequently cremation preceded the erection of the barrow, the ashes being enclosed in an urn or cist. A detailed description of an ancient barrow-burial is given in the Anglo-Saxon poem *Beavulf*, and the accounts of the obsequies of Hector and Achilles in the *liad* and *Odyssey* are well known.

**Barrow Strait**, the connecting channel between Lancaster Sound and Baffin's Bay on the e. and the Polar Ocean on the w. Of great depth, with rocky and rugged shores. Named after Sir John Barrow (1764-1848), a British traveler.

**Bar'ry**, CHARLES (1705-1860), an English architect, b. in London 1795. After executing numerous important buildings, such as the Reform Club-house, London, St. Edward's School, Birmingham, etc., he was appointed architect of the new Houses of Parliament at Westminster, a noble pile, with the execution of which he was occupied for more than twenty-

four years. His son, EDWARD MIDDLETON, (1830-1880), was also a distinguished architect.

Barry, JOHN (1745-1803), naval officer, b. in Ireland. He was apprenticed to seamanship, and became master of a vessel. At the beginning of the Revolution he offered his services to this country, and in 1776 became commander of the Lexington, and captured the British tender *Edward*. He was transferred to the command of the *Effingham*. In the winter of 1776-77, he assisted at the battle of Trenton with some heavy artillery. In 1777, Barry captured a British war schooner in the Delaware River. In 1778 he commanded the Ra*kigh*, which was pursued and driven on shore by a British squadron. Later he was trans-ferred to the *Alliance*, and in a severe engagement captured the Atalanta and Trepassy. He was senior officer, with the rank of commodore in the reorganized navy in 1794.

Bar' sabas, son of Alpheus, brother of James the Less and of Jude, and one of the candidates for the apostolical office left vacant by Judas Iscariot.

Bart (Baert or Barth) (bärt), JEAN, a famous French sailor, b. at Dunkirk, 1650, the son of a poor fisherman. He became captain of a privateer, and after some brilliant exploits was appointed captain in the royal navy. In recognition of his further services he was made commodore. He made the navy of the nation everywhere respected, and furnished some of the most striking chapters in the romance of naval warfare. After the peace of Ryswick he lived quietly at Dunkirk, and d. there while equipping a fleet to take part in the War of the Spanish Succession, 1702.

Barth (bärt), HEINRICH, African traveler, b. at Hamburg 1821, d. in 1865. He graduated at the University of Berlin as Ph.D. in 1844; and set out in 1845 to explore all the countries bordering on the Mediterranean. His explorations, which extended over an area of about 2,000,000 sq. mi., determined the course of the Niger and the true nature of the Sahara

Barthé'lmy - Saint - Hilaire (bar-tāl-mē), JULES (1805-1887), French scholar and statesman. He was professor of Greek and Latin philosophy in the College of France, but re-signed the chair after the coup d'état of 1852 and refused to take the oath; was reappointed 1862; in 1869 was returned to the Corps Législatif; after the revolution was a member of the National Assembly; was elected senator for life in 1875. He published a translation of Aristotle, and works on Buddhism, Mohammed and Mohammedanism, the Vedas, etc.

Bartholdi (bår-tol'dē) AUGUSTE, a French sculptor, b. 1833; best known as the artist of the colossal statue of Liberty now overlooking the harbor of New York.

Barthol'omew, the apostle, is probably the same person as Nathanael, mentioned in the Gospel of St. John as an upright Israelite and one of the first disciples of Jesus. He is said to have taught Christianity in the south of Arabia.

Bartholomew's Day, ST., a feast of the Church of Rome, celebrated (August 24) in honor of St. Bartholomew. What is known as the Massacre of St. Bartholomew was the slaughter of the French Protestants which began Aug. 24, 1572, by secret orders from Charles IX at the instigation of his mother, Catherine de Medici, and in which, according to Sully, 70,000 Huguenots, including women and children, were murdered throughout the country. During the minority of Charles and the regency of his mother a long war raged in France between the Catholics and the Huguenots, the leaders of the latter being the Prince of Condé and Admiral Coligny. In 1570 overtures were made by the court to the Huguenots, which resulted in a treaty of peace. This treaty blinded the chiefs of the Huguenots, particularly the Admiral Coligny, who was wearied with civil war. The king appeared to have entirely disengaged himself from the influence of the Guises and his mother; he invited Coligny to his court. and honored him as a father. The most artful means were employed to increase this delu-sion. The sister of the king was married to the Prince de Béarn (1572) in order to allure the most distinguished Huguenots to Paris. On August 22 a shot from a window wounded the admiral. The king hastened to visit him, and swore to punish the author of the villainy; but on the same day he was induced by his mother to believe that the admiral had de-signs on his life. The following night Catharine held the bloody council, which fixed the execution for the night of St. Bartholomew, Aug. 24, 1572. After the assassination of Coligny a bell from the tower of the royal palace at midnight gave to the assembled companies of burghers the signal for the general massacre of the Huguenots. The Prince of Condé and the King of Navarre saved their lives by going to mass and pretending to embrace the Catholic religion. By the king's orders the massacre was extended throughout the whole kingdom, and the horrible slaughter continued for birthirty days in almost all the provinces. Bartholomew's Hospital, ST., one of the

great hospitals of London, formerly the priory

of St. Bartholomew, and made a hospital by Henry VIII in 1547. On an VIII in 1547. average 6,000 patients are annually admitted to the hospital, while about 100,-000 out-patients are relieved by it. A medical school is attached to it.

Bar'tizan, a small overhanging turret pierced with one or more apertures for archers, projecting generally from the angles on the top of a tower, or from the para-pet, or elsewhere, as in a mediæval castle.

Bartolini (bar-to-lē'nē), LORENZO (1778-1850), a Bartizan. celebrated Italian sculptor, born at Florence. He studied and worked in Paris, and was pat-

ronized by Napoleon. Among his greater works may be mentioned his groups of *Charity* and *Hercules* and *Lycas*, a colossal bust of Napoleon, and the beautiful monument in the cathedral of Lausanne, erected in memory of Lady Stratford Canning. Bartolini ranks next to Canova among modern Italian sculptors.

**Bartolozzi** (lot'sē), FRANCESCO (1725-1813), a distinguished engraver, born at Florence. He later went to London, and Lisbon, Portugal.

later went to London, and Lisbon, Portugal. **Barton, BERNARD**, known as the Quaker poet, b. in London 1784, d. 1849. His poetry, though deficient in force, is pleasing, fluent, and graceful.

Barton, CLARA, philanthropist, b. 1826, in Oxford, Mass. She first went to school in Clinton, N. Y.; became a teacher and founded a free school in Bordentown, N. J., became clerk in the U.S. patent office, 1854. When the Civil War began she devoted herself to the care of wounded soldiers on the battlefield; and in 1864 had charge of the hospitals at the front of the Army of the James. In 1865 she visited Andersonville, Ga., to mark the graves of the Union soldiery. During the war between Germany and France she volunteered her service, and was decorated with the golden cross of Baden and the iron cross of Germany. The American Red Cross Society was organized in 1881, and she became its president, and represented the U.S. at the Red Cross conference in Geneva, Switzerland, in 1884. She was also delegate to the international peace convention at Geneva, in 1884, and a special commissioner for foreign exhibits at the New Orleans exhibition. In 1883 the U.S. Senate committee on foreign relations requested her to prepare a *History of the Red Cross.* This book was published at the government print-ing office, Washington.

Bartram, JOHN (1699-1777), botanist, b. in Chester co., Pa. After studying medicine and surgery, he became interested in the study of plants. He was the first to form a botanic garden for American plants. The garden still contains some fine old trees. Mr. Bartram went on his first extensive botanical expedition, joining a mission to the Six Nations of Indians at Onondaga, and afterward traveling to Oswego, and to the partly explored shores of Lake Ontario, 1743. He published his Ob-servations on the Inhabitants, Climate, Soil, etc., from Pennsylvania to Onondaga, Oswego, and the Lake Ontario, etc. (1751). His Journal of Travels was published in 1766. Mr. Bartram contributed several papers to the American Philosophical Society. He was a friend of Mr. Bartram supported his Dr. Franklin. family by farming, and quarried the stones for the house on the Schuylkill, which he built, and which is still standing. His son, William Bartram (1730-1823) illustrated Barton's Ele-ments of Botany, and was the first to make known many curious and beautiful American plants.

**Baruch** (bā'ruk), a Hebrew scribe, friend and assistant to the prophet Jeremiah. One of the apocryphal books bears the name of Baruch. **Barwood**, a dyewood obtained from a tall tree of West Africa. It is chiefly used for giving orange-red dyes on cotton yarns. See *Camwood*.

Bary'ta, oxide of barium, called also heavy earth, from its being the heaviest of the earths. It is generally found in combination with sulphuric and carbonic acids, forming sulphate and carbonate of baryta, the former of which is called *heavy-spar*. Baryta is a gray powder. has a sharp, caustic, alkaline taste, and a strong affinity for water, and forms a hydrate with that element. It forms white salts with the acids, all of which are poisonous except the sulphate. Several mixtures of sulphate of baryta and white lead are manufactured, and are used as white pigments, or it may be used alone. Carbonate of baryta, which in the natural state is known as witherite, is also used as the base of certain colors. The nitrate is used in pyrotechny, in the preparation of green fireworks.

**Basalt** (ba-salt'), a well-known igneous rock occurring in the ancient trap and the recent volcanic series of rocks, but most abundantly in the former. It is a fine-grained, heavy, crystalline rock, consisting of felspar, augite, and magnetic iron, and sometimes contains a little olivine. Basalt is amorphous, columnar, tabular, or globular. The columnar form is straight or curved, perpendicular or inclined. sometimes nearly horizontal; the diameter of the columns from 3 to 18 in., sometimes with transverse semispherical joints, in which the convex part of one is inserted in the concavity of another; and the height from 5 to 150 ft. The forms of the columns generally are pentagonal, hexagonal, or octagonal. When decomposed it is found also in round masses, either spherical or compressed and lenticular. These rounded masses are sometimes composed of concentric layers, with a nucleus, and sometimes of prisms radiating from a center. Fingal's Cave, in the island of Staffa, furnishes a remarkable instance of basaltic columns. The pillars of the Giant's Causeway, Ireland, composed of this stone, and exposed to the roughest sea for ages, have their angles as perfect as those at a distance from the waves. Basalt often assumes curious and fantastic forms, as for example, those masses popularly known as "Sampson's Ribs" at Arthur's Seat, Edin-burgh, and "Lot" and "Lot's Wife" near the s. coast of St. Helena.

**Baseball**, a game played with a bat and ball which has obtained a national character in the U. S. It is played by nine players a side. A diamond-shaped space of ground, 90 feet on the side, is marked out, the corners being the "bases." One side takes the field, and the other sends a man to bat. When the field side take their places the "pitcher," standing inside the ground near the center and in front of the batsman, delivers a ball to the batsman, who stands at the "home base," and who tries to drive it out of the reach of the fielders, and far enough out of the field to enable him to run round the bases, which scores a run. If he

#### Basedow

and may be followed by another batsman. If he is touched by the ball he is out, and when three on his side are put out, the field side take the bat. Nine of these innings makes a game, which the highest score wins. The bat is of a cylindrical shape, not more than 2½ inches in diameter nor more than 42 inches long. The ball is about 9 inches in circumference and weighs not less than 5 ounces. There are now several professional leagues of baseball clubs in the U. S., the leading one of which is the National League. Nearly every college in America has its baseball team, but these players are amateurs.

**Basedow** (bā'ze-dō), JOHN BERNHARD (1723-1790), German educationalist. The chief feature of Basedow's system is the full development of the faculties of the young at which he aspired, in pursuance of the notions of Locke and Rousseau.

Basel (ba'zl), a canton and city of Switzerland. The canton borders on Alsace and Baden, has an area of 177 sq. mi. and a pop. of 144,283, nearly all speaking German. It is divided into two half-cantons. The city of Basel is 43 mi. n. of Berne, and consists of two parts on opposite sides of the Rhine, and communicating by three bridges, one of them an ancient wooden structure; the older portions are irregularly built with narrow streets; has an ancient cathedral, founded 1010, containing the tombs of Erasmus and other eminent persons; a university, founded in 1459; a seminary for missionaries; a museum containing the valuable public library, pictures, etc. The industries embrace silk ribbons, tanning, paper, aniline dyes, brewing, etc. At Basel was signed the treaty of peace between France and Prussia, April 5, and that between France and Spain, July 22, 1795. Pop. 75,114.

**Basel**, Council of, a celebrated ecumenical council of the church convoked by Pope Martin V and his successor Eugenius IV. It was opened Dec. 14, 1431. The objects of its deliberations were to extirpate heresies (that of the Hussites in particular), to unite all Christian nations under the Catholic church, to put a stop to wars between Christian princes, and to reform the church. It got into a dispute with the pope, declared him guilty of contumacy and deposed him. It sat until May 4, 1449, but declined in importance.

**Base-line**, in surveying, a straight line measured with the utmost precision to form the starting point of the triangulation of a country or district.

**Bashi-Bazooks'**, irregular troops in the Turkish army. They are mostly Asiatics, and have had to be disarmed several times by the regular troops on account of the barbarities by which they have rendered themselves infamous.

**Basic Slag,** the slag or refuse matter which is got in making basic steel, and which, from the phosphate of lime it contains, is a valuable fertilizer.

**Bas'il**, a labiate plant, a native of India, much used in cookery, especially in France, and known more particularly as sweet or common basil.

**Basil**, ST., called the Great, one of the Greek fathers, was b. in 329 and made, in 370, Bishop of Cæsarea in Cappadocia, where he d. in 370. The Greek church celebrates his festival January 1. The vows of obedience, chastity, and poverty framed by St. Basil are essentially the rules of all the orders of Christendom.

**Basil** ica, originally the name applied by the Romans to their public halls, either of justice. of exchange, or other business. The plan of the basilica was usually a rectangle divided into aisles by rows of columns, the middle aisle being the widest, with a semi-circular apse at the end, in which the tribunal was placed.

**Basilica' ta** (also called Potenza), an Italian province, extending north from the Gult of Taranto, and corresponding pretty closely with the ancient Lucania. Area 4,122 sq. mi.; pop. 459,580. Potenza (pop. 20,780) is the capital.

**Bas' illsk**, a fabulous creature formerly believed to exist, and variously regarded as a kind of serpent, lizard, or dragon, and sometimes identified with the cockatrice. It inhabited the deserts of Africa, and its breath, and even its look, was fatal. The name is now

The Mythical Basilisk.

applied to a genius of saurian reptiles belonging to the family Iguanidæ, distinguished by an elevated crest or row of scales, erectible at pleasure, which, like the dorsal fins of some fishes, run along the whole length of the back and tail. The miterd or hooded basilisk is especially remarkable for a membranous bag at the back of the head, of the size of a small hen's egg, which can be inflated with air at pleasure. The other species have such hoods also, but of a less size. To this organ they owe their name, which recalls the basilisk of fable, though in reality they are exceedingly harmless and lively creatures. **Basil'ius 1** (820-886). a Macedonian, em-

**Basil'ius 1** (820-886), a Macedonian, emperor of the East. Though he had worked his way to the throne by a series of crimes, he proved an able and equitable sovereign. The versatility, if not the depth of his intellect, is strikingly displayed in his exhortations to his son Leo, which are still extant.

**Basilius II** (958-1025), emperor of the East. He began to reign in conjunction with his brother Constantine, 975. His reign was almost a continued scene of warfare, his most important struggle being that which resulted in the conquest of Bulgaria, 1018.

**Ba'sin**, in physical geography, the whole tract of country drained by a river and its tributaries. The line dividing one river basin from another is the water-shed, and by tracing the various water-sheds we divide each country into its constituent basins. The basin of a loch or sea consists of the basins of all the rivers which run into it. In geology a basin is any dipping or disposition of strata toward a common axis or center, due to upheaval and subsidence. It is sometimes used almost synonymously with "formation" to express the deposits lying in a certain cavity or depression in older rocks. The "Paris basin" and "London basin" are familiar instances.

**Bas' kerville**, JOHN (1706-1775), celebrated English printer and type founder. From his press came highly prized editions of ancient and modern classics, Bibles, prayer-books, etc., all beautifully printed works.

**Basking-shark**, a species of shark, so named from its habit of basking in the sun at the surface of the water. It reaches the length of forty feet, and its liver yields a large quantity of oil. It frequents the northern seas, and is known also as the sail-fish or sun-fish.

Basques (basks) (or Biscayans), a remarkable race of people dwelling partly in the s.w. corner of France, but mostly in the n. of Spain adjacent to the Pyrenees. They are probably descendants of the ancient Iberi, who occupied Spain before the Celts. They preserve their ancient language, former manners, and national dances, and make admirable soldiers, especially in guerrilla warfare. The Basques, who number about 600,000, occupy in Spain the provinces of Biscay, Guipuzcoa, and Alava; in France parts of the departments of the upper and lower Pyrenees, Ariege, and upper Garonne.

**Bas-relief** (b'i'rē-lēf or bas'rē-lēf) (bassrelief, low-relief), a mode of sculpturing figures on a flat surface, the figures having a very slight relief or projection from the surface. It is distinguished from *haut-relief* (alto*rilievo*), or high-relief, in which the figures stand sometimes almost entirely free from the ground. Bas-relief work has been described as "sculptured painting" from the capability of disposing of groups of figures and exhibiting minor adjuncts, as in a painting.

Bass (bas), the name of a number of fishes of several genera, but originally belonging to a genus of sea-fishes of the perch family, distinguished from the true perches by having the tongue covered by small teeth and the preoperculum smooth. The only British species, called also sea-dace, and from its voracity sea-wolf, resembles somewhat the salmon in shape, and is much esteemed for the table, weighing about 15 lbs. The striped bass, an American species, weighing from 25 to 30 lbs., is much used for food, and is also known as rock-fish. Both species occasionally ascend rivers, and attempts have been made to cultivate British bass in fresh-water ponds with success. Two species of black bass, American fresh-water fishes, are excellent as food and give fine sport to the angler. The former is often called the large-mouthed black bass, from the size of its mouth. Both make nests and take great care of their eggs and young. The sea bass is an American fish of the perch family, weighing 2 to 3 lbs.

**Bass** (bås), The; a remarkable insulator traprock, at the mouth of the Firth of Forth, Scotland, of a circular form, about one mile in circumference, rising majestically out of the sea to a height of 313 ft. It pastures a few sheep, and is a great breeding place of solan-geese.

**Bass**, MICHAEL THOMAS (1799–1884), an English brewer, head of the famous firm of Bass & Co., founded in 1777. For many years the firm has been extending its connections, and now employ about 3.000 persons, with an average annual turnover of \$12,000,000. B. represented Derby in the Liberal interest from 1848 to 1883. His benefactions have been very numerous in the parish of Burton and in Derby. He more than once declined a baronetcy and a peerage. The title of Baron Burton was conferred on his son in 1886.

**Bassa' no,** a commercial city of North Italy, province of Vicenza. Near Bassano, Sept. 8, 1796, Bonaparte defeated the Austrian general Wurmser. Pop. 4,897.

**Bassa no** (from his birthplace; real name Giacomo da Ponte), an Italian painter, b. 1510, d. 1592. He painted historical pieces, landscapes, flowers, etc., and also portraits; and left four sons, who all became painters, Francesco being the most distinguished.

**Bassein** (bas-sān'), a town in Lower Burmah, province of Pegu, on both banks of the Bassein river, one of the mouths of the Irrawaddy, and navigable for the largest ships. It has considerable trade, exporting large quantities of rice, and importing coal, salt, cottons, etc. Pop. 30,177. Bassein District has an area of 7,047 sq. mi. and a pop. of 389,419.

**Basseterre** (bös-tār), two towns in the West Indies. 1, Capital of the island of St. Christopher's, at the mouth of a small river, on the south side of the island. Trade considerable. Pop. 9,097. 2, The capital of the island of Guadaloupe. It has no harbor, and the anchorage is unsheltered and exposed to a constant swell. Pop. 10,649.

**Bass'ia**, a genus of tropical trees found in the East Indies and Africa. One species is supposed to be the sheat-tree of Park, the fruit of which yields a kind of butter that is highly valued, and forms an important article of commerce in the interior of Africa. There are several other species, of which the Indian oil-tree, and the Indian butter-tree, are wellknown examples, yielding a large quantity of oleaginous or butyraceous matter. The wood is as hard and incorruptible as teak.

**Bassoon'**, a musical wind instrument of the reed order, blown with a bent metal mouthpiece, and holed and keyed like the clarinet. Its compass comprehends three octaves rising from B flat below the bass staff. Its diameter at bottom is 3 inches, and for convenience of carriage it is divided into two or more parts, whence its Italian name fagotto, a bundle. It serves for the bass among wood wind instruments, as hautboys, flutes, etc.

**Bass' ora** (or Basrah), a city in Aslatic Turkey, on the w. bank of the Shat-el-Arab (the united stream of the Tigris and Euphrates),

about 50 mi. from its mouth, and nearly 300 s. e. of Bagdad. The chief exports are, dates, camels and horses, wool and wheat; imports: coffee, indigo, rice, tissues, etc. In the eighteenth century the inhabitants were estimated at 150,000; they are now about 6,000. The ruins of the ancient and more famous Bassora founded by Caliph Omar in 636, at one time a center of Arabic literature and learning and regarded as "the Athens of the East"—lie about 9 mi. s. w. of the modern town.

**Bass Strait**, a channel beset with islands, which separates Australia from Tasmania, 120 mi. broad, discovered by George Bass, a surgeon in the royal navy, in 1798.

**Basswood Bass**, the American lime tree or linden, a tree common in N. A., yielding a light, soft timber, used for building boats and canoes.

**Bast,** the inner bark of exogenous trees, especially of the lime or linden, consisting of several layers of fibers. The manufacture of bast into mats, ropes, shoes, etc., is in some districts of Russia a considerable branch of industry, bast mats, used for packing furniture, covering plants in gardens, etc., being exported in large quantities. Though the term is usually restricted, many of the most important fibers of commerce, such as hemp, flax, jute, etc., are the products of bast or liber. **Bastia** (bàs-tẽ'à), the former capital of the

**Bastia** (bås-tē'à), the former capital of the island of Corsica, upon the n.e. coast, 75 mi. n.e. of Ajaccio, with some manufactures, a considerable trade in hides, soap, wine, oil, pulse, etc. Pop. 23,397.

**Bastiat** (bas-tē-à), FREDERIC (1801-1850), French economist and advocate of free trade. He became acquainted with Cobden and the English free traders, whose speeches he translated into French.

Bastille (bas-tel'), a French name for any strong castle provided with towers, but as a proper name, the state prison and citadel of Paris, which was built about 1370 by Charles V. It was ultimately used chiefly for the confinement of persons of rank who had fallen victims to the intrigues of the court or the ca-price of the government. The capture of the Bastille by the Parisian mob, July 14, 1789, was the opening act of the Revolution. On that date the Bastille was surrounded by a tumultuous mob, who first attempted to negotiate with the governor Delaunay, but when these negotiations failed, began to attack the fortress. For several hours the mob continued their seige without being able to effect anything more than an entrance into the outer court of the Bastille; but at last the arrival of some of the Royal Guard with a few pieces of artillery forced the governor to let down the second drawbridge and admit the populace. The governor was seized, but on the way to the townhall, he was torn from his captors and put to death. The next day the destruction of the Bastille commenced. Not a vestige of it exists, but its site is marked by a column in the Place de la Bastille.

**Basu'toland**, a native province and British South African possession. The Basutos belong chiefly to the great stem of the Bechuanas, and have made greater advances in civilization than perhaps any other South African race. In 1866 the Basutos, who had lived under a semi-protectorate of the British since 1848, were proclaimed British subjects, their country placed under the government of an agent, and in 1871 it was joined to Cape Colony. In 1879 the attempted enforcement of an act passed for the disarmament of the native tribes caused a revolt under the chief Moirosi, which the Cape forces were unable to put down. When peace was restored, Basutoland was disannexed from Cape Colony (1884), and is now governed by a resident commissioner under the high commissioner of South Africa. Basutoland has an area of about 10,300 sq. mi., much of it covered with grass, and there is but little wood. The climate is pleasant. The natives keep cattle, sheep, and horses, cultivate the ground, and export grain. It is di-vided into four districts, each presided over by a magistrate. Pop. (Europ.) 5,000; (native) 127,707.

**Bat**, one of the group of wing-handed, flying mammals, having the fore-limb peculiarly modified so as to serve for flight, and constituting the order Cheiroptera. Bats are ani-

Bat's heads.

mals of the twilight and darkness, and are common in temperate and warm regions, but are most numerous and largest in the tropics. All European bats are small, and have a mouselike skin. The body of the largest British species is less than that of a mouse, but its wings stretch about 15 in. During the day it remains in caverns, in the crevices of ruins, hollow trees, and such-like lurking-places, and flits out at evening in search of food, which consists of insects. Several species of the same genus are common in North America. Many bats are remarkable for having a singular nasal cutaneous appendage, bearing in some cases a fancied resemblance to a horseshoe. Two of these horseshoe bats occur in Britain. Bats may be conveniently divided into two sections - the insectivorous or carnivorous, comprising all European and most African and American species; and the fruit-eating, belonging to tropical Asia and Australia, with several African forms. An Australian fruit-eating bat, commonly known as the kalong or flying-fox, is the largest of all the bats; it does much mischief in orchards. At least two species of South American bats are known to suck the blood of other mammals, and thence are called

)

"vampire-bats" (though this name has also been given to a species not guilty of this habit). As winter approaches, in cold climates bats seek shelter in caverns, vaults, ruined and deserted buildings, and similar retreats, where they cling together in large clusters, hanging head downward by the feet, and remain in a torpid condition until the returning spring recalls them to active exertions. Bats generally bring forth two young, which, while suckling, remain closely attached to the mother's teats, The which are two, situated upon the chest. parent shows a strong degree of attachment for her offspring, and when they are captured, will follow them, and even submit to captivity herself rather than forsake her charge.

**Batan'gas,** a town of the Philippines, in the island Luzon, capital of a province of same name, 58 mi. s. of Manilla. Pop. of town and district, 29,360.

**Bata'via**, a city and seaport of Java. on the north coast of the island, the capital of all the Dutch East Indies. It is situated on a wide, deep bay, the principal warehouses and offices of the Europeans, the Java Bank, the exchange, etc., being in the old town, which is built on a low, marshy plain near the sea, intersected with canals and very unhealthy; while the Europeans reside in a new and much healthier quarter. Batavia has a large trade, sugar being the chief export. It was founded by the Dutch in 1619, and attained its greatest prosperity in the beginning of the eighteenth century. Its inhabitants are chiefly Malay, with a considerable admixture of Chinese and a small number of Europeans. Pop. 93,613.

a small number of Europeans. Pop. 93,613. Batavia, Genesee co., N. Y., on Tonawanda creek, 37 mi. e. of Buffalo. Railroads: N. Y. C. & H. R.; Lehigh Valley; Erie & Tonawanda; Canandaigua & Attica branches of N. Y. C. Industries: harvester co., two flouring-mills, wood-working factory, wheel, gun, shoe, canned goods, paper box, pump and farm implement factories, and planing mill. Surrounding country agricultural. The village was first settled in 1800. Pop. est. 1897, 8,665.

**Bates,** EDWARD (1792-1869), statesman, b. in Virginia. He studied law and was attorneygeneral of Missouri. He served a term in Congress, 1827-28. He received forty-eight votes on the first ballot in the Republican convention of 1860, but withdrew in favor of Abraham Lincoln, who afterward made him attorney-general of the U. S.

**Bath**, a city of England in Somersetshire, on the Avon, which is navigable for barges from Bristol. Bath is remarkable for its medicinal waters, the four principal springs yielding no less than 184,000 gallons of water a day. Pop. 54,551.

**Bath**, the immersion of the body in water, or an apparatus for this purpose. The use of the bath as an institution apart from occasional immersion in rivers or the sea, is, as might be anticipated, an exceedingly old custom. Homer mentions the bath as one of the first refreshments offered to a guest; thus, when Ulysses enters the palace of Circe, a bath is pre-

pared for him, and he is anointed after it with costly perfumes. In later times, rooms both public and private, were built expressly for bathing, the public baths of the Greeks being mostly connected with the gymnasia. The fullest details we have with respect to the bathing of the ancients apply to its luxurious de-velopment under the Romans. Their bathing establishments consisted of four main sections: the undressing room, with an adjoining chamber in which the bathers were anointed; a cold room with provision for a cold bath; a room heated moderately to serve as a preparation for the highest and lowest temperatures; and the sweating-room, at one extremity of which was a vapor-bath and at the other an ordinary hot bath. After going through the entire course both the Greeks and the Romans made use of strigils or scrapers, either of horn or metal, to remove perspiration, oil, and impurities from the skin. Connected with the bath were walks, covered race grounds, tennis courts, and gardens, the whole, both in the external and internal decorations, being frequently on a palatial scale. The group of the Laocoon and the Farnese Hercules were both found in the ruins of Roman baths. With respect to modern baths, that commonly in use in Russia consists of a single hall, built of wood, in the midst of which is a powerful metal oven, covered with heated stones, and surrounded with broad benches, on which the bathers take their places. Cold water is then poured upon the heated stones, and a thick, hot steam rises, which causes the perspiration to issue from the whole body. The bather is then gently whipped with wet birch rods, rubbed with soap, and washed with lukewarm and cold water; of the latter, some pailfuls are poured over his head; or else he leaps, immediately after this sweating-bath, into a river or pond, or rolls in the snow. The Turks, by their religion, are obliged to make repeated ablutions daily, and for this purpose there is, in every city, a public bath connected with a mosque. A favorite bath among them, however, is a modification of the hot-air sudorificbath of the ancients introduced under the name of "Turkish," into other than Moham-medan countries. A regular accompaniment of this bath, when properly given, is the opera-tion known as "kneading" generally performed at the close of the sweating process, after the final rubbing of the bather with soap, and consisting in a systematic pressing and squeezing of the whole body, stretching the limbs, and manipulating all the joints as well as the fleshy and muscular parts. Public baths are common in the U.S. Every large city has a number of baths fitted up in very artistic style, and every house or flat has its bathtub or shower bath. There are also numerous "hot springs' in nearly every section. Among the most fa-mous are those at Hot Springs, Garland co., Arkansas, resorted to by invalids for the cure of rheumatism and similar complaints. There are from seventy-five to one hundred springs, varying in temperature from 105° to 160°, issuing from a lofty ridge of sandstone overlooking

the town, while others rise in the bed of the stream near by. The most celebrated natural hot baths in Europe are those of Aix-la-Chapelle, and the various Baden in Germany; Toeplitz, in Bohemia; Bagnières, Baréges, and Dax, in the south of France; and Spa, in Belgium. Besides the various kinds of water-bath with or without medication or natural mineral ingredients, there are also milk, oil, wine, earth, sand, mud, and electric baths, smoke-baths and gas-baths; but these are as a rule only indulged after specific prescription. The practise of bathing as a method of cure in cases of disease falls under the head of hydropathy.

Bath, Sagadohoc co., Me., on Kennebec River, 39 mi. e. of Portland. Railroad: Maine Central. Industries: iron works, shoe factory, and ship building. Surrounding country agricultural. The town was first settled in 1780 and became a city in 1847. Pop. est. 1897, 9,000.

**Bathom'eter**, an instrument for measuring the depth of sea beneath a vessel without casting a line. It is based upon the fact that the attraction exerted upon any given mass of matter on the ship is less when she is afloat than ashore because of the less density of seawater as compared with that of earth or rock.

**Bathori** (bä'to-rē), a Hungarian family, which gave Transylvania five princes, and Po-land one of its greatest kings. The more im-portant members were: 1, STEPHEN (1532-1586), elected prince of Transylvania in 1571, and in 1575 king of Poland. He recovered the Polish territories in possession of the Czar of Muscovy. 2, SIGISMUND, nephew of Stephen, became prince of Transylvania in 1581, shook off the Ottoman yoke, and resigned his dominions to the Emperor Rudolph II, in return for two principalities and a pension. He returned and placed himself under the protection of the Porte, was defeated by the Imperialists in every battle, and sent to Prague, where he d. in 1613. 3, ELIZABETH, niece of Stephen, and wife of Count Nadasdy, of Hungary. She is said to have bathed in the blood of 300 young girls in the hope of renewing her youth, and to have committed other enormities. She was latterly seized and confined till her death in 1614.

**Bath'urst**, a British settlement on the west coast of Africa, on the island of St. Mary's, near the mouth of the Gambia, with a trade in gum, beeswax, hides, ivory, gold, rice, cotton, and palm oil. Pop. 6,000.

**Bat'leŷ**, a town of England, West Riding of York. Principal manufactures: heavy woolen cloths, such as pilot, beaver, police, army, and frieze cloths, flushings, and blankets. Pop. 28,719.

**Bat'on Rouge** (rözh), E. Baton Rouge parish, the capital of Louisiana, on the left bank of the Mississippi, with an arsenal, barracks, military hospital, state-house, state university, etc. On Aug. 5, 1862, the Confederates under General Breckenridge suffered a defeat before it. Pop. 10,478.

**Batoum** (or Batum) (ba töm'), a port on the e. coast of the Black Sea, acquired by Russia by the Treaty of Berlin. Its importance as a

.

naval and military station to Russia is unquestionably great, and it is one of the strongest positions on the Black Sea. The water is of great depth close inshore, and the shipping lies under protection of the overhanging cliffs of the Gouriel Mountains. Pop. 19,890.

**Batrachians** (ba-trā'ki-anz), the fourth order in Cuvier's arrangement of the class Reptilia, comprising frogs, toads, newts, salamanders, and sirens. The term is now often employed as synonymous with amphibia, but is more usually restricted to the order Anura or tailless amphibia.

Bat'tas, a people belonging to the Malayan race inhabiting the valleys and plateaus of the mountains that extend longitudinally through the island of Sumatra. They practise agriculture and cattle-rearing, and are skilful in various handicrafts; they have also a written literature and an alphabet of their own, their books treating of astrology, witchcraft, medicine, war, etc. They are under the rule of hereditary chieftains.

Battering-ram, an engine for battering down the walls of besieged places. The ancients employed two different engines of this kind one suspended in a frame, the other movable on wheels or rollers. They consisted of a beam or spar with a massive metal head, and were set in motion either by a direct application of manual force or by means of cords passing over pulleys. Some are said to have been 120 feet or more in length, and to have been worked

#### Battering-ram.

by 100 men. One is described as being 180 feet long, and having a head weighing 14 tons. They were generally covered with a roof or screen for the protection of the workers. They have been used recently in Irish evictions and evoked much indignation from the Nationalist party.

**Battery**, in criminal law, an assault by beating or wounding another. The least touching or meddling with the person of another against his will may be held to constitute a battery.

Batthyanyi (bàt-yàn'yē), one of the oldest and most celebrated Hungarian families, traceable as far back as the ninth century. Among later bearers of the name have been: COUNT CASIMIR BATTHYANYI, who was associated with Kossuth, was minister of foreign affairs in Hungary during the insurrection of 1849, and d. in Paris 1854; COUNT LOUIS BATTHYANYI, (1809-1849), was leader of the opposition in the Hungarian diet until the breaking out of the commotions of 1848, when he took an active part in promoting the national cause.

Battle Creek, Calhoun co., Mich., on Kalamazoo and Battle Creek Rivers, 160 mi. e. of

Chicago. Railroads: Michigan Central; Grand Trunk; Lake Shore; Cincinnati, Jackson & Mackinaw. Industries: two large threshing machine factories, three flouring mills, three iron foundries, two steam pump factories, and two pure food factories. Surrounding country agricultural. Battle Creek became a city in 1860. Pop. est. 1897, 18,500.

**Baudelaire** (bôd-lär), CHARLES PIERRE (1821-1867), French poet. His first work of importance was a series of translations from Poe, ranking among the most perfect translations in any literature.

**Baudry** (bō-drē), PAUL JACQUES AME (1828-), a prominent French painter. The decoration of the *foyer* of the New Opera House at Paris was intrusted to him — an enormous work, occupying a total surface of 500 sq. meters, but accomplished by him in eight years.

**Bauer** (bou'er), BRUNO (1809-1882), German philosopher, historian, and Biblical critic of the rational school.

**Baumgarten** (boum går-tn), ALEXANDER GOTTLIEB (1714-1762), a German philosopher. He was the founder of æsthetics as a science, and the inventor of this name.

**Baur** (bour), FERDINAND CHRISTIAN (1792-1860), German theologian, founder of the "Tubingen School of Theology."

bingen School of Theology." Bautzen (bout'sen) (or Budissin), German town in the kingdom of Saxony. Chief manufactures: woolens, paper, gunpowder, machines. Napoleon defeated the united armies of the Russians and the Prussians at Bautzen on May 21, 1813. Pop. 21,516.

Bava' ria (German, Baiern; French, Baviere), a kingdom in the south of Germany, the second largest state of the empire. Total area 29,657 sq. mi. The main political divis-ions are: Upper Bavaria, Lower Bavaria, Palatinate, Upper Palatinate, Upper Franconia, Middle Franconia, Lower Franconia, Swabia. After Munich the chief towns are, Nürnberg, Augsburg, Würzburg, and Ratisbon (Regensburg). The principal articles manufactured are, linens, woolens, cottons, leather, paper, glass, earthen and iron ware, jewelry, etc. The optical and mathematical instruments made are excellent. A most important branch of industry is the brewing of beer, for which there are upward of 7,000 establishments, producing over 260 millions of gallons a year. A number of the people maintain themselves by the manufacture of articles in wood, and by felling and hewing timber.

In art Bavaria is best known as the home of the Nürnberg school, founded about the middle of the sixteenth century by Albert Dürer. Hans Holbein is also claimed as a Bavarian; and to these have to be added the eminent sculptors, Kraft and Vischer, both b. about the middle of the fifteenth century. The restoration of the reputation of Bavaria in art was chiefly the work of Ludwig I, under whom the capital became one of the most prominent seats of fine arts in Europe.

The Bavarian crown is hereditary in the male line. The executive is in the hands of the king. The legislature consists of two

chambers: one of senators composed of the princes of the royal family, the great officers of the state, the two archbishops, the heads of certain noble families, and certain members appointed by the crown; the other of deputies, 159 in number, nominated by the electors, who are themselves elected, 1 for every 500 of the population. The lower chamber is elected for six years. Bavaria sends six members to the German Federal Council (Bundesrath) and forty-eight deputies to the Imperial Diet (Reichstag). The army (peace footing, 32,-820; war footing, 112,016) is raised by conscription - every man being liable to serve from January 1 of the year in which he com-pletes his twentieth year. In time of peace it is under the command of the king of Bavaria, but in time of war under that of the emperor of Germany, as commander-in-chief of the whole German army.

History .- The Bavarians take their name from the Boii, a Celtic tribe whose territory was occupied by a confederation of Germanic tribes called after their predecessors Boiarii. These were made tributary first to the Ostrogoths, and then to the Franks, and on the death of Charlemagne, his successors governed the country by lieutenants with the title of margrave, afterward converted (in 921) into that of duke. In 1070 Bavaria passed to the family of the Guelphs, and in 1180 by imperial grant to Otho, count of Wittelsbach. founder of the still reigning dynasty. In 1623 the reigning duke was made one of the elect-ors of the empire. Elector Maximilian II joined in the war of the Spanish succession on the side of France, and this led, after the battle of Blenheim, 1704, to the loss of his dominions for the next ten years. His son, Charles Albert, likewise lost his dominions for a time to Austria, but they were all recov-ered again by Charles's son. Maximilian III (1745). In the wars following the French Revo-lution, Bavaria was in a difficult position between France and Austria, but latterly joined Napoleon, from whom its elector Maximilian IV received the title of king (1805), a title afterward confirmed by the treaties of 1814 and 1815. King Maximilian I was succeeded by his son Ludwig (or Louis) I, under whom various circumstances helped to quicken a desire for political change. Reform being re-fused, tumults arose in 1848, and Ludwig resigned in favor of his son, Maximilian II, under whom certain modifications of the constitution were carried out. At his death in 1864 he was succeeded by Ludwig II. In the war of 1866 Bavaria sided with Austria, and was compelled to cede a small portion of its territory to Prussia, and to pay a war indemnity of \$12,500,000. Soon after Bavaria entered into an alliance with Prussia, and in 1867 joined the Zollverein. In the Franco-German War of 1870-71 the Bavarians took a prominent part, and it was at the request of the king of Bavaria, on behalf of all the other princes and the senates of the free cities of Germany, that the king of Prussia agreed to accept the title of Emperor of Germany.

Since January, 1871, Bavaria has been a part of the German empire, and is represented in the Bundesrath by six, and in the Reichstag by forty-eight members. The eccentricity early displayed by Ludwig II, developed to such an extent that in June, 1886, he was placed under control, and a regency established under Prince Luitpold (Leopold). The change was almost immediately followed by the suicide of the king, and as Prince Otto, the brother and heir of the late king, was insane, the regency was continued. See also Germany.

**Baxter**, RICHARD (1615-1691), the most eminent of the English nonconforming divines of the seventeenth century. The imposition of the doctrine and discipline of the Church of England detached him from the Establishment. He condemned the execution of the king and the election of Cromwell. At the Restoration he became king's chaplain. In 1685 he was arrested and imprisoned. He left about 150 treatises, of which his Saint's Everlasting Rest, and Call to the Unconverted, have been the most popular.

**Bay**, the laurel tree, noble laurel, or sweetbay; but the term is loosely given to many trees and shrubs resembling this. A fatty or fixed oil (used in veterinary medicine) and also a volatile oil is obtained from the berries, but what is called "bayberry oil" is also obtained from the genus candleberry.

**Ba'ya**, the weaver-bird, an interesting East Indian passerine bird, somewhat like the bullfinch. Its nest resembles a bottle, and is suspended from the branch of a tree. The entrance is from beneath, and there are two chambers, one for the male, the other for the female. The baya is easily tamed, and will fetch and carry at command.

**Bayamo** (ba-'jä-mö) (or St. Salvador), a town in the east of Cuba, near the Cauto; pop. 4,560.

Bayard, JAMES ASHETON (1767-1815), statesman, b. in Philadelphia. He was descended from a Huguenot family which settled in Manhattan in the seventeenth century. He graduated at Princeton in 1784, studied law in Philadelphia, was admitted to the bar in 1787, and settled in Wilmington, Del. In 1796 he was elected to Congress as a Federalist. In 1804 he was made U.S. senator. He served from Jan. 15, 1805, till March 3, 1813, and opposed the declaration of war against Great Britain in 1812. President Madison appointed him a commissioner with Albert Gallatin and John Quincy Adams to negotiate a peace with Great Britain. He was appointed U. S. minister to Russia, but declined the office and returned to Wilmington, 1814. His two sons, Richard Henry and James A., were successively senators from Delaware.

**Bayard**, NICHOLAS (1644-1707), b, in Alphen, Holland, d. in New York City; a nephew of Governor Stuyvesant. The old Bayard grounds and mansion in New York City were on the west side of the Bowery, and included the territory now occupied by Lafayette Place, Astor Place, and beyond. In 1664 Nicholas became clerk of the council; was private secretary to Governor Stuyvesant and surveyor of the province. In 1672 he was appointed secretary of the province, and was mayor of New York City and a member of the governor's council in 1685.

Bayard, THOMAS FRANCIS, American statesman, b. at Wilmington, Del., 1828, educated at Flushing, studied law, and in 1868 was elected U. S. senator, where he served till 1884. In 1885 he was made secretary of state in Mr. Cleveland's cabinet. March 30, 1803, was appointed ambassador extraordinary and plenipotentiary to England.

**Bay City**, a city of Michigan, on the east side of Saginaw River, near its mouth in Saginaw Bay, Lake Huron. Chief articles of trade, lumber and salt. Pop. 27,839.

**Bayeux** (bà-you), an ancient town, France, dep. Calvados, 16 mi. n.w. of Caen, with manufactures of lace, calico, and porcelain. In its cathedral, said to be the oldest in Normandy, was preserved for a long time the famous Bayeux tapestry. Pop. 8, 102.

**Bayeux Tapestry**, so called because it was originally found in the cathedral of Bayeux, in the public library of which town it is still preserved. It is supposed to have been worked by Matilda, queen of William the Conqueror. It is 214 ft. in length and 20 in. in breadth, and is divided into seventy-two compartments, the subject of each scene being indicated by a Latin inscription. These scenes give a pictorial history of the invasion and conquest of England by the Normans, beginning with Harold's visit to the Norman court, and ending with his death at Hastings.

**Bay-leaf**, the leaf of the sweet-bay or laurel tree. These leaves are aromatic, and are used in cookery and confectionery.

**Bayley**, JAMES ROOSEVELT (1814-1877), b. in New York City, educated for the Episcopal ministry, and in 1840-41 held a rectorship in Harlem, N. Y. He became a Roman Catholic in 1842, was ordained to the priesthood in 1844. and became first bishop of Newark, N. J., in 1853. In 1872 he was transferred to the archiepiscopal see of Baltimore.

**Bayly** (bā'li), THOMAS HAYNES (1797-1839), English poet, novelist, dramatist and miscellaneous writer. As a song writer he was most prolific and most popular. The Soldier's Teur, We Met—'twas in a Crowd, and a few others, are still well known.

Bay Mahogany, that variety of mahogany exported from Honduras. It is softer and less finely marked than the variety known as Spanish mahogany, but is the largest and most abundant kind.

**Bayonne** (bà-yon), a well-built fortified town, the largest in the French dep. Basses-Pyrénées. Catherine de Medici had an important interview with the Duke of Alba in Bayonne, June, 1565, at which it is said the massacre of St. Bartholomew was arranged. It was also the scene of the abdication of Charles IV of Spain in favor of Napoleon (1808). In 1814 the British forced the passage of the Nive and invested the town, from which the French made a desperate but unsuccessful sortie. Pop. 23,120

17

# Bayonne

**Bayonne**, Hudson co., N. J., on Kill von Kull River, 7 mi. e. of New York City. Railroads: Central R. R. of New Jersey with 5 stations. Industries: oil works, chemical works. The city was incorporated in 1869 and includes what was formerly known as Bergen Point, Centerville, Constable Hook, Bayonne, and Pamrapo, and is populated by people doing business in New York. Pop. est. 1897, 24.500.

**Bayou** (bā-yö'), a name given in the Southern States to a stream which flows from a lake or other stream; frequently used as synonymous with creek or tidal channel.

**Bay Rum**, a spirit obtained by distilling the leaves of *Myrica acris*, or other West Indian trees of the same genus. It is used for toilet

### Beaconsfield

general of division in 1862, and in 1864 was made a marshal of France.

**Bazar'** (or bazaar'), in the East an exchange, market-place, or place where goods are exposed for sale, usually consisting of small shops or stalls in a narrow street or series of streets. These bazar streets are frequently shaded by a light material laid from roof to roof, and sometimes are arched over. Marts for the sale of miscellaneous articles, chiefly fancy goods, are now to be found in most European cities bearing the name of *bazars*. The term bazar is also applied to a sale of miscellaneous articles, mostly of fancy work, and contributed gratuitously in the furtherance of some charitable or other purpose.

Bdellium (del'i-um), an aromatic gum resin

Part of Bayeux Tapestry-Battle of Hastings.

purposes, and as a liniment in rheumatic affections.

**Bay-salt**, a general term for coarse-grained salt, but properly applied to salt obtained by spontaneous or natural evaporation of seawater in large shallow tanks or *bays*.

**Bay-window**, a window forming a recess or bay in a room, projecting outward, and rising from the ground or basement on a plan rectangular, semi-octagonal, or semi-hexagonal, but always straight-sided. The term is, however, also often employed to designate a *bow-window*, which more properly forms the segment of a circle, and an *oriel-window*, which is supported on a kind of bracket, and is usually on the first floor.

**Baza** (bä'thå), an old town of Spain, Andalusia, province of Granada, formerly a large and flourishing city. In 1810 the French, under Marshal Soult, here defeated the Spaniards under Generals Blake and Freire. Pop. 12,895.

**Bazaine** (bá-zān), FRANÇOIS ACHILLE (1811-1888), French general. He served in Algeria, in Spain against the Carlists, in the Crimean War, and joined the Mexican expedition as brought chiefly from Africa and India, in pieces of different sizes and figures, externally of a dark reddish brown, internally clear, and not unlike glue. To the taste it is slightly bitterish and pungent; its odor is agreeable. It is used as a perfume and a medicine, being a weak deobstruent.

Beachy Head, a promontory in the s. of England, on the coast of Sussex, rising 575 feet above sea-level, with a revolving light, visible in clear weather from a distance of 28 mi. A naval battle took place here, June 30, 1690, in which a French fleet under Tourville defeated an English and Dutch combined fleet under Lord Torrington.

**Beaconsfield** (bē'konz-fēld), a village of Buckinghamshire, England, the parish church of which contains the remains of Edmund Burke. It gave the title of earl to the English statesman and novelist, Benjamin Disraeli.

**Beaconsfield**, BENJAMIN DISRAELI, Earl of (1804–1881), an eminent English statesman and novelist, of Jewish extraction; eldest son of Isaac D'Israeli, author of the *Curiosities* of *Literature*. In 1826 he published *Virian Grey*, his first novel; and subsequently traveled in

Italy, Greece, Turkey, and Syria. In 1831 the Young Duke came from his pen. It was followed by Contarini Fleming, Alroy, Henrietta Temple, Venetia, the Revolutionary Epic. In 1835 he unsuccessfully contested Taunton as a Tory. In 1837 he gained an entrance to the House of Commons, being elected for Maidstone. During his first years in Parliament he was a supporter of Peel; but when Peel pledged himself to abolish the corn-laws, Disraeli became the leader of the protectionists. Having acquired the manor of Hughenden in Buckinghamshire, he was in 1847 elected for this county, and he retained his seat till raised to the peerage nearly thirty years later. In 1852, he became chancellor of the exchequer under Lord Derby. In 1858, he again became chancellor of the exchequer, and brought in a reform bill which wrecked the government. In 1866 the Liberals resigned, and Derby and Disraeli came into power, the latter being again chancellor of the exchequer. In 1868 he became premier on the resignation of Lord Derby. In 1874 he again became prime-minister with a strong Conservative majority, and remained in power for six years. This period was marked by his elevation to the peerage in 1876 as earl of Beaconsfield, and by the conclusion of the Treaty of Berlin in 1878. In 1880 he resigned office, though he still re-tained the leadership of his party. Within a few months of his death the publication of a novel called Endymion (his last: Lothair had been published ten years before) showed that his intellect was still vigorous.

**Bead-snake**, a beautiful snake of North America, inhabiting cultivated grounds, especially plantations of the sweet-potato, and burrowing in the ground. It is finely marked with yellow, carmine, and black. Though it possesses poison-fangs, it never seems to use them.

**Beagle** (bē'gl), a small hound, formerly kept to hunt hares, now almost superseded by the harrier, which sometimes is called by its name. The beagle is smaller than the harrier, compactly built, smooth-haired, and with pendulous ears. The smallest of them are little larger than the lap-dog.

**Beam**, a long straight and strong piece of wood, iron, or steel, especially when holding an important place in some structure, and serving for support or consolidation; often equivalent to girder. In a balance it is the part from the ends of which the scales are suspended. In a loom it is a cylindrical piece of wood on which weavers wind the warp before weaving; also the cylinder on which the cloth is rolled as it is woven. In a ship one of the strong transverse pieces stretching across from one side to the other to support the decks and retain the sides at their proper distance : hence a ship is said to be "on her beam ends" when lying over on her side.

**Bean**, a name given to several kinds of leguminous seeds and the plants producing them, probably originally belonging to Asia. The common bean is cultivated both in fields and gardens as food for man and beast. There

are many varieties, as the mazagan, the Windsor, the long-pod, etc., in gardens, and the horse or tick bean in fields. The soil that best suits is a good strong clay. The seed of the Windsor is fully an inch in diameter; the horse-bean is much less, often not much more than half an inch in length and three eighths of an inch in diameter. Beans are very nutritious, containing 36 per cent. of starch and 23 per cent. of nitrogenous matter called legumin, analogous to the caseine in cheese. The bean is an annual, from 2 to 4 feet high. The flowers are beautiful and fragrant. The kidney-bean, French bean, or haricol, is a wellknown culinary vegetable. There are two principal varieties, annual dwarfs and run-The bean cultivated in the U.S. is ners. used largely as an article of food. It is known as the common bean. There are two sorts, the running and the brush, both presenting numerous varieties in size and color. These, cooked with pork, form the well-known "pork and beans." The scarlet-runner bean, a native of Mexico, is cultivated on account of its long rough pods and its scarlet flowers. St. Ignatius bean is not really a bean, but the seed of a large climbing shrub, nearly allied to the species of Strychnos which produces nux vomica. One of the curious products of Mexico is the jumping bean. They grow in pods, each pod containing three beans. They were often exhibited by South American jugglers, who placed them on a table, when they would immediately roll and skip about and make jumps of a couple of inches. This was at one time thought to be the effect of some magical property possessed by the beans, but it was discovered that these vegetables owe their jumping powers to a very simple agent; namely, the larva of a moth, which bores into them and, striking its head against the interior of the bean, causes it to rebound.

**Bean-goose**, a species of wild goose, a migratory bird which arrives in Britain in autumn and retires to the north in the end of April, though some few remain to breed. Being rather less than the common wild goose. it is sometimes called the *small gray goose*.

Bear, the name of several large plantigrade carniverous mammals of the genus Ursus. The teeth are forty-two in number, as in the dog. but there is no carnassial or sectorial tooth, and the molars have a more tubercular character than in other carnivores. The eyes have a nictitating membrane, the nose is prominent and mobile, and the tail very short. The true bears are about ten in number, natives chiefly of North America, Europe, and Asia. They generally lie dormant in their den dur-ing the winter months. The brown or black bear of Europe is the Ursus arctos. It is a native of almost all the northern parts of Europe and Asia, and was at one time common in the British Islands. It feeds on fruits, roots, honey, ants, and in case of need, on mammals. It sometimes reaches the length of seven feet, the largest specimens being found furthest to the north. It lives solitarily. The American black bear is the U. amer

## Bear

icanus, with black shining hair, and rarely above 5 feet in length. It is a great climber, is less dangerous than the brown bear, and is hunted for its fur and flesh. It is very amusing in captivity. The grizzly bear is an inhabitant of the Rocky Mountains; is a ferocious animal, sometimes 9 feet in length, and has a bulky and unwieldy form, but is nevertheless capable of great rapidity of motion, The extinct cave-bear seems to have been closely akin to the grizzly. The Siberian bear is perhaps a variety of the brown bear. The

Polar Bear.

polar or white bear is an animal possessed of great strength and fierceness. It lives in the polar regions, frequents the sea, feeds on fish, seals, etc., and usually is 7 to 8 feet in length. The Malayan or cocoanut palm bear is perhaps the smallest of the bears. It inhabits Cochin-China, Nepaul, the Sunda islands, etc., lives exclusively on vegetable food, and is an expert climber. It is called also sun-bear and bruang. The Indian black bear or sloth-bear of India and Ceylon is reputed to be a flerce and dangerous animal.

**Bear**, Great and Little, the popular name of two constellations in the northern hemisphere. The Great Bear is situated near the pole. It is remarkable for its well-known seven stars, by two of which, called the pointers, the polestar is always readily found. These seven stars are popularly called the *wagon*. Charles's Wain, or the Plow. The Little Bear is the constellation which contains the pole-star. This constellation has seven stars placed together in a manner resembling those in the Great Bear.

**Bearberry**, an evergreen shrub of the heath family growing on the barren moors of Scotland, Northern Europe, Siberia, and North America. The leaves are used in medicine as an astringent and tonic.

Beard, the hair upon the chin, cheeks, and upper lip, which in the human family appears at the age of puberty as a distinctive mark of the male sex. It is usually rather lighter in color than the hair of the head, and as a general rule its character depends upon the nature of the climate. In hot and dry countries.

it is invariably dark, dry, and long; and, on the other hand, thick, curly, and fair in cold and damp countries. The hair, being a bad conductor of heat, protects the face and throat from cold, and acts as a safeguard against ex-cessive heat. The B., particularly the mus-tache, or hair of the upper lip, is of great utility in preventing dust of any kind being inhaled with the breath, particularly so to masons, bakers, glass-engravers, and workers in metals, who in their avocations are constantly exposed to an atmosphere charged with minute particles of the materials operated upon. Slaves in ancient times were deprived of their beards, and with the Turks even now a state of servitude among the attendants of the seraglio is indicated by a shaven face. The intense love of cleanliness on the part of the Egyptians would not suffer them to wear a B., save, according to Herodotus, in times of mourning. Though a shaving people, they had a singular custom of wearing upon the chin a false B. of plaited hair, which differed in shape according to the rank and position of the wearer. Kings wore long and square-bottomed beards, those of private individuals were very short, and gods were distinguished by their long beards curling up at the end.

Among the early Greeks a thick B. was considered a mark of manliness, and the Greek philosphers thought that a certain dignity of character attached to its long growth. Shaving was introduced into Greece by Alexander the Great, who ordered his soldiers to perform that operation, and the practise continued general till the time of Justinian. About 300 B. C., Ticinius Mænas is said to have introduced to the Romans a Sicilian barber who inaugurated shaving, and Pliny states that Scipio Africanus was the first Roman who shaved daily. Later on, the festival which celebrated the assumption of the toga virilis by a young Roman was made the occasion of the first operation of shaving, and the hair then cut off was consecrated to some deity. The Bayeux tapestry shows that mustaches were worn by the English soldiers prior to the inva-sion of the Normans, who shaved not only the entire face, but the back of the head likewise. This Norman custom caused Harold's spies to report that the invaders were all priests. Louis XIII, of France, not being endowed by nature with a B., his courtiers revived the fashion of shaving, and soon after, partial shaving, and trimming the mustaches and B. to an ornamental form, became general over Europe. In the sixteenth century the English clergy were noted for their beards of great length. In the beginning of the eighteenth century, the face was wholly shaven, and continued so till early in the present century, when the French led the van in again wearing the B. During the reign of Czar Peter the Great, a tax was imposed upon beards, and collected at the gates of every town.

Beard, GEORGE MILLER (1839-1883), b. at Montville, Conn., graduated at Yale in 1862,

and took his degree of M. D. in 1866. Doctor Beard was a specialist on diseases of the nervous system, and wrote extensively on the medical use of electricity and other branches of medical science.

**Beard**, WILLIAM HOLBROOK, painter, b. in Painesville, O. 1825. He began as a portrait painter about 1841, and settled in Buffalo in 1850, remaining until 1857. He went to Europe and studied in Switzerland, Italy, and France. In 1860 he established himself in New York City, and became a member of the Academy in 1802. He has devoted himself almost exclusively to the painting of animals.

**Beardstown**, Cass co., Ill., on Illinois River, 45 mi. w. of Springfield. Railroads: B. & O. S. W., and C. B. & Q. It has 6 churches, 1 high school, and 2 ward schools. Industries: 2 banks, 2 flouring mills, 1 brewery, 1 saw mill, electric light plant and a number of factories. Natural gas now used for fuel to run the engines of the mills and electric light plant. The town was founded by Thomas Beard in 1829, incorporated as a town in 1837, and became a city in 1849. Pop. est. 1897, 5,000.

Bearing, the direction or point of the compass in which an object is seen, or the situation of one object in regard to another, with reference to the points of the compass. Thus, if from a certain situation an object is seen in the direction of n.e., the *bearing* of the object is said to be n.e. from the situation. To take bearings, to acertain on what point of the compass objects lie.

pass objects lie. Bear Lake, Great, an extensive sheet of fresh water in the n.w. territory of Canada. Area about 14,000 sq. mi. The water is very clear and the lake abounds in fish.

**Béarn** (b&-årn), one of the provinces into which France was formerly divided, now chiefly included in the department of Lower Pyrenees. Pau is the chief town. There is a peculiar and well-marked dialect—the Béarnease—spoken in this district, which has much more affinity with the Spanish than with the French.

**Beatrice,** Gage co., Neb., on Big Blue River, 90 mi. s.w. of Omaha. Surrounding country agricultural. Railroads: U. P., R. I., B. & M. P. Principal manufactures: flour, lumber, and cement. Water power furnished by the river. There are also numerous quarries of magnesia, and limestone, which is used as building material. Pop. est. 1897, 14.230.

**Beatrice Portinari** (1266-1290) (bā-á-trō' chāpor-tō-nā' rē), the poetical idol of Dante; the daughter of a wealthy citizen of Florence, and wife of Simone de Bardi. She was but eight years of age, and Dante nine, when he met her first at the house of her father. He altogether saw her only once or twice, and she probably knew little of him. The story of his love is recounted in the Vita Nuova, which was mostly written after her death.

Beau'tort, the name of sixteen different towns and castles in France, of which the most important is B.-EN-VALLE'E, a town in the department of Maine-et-Loire (Anjou), 15 mi. e. of Angers, with manufactures of sailcloth. leather, etc., and a trade in grain, hemp, nuts, prunes, and wine. Pop. 4,492. B. had formerly a strong castle, and gave title to the English Dukes of B.

Beauharnais (bö-àr-nā), ALEXANDRE, Viscount (1760-1794). He married Joséphine Tascher de la Pagerie, who was afterward the wife of Napoleon. He served under Rochambeau in the Revolutionary War. In 1792 he was general of the army of the Rhine. He was falsely accused of having promoted the surrender of Mainz, and was guillotined.

Beauharnais, EUGENE DE (1781-1824), Duke of Leuchtenberg, Prince of Eichstädt, and Viceroy of Italy during the reign of Napoleon. He accompanied Napoleon to Egypt in 1798; rose rapidly in the army; was appointed viceroy of Italy in 1805. To him and to Ney, France was mainly indebted for the preservation of the remains of her army during the retreat After the fall of Napoleon from Moscow. he delivered Lombardy and all Upper Italy to the Austrians. He then went to Paris, and thence to his father-in-law at Munich, where he afterward resided. His sister HOR-TENSE EUGENIE (1783-1837). She became Queen of Holland by marrying Louis Bona parte. Napoleon III. was her third and youngest son.

Beaumarchais (bō-mär-shā), PIERRE AUGUS-TIN CARON DE (1732-1799), a French wit and dramatist. He occupied himself with literature, and published two dramas. He first distinguished himself by his Mémoires, or statements in connection with a lawsuit, which by their wit, satire, and liveliness entertained all France. The Barber of Seville and the Marriage of Figaro have given him a permanent reputation. He was a singular instance of versatility of talent, being at once an artist, politician, projector, merchant, and dramatist.

**Beaumont** (bo'mont), FRANCIS, and **Fletcher**, JOHN, two eminent English dramatic writers, contemporaries of Shakespeare, and the most famous of literary partners.

Beaumont, WILLIAM, M. D., an American surgeon, b. 1785, d. 1853. His experiments on digestion with the Canadian, St. Martin, who lived for years after receiving a gunshot wound in the stomach which left an aperture of about two inches in diameter, were of great importance to physiological science.

**Beaune** (bon), a town in France, dep. Côte d'Or, 23 mi. s.s.w. Dijon, well built, with handsome church, public library, museum. etc., and a trade in the fine Burgundy and other wines of the district. Pop. 12,470.

**Beaune** (bon), FLORIMOND, a distinguished mathematician and friend of Descartes, b. at Blois 1601, d. at the same place 1652. He may be regarded as the founder of the integral calculus.

**Beauregard** (bō-rė-gàrd), PETER GUSTAVE TOUTANT DE (1818-), American soldier. He studied at the military academy, West Point, and left it as artillery lieutenant in 1838. He served in the Mexican War, and on the outbreak of the Civil War joined the Confederates.

Beauvais

He commanded at the bombardment of Fort Sumter, gained the battle of Bull Run, lost that of Shiloh, assisted in the defense of Charleston, and aided Lee in that of Richmond.

**Beauvais** (bō-vā) (ancient Bellovacum), a town in France, capital of the department of Oise, with some fine edifices, the choir of the uncompleted cathedral being one of the finest specimens of Gothic architecture in France. In 1472 Beauvais resisted an army of 80,000 Burgundians under Charles the Bold. On this occasion the women particularly distinguished themselves, and one of them, Jeanne Lainé, called La Hachette, seeing a soldier planting a standard on the wall, seized it and hurled him to the ground. The banner is preserved in the townhall, and an annual procession of young girls commemorates the deed. Manufactures: tapestry and carpets, trimmings, woolen cloth, cottons, etc. Pop. 19,382.

**Beaver**, a rodent quadruped, about two feet in length exclusive of the tail, at one time common in the northern regions of both hemispheres, but now found in considerable numbers only in the U. S. and Canada, living in colonies, but occurring solitary in Central Eu-

Beavers and Village.

rope and Asia. It has short ears, a blunt nose, small fore-feet, large webbed hind-feet, with a flat ovate tail covered with scales on its upper surface. It is valued for its fur, which used to be largely employed in the manufacture of hats, but for which silk is now for the most part substituted, and for an odoriferous secretion named castor, at one time in high repute, and still largely used in some parts of the world as an anti-spasmodic medicine. The food of the beaver consists of the bark of trees, leaves, roots, and berries. Their favorite haunts are rivers and lakes which are bordered by forests. In winter they live in houses, which are 3 to 4 feet high, are built on the water's edge, and being substantial structures with the entrance under water afford them protection from wolves and other wild animals. These dwellings are called beaver ''lodges,''

and accommodate a single family. They also live in burrows. They can gnaw through large trees with their strong teeth, this being done partly to obtain food, partly to get materials for houses or dam-building. When they find a stream not sufficiently deep for their purpose they throw across it a dam constructed with great ingenuity of wood, stones, and mud.

**Beaver Falls**, Beaver co., Pa., near the junction of the Beaver River with the Ohio, 34 mi. from Pittsburgh. Various factories are here. Pop. 10,100.

**Beaver**, JAMES A., b. in Perry co., Pa., 1837, practiced law, and, in 1861, joined the volunteer army as a lieutenant and was made a colonel. He was wounded at Chancellorsville and lost a leg at Petersburg. He was elected governor of Pennsylvania on the Republican ticket in 1882 and in 1886.

**Becerra** (be-ther'a), GASPAR (1520-1570), a Spanish painter and sculptor. He studied under Michel Angelo at Rome, and is credited with the chief share in the establishment of the fine arts in Spain.

Bechuanas (Betchuanas) (bech-wan'az). a race inhabiting the central region of South Africa north of Cape Colony. They belong to the great Kaffre stem, and are divided into tribal sections. They live chiefly by husbandry and cattle rearing, and they work with some skill in iron, copper, ivory, and skins. They have been much harassed by Boers and others, and this led them to seek British protection. From 1878 to 1880 South Bechuanaland was partly administered by British officers; and in 1884 and 1885 great part of the rest of their territory was brought under British influence. the farthest northern portion of it, however, reaching to the Zambezi, being only a protec-torate. The area is 180,000 sq. mi., and pop. 478,000. Chief towns: Vryburg, Mafeking, and Jaungs. Gold, coal, and copper have been found.

**Beck' ford,** WILLIAM (1759-1844), an English writer famous in his time for his immense wealth and his eccentricities. In 1770 the death of his father left him in the possession of \$5,000,000 of money, and an income of \$500,000 a year. His literary fame rests upon his eastern tale *Vathek*, which he wrote in French in three days and two nights.

**Bookmann**, JOHANN (1739–1811), German writer on the industrial arts and agriculture. He was professor of physics and natural history at St. Petersburg. and afterward for almost forty-five years professor of philosophy and economy in Göttingen. His *History of Intentions* is well known in the English translation of it.

Becquerel (bek-rel), ANTOINE CESAR (1788– 1878), French physicist. He served as an officer of engineers, and retired in 1815, after which he devoted himself to the study of electricity, especially electro-chemistry. He refuted the "theory of contact" by which Volta explained the action of his pile or battery. Becquerel may be considered one of the creators of electro-chemistry.

Bed (or stratum), is a layer of rock of simi-

lar materials, and of some thickness, cohering more or less firmly together, as a rule. course, in the case of soft unconsolidated strata, the materials of a bed may not be coherent. Beds are often composed of many fine laminæ or plates. The laminæ are the results of intermissions in the supply of materials, produced by such causes as the ebb and flow of the tide, river-floods, or the more or less turbid state of the water under which they were deposited. When the intervals between the supply of materials were short, the numerous laminæ closely adhere, and form a bed cut off from the superior deposit by the occurrence of a longer interval, during which the bed became consolidated more or less before the next was deposited. When the lamination is obscure, or not distinct from the stratification, it would seem to indicate that the materials had been supplied without any intermission.

Bede (Beda, or Bæda) (672-735), known as the Venerable Anglo-Saxon Scholar, educated at St. Peter's monastery, Wearmouth; took deacon's orders in his nineteenth year at St. Paul's monastery, Jarrow, and was ordained priest at thirty. He was the most learned Englishman of his day, and in some sense the father of English history, his most important work being his *Ecclesiastical History of England*.

**Bedeguar** (or Bedegar) (*bed'e-gär*), a spongy excressence or gall, sometimes termed sweetbrier sponge, found on various species of roses, and produced by several insects as receptacles for their eggs. Once thought a diuretic and vermifuge.

Bed'ford, England, county town of Bedford-shire, on the Ouse. The chief buildings are the law courts, a range of public schools, a large infirmary, county jail, etc., and the churches. There is an extensive manufactory of agricultural implements; lace is also made, and there is a good trade. John Bunyan was born at Elstow, a village near the town, and it was at Bedford that he lived, preached, and was imprisoned. A fine monument has been erected to him in the town. Pop. 28,023. Bedfordshire (or Beds) the county, is bounded by Northampton, Bucks, Herts, Cambridge, and Huntingdon. Area 463 sq. mi. Two thirds of the soil is under tillage. Besides the usual cereal and other crops, culinary vegetables are extensively cultivated for the London market. Principal manufactures: agricultural implements, and straw-plait for hats, which is made up principally at Dunstable and Luton. Pop. 160.729.

Bedford, JOHN, Duke of, one of the younger sons of Henry IV, king of England. He defeated the French fleet in 1416, commanded an expedition to Scotland in 1417, and was lieutenant of England during the absence of Henry V in France. He became regent of France, and for several years his policy was as successful as it was able and vigorous. The greatest stain on his memory is his execution of the Maid of Orleans (Joan of Arc) in 1431. He died in 1435 at Rouen, and was buried in the cathedral of that city.

Bedlam, a corruption of Bethlehem (hospital), the name of a religious house in London, converted into a hospital for lunatics. The original Bedlam stood in Bishopsgate street, its modern successor is in St. George's Fields. The lunatics were at one time treated as little better than wild beasts, and hence Bedlam came to be typical of any scene of wild confusion. The average number of patients is about 300.

Bedouins (bed-u-enz'), a Mohammedan peo-ple of Arab race inhabiting chiefly the deserts of Arabia, Syria, Egypt, and North Africa. They lead a nomadic existence in tents, huts, caverns, and ruins, associating in families under sheiks, or in tribes under emirs. In respect of occupation they are only shepherds, herdsmen, and horse-breeders, varying the monotony of pastoral life by raiding on each other, and plundering unprotected travelers whom they consider trespassers. They are ignorant of writing and books, their knowledge being purely traditional and mainly genealogical. In stature they are undersized, and, though active, they are not strong. The ordinary dress of the men is a long shirt girt at the loins, a black or red and yellow handkerchief for the head, and sandals; of the women, loose drawers, a long shirt, and a large dark-blue shawl covering the head and figure. The lance is the favorite weapon.

Bee, the common name given to a large family of hymenopterous or membranous-winged insects, of which the most important is the

Black and Yellow Bee.

common hive or honey bee. It belongs to the warmer parts of the eastern hemisphere, but is now naturalized in the western. A hive commonly consists of one mother or queen, from 600 to 800 males or drones, and from 15,000 to 20,000 working bees, formerly termed neuters, but now known to be imperfectly developed females. The last mentioned, the smallest, have twelve joints to their antennæ, and six

abdominal rings, and are provided with a sting; there is, on the outside of the hind legs, a smooth hollow, edged with hairs, called the basket, in which the kneaded pollen or beebread, the food of the larvæ, is stored for transit. The queen has the same characteristics, but is of larger size, especially in the abdomen; she has also a sting. The males, or drones, differ from both the preceding by having thirteen joints to the antennæ: a rounded head, with larger eyes, elongated and united at the summit; and no stings. According to Huber the working-bees are themselves divisible into two classes: one, the *cirieres*, devoted to the collec-tion of provisions, etc.; the other, smaller and more delicate, employed exclusively within the hive in rearing the young. The mouth of the bee is adapted for both masticatory and suctorial purposes, the honey being conveyed thence to the anterior stomach or crop, communicating with a second stomach in which alone a digestive process can be traced. The queen, whose sole office is to propagate the species, has two large ovaries, consisting of a great number of small cavities, each containing six-teen or seventeen eggs. The inferior halfteen or seventeen eggs. circles, except the first and last, on the abdomen of working-bees, have each on their inner surface two cavities, where the wax, secreted by the bee from its saccharine food, is formed in layers, and comes out from between the abdominal rings. Respiration takes place by means of air-tubes which branch out to all parts of the body, the bee being exceedingly sensitive to an impure atmosphere. Of the organs of sense the most important are the antennæ, deprivation of these resulting in a species of derangement. The majority of entomologists regard their function as in the first place auditory, but they are exceedingly sensitive to tactual impressions, and are apparently the principal means of mutual communication. Bees undergo perfect metamorphosis, the young appearing first as larvæ, then changing to pupe, from which the imagos or perfect in-sects spring. Whether the offspring are to be female or male is said to be dependent upon the contact or absence of contact of the egg with the impregnating fluid received from the male and stored in a special sac communicating with the oviduct, unfertilized eggs producing males. The further question whether the offspring shall be queens or workers is resolved by the influence of environment upon function. The enlargement of a cell to the size of a royal chamber and the nourishment of its inmate with a special kind of food appear to be sufficient to transform an ordinary working-bee larvæ into a fully-developed female or queen bee. The season of fecundation occurs about the beginning of summer, and the laying begins immediately afterward, and continues until autumn; in the spring as many as 12,000 eggs may be laid in twenty-four days. Those laid at the commencement of fine weather all belong to the working sort, and hatch at the end of four days. The larvæ acquire their perfect state in about twelve days, and the cells are then immediately fitted up for the reception of new

eggs. The eggs for producing males are laid two months later, and those for the females immediately afterward. This succession of generations forms many distinct communities, which, when increased beyond a certain degree, leave the parent hive to found a new colony elsewhere. Thus three or four swarms sometimes leave a hive in a season. A good swarm is said to weigh at least 6 or 8 pounds. The humblebees, or bumblebees, of which

about forty species are found in Britain and over sixty in North America, belong to the genus Bombus, which is almost worldwide in its distribution. Of these species solitary females which have survived the winter commence constructing small nests when the weather begins to be warm enough; some of them going deep into the earth in dry banks, others preferring heaps of stone or gravel, and others choosing always some bed of dry moss. In the nest the bee collects a mass of pollen, and in this lays some eggs. The cells in these nests are not the work of the old bee, but are formed by the young insects similarly to the cocoons of silkworms; and when the perfect insect is released from them by the old bee, which gnaws off their tops, they are employed as honey-cups. The humblebees, however, do not store honey for the winter, those which survive till the cold weather leaving the nest and penetrating the earth, or taking up some other sheltered position, and remaining there till the spring. The first brood consists of workers, and successive broods are produced during the summer. The experiment of domesticating different kinds of wild bees has been tried with no satisfactory results. Some bees, from their manner of nesting, are known as "mason bees," "carpenter bees," and "up-holsterer bees." Some of these bees cement particles of sand or gravel together with a wiscid substance in forming their nests; others make burrows in wood. The leaf-cutter or upholsterer bee lines its burrow with bits of leaf cut out in regular shapes.

**Beech**, the common name of trees well known in various parts of the world, including

Branch of Common Beech. a.-flower; b.-fruit. America, New Zealand, and Terra del Fuego. The wood is hard and brittle, and if exposed

to the air liable soon to decay. It is, however, peculiarly useful to cabinetmakers and turners; carpenters' planes, furniture, sabots, etc., being made of it; and it is durable under water for piles and mill-sluices. The fruit or beech mast, when dried and powdered, may be made into a wholesome bread; it has also occasionally been roasted and used as a substitute for coffee, and yields a sweet and palatable oil used by the lower classes of Silesia instead of butter. Beech mast is, however, chiefly used as food for swine, poultry, and other animals. The leaves of the beech tree collected in the autumn, before they have been injured by the frosts, are in some places used to stuff mattresses. The North American white beech is identical with the European species.

identical with the European species. Beecher, HENRY WARD (1813-1887), American preacher, third son of Lyman Beecher, b. Litchfield, Conn. As a child he was diffident and sensitive, loved the ocean and was only prevented from going to sea by his conversion (1826). When but eleven years old he defeated an opponent in a debate on Paine's Age of Reason. He showed marked talent as a debater in college. He studied theology under his father's instruction in Lane Semi-nary. He was pastor of a Presbyterian church in Lawrenceburg, Ind. (1837-39), and at the same time was connected with an anti-slavery paper in Cincinnati. From 1839-47 he preached in Indianapolis, contributing articles on fruits, flowers, and farming to an agricultural paper. In 1847 he took charge of Plymouth church, Brooklyn. His congregation, noted for generosity and intelligence, heartily sympathized with him in his efforts for reform, especially in his advocacy of abolition and temper-ance. His opinion on all public questions was eagerly sought. He was original in treatment and choice of subjects for his sermons, and his delivery was eloquent, dramatic, pathetic, and witty. In power of physical endurance he was a marvel. Tender-hearted and charitable himself, any form of injustice called from him bitter denunciations. As an after-dinner speaker he was without a peer, and his popularity as a lecturer knew no abatement. One famous oration of his was on Robert Burns, delivered January, 1859. Another, delivered April, 1865, was his Fort Sumter oration. He was a Republican and aided the cause for which it stood by pen and speech. He took part in the canvass of 1856. Through his influence and addresses, opinion in England concerning the Civil War was materially modified. His trial for adultery (1875) ended by a division of the jury, nine for acquittal and three against. His last public address was in Chickering hall, New York, Feb. 25, 1887, in favor of high license. After he came to Brooklyn he contributed his Star Papers to the Independent, of which he became editor 1861. He edited the Christain Union (1870-81) and was a frequent contributor to the Ledger. In Plymouth Pulpit are preserved the sermons preached from 1859 till his death. Among his many published works is a novel entitled Norwood. He married, 1837, Eunice White Bullard, author of From Dawn to Daylight. She d. March 8, 1897. H. W. Beecher's three brothers, Charles, Edward, and Thomas, have all distinguished themselves as Congregational clergymen. His sister Catherine Esther (1800-1878) did much for the education of women, and wrote on this subject and on domestic economy and kindred subjects. Beecher, LYMAN (1775-1863), clergyman, b.

in New Haven, Conn., graduated at Yale in 1797, and studied theology. In 1798 he was licensed to preach, accepted the pastorate of the Presbyterian church in East Hampton, L. I. A sermon on dueling, suggested by the duel between Alexander Hamilton and Aaron Burr, in 1806, made a great impression, and he soon became one of the best known preachers of New England. He was pastor of the Con-gregational church in Litchfield, Conn. (1810-26), and pastor of the Hanover Street church, Boston (1826-1832). He upheld the Puritan doctrine. From 1832 till 1851 Mr. Beecher was president of the Lane Theological Seminary, Cincinnati, in which he was professor of theology, and in 1832-42 was pastor of the Second Presbyterian church of Cincinnati. In 1835 Mr. Beecher was arraigned and tried for heresy by the Calvinists. He was acquitted by the general assembly, and on the division of the Presbyterian church into two factions. he joined the new school. He returned to Boston, 1851, and spent his time in publishing and revising his works. During his last 10 years he lived in Brooklyn. He was married 3 times, and his five sons, William Henry. Edward George, Henry Ward, Charles, and Thomas Kinnicut became clergymen.

Bee-eaters, a family of Fissirostral Passerine birds, distributed over Africa, India, the Moluccas, and Australia, chiefly known in Europe as common bee-eater, a summer visitant to Russia and the Mediterranean borders. For the most part they nest in colonies, depositing their eggs like the sand-martins, at the end of a tunnel sometimes 8 or 9 ft. long. They are frequently killed for their plumage, which is brownish-red and yellow above, paleblue on the forehead, yellow at the breast, and green at the wings.

Beef-eaters, yeomen of the guard of the sovereign of Great Britain, stationed by the sideboard at great royal dinners, and dressed after the fashion of the time of Henry VII. Also a name for certain African insessorial birds which feed on the larvæ embedded in the hides of buffaloes or other large animals.

Beef, extract of. The beef is cut from the cattle for the most part from the forequarters. No shanks or gluey parts of the animal, but only the lean pieces are used. These are thoroughly washed and loaded into trucks and hauled away to the cooking department, consisting of a long room in which are two rows of round copper boilers. These consist of an upper and a lower hemisphere so built that they can be fastened together hermetically. The lower hemisphere is built double, the intervening space being filled with hot water. From the upper hemisphere there extends a pipe which is connected with a vacuum pump.
There is also a large eye of glass in the upper hemisphere. About 2,000 pounds of flesh are placed in a kettle with a little water, the air is pumped out, and the hot water is turned into the jacket. The meat is cooked for six or eight hours. The liquor which surrounds it is thick and pasty. The process of cooking is watched by experienced workmen through the glass windows. The liquor is now drained off and clarified, after which it is pumped through two or three filter presses which catch any impurities and retain all the fibers still left in the mass of extract. It is then poured into a vacuum pan, 7 ft. long, 12 ft. high, and 6 ft. broad, the bottom part of which is filled with steam coils, and from the top a pipe runs to the exhaust pump. Enough extract liquor is allowed to flow into the pans to cover the pipes and the free water is quickly evaporated. The extract then passes to a second vacuum pan, where it is condensed to a thick brown paste. It is then sent to a mill where it is rendered thoroughly homogeneous. It is then placed in small jars and is ready for market. Each pound of the extract contains all of the nutritive matter in 45 pounds of meat.

Beef, preparation of. In the large packing houses the preparation of beef is an interest-ing process. The steers are caught in long narrow pens, divided by doors into compartments large enough for two animals. The butcher passes along on a little platform just back of the pens and above them, with a large iron sledge-hammer. The object is to hit the animal just hard enough to stun it, for if it is killed outright the blood does not run so freely after the throat is cut. The animals are then slid into the slaughtering room and a workman hitches a rope to the animal's leg and raises it into the air by means of pulleys until it can be hitched to a traveling pulley running on ceil-ing rails. Another man cuts the animal's throat and the blood splashes down and is carried off by means of troughs in the floor to vats below, where it is taken away to the fertilizer factory (see Blood). The animal is now trundled along until it reaches the "header" who, with very few movements splits the skin of the head, draws it loose and severs the head from the body. The head is thrown down a chute to a room below, where one man removes the tongue, another cuts off the cheek meat, and another sends the remaining bones to the fertilizer factory. In the meantime the animal is switched off on a side-track leading toward the butchering beds. A butchering bed consists of two large iron plates set into the floor about two feet apart and full of small round holes. Four men, called the "foot-skinners," begin the work and lay back the hide from the legs of the first animal and then pass quickly to the next. The "leg-breakers" succeed them and cut off the legs at the first joint and throw them to one side. The "ripper-open," as he is called, comes next and performs his part of the work. Then the "caulpuller" removes the caul-fat, after which the "floorsmen" begin the skinning of the carcass. This process requires great skill and care, as

only the fell between the hide and the flesh must be cut. When the hide has been skinned down to the back the animal is again suspended in the air. The fell is beaten down by a man with a cleaver, and as soon as it is loosened it is spread out on the floor. The entrails are removed and sent down through a chute and the "backbone-splitter" cuts the carcass down at exactly the center of the backbone. When the two halves swing apart they are pushed along the ceiling rail into the cooling-room, where they are kept for a week or two to cure. The whole process from the time the animal leaves the killing stalls until the halves of beef hang in the cooling-room is about eight minutes. During the work of slaughtering there are several inspectors present who watch every animal. These are the government inspector, the state inspector, a representative from the city health department, and the private inspector of the com-The caul-fats are now utilized in the manufac-ture of oleomargarine oil. The common fats are rendered into tallow. The tongue, liver, and heart are sold or made into sausage. The intestines are cleaned and utilized in covering sausages of several kinds. From the stomach comes plain or honeycomb tripe and pepsin, and the gall is used by printers, painters, and dyers. The horns, shins, and bladebones are used for knife-handles, combs, bone buttons; and the knuckles, feet, sinews, bones from the extract department, hoofs, hide trimmings, and calves' feet are utilized in the glue department and for fertilizers.

Bee-hawk, a name given to the honey-buzzard which preys on hymenopterous insects.

**Beelzebub** (bē-el'zē-bub) (Hebrew "the god of flies"), the supreme god of the Syro-Phœnician peoples, in whose honor the Philistines had a temple at Ekron. The origin of this worship is probably to be sought in the scourge of flies to which the hot plain of Philistia has always been subject.

Beer. See Brewing.

Beershe ba, "the well of the oath," the place where Abraham made a covenant with Abimelech, and in common speech representative of the southernmost limit of Palestine, near which it is situated. It is now a mere heap of ruins near two large and five smaller wells, though it was a place of some importance down to the period of the Crusades.

Bees' wax, a solid fatty substance secreted by bees, and containing in its purified state three chemical principles-myricin, cerin, and ceroelin. It is not collected from plants, but elaborated from saccharine food in the body of the bee. It is used for the manufacture of candles, for modeling, and in many minor processes. Before beeswax is put on the market it must be whitened or bleached. The beeswax is sent to the bleaching house in the shape of loaf-shaped cakes, each weighing about 25 pounds. The cakes are broken into small pieces and put into a cedar vat about 5 ft. high and 3 ft. across. In the bottom of this vat are two square wooden pipes in the

tops of which are holes which are connected with a steam pipe. This steam pipe conveys the steam to the wooden pipes at a pressure of about 60 pounds to the sq. in. Between 1,200 and 1,800 pounds of wax is placed into the vat and enough water is run in to float it. The steam is then turned on and it jets up through the holes in the wooden pipes, melting the wax. The dirt in the wax falls to the bottom of the vat, and in about three hours after the steam is on, the wax is ready to be drawn off. The wax after passing through a sieve falls into a wooden roller about 5 ft. long and a foot and one-half in diameter which re-volves in cool water. The wax clings to the roller and is carried around into the water. The roller turns once every second, and when the chilled beeswax is carried around into the cooler water it flies off the roller into the water bed. It is then lifted out by means of wooden forks, placed in boxes, and carried outside to the bleaching bed. These beds stand about 3 ft. above the ground and are about 100 ft. long, 15 ft. wide, and 1 ft. deep. The wax is spread out on these beds and allowed to remain for about 5 weeks exposed to the full light of the sun. The wax is sprinkled with water several times a day to prevent it from melting under the sun's rays, and each day it is harrowed with a rake so that all parts will be exposed to the sun several times. The wax is then a creamy white. It is taken back to the melting vats, remelted, run through a screen over a wooden roller, and brought back to the bleaching bed for another stay of about two weeks. By this time the wax is a pure white and is ready to be put into marketable shape. The wax is again melted and placed into pans and allowed to remain about an hour, when it is ready for the market.

Beet, a genus of plants, nat. order Chenopodiaceæ, distinguished by its fruit being enclosed in a tough woody or spongy five-lobed enlarged calyx. Two species only are known in general cultivation: namely, the sea beet and the garden beet. The former is a tough-

rooted perennial, common on many parts of the British coast and sometimes cultivated for its leaves, which are an excellent substitute for spinach. Of the garden beet, which differs from the last in being of only biennial duration and in forming a tender fleshy root, two principal forms are known to cultivators, the chard beet and the common beet. In the chard beet the roots are small, white, and rather tough, and the leaves are

Common Beet. furnished with a broad, fleshy midrib (*chard*), employed as a vegetable by the French, who dress the ribs like sea kale under the name of *poirée*. Some writers regard this as a peculiar species. The common beet includes all the fleshy-rooted varieties, such as red beet (with a fleshy large carrot shaped root), yellow beet, sugar beet, mangel-wurzel, etc. For garden purposes the best is the red beet of Castelnaudary, so called from a town in the s. w. of France. The beet requires a rich light soil, and being a native of the Mediterranean region is impatient of severe cold, requiring to be taken up in the beginning of winter and packed in dry sand, or in pits like potatoes, the succulent leaves having been first removed. Red beet is principally used at table, but if eaten in great quan-tity is said to be injurious. The beet may be taken out of the ground for use about the end of August, but it does not attain its full size and perfection till the month of October. A good beer may be brewed from the beet, and it yields a spirit of good quality. From the white beet the French, during the wars with Napoleon I, succeeded in preparing sugar, that article, as British colonial produce, having been prohibited in France. Since that time, with the increase of chemical and technical knowledge, the making of beet-sugar has become an important industry in the U.S., France, Germany, Austria, Russia, Belgium, and Holland.

The process of making sugar from beets in the U.S. is substantially as follows : Beets are brought into the factory, dumped into long V-shaped trenches 10 to 20 ft. wide and 6 to 10 ft. deep. At the bottom of each of these is another ditch reaching downward with perpendicular sides 20 to 30 in. deep and having a curved bottom 18 in. wide. The sides and bottom are coated with cement, making a sort of flume through which water will flow. All the ditches slope toward the factory and meet near it in one large ditch. Before the beets are thrown into the larger and upper trench the smaller one is covered with boards to prevent the beets from falling into it, thus the beets are kept until needed. The object is to keep the beets without losing the sugar or blackening the juice. The beets when brought in have had the leaves cut off and most of the soil knocked off. When they are wanted in the factory a stream of water from an overhead flume is let into the upper end of the bottom ditch. The loose boards covering it are raised and the beets are allowed to fall into the swiftly running stream below and are floated along to the house. At the end of the ditch the beets are caught by buckets arranged along the rim of a large revolving wheel, lifted out of the water and discharged into a washing machine. From the washing machine they are discharged into an elevator which carries them to the very top of the building. Here they are discharged into an automatic weighing machine which weighs off half a ton at a time, registers, and drops the beets into the slicer. The slicer is a large wheel lying flatwise and carrying upon its flat surface corrugated knives, which in revolving under the beets cuts them into long, thin, diamond-shaped slices about ‡ in. wide and a in. thick. Just below the slicer upon the

second floor of the factory is a circle of 12 to 14 wrought-iron tanks each capable of holding about one and one-half tons of slices. A revolving chute from the slicer fills each one in succession. Large pipes connect these to-gether. The first is filled with slices, and water is let in from a tank above, which is allowed to stand while the second tank is fill-Then the valves are opened into the ing. next tank containing fresh slices, and fresh water, running into the first tank under pressure, forces the water already containing some sugar on into the next tank, where it becomes richer, and so on from tank to tank, always tending to bring the sugar which is outside the little beet cells and that which is inside to a balance. As the water progresses it is raised in temperature by steam coils. After the water has gone through about ten tanks it contains about as much sugar as the beets, and is drawn off into a measuring tank. The slices in the first tank, which have by this time been supplied with fresh water eight or ten times, have lost all or nearly all their sugar. These exhausted slices are dropped from the tank and run through presses, and the pulp remaining is shipped away for cattle feeding. This apparatus is called the "diffu-sion battery," and when once started, fresh slices are supplied and juice is drawn off almost continuously. This juice contains much organic matter that is not sugar. It is run from the measuring tanks into tall cylindrical vessels which hold about 2,000 gallons each. To remove the coloring and other organic matter a thick milk of lime is added. Carbonic acid, which is heated to almost boiling by steam pipes, is passed into the liquid to free it from excess of lime. The juice is then forced by automatic pumps to the filter press, whence it comes quite clear and of a strawyellow color. The lime pressed out in cakes forms one of the best land plasters that can be used. The juice is limed, carbonated. and filtered again and then goes to the evaporator. These are a series of four large tubular boilers supplied with the exhaust steam from the engine; each has a greater vacuum than the one before it, and the juice as it flows along from one to the next is evaporated rapidly and at a low temperature. As it comes from the last it is a moderately thick syrup, and when it has been filtered it is ready to be boiled down to sugar. The syrup is pumped up into the vacuum tanks. These are large cylindrical bodies ten feet in diameter with oval top and bottom. Inside are copper steam pipes coiled, and a large air pump with an 18-inch cylinder keeps up a high vacuum and removes the evaporated water, so that the boiling down goes on rapidly and at a low temperature. In the sides of the pan are glass windows through which the mass may be watched. When the grains begin to appear fresh syrup is added until they are of the required size, then the water is evaporated and the steam is shut off, the pump stopped, a valve is opened at the bottom of the pan, and the whole mass is allowed to run into the

tanks below. The syrup is now dark and so thick that it will hardly run. It is drawn into large whirling drums which have their sides perforated with small holes and lined with brass gauze. As the drums revolve the sugar rises up along the sides, and the molasses is thrown out through the holes, while the sugar, too large to get through, remains sticking to the gauze. A spray of cold water and air is directed against the sugar to wash it, and a little bluing is added to give it brill-iancy. The mill is stopped, and the sugar. now white and moist, is dropped from the bottom and conveyed to a large horizontal revolving cylinder, which is heated by steam and called the granulator. There the sugar is dried, and the fine dust of sugar contained in the granulator, is drawn out by a suctionblower. The sugar passes through screens at the end of the granulator and is then ready for market. The molasses which is thrown off through the small holes in the whirling drums, is mixed with fresh syrup and boiled again, or is boiled alone and passed through the drums, and the brown sugar resulting is refined by mixing with fresh syrup. Throughout the whole process a careful chemical control is maintained, and the material is tested at every stage.

Beethoven (ba'to-vn), Ludwig von (1770-1827), a great German musical composer, b. at Bonn, studied under his father (a tenor singer), Pfeiffer, Van der Eden, and Neefe; began to publish in 1783; became assistant court organist in 1785; and was sent by the Elector of Cologne to Vienna in 1792, where he was the pupil of Haydn and Albrechtsberger, and acquired a high reputation for piano-forte extemporization before the merit of his written compositions was fully understood. In or near Vienna almost all his subsequent life was spent, his artistic tour in North Germany in 1796 being the most important break. He d. March 27, 1827. His later life was rendered somewhat morbid by his deafness, of which the first signs appeared in 1797. His best works were published after 1800, two periods being observable: the first from 1800 to 1814, comprising Symphonies 2-8; the opera Fidelio (originally Leonore), the music to Goethe's Egmont, and the overtures to Prometheus, Coriolanus, King Stephen, and Fidelio; the second (in which the poetic school of musicians find the germs of the subsequent development through Schumann, Wagner, and Liszt) comprising the 9th Symphony, the Missa Solemnis, and the Sonatas.

Beetle, a name often used as synonymous with the term Coleoptera, but restricted by others to include all those insects that have their wings protected by hard cases or sheaths, called elytra. Beetles vary in size from a mere point to the bulk of a man's fist, the largest, the elephant beetle of South America, being 4 inches long. The so-called "black beetles" of kitchens and cellars are not properly beetles at all, but cockroaches, and of the order Orthoptera. One of the most celebrated beetles is the Sacred Scarabæus of Egypt. It

#### Begonia

is noted for the method in which it deposits its eggs. This beetle rolls its eggs up into small bits of cow-dung and rolls the ball along the ground in search of a spot sufficiently soft to allow her to excavate a place for the eggs. The mode of progress is very peculiar. She turns her back upon the ball, grasps it with her hind legs and works backward, pushing the ball along as a horse backs a cart.

Perhaps the largest and handsomest of the beetle race belongs to the Dynastes family. These beetles are large-bodied and stoutlimbed, and reside in decaying vegetable matter, especially in rotton tree trunks or branches. They are of great service to the forest lands. Some are able to take a tree as soon as it is fallen and riddle the timber with their galleries. The rain penetrates these tunnels, lodges there, and thus decay sets in.

**Bego'nia**, an extensive genus of succulentstemmed herbaceous plants, order Begoniaceæ, with fleshy, oblique leaves of various colors, and showy unsexual flowers, the whole perianth colored. They readily hybridize, and

Begonia.

many fine varieties have been raised from the tuberous-rooted kinds. From the shape of their leaves they have been called *eleplant's ear*. Almost all plants of the order are tropical, and have mostly pink or red flowers.

ical, and have mostly pink or red flowers. **Behar'**, a prov. of Hindustan, in Bengal, area 44,139 sq. mi. Opium and indigo are largely produced. It is the most densely peopled prov. of India; pop. 23,127,104. Patna is the capital. The town of Behar, in the Patna district, contains some ancient mosques and the ruins of an old fort; it is a place of large trade. Pop. 48,008.

Behe' moth, the animal described in Job 40. The description is most applicable to the hippopotamus, and the word seems to be of Egyptian origin, and to signifiy "water ox." but it has been variously asserted to be the ox, the elephant, the crocodile, etc.

Behis tun (or Bis'utan), a mountain near a village of the same name in Persian Kurdistan, celebrated for the sculptures and cuneiform inscriptions cut upon one of its sides a rock rising almost perpendicularly to the height of 1,700 ft. These works, which stand

## Behring

about 300 ft. from the ground, were executed by the orders of Darius I, king of Persia, and set forth his genealogy and victories. To receive the inscriptions, the rock was carefully

**Rock Inscriptions at Behistun.** 

polished and coated with a hard, siliceous varnish. Their probable date is about 515 B.C. First copied and deciphered by Rawlinson.

Behring (or Bering) (bā'ring), VITUS (1680-1741), a famous navigator, b. at Horsens, Jutland. The courage displayed by him as captain in the navy of Peter the Great during the Swedish wars, led to his being chosen to command a voyage of discovery in the Sea of Kamtchatka. In 1728, and subsequently, he examined the coasts of Kamtchatka, Okhotsk, and the north of Siberia, ascertaining the relation between the northeastern Asiatic and northwestern American coasts. Returning from America in 1741, he was wrecked upon the desert island of Awatska (Bering's Island), and died there.

Behring's (or Bering) Strait, Sea, and Island.—The strait is the channel separating the continents of Asia and America, and connecting the North Pacific with the Arctic Ocean; breadth at the narrowest part, between Cape Prince of Wales and East Cape, about 36 mi.: depth in the middle from 29 to 30 fathoms. It is frozen in winter and seldom free from fog or haze. Though named after Vitus Bering, it was only fully explored by Cook in 1778. BERING'S SEA, sometimes called the Sea of Kamtchatka, is that portion of the North Pacific Ocean lying between the Aleutian Islands and Bering's Strait. BERING'S ISLAND, the most westerly of the Aleutian chain, off the east coast of Kamtchatka. It is uninhabited, and is without wood. A contention between the U.S. and Great Britain as to the capture of seals in Bering's Sea was referred by treaty to a court of arbitration in 1892, consisting of

seven persons, two representing the U.S., two representing Great Britain (one to be a Canadian), and one each from France, Sweden, and This court decided that the U.S. and Italy. Great Britain were each to prevent their subjects from killing or hunting seals within a radius of 60 mi. around the Pribilov Islands or in any part of the Pacific Ocean north of lat. 35° n. or e. of lon. 180° during the breeding season. The Pacific Ocean, according to the treaty of 1825, includes Bering Sea. The matter of damages was to be settled by diplomatic negotiations. In 1894 Secretary Gresham proposed to pay \$425,000 in full settlement of all damages, but Congress refused to ratify the agreement on the ground that the amount was excessive. It was later arranged that a tribunal consisting of one representative of the U.S. and one of Great Britain was to meet either at Victoria or San Francisco and award damages for seizures made. The president of the U.S. appointed a commission of scientists in 1896 to make investigation of the condition of fur seals of Alaska and report to Congress.

**Beira** ( $b\bar{a}'i$ - $r\bar{a}$ ), a province of Portugal. Area 9,248 sq. mi.; pop. 1,450,441. Chief town Coimbra. It is mountainous, and well watered, and productive of wine and olives. The heir apparent of the crown is styled Prince of Beira.

**Bejapoor'**, a ruined city of Hindustan, in the Bombay presidency, near the borders of the Nizam's dominions, on an affluent of the Krishna. It was one of the largest cities in India until its capture by Aurungzebe in 1686. The ruins, of which some are in the richest style of Oriental art, are chiefly Mohammedan; the principal being Mahomet Shah's tomb, with a dome visible for 14 miles, and a Hindu temple in the earliest Brahmanical style. Pop. 16,759.

Bekes (bā'kāsh), a town, Hungary, at the junction of the Black and White Körös, with a trade in flax, cattle, corn, wine, etc. It is noted for bee culture. Pop. 24,561. Bei (also belgar), the Hindu name of the Bengal quince. The fruit, which is not

**Bei** (also belgar), the Hindu name of the Bengal quince. The fruit, which is not unlike an orange, is slightly aperient; a perfume and yellow dye are obtained from the rind, and a cement from the mucus of theseed.

Bei and the Dragon, a book of the Apocrypha, forming a sort of addition to the book of Daniel. In it Daniel is shown as exposing the imposture of the priests of Bel and killing a sacred dragon.

**Beffast**, Waldo co., Me., on Penobscot Bay, 30 mi. s.w. of Bangor. Railroad: Belfast & Moorehead line; steamboat line to Boston. Industries: iron foundry, two shoe factories, two sash and blind, ax, and bath-brush factories. Surrounding country agricultural and some granite quarries. The town was first settled in 1770 and became a city in 1853. Pop. est. 1897, 5,500.

**Belfast'**, a seaport of Ireland, principal town of Ulster, and county town of Antrim. The chief educational institutions are the Queen's college, with about twenty professors, and the theological colleges of the Presbyteri-

ans and Methodists. Belfast Lough is about 12 mi. long, and 6 mi. broad at the entrance, gradually narrowing as it approaches the town. The harbor and dock accommodation is now extensive, new docks having been recently added. Belfast is the center of the Irish linen trade, and has the majority of spinning mills and power-loom factories in Ireland. The iron ship-building trade is also of importance, and there are breweries, distilleries, flour mills, oil mills, foundries, print works, tan yards, chemical works, rope works, etc. The commerce is large. Belfast is comparatively a modern town, its prosperity dating from the introduction of the cotton trade in 1777. It has suffered severely at various times from faction fights between Catholics and Protestants, the more serious having been in the years 1864, 1872, and 1886. Pop. 255,950.

**Beifort** (or Béfort) (bā-fōr), a small fortified town and territory of France, in the former dep. Haut Rhin. Pop. 25, 455. In the Franco-German War it capitulated to the Germans only a fter an investment of more than three months' duration (1870-71). It has since been greatly strengthened. Belfort, with the district immediately surrounding it, is the only part of the department of Haut Rhin which remained to France on the cession of Alsace to Germany. Area 234 sq. mi.; pop. 83,670.

**Beigaum** (bel-gaum), a town and fortress in Hindustan, Bombay presidency, district of Belgaum, on a plain 2,500 feet above the sealevel. In 1818 the fort and town were taken by the British, and from its healthy situation selected as a permanent military station. Pop. of town (including 7.921 for the cantonment), 40,737. The area of the district is 4,657 sq. mi., with a pop. of 1,013,261.

Belgium (bel'-jum), a European kingdom. Area 11.366 sq. mi. For administrative purposes it is divided into nine provinces: Ant-werp, Brabant, East Flanders, West Flanders, Hainaut, Liege, Limburg, Luxemburg, and Namur. Pop. 6,262,272. Brabant, the metropolitan province, occupies the center. The capital is Brussels; other chief towns are Ant-werp. Ghent, and Liége. The chief rivers are the Scheldt (or Schelde) and Meuse (or Maas); other navigable streams are the Dender, Dyle. Lys, Ourthe, Rupel, and Sambre. There are also a number of canals. The climate bears a considerable resemblance to that of the same latitudes in England; healthiest in Luxemburg and Namur, unhealthiest in the fens of Flanders and Antwerp. About one sixth of the whole surface of the kingdom is occupied by wood, Luxemburg and Namur being very densely wooded. These woods, the remains of the ancient forest of Ardennes, consist of hard wood, principally oak, and furnish valuable timber, besides many tons of bark both for the home tanneries and for exportation, and large quantities of charcoal. South Brabant also possesses several fine forests, among others that of Soignies; but in the other provinces the timber--mostly varieties of poplar-is grown in small copses and hedgerows.

About four fifths of the whole kingdom is

# Belgium

under cultivation, and nearly eleven twelfths of it profitably occupied, leaving only about one twelfth waste. Flemish husbandry partakes more of the nature of garden than of field culture, being largely spade-farming. The chief corn crops are wheat, rye, and oats, but they do not suffice for the wants of the country. . The chief green crops are potatoes, beets (partly for sugar), and flax, the last a most valuable crop in the Flemish rotation. The cattle are good and numerous. The horses of Flanders are admirably adapted for draught, and an infusion of their blood has contributed not a little to form the magnificent teams of the London draymen. The minerals of Bel-gium are highly valuable. They are almost entirely confined to the four provinces of Heineut Lizer Norme and Lycenburg and Hainaut, Liége, Namur, and Luxemburg, and consist of iron and coal, lead, manganese, and zinc, the first two minerals being far the most important. The iron-working district lies between the Sambre and the Meuse, and also in the province of Liége. At present the largest quantity of oil is raised in that of Namur. The coal field has an area of above 500 sq. mi. The quantity of coal mined annually is about 18,000,000 tons. The export, chiefly to France, is over 5,000,000 tons, forming one of the largest and most valuable of all Belgian ex-Belgium is also abundantly supplied ports. with building stone, pavement limestone, roofing-slate, and marble.

The industrial products of Belgium are very numerous, and are mostly of high character. The chief are those connected with linen, wool, cotton, metal, and leather goods. In respect of manufactures the fine linens of Flanders, and lace of South Brabant, are of European reputation. Scarcely less celebrated are the carpets and porcelain of Tournay, the cloth of Verviers, the extensive foundries, machine works, and other iron establishments of Liége. The commerce of Belgium is large own products, she is admirably situated for the transit trade of Central Europe, to which her fine harbor of Antwerp and excellent railway and canal system minister. The external trade is chiefly carried on by means of foreign vessels. The total burden of the Belgian mercantile marine is only about 80,000 tons. The railways have a total length of 2,800 miles, about three fourths belonging to the state.

The Belgian population is the densest of any European state (508 per sq. mi.), and is composed of two distinct races—Flemish, who are of German, and Walloons, who are of French extraction. The former, by far the more numerous, have their principal locality in Flanders; but also prevail throughout Antwerp, Limburg, and part of South Brabant. The latter are found chiefly in Hainaut, Liége, Namur, and part of Luxemburg. The Flemings speak a dialect of German, and the Walloons a corruption of French, with a considerable ble infusion of words and phrases from Spanish and other languages. French is the official and literary language, though Flemish is also successfully employed in literature.

# Belgium

Improved means of education are, now at the disposal of the people, every commune being bound to maintain at least one school for elementary education, the government paying one sixth, the province one sixth, and the commune the remainder of the expenditure. In all the large towns colleges have been established; while a complete course for the learned professions is provided by four universities, two of them, at Ghent and Liege, established and supported by the state; one at Brussels, the free university, founded by voluntary association; and one at Louvain, the Catholic university, founded by the clergy. By the Belgian constitution the executive power is vested in a hereditary king; the legislative, in the king and two chambers-the senate and the chamber of representatives—both elected by citizens paying direct taxes, the former for eight years, and the latter for four, but one half of the former renewable every four years, and one half of the latter every two years. Each of the prov-inces is administered by a governor and is subdivided into arrondissements administratifs and arrondissements judiciaires; subdivided again, respectively, into cantons de milice and cantons de justice de paix. Each canton is composed of several communes, of which the sum total is 2,514. The army is formed by conscription, to which every able man who has completed his nineteenth year is liable, and also by voluntary enlistment. The peace strength is 48,841 officers and men; in time of war 154,780. Besides this standing army there is a garde cirique numbering 43,647 active and 90,600 non-active men. The navy is confined to a few steamers and a small flotilla of gunboats. The coins, weights, and measures are the same, both in name and value, as those of France.

*llistory.*—The territory now known as Bel-gium originally formed only a section of that known to Cæsar as the territory of the Belgæ, extending from the right bank of the Seine to the left bank of the Rhine, and to the ocean. This district continued under Roman sway till the decline of the empire; subsequently formed part of the kingdom of Clovis; and then of that of Charlemagne, whose ancestors belonged to Landen and Herstal on the confines of the Ardennes. After the breaking up of the empire of Charlemagne Belgium formed part of the kingdom of Lotharingia under Charlemagne's grandson, Lothaire; Artois and Flanders, however, belonging to France by the treaty of Ver-dun. For more than a century this kingdom was contended for by the kings of France and the emperors of Germany. In 953 it was conferred by the Emperor Otto upon Bruno, archbishop of Cologne, who assumed the title of archduke, and divided it into two duchies, Upper and Lower Lorraine. In the frequent struggles which took place during the eleventh century Luxemburg, Namur, Hainaut, and Liége usually sided with France, while Brabant, Holland, and Flanders commonly took the side of Germany. The contest between the civic and industrial organizations and feudalism, which went on through the twelfth and thirteenth centuries, and in which Flanders

bore a leading part, was temporarily closed by the defeat of the Ghentese under Van Artevelde in 1382. In 1384 Flanders and Artois fell to the house of Burgundy, which in less than a century acquired the whole of the Nether-lands. The death of Charles the Bold at Nancy, in his attempt to raise the duchy into a kingdom (1477), was followed by the succession and marriage of his daughter, Mary of Burgundy, by which the Netherlands became an Austrian possession. With the accession, however, of the Austrian house of Hapsburg to the Spanish throne, the Netherlands, after a brief period of prosperity attended by the spread of the reformed religion, became the scene of increasingly severe persecution under Charles V and Philip II of Spain. Driven to rebellion, the seven northern states under William of Orange, the Silent, succeeded in establishing their independence, but the southern' portion, or Belgium, continued under the Spanish yoke.

From 1598 to 1621 the Spanish Netherlands were transferred as an independent kingdom to the Austrian branch of the family by the marriage of Isabella, daughter of Philip II, with the Archduke Albert of Austria. He died childless, however, and they reverted to Spain. After being twice conquered by Louis XIV, conquered again by Marlborough, coveted by all the powers, deprived of territory on the one side by Holland and on the other by France, the southern Netherlands were at length, in 1714, by the peace of Utrecht, again placed under the dominion of Austria, with the name of the Austrian Netherlands. During the Austrian War of Succession the French under Saxe conquered nearly the whole coun-try, but restored it in 1748 by the peace of Aix-la-Chapelle. On the succession of Joseph II, the "philosophic emperor," a serious insurrection occurred, the Austrian army being defeated at Turnhout, and the provinces forming themselves into an independent state as United Belgium (1790). They had scarcely been subdued again by Austria before they were conquered by the revolutionary armies of France, and the country divided into French departments, the Austrian rule being practically closed by the battle of Fleurus (1794), and the French possession confirmed by the treaties of Campo Formio (1797) and Lunéville (1801).

In 1815 Belgium was united by the Congress of Vienna to Holland, both countries together now forming one state, the Kingdom of the Netherlands. This union lasted till 1830, when a revolt broke out among the Belgians, and soon attained such dimensions that the Dutch troops were unable to repress it. A convention of the great powers assembled in London, favored the separation of the two countries, and drew up a treaty to regulate it; the National Congress of Belgium offering the crown, on the recommendation of England, to Leopold, prince of Saxe-Coburg, who acceded to it under the title of Leopold I, on July 21, 1831. In November of the same year the five powers guaranteed the crown to him by the

.

treaty of London, and the remaining difficulties with Holland were settled in 1839, when the Dutch claims to territory in Limburg and Luxemburg were withdrawn. The reign of Leopold was for Belgium a prosperous period of thirty-four years. Leopold II suc-ceeded his father in 1865. In recent years the chief feature of Belgian politics has been a keen struggle between the clerical and the liberal party. Till 1878 the clerical party maintained the upper hand, but to a large extent by corruption at the elections. In 1877 a bill was passed to put down corruption, and to increase the number of town deputies to the chamber of representatives; and at the next elections, in June, 1878, the liberals gained a majority, which they lost in 1884. In 1885, on the constitution by the Congress of Berlin of the Congo Free State, in which Leopold II had shown an active interest, he was invited to become its sovereign, and has since held that title.

**Beigrade** (bel-grad'), capital of Servia. It manufactures carpets, silk stuffs, hardware, cutlery, and saddlery, and carries on an active trade. Being the key of Hungary, it was long an object of flerce contention between the Austrians and the Turks, remaining, however, for the most part in the hands of the Turks until its evacuation by them in 1867. Since the treaty of Berlin (July, 1878) it has been the capital of an independent state. Pop. 54-763,

**Be'llal**, a word which by the translators of the English Bible is often treated as a proper name, as in the expressions, son of Belial, man of Belial. In the Old Testament, however, it ought not to be taken as a proper name, but it should be translated wickedness or worthlessness. To the later Jews Belial seems to have become what Pluto was to the Greeks, the name of the ruler of the infernal regions; and in 2 Cor. 6:15 it seems to be used as a name of Satan, as the personification of all that is bad.

Belisa' rius (505-565), the general to whom the Emperor Justinian chiefly owed the splendor of his reign; b. in Illyria about 505 A. D. He obtained the chief command of an army on the Persian frontiers, and in 530 gained a victory over a superior Persian army. In the year 532 he checked the disorders in Constantinople. He took Carthage and led Gelimer, the Vandal king, in triumph through Constantinople. He stormed Naples, held Rome for a year, took Ravenna, and led captive Vitiges, the Gothic king.

Belize (be-lez'), the capital and only trading port of British Honduras, situated at the mouth of the southern arm of the river Belize. Exports: chiefly mahogany, rosewood, logwood, cedar, cocca-nuts, and sugar. Pop. about 5,800.

Bell, a hollow, somewhat cup-shaped, sounding instrument of metal. The metal from which bells are usually made (by founding) is an alloy, called bell-metal, commonly composed of eighty parts of copper and twenty of tin. The proportion of tin varies, however, from one third to one fifth of the weight of the copper, according to the sound required, the size of the bell, and the impulse to be given. The clear-

ness and richness of the tone depend upon the metal used, the perfection of its casting, and also upon its shape; it having been shown by a number of experiments that the well-known shape with a thick lip is the best adapted to give a perfect sound. The depth of a tone of a bell increases in proportion to its size. A bell is divided into

Ancient Crotal.

the body or barrel, the ear or cannon, and the clapper or tongue. The kp or sound-bow is that part where the bell is struck by the clapper.

It is uncertain whether the jangling instruments used by the Egyptians and Israelites can be correctly described as bells; but it is certain that bells of a considerable size were in early use in China and Japan, and that the Greeks and Romans used them for various purposes. They are said to have been first in--troduced into Christian churches about 400 A. D. by Paulinus, bishop of Nola, in Campa-nia (whence campana and nola as old names of bells), although their adoption on a wide scale does not become apparent until after the year 550, when they were introduced into France. Benedict Biscop, abbot of Wearmouth, seems to have imported bells from Italy to England in 680, but their use in Ireland and Scotland is probably of earlier date. The oldest of those existing in Great Britain and Ire-land, such as the "bell of St. Patrick's will" and St. Ninian's bell, are quadrangular and made of thin iron plates hammered and riveted together. Until the thirteenth century they were of comparatively small size, but after the casting of the Jacqueline of Paris (64 tons) in

1400, their weight rapidly increased. Among the more famous bells are the bell of Cologne, 11 tons, 1448; of Dantzic, 6 tons, 1453; of Halberstadt, 7‡, 1457; of Rouen, 16, 1501; of Breslau, 11, 1507; of Lucerne, 7‡ 1636; of Oxford, 7‡, 1680; of Paris, 12‡, 1680; of Bruges, 10‡, 1680; of Vienna, 17‡, 1711; of Moscow (the monarch of bells), 193, 1736; three other bells at Moscow ranging

Queen Mary's Hand Bell-from 16 to 31 tons, and a fourth, of 80 tons, cast in 1819; the bell of Lincoln (Great Tom), 5‡, 1834; of York Minster (Great Peter), 10‡, 1845; of Montreal, 13‡, 1847, the largest bell in America; of Westminster (Big Ben), 15‡, 1856; (St. Stephen), 13‡, 1858; the Great Bell of St. Paul's, 17‡, 1882. Others are the bells of Ghent (5), Görlitz (10‡), St. Peter's, Rome (8), Antwerp (7‡), Olmutz (18), Brussels (‡), Novgorod (31), Pekin (53‡). Besides their use in churches bells are employed for various purposes, the most common use being to summon attendants or domestics in private houses, hotels, etc. Bells for this purpose are of small size and may be held in the hand and rung, but most commonly are rung by means of wires stretched from the various apartments to the place where the bells are hung. Bells rung by electricity are now becoming common in hotels and other establishments.

Bells, as the term is used on shipboard, are the strokes of the ship's bell that proclaim the hours. Eight bells, the highest number, are rung at noon and every fourth hour afterward: *i. e.*, at 4, 8, 12 o'clock, and so on. The intermediary periods are indicated thus: 12:30, 1 bell; 1 o'clock, 2 bells; 1:30, 3 bells, etc., until the eight bells announce 4 o'clock, when the series recommences: 4:30, 1 bell; 5 o'clock, 2 bells, etc. The even numbers of strokes thus always announce hours, the odd numbers halfhours.

The manufacture of a bell is a difficult and interesting process, and the success of a bell depends in the first place on the amount of accuracy with which its dimensions have been figured out beforehand. The thickness of the bell's edge must bear a certain proportion to its diameter and height. It must also be of just the right thickness in its various parts. There are exact rules for calculating the dimensions and the proportions of the metal to the size of the bell. Copper and tin are used for large bells, but the mixture varies widely. About four parts of copper are used with each part of tin. When the design has been made for a bell it goes to a pattern maker. This workman cuts out two long strips of wood, one of them just the contour of the inside of the projected bell and the other the contour of the outside. A basin for the mold is made in the foundry. It is constructed in the earth and consists mainly of fire brick and clay, a stout post perfectly plumb is planted in the center and is of the same height as the proposed bell. The two contour pieces are pivoted to the post so that they will swing around in either direction. In the center of the basin and around the post is built a little furnace of brick so large that it almost reaches the sweep of the inside of the contour leg of the compass. It is then pieced out on top with fire clay until it exactly conforms to the sweep of the contour pieces. It is made very smooth and is allowed to harden. This forms a core. Then grease is applied, then more clay, until it reaches and is swept smooth by the upper contour leg. This covering of clay is exactly the size and shape of the projected bell. If there are to be any designs or inscriptions on the bell they are worked in in reverse order and plugged in with wax. When it is dry it is smeared with grease and another layer of clay, called a mantle, which is packed on roughly, a hole being left in the top through which the molten metal can be poured. After this has hardened, the whole mass is shaped by building a hot fire in the interior furnace. The wax in the inscrip-

18

tions and the grease vaporize and pass off. The mantle, or the mold for the outer part of the bell, can now be easily lifted off. When the next layer of clay is removed and the mantle replaced, the space left between it and the core furnishes the bell mold. The great mass of bell metal is brought from the furnace and poured into the mold. Small pieces of broken bells are thrown into the crucible to cool the metal. When the mold is full the pouring is complete. The mold is left for several weeks to grow cool and shrink because if it were broken open at once the bell would cool more rapidly on the outside than on the inside and would break. When the mold is taken off, the bell is tested and if it gives out a single pure tone it is regarded as a perfect cast. If the tone is not pure the bell can sometimes be tuned by filing away parts of the inside surface.

Bell, ALEX. GRAHAM, a noted physicist, b. in Edinburgh, 1847. He was trained in his father's system of removing impediments of speech, in the university of Edinburgh, and matriculated 1867, at London university, but left on account of failing health. He removed to Canada, 1870, where he designed and partly constructed the telephone exhibited in Philadelphia, 1870. His residence had been in Boston from 1872, being professor of Vocal Physiology at Boston university. His fame and fortune are due to the commercial importance of the telephone of which he holds the patent. Elisha Gray filed his caveat in the patent office two hours after Bell's application. After Bell, a large number of experimenters appeared, suggesting endless modification but no essentially new principle. In a lecture delivered by Reis in Frankfort, in the year 1861, an apparatus was described which has given rise to much discussion concerning priority of invention.

The *Photophone*, the joint work of Bell and Taintor, in which a vibratory beam of light is substituted for a wire in conveying speech, was introduced to the public, 1880. In 1881 Bell and Taintor, with an improved form of Hughes's induction balance, attempted unsuccessfully to locate the ball which caused Garfield's death. Another interesting experiment of Bell's was attempting to record speech by photographing the vibrations of a jet of water. Bell resides in Washington and is a member of many learned societies. He introduced into the U. S. his father's system of educating deaf mutes.

**Bell**, HENRY (1767–1830), the first successful applier of steam to the purposes of navigation in Europe, was born in Linlithgowshire. In 1708 he turned his attention specially to the steamboat, the practicability of steam navigation having been already demonstrated. In 1812 the *Comet*, a small thirty-ton vessel built at Glasgow under Bell's direction, and driven by a three horse-power engine made by himself, commenced to ply between Glasgow and Greenock, and continued to run till she was wrecked in 1820. This was the beginning of steam navigation in Europe. Bell is also cred-

#### **Belladonna Lily**

ited with the invention of the "discharging machine" used by calico-printers.

Bell, JOHN (1797-1869), born near Nashville. Tenn. He was graduated at what is now the university of Nashville in 1814, was admitted to the bar in 1816, and was elected to the state senate in 1817. He served in Congress as a Whig, 1827-41, winning reputation as a debater. He became an ardent supporter of the protective tariff. He supported General Jack-son as candidate for the Presidency in 1832. In 1834 he was elected speaker of the House of Representatives. He favored the reception of petitions for the abolition of slavery in the District of Columbia. In 1841 he was ap-pointed secretary of war by President Harrison. He was in the U.S. Senate 1849-59. He opposed the Texas annexation policy, advocated Henry Clay's compromise of 1850, voted against the Kansas-Nebraska bill of 1850, and opposed the repeal of the Missouri Compro-Mr. Bell was nominated for President, mise. with Edward Everett for Vice-President, by a convention of the "Constitutional Union" in 1860, when secession was threatened by the Southern States, and he received the electoral votes of Tennessee, Virginia, and Kentucky. He, with seven other citizens of Tennessee, issued an address recommending his state to preserve an armed neutrality in 1861, and on April 23, 1861, he delivered an address in Nashville in support of the Southern policy. Mr. Bell did not serve in the Civil War.

Belladon' na, a European plant, the deadly nightshade. It is native in Britain. All the parts of the plant are poisonous, and the incautious eating of the berries has often produced death. The inspissated juice is commonly known by the name of extract of belladonna. It is narcotic and poisonous, but is of great value in medicine, especially in nervous ailments. It has the property of causing the pupil of the eye to dilate. The fruit of the plant is a dark, brownish-black, shining berry. The name signifies "beautiful lady," and is said to have been given from the use of the plant as a cosmetic.

Belladonna Lily, so called on account of its beauty, with delicate blushing flowers clus-

Belladonna. a .- flower. b.-fruit.

### Bellaire

tered at the top of a leafless flowering stem. It is a native of the Cape of Good Hope and of the West Indies.

Bellaire, Belmont co., O., 5 mi. below Wheeling, on the Ohio; numerous manufacturing works. Pop. 9,934.

**Bellamy**, EDWARD, b. in Massachusetts, 1850; was admitted to the bar in 1871. He was connected with the Springfield, Mass., and New York press, and in 1888 published *Looking Back*ward, a dream of perfect socialism.

**Bellary** (bel-ä'ri), a town in India, presidency of Madras, capital of a district of the same name, 280 mi. n. w. of Madras; a military station, with a fort crowning a lofty rock, and other fortifications. Pop. 59,467. The district was ceded to the British in 1800. Area 5,975 sq. mi; pop. 900,126.

Bellay (bel-s), JOACHIM DU (1524-1560), distinguished French poet, known as the French Ovid. In 1555 he became canon of Notre Dame, and a short time before his death he was made archbishop of Bordeaux. Spenser translated some of his sonnets into English.

**Bell-bird**, the name given to a South American passerine bird, so named from its sonorous, bell-like notes; and also to a bird of Australia, a bird of the family Meliphagidæ (honey-suckers), whose notes also resemble the sound of a bell.

**Bell-crank**, in machinery, a rectangular lever by which the direction of motion is changed through an angle of  $90^{\circ}$ , and by which its velocity ratio and range may be altered at pleasure by making the arms of different lengths. It is much employed in machinery, and is named from its being the form of crank employed in changing the direction of the bell wires of house bells.

**Bell-Alliance**, a farm 13 mi. s. of Brussels, famous as the position occupied by the center of the French Army in the battle of Waterloo, June, 1815.

**Belic-Isle** (bel-**č**) (or Belle-Isle-en-Mer), a French Island in the Bay of Biscay, dcp. of Morbinan, 8 mi. s. of Quiberon Point; length 11 mi.; greatest breadth 6 mi. Pop. 10,000,177, largely engaged in the pilchard fishing. The capital is Le Palais on the n. e. coast.

**Belle-Isle** (bel-il), a rocky island, 9 mi. long, at the eastern entrance to the Strait of Belle-Isle, the channel, 15 mi. wide, between Newfoundland and the coast of Labrador. Steamers from Glasgow and Liverpool to Quebec round the north of Ireland commonly go by this channel in summer as being the shortest route.

**Beller' ophon** (or Hippon'ous), in Greek mythology, a hero who, having accidentally killed his brother, fled to Protus, king of Argos, whose wife, Antæa, fell in love with him.

Belles-lettres (bel-let-r), polite or elegant literature; a word of somewhat vague signification. Rhetoric, poetry, fiction, history, and criticism, with the languages in which the standard works in these departments are written, are generally understood to come under the head of belles-lettres.

Beileville, St. Clair co., Ill., on Richland

Creek, 14 mi. s. e. of St. Louis. Railroads: Illinois Central; L. & N.; L. E. & St. L.; St. L. B. & S. Industries: nail mills, four flouring mills, four iron foundries, machine shops, keg, clothing, and glass factories, and four farm implement factories. Surrounding country agricultural and mineral. The town was first settled in 1814 and became a city in 1850. Pop. est. 1897, 22,000.

**Belleville**, a town of Canada, prov. Ontario, capital of Hastings co., on the Bay of Quinté, at the mouth of the Moira, with flourishing trade and manufactures. It is rather a fine town, and has a Methodist Episcopal university for men and women (two colleges). Pop. 10,100.

**Bellini** (bel- $\bar{e}$ - $n\bar{e}$ ), JACOPO, and his two sons, GENTILE and GIOVANNI, the founders of the Venetian school of painting. The father excelled in portraits, but very little of his work is extant. He d. about 1470. Gentile was b. in 1421, and in 1479 went to Constantinople, Mohammed II having sent to Venice for a skillful painter; d. at Venice in 1501. Giovanni was b. about 1424, and d. about 1516. He contributed much to make oil-painting popular, and has left many noteworthy pictures. Titian and Giorgione were among his pupils.

Bellini (bel-ē'nē). VINCENZO (1802-1835), a celebrated composer, b. at Catania in Sicily. He was educated at Naples under Zingarelli, commenced writing operas before he was twenty, and composed for the principal musical establishments in Europe. His most celebrated works are I Montecchi e Capuleti (1829): La Somnambula (1831); Norma, his best and most popular opera; and I Puritani (1834). Bellmann, KARL MICKEL (1740-1795), the

Bellmann, KARL MICKEL (1740-1795), the most original among the Swedish lyric poets. His songs, in which love and liquor are common themes, are sung over the whole country, and "Bellmann" societies hold an annual festival in his honor.

Bello'na, the goddess of war among the Romans, often confounded with Minerva. She was the sister of Mars, or, according to some, his daughter or his wife. She is described by the poets as armed with a bloody scourge, her hair disheveled, and a torch in her hand.

Bel'lows, an instrument or machine for producing a strong current of air, and principally used for blowing fires, either in private dwellings or in forges, furnaces, mines. etc. It is so formed as, by being dilated and contracted, to inhale air by an orifice which is opened and closed with a valve, and to propel it through a tube upon the fire. It is an ancient contrivance, being known in Egypt, India, and China many ages ago, while forms of it are used among savage tribes in Africa. Bellows of very great power are called blowing machines, and are worked by machinery driven by steam. The blowing machines now almost exclusively used for blast furnaces are of the cylinder and piston type. At first the blowing cylinders had the power of propelling a blast only when the piston was moving in one direction. The cylinder engines of the present day

#### **Bellows-fish**

may be classed in two chief systems, according as the cylinder is placed horizontally or vertically. In the former case the steam and blast cylinders are usually in one line, the same rod carrying the pistons of both, and being guided on both sides, while a fly-wheel is employed as regulator. In the vertical systems the steam and blowing cylinders are sometimes similarly connected, but in the larger engines, they are generally placed one at each end of a beam connecting their pistons. Another kind of blow-ing engine consists of a barrel-shaped vessel supported horizontally by the two ends of its axis. The cylinder is divided longitudinally by a plane extending from the middle of the internal surface above (the barrel being in its position of rest) to near the opposite side. Suppose the cylinder partly filled with water and made to turn a little way round on its axis, the air on one side will be compressed by the water, while that on the other will be rarefled. A valve opening outward from the condensed side admits the air to a cavity from which a nozzle pipe proceeds, while a valve opening inward on the rarefled side admits external air. With additional and corresponding values the process is repeated on the reverse oscillation of the cylinder. Thus by swinging the cylinder from side to side, by a crank and rod connected with the engine, alternate puffs of air are propelled into a regulative air chest of special construction, which then supplies a steady blast.

Fan-blast machines are frequently employed in the cupola furnaces where anthracite is burned. In one common form the fan consists of four spokes of a rimless wheel, tipped with vanes and made to rotate in a cylindrical chest, in which it has often a slightly eccentric position. There are openings on both sides round the spindle for admission of air, which, sucked in by the centrifugal action of the fan as it quickly rotates, flows toward the vanes, and is driven through an exit pipe attached to another part of the cylinder. A new form of blower has a chamber in which three drums of equal size are enclosed, two in a line below and one above; the upper one is provided with wings, and the two lower have wide slots along their entire length, allowing the wings to enter in the course of rotation. The function of the two lower drums is to supply alternately abutments to prevent the escape of the air. Thev are caused to revolve in proper relation with the motion of the upper drum by spur-wheels on the journals, which mesh into another spurwheel on the shaft of the upper drum. In the moving parts of this machine there are no parts that come into actual contact except the teeth of the spur-wheels.

Bellows-fish, a fish, called also the Trumpetfish or Sea-snipe. It is not uncommon in the Mediterranean. It is 4 or 5 inches long, and has an oblong oval body and a tubular elongated snout, which is adapted for drawing from among sea-weed and mud the minute crustacea on which it feeds.

Bell Rock (or inch cape), a dangerous reef surmounted by a lighthouse, situated in the German Ocean about 12 mi. from Arbroath, nearly opposite the mouth of the river Tay. The lighthouse was erected in 1808-11 by Robert

Stevenson from Rennie's plan at a cost of upward of \$300,-000. It rises to a height of 120 feet; has a revolving light showing alternately red and white every minute, and visible for upward of 15 mi. It also contains two bells which are rung during thick weather. The reef is partly uncovered at ebb-tides.

Belluno (bel-lö'nō), a city of Northern Italy, capital of a province of the same name, on the Piave, 48 mi. n. of Venice. Has a cathedral, a handsome theater, etc.; and manufactures of silk, strawplait, leather, etc. Pop. 16,-The province has an Ō00. area of 1,271 sq. mi. and a pop. of 195.419.

Section of Beil

Beloit, Rock co., Wis., 69 Rock Lighthouse. mi. s.w. of Milwaukee, the seat of Beloit college; various factories. Pop. est. 1897, 7,000

Bel'per, a town, England, Derbyshire, in a valley, on the Derwent, 7 mi. n. of Derby, with large cotton mills, foundries, etc., and in the neighborhood numerous collieries. Pop. 10,420.

Belshaz'zar, the last of the Babylonian kings, who reigned conjointly with his father. Nabonadius. He perished B. c. 538, during the successful storming of Babylon by Cyrus. This event is recorded in the book of Daniel.

Belt, belting, a flexible endless band, or its material, used to transmit motion or power from one wheel, roller, or pulley to another,

#### Belt Lacing.

and common in various kinds of machinery. Driving belts are usually made of leather or india-rubber, or some<sup>•</sup>woven material, but ropes and chains are also used for the same purpose.

There are a number of ways of lacing a belt, but every machinist has his own favorite method. One rather complex but effective method is to punch 24 holes, 13 on one side and 11 on the other side, as shown in cut. The lace is doubled in the center of its length and run through the middle hole (13) of the second row on that side of the joint which contains 11 holes. The lace is passed over and under from side to side, bringing both ends of the lace out of the middle hole (1), and there the ends are tied on the outside of the belt. By this means there is no crossing of the lace on either side, and there can be no side play and the lace will not creep. When a light belt is called upon to do little work, it is customary to lace the belt shoe-string fashion, back and forth through single rows of holes, always beginning the lacing in the center of the belt. Imperfectly adjusted belting is a fruitful cause of power waste, and a poorly laced joint is the principal cause of loss of transmitted energy. If a lace be crossed on the under side the belt is raised from the pulley every time the joint comes around, and not only is the power wasted, but the lace is soon worn through. Sometimes the lace on the other side is covered by a piece of belting, scraped thin and cemented to the joint. In many cases the ends of the belt are scarfed, the laps cemented together and the whole strengthened by rivets. For lacing wide belts which are too heavy to be stretched by hand, the stretching clamp is used. This holds the ends firmly until the belt is laced.

**Belt**, The Great and Little, two straits connecting the Baltic with the Cattegat, the former between the islands of Zealand and Funen, about 18 mi. in average width; the latter between Funen and the coast of Schleswig, at its narrowest part not more than a mile in width.

Bei'tane, a sort of festival formerly observed in Ireland and Scotland, and still kept up in a fashion in some remote parts. It is celebrated in Scotland on the first day of May usually by kindling fires on the hills and eminences. In early times it was compulsory on all to have their domestic fires extinguished before the Beltane fires were lighted, and it was customary to rekindle the former from the embers of the latter. This custom no doubt derived its origin from the worship of the sun.

Belton, Bell co., Tex., 55 mi. n.e. of Austin, the seat of the Chamberlain institute; two banks, and a Masonic temple. Pop. 4,300.

Beiuga (be-lö'ga), a kind of whale or dolphin, the white whale or white fish, found in the northern seas of both hemispheres. It is from 12 to 18 feet in length, and is pursued for its oil (classed as "porpoise oil") and skin. In swimming the animal bends its tail under its body like a lobster, and thrusts itself along with the rapidity of an arrow. A variety of sturgeon found in the Caspian and Black Seas is also called beluga.

**Beizo'ni,** GIOVANNI BATTISTA (1778-1823) (John Baptist), an enterprising traveler, was b. at Padua. In 1803 he emigrated to Eng-

,

land. In 1815 he visited Egypt, where he made a hydraulic machine for Mehemet Ali. He then devoted himself to the exploration of the antiquities of the country. He succeeded in transporting the bust of Memnon (Rameses II) from Thebes to Alexandria, from whence it came to the British Museum; explored the great temple of Rameses II at Abu-Simbel; opened the tomb of Seti I, from which he obtained the splendid alabaster sarcophagus bought by Sir John Soane for \$10,000, and he also succeeded in opening the second of the pyramids of Ghizeh.

**Bembecidæ** (-bes'i-dē), a family of wasp-like insects with stings, mostly natives of warm countries, and known also as sand-wasps. The female excavates cells in the sand, in which she deposits, together with her eggs, various larvæ or perfect insects stung into insensibility, so as to furnish support for her progeny when hatched. They are very active, fond of the nectar of flowers, and delight in sunshine. Bembex is the typical genus of this family.

**Ben**, oil of, the expressed oil of the bennut, the seed of the ben or horse-radish tree of India. The oil is inodorous, does not become rancid for many years, and is used by perfumers and watchmakers.

**Benares** (be-nä'rez), a town in Hindustan, Northwest Provinces, administrative headquarters of a district and division of the same name, on the left bank of the Ganges, from which it rises like an amphitheater, presenting a panorama of temples, mosques, palaces, and other buildings. It is the headquarters of the Hindu religion. Benares carries on a large trade in the produce of the district and manufactures silks, shawls, embroidered cloth, jewelry, etc. The population, including the neighboring cantonments at Sikraul (Secrole), 229,467. The district has an area of 1,009 sq. mi., and a pop. of 921,943.

Bencoo'len, a seaport of Sumatra, on the s. w. coast. The English settled here in 1685, and retained the place and its connected territory till 1825, when they were ceded to the Dutch in exchange for the settlements on the Malay Peninsula: since then Bencoolen has greatly declined. Pop. 15,000. Bender', a town and fortress of Russia, in

**Bender'**, a town and fortress of Russia, in Bessarabia, on the Dniester. Its commerce is important, and it carries on some branches of manufacture. Pop. 24,625.

**Ben'edict**, the name of fourteen popes from 574 to 1758.

Benedict, SIR JULIUS (1804–1885), pianist and composer, b. at Stuttgart, d. at London. He took up his residence in England in 1835, and was knighted in 1871. Principal works: the operas of *The Gypsy's Warning*, *Undine*, St. Cecilia, Lily of Killarney, and *Graziella*.

Benedic'tine, a liquor prepared by the Benedictine monks of the abbey of Fécamp, in Normandy, France, consisting of spirit (fine brandy) containing an infusion of the juices of plants, and said to possess digestive, antispasmodic, and other virtues, and to have

prophylactic efficacy in epidemics. Made in

the same way since 1510. **Benefit of Clergy** was a privilege by which formerly in England, the clergy accused of capital offenses were exempted from the jurisdiction of the lay tribunals, and left to be dealt with by their bishop. Though originally it was intended to apply only to the clergy or clerks, latterly every one who could read was considered to be a clerk, and the result of pleading "his clergy " was tantamount to acquittal. A layman could only receive the benefit of clergy once, however, but he was not allowed to go without being branded on the thumb, a punishment which latterly might be commuted to whipping, imprisonment, or transportation. Abolished in 1827.

Beneven' to, a city of Southern Italy, the see of an archbishop, in a prov. of same name, on a hill between the rivers Sabato and Calore, occupying the site of the ancient Beneventum, and largely built of its ruins. Few cities have so many remains of antiquity, the most perfect being a magnificent triumphal arch of Trajan, built in 114. The cathedral is a building of the twelfth century in the Lombard-Saracenic style. Pop. 22,699. The prov. has an area of 680 sq. mi., and a pop. of 238,425. Bengai (ben-gal'), a presidency of British India, which includes the whole of British India except what is under the governors of

Madras and Bombay; area 151,543 sq. mi.; pop. 71.346,987. The feudatory states connected with it have an aggregate area of 36,634 sq. mi., and a pop. of 2,845,405.

As a whole Bengal consists of plains, there being few remarkable elevations, though it is surrounded with lofty mountains. It is intersected in all directions by rivers, mostly tributaries of its two great rivers, the Ganges and Brahmaputra, which annually, in June and July, inundate a large part of the region. The country is subject to great extremes of heat, which, added to the humidity of its surface, renders it generally unhealthy to Europeans. The seasons are distinguished by the terms hot (March to June), rainy (June to October), and cold (the remainder of the year). The most unhealthy period is the latter part of the rainy season. The mean temperature of the whole year varies between  $80^\circ$  F. in Orissa and  $74^\circ$  F. in Assam, that of Calcutta being 79°. In the hill station of Darjeeling the mean is about 54°, occasionally falling as low as 24° in the winter. The heaviest rainfall occurs in Eastern Bengal, the annual average amounting to over 100 in., an amount greatly exceeded in certain localities. Besides rice and other grains, which form along with fruits the principal food of the population, there may be noted among the agricultural products indigo, opium, cane-sugar, tobacco, betel, cotton, and jute and sunn plants. Tea is now extensively grown in some places, notably in Darjeeling district and Chittagong. Cinchona is cultivated in Darjeeling and Sik-The forests cover 12,000 sq. mi., the kim. principal forest trees being the sal on the Himalaya slopes, sál and teak in Orissa. Wild

animals are most numerous in the Sundarbans and Orissa, snakes being remarkably abun-dant in the latter district. The principal minerals are coal, iron, and salt. Coal is worked at Raniganj, in Bardwan district, where the seams are about 8 ft. in thickness, and iron in the district of Bírbhúm, in the same division. Salt is obtained from the maritime districts of Orissa. The principal manufactures are cotton piece-goods of various descriptions, jute fabrics. blanketing, and silks. Muslins of the most Muslins of the most beautiful and delicate texture were formerly made at Dacca, but the manufacture is almost extinct. Sericulture is carried on more largely in Bengal than in any other part of India, and silk weaving is a leading industry in many of the districts. The commerce, both internal and external, is very large. The chief exports are opium, jute, indigo, oil-seeds, tea, hides and skins, and rice; the chief import is cot-ton piece-goods. The foreign trade is chiefly with Britain, China, the Straits Settlements, France, the U. S., and Ceylon. Internal communication is rendered easy by a very complete railway and canal system, while the boat trade on the rivers is, for magnitude and vari-ety, quite unique in India. The people of Bengal are mainly of Hindu race except in the valleys of Chittagong, where they are chiefly Bur-mese. Over 20,000,000 are Mohammedans in religion, more than double this profess Hindu-ism. The dialects spoken are Bengálí in Bengal proper, Hindí in Patna division, and Uríya in Orissa. The first rudiments of education are usually given in the primary schools that have been developed out of the native schools, and are now connected with government. There are also a number of secondary and superior schools established by government, including eight government colleges. The highest educational institution is the Calcutta university, the chief function of which is to examine and confer degrees. The population of Bengal beyond the capital, Calcutta, and its suburbs, is largely rural. There are alto-gether 33 towns with upward of 20,000 inhabitants, and 200 with over 5,000, but many of these towns are mere collections of rural hamlets in which all the operations of husbandry are carried on.

The first of the East India Company's settlements in Bengal were made early in the seven-teenth century. The rise of Calcutta dates from the end of the same century. The greater part of Bengal came into the hands of the East India Company in consequence of Clive's victory at Plassy in 1757, and was formally ceded to the Company by the nabob of Bengal in 1765. Chittagong had previously been ceded by the same prince, but its government under British administration was not organized till 1824. Orissa came into British hands in 1803. In 1858 the country passed to the crown, and since then the history of Bengal has been, on the whole, one of steady and peaceful progress.

Bengal, Bay of, that portion of the Indian Ocean which lies between Hindustan and Farther India, or Burmah, Siam, and Malacca,

and may be regarded as extending south to Ceylon and Sumatra. It receives the Ganges, Brahmaputra, and Irrawaddy. Calcutta, Rangoon, and Madras are the most important towns on or near its coasts.

**Benga'li**, one of the vernacular languages of India, spoken by about 50,000,000 people in Bengal, akin to Sanskrit and written in characters that are evidently modified from the Devanågari (Sanskrit). Its use as a literary language began in the fourteenth century with poetry. Large numbers of Bengali books are now published, as also newspapers. A large number of words are borrowed from Sanskrit literature.

**Benguela** (ben-gā'là), a district belonging to the Portuguese on the w. coast of South Africa; area, perhaps 150,000 sq. mi. Copper, silver, iron, salt, sulphur, petroleum, and other minerals are found. Pop. est. at 2,000,000. The capital, also called Benguela (or San Felipe de Benguela), is situated on the coast, on a bay of the Atlantic, in a charming but very unhealthy valley. It was founded by the Portuguese in 1617, and was formerly an important center of the slave-trade, but has now only a spasmodic trade in ivory, wax, gum copal, etc. Pop. about 3,000.

**Beni** (bā'nē), a river, South America, state of Bolivia. It rises in the eastern slopes of the Andes, and after a course of 900 mi. joins the Mamore to form the Madeira, which flows into the Amazon near Serpa.

Benin', a negro kingdom of West Africa, on the Bight of Benin, extending along the coast on both sides of the Benin River, w. of the lower Niger, and to some distance inland. The chief town is Benin (pop. 15,000), situated on the river Benin, one of the mouths of the Niger. The country, which gradually rises as it recedes from the coast, is well wooded and watered, and rich in vegetable productions. Cotton is indigenous, and woven into cloth by the women, and sugar-cane, rice, yams, etc., are grown. The religion is Fetichism, and human sacrifices are numerous. There is considerable trade in palm-oil. In consequence of a massacre of a British mission, the king was deposed, and the country annexed by the British in 1897.

Benjamin, JUDAN P. (1811-1884), "the brains of the Confederacy," b. at St. Croix, W. I., d. at Paris; studied law in New Orleans; elected U. S. senator for Louisana 1857, and became a member of the cabinet under Jefferson Davis (1861); in 1865 escaped to England; soon became famous as a lawyer there.

**Benlo'mond,** a mountain of Scotland in Stirlingshire, rising to a height of 3, 192 feet and giving a magnificent prospect of the vale of Stirling, the Lothians, the Clyde, Ayrshire, Isle of Man, hills of Antrim, etc.

**Ben-Mac-Duhi** (or Ben-Muich-Dhui) (-mikdö'i), the second highest mountain in Scotland, situated in the southwest of Aberdeenshire, on the borders of Banffshire, forming one of a cluster of lofty mountains, among which are Brae-riach, Cairntoul, and Cairngorm. Height, 4,290 feet, **Benne** (ben'e) **oil**, a valuable oil expressed from the seeds of *Besamum orientale* and *S. indicum*, much cultivated in India and Egypt, etc., and used for similar purposes with olive oil. Also called *sesamum oil* and *gingelly oil*.

Bennett, JAMES GORDON (1795-1872), American journalist, originator and editor of the New York Herald, was by birth a Scotchman. Destined for the priesthood in the Roman Catholic church, he was educated in a seminary at Aberdeen. But it became evident that he was naturally unfit for the priestly calling. The reading of Franklin's Autobiography led him to emigrate to America in the spring of 1819. Landing at Halifax, he earned a poor living there for a short time by giving lessons in French, Spanish, and bookkeeping; he passed next to Boston, where starvation almost threatened him till he got employment in a printing office; and in 1822 he went to New York. An engagement as a translator of Spanish for a newspaper took him for a few months to Charleston, S. C. On his return to New York he projected a school, and did subordinate work for the journals. In 1825 he made his first attempt to establish a journal of his own, and the next ten years were occupied in a variety of similar attempts, which proved futile. During that period, however, he became Washington correspondent of the Inquirer; and his letters, written in imitation of the letters of Horace Walpole, attracted attention. Notwithstanding all his hard work and his resolutely abstemious life, he was still a poor man. In 1835 appeared the first number of a small one-cent paper, bearing the title of New York Herald, and issuing from a cellar, in which the proprietor and editor played also the part of salesman. By his immense industry and practical sagacity, variety of news, spicy correspondence, supply of personal gossip and scandal, the paper became a great commercial success. Bennett continued to edit the *Herald* till his death. The successful mission of Stanley to Central Africa in search of Dr. Livingstone, of whom nothing had long been heard, was undertaken by his desire and at his expense; and he thus showed in the last year of his life the inextinguishable spirit of enterprise which had animated him throughout his whole career.

Bennett, JAMES GORDON, JR.. son of the above, b. 1841; proprietor N. Y. *Herald*; at his father's death projected Stanley's expedition to Africa in search of Livingstone and the Jeanette polar expedition; associated with Mackay in Commercial Cable.

**Bennett**, WILLIAM STERNDALE (1816-1875), an English composer, b. at Sheffield, where his father was organist; became pupil of the Royal Academy in 1826, studying under Ciprani Potter, Crotch, and Lucas, and afterward Moscheles. He studied in Leipsic from 1836 to 1838. He was appointed professor of music at Cambridge in 1856, and was knighted in 1871.

**Ben-Ne'vis**, the most lofty mountain in Great Britain, in Inverness-shire. It rises to the height of 4,406 ft., and in clear weather yields a most extensive prospect. An observa-

tory was established on its summit in May, 1881, by the Scottish Meteorological Society.

Ben' nington, a town in Vermont where, on Aug. 16, 1777, General Stark at the head of 1,600 American militia was victorious over the British. Pop. 6.391.

**Benson**, EDWARD WHITE (1820–1896), archbishop of Canterbury, was b. in Birmingham, England, and took the highest classical honors at Cambridge in 1852. He was ordained priest in 1857, became headmaster of Wellington college in 1858, and was consecrated bishop of Truro, 1877. In December, 1882, he was consecrated archbishop. His son gained some fame as a society novelist.

**Bentham** (ben'tham), GEORGE (1800-1884), English botanist, nephew of Jeremy Bentham. He early attached himself to botany, and having resided in Southern France (where his father had an estate) in 1814-26 he published in French (1820) a work on the *Plants of the Pyrenees and Lower Languedoc.* Along with Sir J. D. Hooker he produced the great work of descriptive botany, *Genera Plantarum*; another great work of his was the *Flora Australiensis.* 

**Ben'tham, JEREMY** (1748-1832), the real founder of the Utilitarian school of philosophy, and an eminent writer on jurisprudence and legislation, was b. at London. He was educated at Westminster school, and Queen's college, Oxford, where he graduated at the age of sixteen. He studied at Lincoln's Inn for the bar at the request of his father. When a boy, he had been nicknamed the "philosopher," from his tendency to speculation, and he now devoted himself to the criticism of ethics and legislation. His first work, A Fragment of Government, which was an ingenious criticism of Blackstone's Commentaries, was published in 1776, and brought him into notice. It was followed by his Principles of Morals and Legislation in 1780; his Defense of Usury, in 1787; his Introduction to the Principles of Morals and Legislation in 1802: A Treatise on Judicial Evidence in 1813; and The Book of Fallacies in 1824.

Benton, THOMAS HART (1782-1858), American statesman, b. Hillsborough, N. C. His father, Col. Jesse Beuton, was a lawyer of North Carolina, and private secretary to Governor Tryon. He was partly educated at the university of North Carolina, but removed to Tennessee. Thomas studied law with St. George Tucker, was admitted to the bar of Nashville in 1811. In 1810 he entered the U. S. army, and was Jackson's aide-de-camp. Subsequently he had a quarrel with Andrew Jackson, which resulted in a personal combat with knives and pistols, and a long and bitter feud. He also raised a regiment of which he was appointed colonel, and when this was disbanded in 1813, he was made lieutenant-colonel by President Madison. In 1815 he moved to St. Louis, where he practised law and founded *The Missouri Inquirer*, a journal of strong proslavery proclivities. He advocated the ad-

it was included in the Union in 1820, he was chosen to the U.S. Senate, where he served for thirty years. He caused the adoption of a bill throwing the mineral and saline lands of Missouri open for occupancy; was an advocate of a railroad to the Pacific; favored the opening of trade with New Mexico; encouraged the establishment of military stations in Missouri: gave attention to post-roads, and, during the political agitation caused by President Jackson's determination to overthrow the U.S. Bank and to place the currency on a me-tallic basis, he advocated that measure, and received the name of "Old Bullion." He took an active part in the discussions in regard to the Oregon boundary, the annexation of Texas. and during the Mexican War he was useful to the government. He opposed Henry Clay's compromise measures in 1850, and his strug-gle against J. C. Calhoun's resolutions cost him his seat in the Senate. In 1852 he was elected to the House of Representatives, where he opposed the policy of President Pierce, and the Kansas-Nebraska bill, and in 1854 was defeated for Congress by a coalition of his former political opponents. He then retired from public life, and devoted himself to completing his Thirty Years' View, or a History of the Working of the American Government from 1820 to 1850. Gen. John C. Fremont married his daughter, Jessie.

**Ben'zine**, a liquid hydrocarbon obtained from coal-tar and petroleum. It may also be got by distilling 1 part of crystallized benzoic acid intimately mixed with 3 parts of slaked lime. It is quite colorless, of a peculiar, ethereal, agreeable odor, is used by manufacturers of india-rubber and gutta-percha, on account of its great solvent powers, in the preparation of varnishes, and for cleaning gloves, removing grease-spots from woolen and other cloths, etc., on account of its dissolving fats and resins. It is highly inflammable.

It is highly inflammable. Benzo'ic Acid, a vegetable acid obtained from benzoin and other resins and balsams, as those of Peru and Tolu. It forms light feathery needles; taste pungent and bitterish; odor slightly aromatic.

**Benzoic Ether**, a colorless, oily liquid, with a feeble aromatic smell and a pungent aromatic taste, obtained by distilling together 4 parts alcohol, 2 of crystallized benzoic acid, and 1 of concentrated hydrochloric acid.

**Ben'zoin**, a solid, brittle, vegetable substance, the concrete resinous juice flowing from incisions in the stem or branches of the *Styrax Benzoin*, a tree 70 or 80 feet high, nat. order Styracaceæ. In commerce several varieties are distinguished, of which the yellow, the Siam, the amygdaloidal—the last containing whitish tears of an almond shape—and Sumatra firsts are the finest. It is imported from Siam, Singapore, Bombay, and occasionally from Calcutta; it is found also in South America. The pure benzoin consists of two principal substances; viz., a resin, and an acid termed *benzoic*. It has little taste, but its smell is fragrant when rubbed or heated, and it is used as incense in the Greek and Roman Catholic

churches. It is insoluble in water, but soluble in alcohol, in which form it is used as a cosmetic and in pharmacy. Benzoin may be produced by the contact of alkalies with the commercial oil of bitter almonds. It is also known as benjamin, or gum benjamin.

Be owulf, an Anglo-Saxon epic poem, the only existing MS. of which belongs to the eighth or ninth century and is in the Cottonian Library (British Museum). It recounts the adventures of the hero Beowulf, especially his delivery of the Danish kingdom from the monster Grendel and his equally formidable mother, and, lastly, the slaughter by Beowulf of a fiery dragon, and his death from wounds received in the conflict. The character of the hero is attractive through its noble simplicity and disregard of self. The poem, the longest and most im portant in Anglo-Saxon literature, is in many points obscure, and the MS. imperfect.

**Béranger** (bā-rän-zhā), PIERRE JEAN DE (1780-1857), a famous French lyric poet. He applied in 1804 to Lucien Bonaparte for assistance, and succeeded in obtaining from him first, a pension of 1,000 francs, and five years later a university clerkship. Many of his songs became extremely popular, and in 1815 the first collection of them was published. A third collection appeared in 1825, and in 1828 a fourth, which subjected him to a state prosecution, an imprisonment of nine months, and a fine of 10,000 francs. In 1833 he published his fifth and last collections, thereafter remaining silent till his death. He died at Paris.

**Berar'**, otherwise known as the Hyderabad Assigned Districts, a province of India, in the Deccan, under the British resident at Hyderabad; area 17,717 sq. mi. The principal town is Ellichpore. Coal and iron ore are both found in the province, the pop. of which is 2,897,491.

in the province, the pop. of which is 2,897,491. **Berber**, a town of Egypt on the right bank of the Nile, about 20 miles below the confluence of the Atbara, a station for merchants on the route from Sennaar and Khartoum to Cairo, and also from Suakim. Pop. 8,000.

Ber bers, a people spread over nearly the whole of Northern Africa, from whom the name Barbary is derived. The chief branches into which the Berbers are divided are: first, the Amazirgh (or Amazigh), of Northern Morocco numbering from 2,000,000 t o 2,500,000. They are for

the most part quite independent of the Sultan of Morocco, and live partly under chief-

tains and hereditary princes and partly in small republican communities. Second, the Shuluh (Shillooh, or Shellakah), who number about 1,450,000 and inhabit the south of Morocco. They are more highly civilized than the Amazirgh. Third, the Kabyles in Algeria and Tunis, who are said to number 960,000 souls; and fourth, the Berbers of the Sahara, who inhabit the oases. The Berbers generally are about the middle height; their complexion is brown, and sometimes almost black, with brown and glossy hair. They are sparely built but robust and graceful; the features approach the European type. Their language has affinities to the Semitic group, but Arabic is spoken along the coast.

**Berbice** (ber-bes'), a district of British Guiana watered by the river Berbice. Area 750 sq. mi.; pop. 51,176. It contains the town of Berbice (or New Amsterdam), which has three churches and several public buildings. Pop. 8,903.

Berdiansk', a seaport of Southern Russia, gov. of Taurida, on the north shore of the Sea of Azof, with an important export and inland trade. Pop. 20,000.

Ber' ditchef, a city of European Russia, gov. of Kiev, with broad streets, well-built houses, numerous industrial establishments, and a very large trade, having largely attended fairs. Pop. 98,824, chiefly Jews.

**Berenice** (ber-e-nī'sē), the name of several distinguished women of antiquity; in particular the wife of Ptolemy Euergētes, king of Egypt. When her husband went to war in Syria she made a vow to devote her beautiful hair to the gods if he returned safe. She accordingly hung it in the temple of Venus, from which it disappeared, and was said to have been transferred to the skies as the constellation *Coma Berenices.* Also the wife of Mithridates the Great, king of Pontus, put to death by her husband (about 71 B. C.), lest she should fall into the hands of Lucullus.

Beresford, WILLIAM CHARLES DE LA POER, b. in Ireland, 1846. He entered the British navy and distinguished himself at the bombardment of Alexandria, 1882, and in the Khartoum expedition in 1885. He is a member of Parliament, and served a term at the Admiralty Board, but resigned in 1889 to accept a naval command.

**Berez'ina**, a tributary of the Dnieper, in the Russian province of Minsk, rendered famous by the disastrous passage of the French army under Napoleon during the retreat from Moscow, Nov. 27-20, 1812.

Ber' gama (ancient Pergamos), town, Turkey in Asia, n. of Smyrna: contains fine ruins of a Roman palace, etc. Pop. 16,070.

Ber'gamo, a town of North Italy, capital of the province of Bergamo (1,098 sq. mi, 419,599 inhabitants), consists of two parts, the old town situated on hills and having quite an ancient appearance, and the new town almost detached and on the plain. It trades largely in silk, silk goods, corn, etc., has the largest annual fair in North Italy, and extensive manufactures. Pop. 39, 129,

Ber'gamot, a fruit-tree, a variety or species of the genus Cürus, variously classed with the orange, the lime, or made a distinct species. It is probably of Eastern origin though now grown in Southern Europe, and bears a paleyellow pear-shaped fruit with a fragrant and slightly acid pulp. Its essential oil is in high esteem as a perfume. Bergamot is also a name given to a number of different pears.

Bergen (ber'gen), a seaport on the w. coast of Norway. The trade is large; timber, tar, train oil, cod-liver oil, hides, and particularly dried fish (stock-fish) being exported in return for corn, wine, brandy, coffee, cotton, woolens, and sugar. In 1445 a factory was established here by the Hanseatic cities of Germany. Pop. 53,684.

Bergen-op-zoom (ber'gen-op-zōm), a town, Holland, in a marshy situation on the Scheldt, 20 mi. n.n.w. of Antwerp. It was formerly of great strength, both from the morasses surrounding it and from its fortifications, and successfully resisted the attacks of the Duke of Parma in 1581 and 1588, and of Spinola in 1622, but was taken by the French in 1747 and 1794, and unsuccessfully attempted by the British in 1814. Pop. 12,478.

**Bergerac** (bārzh-rāk), town, France, department of the Dordogne. It has iron works, manufactures paper, hosiery, earthenware, liquors, etc., and gives its name to the wine of the Dordogne district, sometimes termed in France *petit champagne*. Pop. 14,735.

France petit champagne. Pop. 14,735. Bergh, HENRY (1823-1888), founder of the American Society for the Prevention of Cru-elty to Animals. After studying at Columbia college, he went to Europe, where he spent twelve years, and in 1862 was appointed secretary of the American legation in St. Petersburg. This position he resigned. In 1864 he returned to this country, and resolved to devote his time to the protection of animals. The first American society of the class was incorporated, with Mr. Bergh as its president, 1866. In the face of ridicule and opposition, Mr. Bergh created a reform recognized as one of the beneficent movements of the age. In 1886 thirty-nine states of the Union, Brazil, and the Argentine Republic had adopted the original laws procured for him by the legisla-ture of New York. Mr. Bergh received no salary for his services. He invented artificial pigeons for the sportsman's gun, and procured an ambulance for removing injured animals from the street. In 1874 he rescued a little girl from brutal treatment, which led to the founding of a Society for the Prevention of Cruelty to Children.

**Bergman** (ber $\hbar$ 'mån), TORBERN OLOF (1735-1784), a Swedish physicist and chemist. He studied under Linnæus at Upsala; in 1758 became Doctor of Philosophy and professor of physics there; and in 1767 became professor of chemistry. He succeeded in the preparation of artificial mineral waters, discovered the sulphureted hydrogen gas of mineral springs, and published a classification of minerals on the basis of their chemical character and crystalline forms. His theory of chemical affinities greatly influenced the subsequent development of chemistry.

Berhampur, the name of two Indian towns: 1, A town and military station in the n. e. portion of Madras presidency, the headquarters of Ganjám district, with a trade in sugar and manufactures of silk. Pop. 25,653. 2, A municipal town and the administrative headquarters of Murshidábád district, Bengal; formerly a military station, and having still larger barracks. It was the scene of the first overt act of mutiny in 1857. Pop. 22,515.

Ber'iberi, a disease endemic in parts of India, Ceylon, etc., characterized by paralysis, numbness, difficult breathing, and often other symptoms, attacking strangers, especially sailors, as well as natives, and generally fatal. Berkeley, Alameda co., Cal., a flourishing

Berkeley, Alameda co., Cal., a flourishing town, seat of State university and Agricultural college; also state institution for deaf, dumb, and blind. Pop. 1890, 5,101.

and blind. Pop. 1890, 5, 101. Berkeley (berk'li), DR. GEORGE (1685-1753), Bishop of Cloyne in Ireland, celebrated for his ideal theory. Became fellow of Trinity col-lege, Dublin, in 1707; went to England in 1713; traveled on the continent in 1714, and again in 1716-20. In 1721 he was appointed chaplain to the lord-lieutenant of Ireland, the Duke of Grafton. In 1724 he became dean of Derry. He now published his proposals for the conversion of the American savages to Christianity by the establishment of a college in the Bermuda Islands; and subscriptions having been raised, he set sail for Rhode Island in 1728, proposing to wait there till a promised grant of \$100,000 had been got from the government. Berkeley's philosophy maintains that the belief in the existence of an exterior material world is false and inconsistent with itself; that those things which are called sensible material objects are not external but exist in the mind and are merely impressions made on our minds by the immediate act of God, according to certain rules termed laws of nature, from which he never deviates; and that the steady adherence of the Supreme Spirit to these rules is what constitutes the reality of things to his creatures, and so effectually distinguishes the ideas perceived by sense from such as are the work of the mind itself or of dreams, that there is no more danger of confounding them together on this hypothesis than on that of the existence of matter. He is well-known for his verses wherein occurs the expression, "westward the course of empire takes its way."

Berkeley, SIR WILLIAM, colonial governor of Virginia. He was sent as governor to Virginia in 1641. When Cromwell attained to the control of the British government, Governor Berkeley offered an asylum in Virginia to loyalist gentlemen. He was compelled to resign. On the death of Samuel Mathews, the governor who had succeded him, Berkeley was temporarily elected governor, and received his commission from Charles II, after the restoration. Several harsh measures adopted by him caused considerable dissatisfaction among the colonists, particularly his faithlessness and obstinacy in dealing with Indians. In 1665 the king demanded his return; nevertheless Berkeley continued his authority in Virginia for eleven years longer. In 1675 he was prematurely recalled to England.

Berk' hamstead, Great, a town in England, Hertfordshire, with manufactures of strawplait and wooden ware. Birthplace of the poet Cowper, Pop. 5,034.

Berkshire (or Berks), a county of England, area 752 sq. mi. Few manufactures are carried on, the principal being agricultural implements and artificial manures, flour, paper, sacking and sail-cloth, and biscuits (at Reading). Malt is made in great quantities. The minerals are unimportant. Pop. 238,496.

Berlin', the largest town in Germany; capital of the Prussian dominions and of the German empire, in the province of Brandenburg, on a sandy plain on both sides of the Spree, here about 200 feet broad. The original portion of the city lies on the right bank of the river, and is irregularly built. The more modern portion is regular in its plan, and the streets are lined with lofty and well-built edifices mostly of white freestone, or brick covered with a coating of plaster or cement. Of the numerous bridges, the finest is the Castle (Schloss) Bridge, 104 feet wide, and having eight piers sur-mounted by colossal groups of sculpture in marble. The principal and most frequented street, Unter den Linden ("under the lime-trees") is about two thirds of a mile in learnth trees"), is about two thirds of a mile in length and 160 feet wide, the center being occupied by a double avenue of lime-trees. At the e. end of this street, and round the Lustgarten (a square with which it is connected by the Schloss Bridge) are clustered the principal public buildings of the city, such as the royal palace, the palace of the crown prince, the arsenal, the university, the museums, royal academy, etc.; while at the w. end is the Brandenburg Gate, regarded as one of the finest portals in existence. Immediately beyond this gate is the Thiergarten (zoological garden), an extensive and well-wooded park containing the palace of Bellevue and places of public amusement. There are also several other public parks. The principal public buildings are the royal palace or Schloss, a vast rectangular pile; the museum (opposite the Schloss), a fine Grecian building, with an extensive collection of sculpture and painting; the royal theater is also a fine Grecian edifice. The royal library and palace of the emperor are united; the former contains above 900.000 volumes and 15,500 manuscripts and charts. The arsenal, besides arms and artillery, contains flags and other trophies of great antiquity. The university, the exchange, the Italian opera house, the principal Jewish synagogue, the townhall, and the old architectural academy are all beautiful structures. The town contains altogether about twentyfive theaters, thirty hospitals, sixteen barracks, ten or twelve cemeteries, etc. The prevailing style of the newer buildings, both public and private, is Grecian, pure or Italianized. One of the most remarkable of modern monuments is that erected in 1851 to Frederick the Great

in the Unter den Linden - the chef d'œuvre of Rauch and his pupils. The literary institutions of the city are numerous and excellent they include the university, having an educational staff of nearly 260 professors and teachers, and attended by over 4,000 students, exclusive of 1,200 to 1,400 who do not matriculate; the academy of sciences; the academy of fine arts, and the technical high school or academy of architecture and industry (occupying a large new building in the suburb of Charlottenburg). The manufactures are various and extensive. including steam engines and other machinery, brass founding, and various articles of metal, sewing machines, paper, cigars, pottery and porcelain, pianos and harmoniums, artificial flowers, etc. In the royal iron foundry, busts, statues, bas-reliefs, etc., are cast, together with a great variety of ornaments of unrivaled delicacy of workmanship. The oldest parts of the city were originally poor villages, and first rose to some importance under Markgraf Albert (1206-20), yet about two centuries ago Berlin was still a place of little consequence, the first important improvement being made by the great Elector Frederick William, who planted the Unter den Linden, and in whose time it already numbered 20,000 inhabitants. Under his successors, Frederick I and Frederick the Great, the city was rapidly enlarged and improved, the population increasing fivefold in the hundred years preceding the death of Frederick the Great and tenfold in the century succeeding it. Pop. 1,578,794.

Treaty of Berlin, the treaty signed July 13, 1878, at the close of the Berlin Congress, which was constituted by the representatives of the six great powers and Turkey. The treaty of San Stefano previously concluded between Turkey and Russia was modified by the Berlin treaty, which resulted in the division of Bulgaria into two parts, Bulgaria proper and Eastern Roumelia, the cession of parts of Armenia to Russia and Persia, the independence of Roumania, Servia, and Montenegro, the transference of Bosnia and Herzegovina to Austrian administration, and the retrocession of Bessarabea to Russia. Greece was also to have an accession of territory. By a separate arrangement previously made between Britain and Turkey the former got Cyprus to administer.

Berlin, Green Lake co., Wis., on Fox River, 97 mi. n. w. of Milwaukee. Railroad: C. M. & St. P. Industries: shoe co., one feed mill, two iron foundries, two wagon factories, and others. First settled in 1848 by Nathan Strong, and called "Strong's Landing." Became a city in 1857. Pop. est. 1897, 4,400.

Berlin', a town of Canada, prov. Ontario, about 60 mi. w. s. w. of Toronto, with some manufactures. Pop. 7,425. Berlin Spirit, a coarse spirit distilled from

potatoes, beets, etc.

Berlioz (ber-li-os), HECTOR (1803-1869), a French composer, the leader of the Romantic school of music in his native country. He forsook medicine to study music at the Paris Conservatoire, where he gained the first prize in 1830 with his cantata Sardanapale. As critic of the Journal des Debats and feuilletonist he displayed scarcely less originality than in his music. His musical works belong to the Romantic school, and are specially noteworthy for the resource they display in orchestral coloring.

Ber' mondsey, a parish near and part of London, England, on the Surrey side of the Thames, between Southwark and Rotherhithe. Large tan yards and wharfs. Pop. 64,682.

**Bermu'da Grass**, a grass cultivated in the West Indies, U. S., etc., a valuable fodder grass in warm climates.

**Bermu'das** (or Somers Islands), a cluster of small islands in the Atlantic Ocean belonging to Britain; area 20 sq. mi. They were first discovered by Juan Bermudez, a Spaniard, in 1522; in 1609 Sir George Somers, an Englishman, was wrecked here, and, after his shipwreck, formed the first settlement. The most considerable are St. George, Bermuda or Long Island (with the chief town Hamilton, the seat of the governor), Somerset, St. David's, and Ireland. They form an important British naval and military station. An immense iron floating dock, capable of receiving a vessel of 3,000 tons, was towed from London to the Bermudas in 1868. The climate is generally healthy and delightful, but they have been sometimes visited by yellow fever. Numbers of persons from the U. S. and Canada now pass the colder months of the year in these islands. Pop. 16,000.

Bern, a town in Switzerland, capital of the canton Bern, and, since 1848, of the whole Swiss Confederation. Among the public buildings are the great Gothic cathedral, built between 1421 and 1502; the church of the Holy Spirit; the federal-council buildings (or parliament house), commanding a splendid view of the Alps: the university, the town house, a Gothic edifice of the fifteenth century; the mint; etc. Bern has an academy and several literary societies, and an excellent public library. Manufactures: woolens, linens, silk stuffs, stockings, watches, clocks, toys, etc. Bern became a free city of the empire in 1218. In 1353 it entered the Swiss Confederacy. Pop. 47,620. The canton of Bern has an area of 2,657 sq. mi. Of the surface over 58 per cent. is under cultivation or pasture. Agriculture and cattle-rearing are the chief occupations; manufactures embrace linen, cotton, silk, iron, watches, glass, pottery, etc. Bienne and Thun

are the chief towns after Bern. Pop. 536,670. Bernadotte (ber-nå-dot) (1764-1844), JEAN BAFTISTE JULES, a French general, afterward raised to the Swedish throne, was the son of an advocate of Pau. He enlisted at seventeen, became sergeant major in 1789, and subaltern in 1790. In 1794 he was appointed a general of division, and distinguished himself greatly in the campaign in Germany, and on the Rhine. In 1798 he married Mademoiselle Clary, sister-in-law of Joseph Bonaparte. The following year he became for a short time minister of war, and on the establishment of the empire was raised to the dignity of marshal of France, and the title of Prince of Ponte-Corvo. On the death of the Prince of Holstein-Augustenburg the heir apparency to the Swedish crown was offered to the Prince of Ponte-Corvo, who accepted with the consent of the emperor, went to Sweden, abjured Catholicism, and took the title of Prince Charles John. In the maintenance of the interests of Sweden a serious rupture occurred between him and Bonaparte, followed by his accession in 1812 to the coalition of sovereigns against Napoleon. At the battle of Leipsic he contributed effectually to the victory of the At the close of the war strenuous allies. attempts were made by the Emperor of Austria and other sovereigns to restore the family of Gustavus IV to the crown; but Bernadotte. retaining his position as crown prince, became king of Sweden on the death of Charles XIII in 1818, under the title of Charles XIV. During his reign agriculture and commerce made great advances, and many important public works were completed. He was succeeded by his son Oscar.

Ber nard, GREAT ST., a celebrated Alpine pass in Switzerland, canton Valais, on the mountain road leading from Martigny in Switzerland to Aosta in Piedmont, and rising to a height of 8.150 ft. Almost on the very crest of the pass, near a small lake on which ice sometimes remains throughout the year, is the famous hospice, next to Etna observatory the highest inhabited spot in Europe. The hospice was founded in 962 by St. Bernard of Menthon, an Italian ecclesiastic, for the benefit of pilgrims to Rome. In May, 1800, Napoleon led an army of 30,000 men, with its artillery and cavalry, into Italy by this pass.

Bernard, LITTLE ST., a mountain, Italy, belonging to the Graian Alps, about 10 mi. s. of Mont Blanc. The pass across it, one of the easiest in the Alps, is supposed to be that which Hannibal used. Elevation of hospice, 7,192 ft.

Ber' nard, SAINT, of Clairvaux (1091-1153), one of the most influential ecclesiastics of the Middle Ages, b. at Fontaines, Burgundy. In 1113 he became a monk at Citeaux; in 1115 first abbot of Clairvaux, the great Cistercian monastery near Langres. In 1140 he secured the condemnation of Abelard for heresy. Seventy-two monasteries owed their foundation or enlargement to him; and he left no fewer than 440 epistles, 340 sermons, and 12 theological and moral treatises. He was canonized in 1174.

**Bernburg** (bern'burk), a town, Germany, duchy of Anhalt, on both sides of the Saale, divided into the old, the new, and the high town; the first two communicating by a bridge with the latter. It contains an oil mill, breweries, distilleries; and manufactures paper, earthenware, copper and tinwares, etc. Pop. 28,326.

Bernese Alps, the portion of the Alps which forms the northern side of the Rhone Valley, and extends from the Lake of Geneva to that of Brienz, comprising the Finsteraarhorn. Schreckhorn, Jungfrau, Monk, etc.

Bernhardt (ber-när), ROSINE SARA, a French actress, born at Paris 1844. Of Jewish descent, her father French. her mother Dutch, her

early life was spent largely in Amsterdam. In 1858 she entered the Paris Conservatoire and gained prizes for tragedy and comedy in 1861 and 1862; but her debut at the Théâtre Français in Iphigénie and Scribe's Valérie was not a success. After a brief retirement she reappeared at the Gymnase and the Porte Saint-Martin in burlesque, and in 1867 at the Odćon in higher drama. Her success in Hugo's Ruy Blas led to her being recalled to the Théatre Français, since which she has abundantly proved her dramatic genius. In 1879 she visited London, and again in 1880, about which time she severed connection with the Comédie Française under heavy penalty. In 1882 she married M. Damala, a Greek, from whom she was shortly afterward divorced. Her tours both in Europe and America have never failed to be successful.

**Bernina** (ber-nē'nā), a mountain in the Rhætian Alps, 13,000 ft. high, with the large Morteratsch Glacier. The Bernina Pass on the west of the mountain is 7,695 ft. in height.

Bernouilli (or Bernoulli) (ber-nö-yō), a family which produced eight distinguished men of science. The family fled from Antwerp during the Alva administration, going first to Frankfort, and afterwards to Bale. Of these JAMES, b. at Bâle 1654, became professor of mathematics there 1687, and d. 1705. He applied the differential calculus to difficult questions of geometry and mechanics; calculated the loxodromic and catenary curve, the logarithmetic spirals, the evolutes of several curved lines, and discovered the so-called numbers of Bernouilli. JOHN, b. at Bale 1667, wrote with his brother James a treatise on the differential calculus; developed the integral calculus, and discovered, independently of Leibnitz. the exponential calculus. In 1694 he became doctor of medicine at Båle, and in 1695 went, as professor of mathematics, to Groningen. After the death of his brother in 1705 he received the professorship of mathematics at Bâle, which he held until his death in 1748.

Bern'storff, the name of a German noble family, of whom the most distinguished was JOHANN HARTWIG ERNST (1712-1772), Count von-Bernstorff, Danish statesman under Frederick V. and Christian VII. He was the most influential member of the government, which distinguished itself under his direction by a wise neutrality during the Seven Years' War, etc., by measures for improving the condition of Danish peasantry; by promoting science, and sending to Asia the expedition which Neibuhr accompanied. By his efforts Denmark acquired Holstein.

**Berri** (or Berry), formerly a province and dukedom, with Bourges as capital, almost in the center of France. It is now mainly comprised in the departments Indre and Cher. It gave the title of Duke to a noted French soldier (1778-1820).

Berry, a succulent fruit, in which the seeds are immersed in a pulpy mass inclosed by a thin skin. The name is usually given to fruits in which the calyx is adherent to the ovary and the placentas are parietal, the seeds finally separating from the placenta and lying loose in the pulp. The term, however, is frequently used to include fruits in which the ovary is free and the placentas central, as the grape. Popularly it is applied to fruits like the strawberry, bearing external seeds on a pulpy receptacle, but not strictly berries.

**Bersaglieri** (ber-sål-yā'rē), a corps of Italian sharpshooters organized early in the reign of Victor Emmanuel by General Alessandro della Marmora. Two battalions took part in the Crimean War and distinguished themselves at the battle of Tchernaya (Aug. 16, 1855). They are the "show" soldiers of the Italian army, and at reviews execute all movements, like the Zouaves, at a sharp run.

Berthler (bert-yā), ALEXANDER (1753-1815), prince of Neuchätel and Wagram, marshal, vice-constable of France, etc. While yet young he served in America with Lafayette, and after some years' service in France he joined the army of Italy in 1795 as general of division and chief of the general staff, receiving in 1798 the chief command. In this capacity he entered Rome, abducted Pius VI, abolished the papal government, and established a consular one. He followed Bonaparte to Egypt as chief of the general staff; was appointed by him minister of war after the 18th Brumaire; accompanied him to Italy in 1800, and again in 1805, to be present at his coronation; and was appointed chief of the general staff of the grand army in Germany. After Napoleon's abdication he was taken into the favor and confidence of Louis XVIII.

**Berthollet** (ber-to-lä), CLAUDE LOUIS, Count (1748–1822), an eminent French chemist. His chief chemical discoveries were connected with the analysis of ammonia, the use of chlorine in bleaching, the artificial production of nitre, etc.

Berwick (ber'ik) (or more fully Berwick-on-Tweed), a seaport town of England, on the Scottish border. Chief industries: iron-founding, the manufacture of engines and boilers, agricultural implements, feeding-cake, manures, ropes, twine, etc.; there is a small shipping trade. In the beginning of the twelfth century, during the reign of Alexander I, Berwick was part of Scotland, and the capital of the district called Lothian. In 1216 the town and castle were stormed and taken by King John; Bruce retook them in 1318; but, after undergoing various sieges and vicissitudes. both were surrendered to Edward IV in 1482. and have ever since remained in possession of England. Pop. 13,929. The county of Berwick, the most eastern border county of Scotland, is divided into the three districts of Lauderdale (the valley of the Leader). Lammermoor, and the Merse, or March (the valley of the Tweed). Total area 464 sq. mi.; pop. 32,406. The minerals are unimportant, though freestone and marl are abundant. The county is in high repute for agriculture, but has few manufactures, the principal being paper. The county town is Greenlaw.

**Ber'yl**, a colorless, yellowish, bluish, or less brilliant green variety of emerald, the pre-

# Berzelius

vailing hue being green of various shades, but always pale, the want of color being due to absence of chromium, which gives to the em-

Beryl, in its primary form.

best beryls are found in Brazil, in Siberia, and Ceylon, and in Dauria, on the frontiers of China. Beryls are also found in many parts of the U.S. Some of the finer and transparent varieties of it are often called aquamarine.

structure

The

Berze' Hus, John James, Baron (1779-1848), Swedish chemist; studied medicine at Upsala, and was appointed lecturer in chemistry in the Stockholm military academy in 1806, and the following year professor of pharmacy and medicine. He discovered selenium and thorium, first exhibited calcium, barium, strontium, tantalum, siliciun, and zirconium in the elemental state, and investigated whole classes of compounds, as those of fluoric acid, the metals in the ores of platinum, tantalum, molybdenum, vanadium, sulphur salts, etc., and introduced a new nomenclature and classification of chemical compounds. His writings comprise an important Text-book of Chemistry.

Besançon (bé-sán-sõn), a town of Eastern France, capital of the dept. Doubs, surmounted by a strong citadel. It is further strengthened by a system of forts on neighbor-ing eminences. The manufactures comprise linen, cotton, woolen, and silk goods, ironmongery, etc.; but the principal industry is watchmaking, which employs about 13,000 persons. Besançon is the ancient Vesontio, Besontium, or Bisontium described by Caesar. In the fifth century it came into possession of the Burgundians; in the twelfth passed with Franche-Comté to the German empire. In 1679 it was ceded to France along with the rest of the Franche-Comté, of which it remained the capital till 1793, with a parliament, etc., of its own. Pop. 56,055.

Besant', ANNIE, English theosophist; is the divorced wife of the Rev. F. Besant, of Sibsey, Lincolnshire. She was for years the associate of Bradlaugh and then embraced theosophy and Madame Blavatsky.

Besant', WALTER, English novelist, b. 1838. He is best known by his novels, a number of which were written in partnership with the late Mr. James Rice, including Ready-Money, Mortiboy; This Son of Vulcan; The Case of Mr. Lucraft; The Golden Butterfly; The Monks of Thelema; etc. Since Mr. Rice's death (1882) he has written All Sorts and Conditions of Men; All in a Garden Fair; Dorothy Foster; The World Went very Well Then; etc.

# **Bessemer Steel**

Bessara 'bia, a Russian province between the Pruth and Danube and the Dniester. It was conquered by the Turks 1474, taken by the Russians 1770, ceded to them by peace of Bucharest in 1812; the s. e. extremity was given to Turkey in 1856, but restored to Russia by treaty of Berlin, 1878, in exchange for the Dobrudsha. It is fertile in grain, but is largely used for pasturage. Capital, Kishenef. Area 17,619 sq. mi.; pop., chiefly Wallachians, Gyp-sies, and Tartars, 1,723,450.

Bes'sel, FRIEDRICH WILHELM (1784-1846), a German astronomer appointed in 1810 director of the observatory at Königsberg. In 1840 he called attention to the probable existence of a planetary mass beyond Uranus, resulting in the discovery of Neptune.

Bessemer, Jefferson co., Ala., on Valley Creek, 13 miles s. w. of Birmingham. Rail-roads: Ala. Gt. Southern; L. & N.; Georgia Pacific; K. C. M. & B.; Southern; Bessemer & Birmingham; Birmingham, Powderly & Bessemer. Industries: two iron foundries, flour mill, coke ovens, etc. Surrounding country agricultural and mineral. It is the sixth city in taxable values, and the seventh in population, in Alabama. The town b in 1888. Pop. est. 1897, at 6,500. The town became a city

Bessemer, HENRY, an English engineer and inventor, was b. in Hertfordshire in 1813, and is chiefly known in connection with the celebrated process for making steel which bears his name— a process which has effected an entire revolution in the steel trade. This important invention is described in the following article. B. has distinguished himself by many other inventions and scientific improvements.\_ In 1875 considerable attention was attracted by what was known as the B.-saloon steamer, which was designed to counteract the unpleasant motion of the sea by means of a swinging cabin, to be kept in position by an ingenious arrangement of machinery. But after several experiments in the English Channel with a large steamer built for the purpose, the inven-tion has apparently failed. In 1871 B. was appointed president of the Iron and Steel Institute, and in 1879 received the honor of knighthood.

Bess'emer Steel is steel made direct from pig iron by a process patented in 1855, and subsequently, by Henry B. This process, as now worked. is briefly as follows: The pig iron is remelted in a cupola, and poured into a large vessel called & converter, lined with fire brick and capable of revolving upon horizontal trunnions. The converter is then turned up, and air at a high pressure is blown upward through the liquid metal. Most of the silicon is first burnt out, a dull flame appearing at the mouth of the converter; presently the carbon begins to burn (combining with the oxygen of the blast), and the flame increases to a dense, white, roaring blaze, accompanied by most violent ebullition. This continues until the decarburization is complete, when the flame suddenly contracts. The converter is then turned down, and a measured quantity (about 6 or 8 per cent.) of spiegeleisen (iron containing

## Betel

about 10 per cent. of manganese) is run into it. This is sufficient to add the required amount of carbon for the steel, and after the occur-

Bessemer Converting Vessel.

rence of a further short "flaming reaction," the liquid steel is run out into ladles, and thence into molds.

The use of *spicgeleisen* was patented by Robert Mushet in 1856, but the patent was subsequently allowed to lapse. It is, however, of the greatest importance in the B. process, not only for the reason mentioned, but also because the manganese combines with the oxygen left in the iron by the passage through it of such a large body of air, which would otherwise have a most deleterious effect on the quality of the steel produced.

In Sweden and Germany, where manganiferous ores are frequently used, the decarburizing of the liquid metal is generally stopped short at the required point, and the steel run off; the exact instant at which the point for turning down the converter is reached being determined by the spectroscope. This beautiful application of the principles of spectrum analysis is due to Sir Henry E. Roscoe. The remelting of the pig in a cupola is also frequently dispensed with abroad.

Bet'el (bet'le), a species of pepper, a creeping or climbing plant, native of the East Indies. The leaves are employed to enclose a piece of the areca or betel nut and a little lime into a pellet, which is extensively chewed in the East. The pellet is hot and acrid, but has aromatic and astringent properties. It tinges the saliva, gums, and lips a brick-red, and blackens the teeth,

Betel nut, the kernel of the fruit of a beautiful palm, found in India and the East, and named from being chewed along with betel leaf. When ripe it is of the size of a cherry, conical in shape, brown externally, and mottled internally like a nutmeg. Ceylon alone exports 70,000 cwt. annually.

Beth'any (now called El'Azariyeh or Lazarieh), a village of Palestine at the base of Mount Olivet, about two mi. e. of Jerusalem, formerly the home of Martha, Mary, and Lazarus, and the place near which the ascension of our Lord took place.

**Bethes' da** ("house of mercy"), a pool in Jerusalem near St. Stephen's Gate and the Temple of Omar. It is 400 ft. long, 130 broad, and 75 deep, and now known as Birket Israel. See John 5: 2-9.

Beth'lehem, the birthplace of Christ; a village, formerly a town in Palestine, a few miles south from Jerusalem. Pop. about 3,000, chiefly Christians, who make rosaries, crucifixes, etc., for pilgrims. There are three convents for Catholics, Greeks, and Armenians. A richly adorned grotto lighted with silver and crystal lamps, under the choir of the fine church built by Justinian, is shown at the actual spot where Jesus was born.

Bethlehem, a town of Pennsylvania founded by Moravians in 1741, on the Lehigh, across which is a bridge connecting it with South Bethlehem, the seat of Lehigh University. Pop. 6,762. The vast Bethlehem iron works here produce armor plate and guns for the American navy and coast defense service.

**Bel'tis** (or Bitlis), a town, Turkish Armenia, not far from Lake Van, one of the most ancient cities of Kurdistan. Pop. (Turks, Kurds, and Armenians) from 5,000 to 10,000.

**Beust** (boist), FRIEDRICH FERDINAND, Count von (1809–1886), Saxon and Austrian statesman. He adopted the career of diplomacy, and as a member of embassies or ambassador for Saxony resided at Berlin, Paris, Munich, and London.

Betel vine.

He lent his influence on the side of Austria against Prussia before the war of 1866, after which, finding his position in Saxony difficult, he entered the service of Austria as minister

of foreign affairs, became president of the ministry, imperial chancellor, and in 1868 was created count. In 1871-78 he was ambassador in London, in 1878-82 in Paris.

**Beuthen** (boi'tn), a town in Prussian Silesia near the s.e. frontier, in the government of Oppeln; the center of a mining district. Manufactures of cloth and linens. Pop. 22,811.

**Beveland** (bē've-lånt), North and South, two islands in the estuary of the Scheldt. Netherlands, province of Zealand; area of North Beveland, 18 sq. mi., pop. 6,000; area of South Beveland, 25 sq. mi., pop. 23,000; chief town, Goes, 5,000. It is very fertile, and has manufactures of salt, leather, beer, etc.

Bev'erley, town of England, East Riding of Yorkshire, 10 mi. n.n.w. of Hull, and 1 from the river Hull, with which it has canal connection: has a fine Gothic minster, completed in the reign of Henry III, and in some regards unsurpassed. Pop. 12,539.

**Beverly**, Mass., about 18 mi. n.e. of Boston; a fine harbor, various manufactures. Pop. 1890, 10,821.

Bewick (bū'ik), THOMAS (1753-1828), a celebrated English wood engraver. He executed the woodcuts for Hutton's Mensuration. In 1775 he received the Society of Arts prize for the best wood engraving. He became known as a skilled wood engraver and designer by his illustrations to Gay's Fables, Æsop's Fables, etc. He quite established his fame by the issue of his History of Quadrupeds. Among his other works may be cited the engravings for Goldsmith's Trareler and Deserted Village, Parnell's Hermit, and Somerville's Chase.

**Beyrout** (bIröt') (or Beirut; ancient Berytus), the chief seaport of Syria, pashalic of Acre, 60 mi. n.w. of Damascus; pop. 83,729, mostly Christians. Its chief exports are, olive oil, cereals, sesame, tobacco, and wool; its manufactures are silk and cotton. In ancient times Beyrout was a large and important Phœnician city. The Byzantine emperor Theodosius II raised it to the rank of a metropolis, and it again rose to importance during the Crusades. In later times it was long in the possession of the Druses. It was bombarded and taken by the British in 1840.

Be'za (properly, de Beze), THEODORE (1519-1605), next to Calvin the most distinguished man in the early reformed church of Geneva; born of a noble family at Vezelay, Burgundy, educated in Orleans under Melchior Volmar, a German scholar devoted to the Reformation; in 1539 became a licentiate of law, and went to reside at Paris. In 1549 he became professor of Greek at Lausanne. He rendered service to the cause of the reformers at the court of the king of Navarre and in attendance upon Condé and Coligny. In 1564 the administration of the Genevese church fell entirely to his care. Among his many works, his History of Caltin-ism in France from 1521 to 1563, and Theological Treatises, are still esteemed; but he is most famous for his Latin translation of the New Testament.

**Béziers** (bā-zyār), a town in Southern France, dep. Hérault, beautifully situated on a

height and surrounded by old walls, its chief edifices being the cathedral, a Gothic structure crowning the height on which the town stands, and the old episcopal palace, now used for public offices; manufactures: woolens, hosiery liquors, chemicals, etc., with a good trade in spirits, wool, grain, oil, verdigris, and fruits. In 1209 Béziers was the scene of a horrible massacre of the Albigenses. Pop. 45,475.

Be zoar, a concretion or calculus, of a roundish or ovate form, met with in the stomach or intestines of certain animals, especially ruminants. Nine varieties of bezoars have been enumerated, broadly divisible into those which consist mainly of mineral and those which consist of organic matter. The true oriental bezoars, obtained from the gazelle, belong to the second class. They are formed by accretion round some foreign substance, a bit of wood, straw, hair, etc., and were formerly regarded as efficacious in preventing infection and the effects of poison.

**Bhagalpur** (bhü-gal-pör), a city in Bengal, capital of a district of the same name. There are several indigo works in the neighborhood. Pop. 69,106. The district of Bhagalpur has an area of 4,327 sq. mi. and a pop. (chiefly Hindus and Mohammedans) of 2,032,696.

**Bhagavad-Gita**, a philosophical Sanscrit poem supposed to belong to the first century before Christ, which containing some didactic and philosophical doctrines, is read in the English translation by the theosophists.

**Bhamo**, a town of Burmah on the Upper Irrawaddy, about 40 mi. from the Chinese frontier. It is the starting point of caravans to Yunnan, and is in position to become one of the great emporiums of the east in event of a regular overland trade being established between India and West China. Pop. 8,018.

Bhang. See Hashish.

**Bhar'trihari**, Indian poet, reputed author of a book of apophthegms, according to legend a dissolute brother of King Vikramáditya (first century B. C.), who became a hermit and ascetic. The collection of 300 apophthegms bearing his name is, however, probably an anthology; 200 of them were translated into English and published at Nürnberg by Abraham Roger as early as 1653, the first Indian writings known in Europe.

Bheels (or Bhils), a Dravidic race inhabiting the Vindhya, Satpura, and Satmala Hills, a relic of the Indian aborigines driven from the plains by the Aryan Rajputs. They appear to have been orderly and industrious un-der the Delhi emperors; but on the transfer of the power in the eighteenth century from the Moguls to the Marathas they asserted their independence, and being treated as outlaws took to the hills. Various attempts to subdue them were made by the Gaekwar and by the British in 1818 without success. A body of them was, however, subsequently reclaimed and a Bheel corps formed, which stormed the retreats of the rest of the race and reduced them to comparative order. The hill Bheels wear little clothing, and live precariously on grain, wild roots, and fruits, vermin, etc., but

the lowland Beels are in many respects Hinduized. Their total numbers are about 750,000.

**Bhopal** (bho-päl'), a native state of Central India under British protection, on the Nerbudda, in Malwah. Area 6,784 sq. mi. Chief exports: sugar, tobacco. ginger, and cotton. Pop. 952,486. The capital of above state, also called Bhopal, is on the boundary between Malwah and Gundwana. Pop. 55,402.

**Bhurtpore'** (or Bhartpur'), a native state, India, in Rajputána. Area 1,982 sq. mi. Chief productions: corn, cotton, and sugar. Under British protection since 1826. Pop. 640,303. The capital, which has the same name, is a fortified place, and was formerly of great strength, Lord Lake being compelled to raise the siege in 1805 after losing 3,100 men. It was taken by Lord Combermere in 1827. Pop. 66,163.

Bhutan (bhu-tān'), an independent state of India, in the Eastern Himalayas, with an area of about 10,000 sq. mi. Pop. 20,000 or 30,000.

**Biaf'ra**, Bight of, an African bay running in from the Gulf of Guinea, having the Cameroon Mountains at its inner angle, and containing the island of Fernando Po.

**Blar' ritz**, a small seaport, France, Besses-Pyrénées, near Bayonne. It became a fashionable watering place during the reign of Napoleon III, who had an autumn residence there. Pop. 9,117.

**Bi'as,** one of the seven sages of Greece, b. at Priene, in Ionia; flourished about 570 B. C. He appears to have been in repute as a political and legal adviser, and many sayings of practical wisdom attributed to him are preserved by Diogenes Laertius.

Bible (Greek biblia, books, from biblos, the inner bark of the papyrus, on which the ancients wrote), the collection of the Sacred Writings or Holy Scriptures of the Christians. Its two main divisions, one received by both Jews and Christians, the other by Christians only, are improperly termed Testaments, owing to the confusion of two meanings of the Greek work diatheke, which was applied indifferently to a covenant and to a last will or testament. The Jewish religion being represented as a compact between God and the Jews, the Christian religion was regarded as a new compact between God and the human race; and the Bible is, therefore, properly divisible into the Writings of the Old and New Covenants. The books of the Old Testament received by the Jews were divided by them into three classes: 1, The Law, con-tained in the Pentateuch or five books of Moses. 2, The Prophets, comprising Joshua, Judges, 1 and 2 Samuel, 1 and 2 Kings, Isaiah, Jeremiah, Ezekiel, and the twelve minor prophets. 3, The Ketubim (or Hagiographa) (holy writings) containing the Psalms, Proverbs, Job, in one division: Ruth, Lamentations, Ecclesiastes, Esther, the Song of Solomon, in another division; Daniel, Ezra, Nehe-miah, 1 and 2 Chronicles, in a third. These books are extant in the Hebrew language; others, rejected from the canon as apocryphal by Protestants, found only in Greek or Latin.

The books of Moses were deposited, according to the Bible, in the tabernacle, near the ark, the other sacred writings being similarly preserved. They were removed by Solomon to the temple, and on the capture of Jerusalem by Nebuchadnezzar probably perished. Ac-cording to Jewish tradition Ezra, with the assistance of the great synagogue, collected and compared as many copies as could be found, and from this collation an edition of the whole was prepared, with the exception of the writings of Ezra, Malachi, and Nehemiah, added subsequently, and certain obviously later insertions in other books. When Judas Maccabæus repaired the temple, which had been destroyed by Antiochus Epiphanes, he placed in it a correct copy of the Hebrew Scriptures, whether the recension of Ezra or not is not known. This copy was carried to Rome by Titus. The exact date of the determination of the Hebrew canon is uncertain, but no work known to be written later than about 100 years after the captivity was ad-mitted into it by the Jews of Palestine. The Hellenistic or Alexandrian Jews, however, were less strict, and admitted many later writings, forming what is now known as the Apocrypha, in which they were followed by the Latin Church. The Protestant churches at the reformation gave in their adherence to the restricted Hebrew canon, though the apocrypha was long included in the various editions of the Bible. The division into chapters and verses, as it now exists, is of comparatively modern origin, though divisions of some kind were early introduced. Cardinal Hugo de Sancto Caro, in the thirteenth century, divided the Latin translation known as the Vulgate into chapters for convenience of reference, and similar divisions were made in the Hebrew text by the Rabbi Mordecai Nathan in the fifteenth century. About the middle of the sixteenth century the verses in Robert Stephanus's edition of the Vulgate were for the first time marked by numbers.

The earliest and most famous version of the Old Testament is the Septuagint, or Greek translation, executed by Alexandrian Greeks. and completed probably before 130 B. C., different portions being done at different times. This version was adopted by the early Christian church and by the Jews themselves, and has always held an important place in regard to the interpretation and history of the Bible. The Syriac version, the Peshito, made early in the second century after Christ, is celebrated for its fidelity. The Coptic version was made from the Septuagint in the third or fourth The Gothic version, by Ulphilas. century. was made from the Septuagint in the fourth century, but mere insignificant fragments of it are extant. The most important Latin version is the Vulgate, executed by Jerome, partly on the basis of the original Hebrew, and completed in 405 A. D.

The printed editions of the Hebrew Bible are very numerous. The first edition of the entire Hebrew Bible was printed at Soncino in 1488. The Brescian edition of 1494 was used

19

by Luther in making his German translation. The editions of Athias (1661 and 1667) are much esteemed for their beauty and correctness. Van der Hooght followed the latter. Doctor Kennicott did more than any one of his predecessors to settle the Hebrew text. His Hebrew Bible appeared at Oxford in 1776-80, two vols. folio. The text is from that of Van der Hooght, with which 630 MSS. were collated. De Rossi, who published a supplement to Kennicott's edition (Parma, 1784-99, five vols. 4to), collated 958 MSS. The German Orientalists, Gesenius, De Wette, etc., in recent times, have done very much toward correcting the Hebrew text. The oldest MS. of the Hebrew Bible belongs to 1106, and presents what is known as the Massoretic text; that is, the text provided with the vowel points and other markings which were inserted by Jewish scholars known as the Massoretes.

The books of the New Testament were all written in Greek, unless it be true, as some critics suppose, that the gospel of St. Matthew was originally written in Hebrew. Most of these writings have always been received as canonical; but the Epistle to the Hebrews, commonly ascribed to St. Paul, that of St. Jude, the second of Peter, the second and third of John, and the Apocalypse, have been doubted. The three oldest MSS. are: 1, the Sinaitic MS., discovered by Tischendorf in a convent on Mount Sinai in 1859, assigned to the middle of the fourth century; 2, the Vatican MS. at Rome, of similar date; 3, the Alexandrine MS. in the British Museum, assigned to the middle of the fifth century. Each MS. contains also the Septuagint Greek of the Old Testament in great part. The Vulgate of Jerome embraces a Latin translation of the New as well as of the Old\_Testament, based on an older Latin version. The division of the text of the New Testament into chapters and verses was introduced later than that of the Old Testament; but it is not precisely known when or by whom. The Greek text was first printed in the Complutensian Polyglot, in 1514; in 1516 an edition of it was published at Basel by Erasmus. Among recent valuable editions are those of Lachmann, Tischendorf, Tregelles, and Westcott and Hort.

Of translations of the Bible into modern languages the English and the German are the most celebrated. Considerable portions were translated into Anglo-Saxon, including the Gospels and the Psalter. Wycliffe's translation of the whole Bible (from the Vulgate), begun about 1356, was completed shortly be-**T**he fore his death, which took place in 1384. first printed version of the Bible in English was the translation of William Tindall (or Tyndale), whose New Testament was printed in quarto at Cologne in 1525, a small octavo edition appearing at the same time at Worms. Tonstall, bishop of London, caused the first edition to be bought up and burned. The Pentateuch was published by Tindall in 1530, and he also translated some of the prophetical books. Our translation of the New Testament is much in-

debted to Tindall's. A translation of the entire Bible was published by Miles Coverdale in 1535. It was undertaken at the instance of Thomas Cromwell, and being made from German and Latin versions was inferior to Tindall's. After the death of Tindall, John Rogers undertook the completion of his translation and the prepa-ration of a new edition. In this edition the latter part of the Old Testament (after 2 Chronicles) was based on Coverdale's version. A revised edition was published in 1539 under the superintendence of Richard Taverner. In the same year as Taverner's, another edition appeared, printed by authority, with a preface by Cranmer, and hence called Cranmer's Bible. This was the first Bible printed by authority in England, and a royal proclamation in 1540 ordered it to be placed in every parish church. This continued, with various revisions, to be the authorized version till 1568. In 1557-60 an edition appeared at Geneva, based on Tin-dall's-the work of Whittington, Coverdale, Goodman, John Knox, and other exiles-and commonly called the Geneva (or Breeches) Bible (from "breeches" standing instead of "aprons" in Gen. 3:7). This version, for 60 years the most popular in England, was allowed to be printed in England under a patent of monopoly in 1561. It was the first printed in Roman letters, and was also the first to adopt the plan previously adopted in the Hebrew of a division into verses. It omitted the Apocrypha, left the authorship of the Epistle to the Hebrews open, and put words not in the original in italics. The Bishops' Bible, published 1568 to 1572, was based on Cranmer's, and revised by Archbishop Parker and eight bishops. It succeeded Cranmer's as the authorized version, but did not commend itself to scholars or people. In 1582 an edition of the New Testament, translated from the Latin Vulgate, appeared at Rheims, and in 1609-10 the Old Testament was published at Douay. This is the version recognized by the Roman Catholic Church.

In the reign of James I a Hebrew scholar, Hugh Broughton, insisted on the necessity of a new translation, and at the Hampton Court Conference (1604) the suggestion was accepted by the king. The work was undertaken by forty-seven scholars divided into six companies, two meeting at Westminster, two at Oxford, and two at Cambridge, while a general ford, and two at Camoriuge, while a por-committee meeting in London revised the portions of the translation finished by each. revision was begun in 1607, and occupied three years, the completed work being published in folio in 1611. By the general accuracy of its translation and the purity of its style it superseded all other versions. In response, however, to a widely-spread desire for a translation even yet more free from errors, the Convocation of Canterbury in 1870 appointed a committee to consider the question of revis-ing the English version. Their report being favorable, two companies were formed, one for the Old Testament and one for the New, consisting partly of members of Convocation and partly of outside scholars. Two similar companies were also organized in America to work

along with the British scholars. The result was that the revised version of the New Testament was issued in 1881; that of the Old Testament in 1884. The revision has been carried out in a spirit of reverence toward the older version, and few alterations have been admitted but such as have been called for on the score of accuracy, clearness, and uniform-ity. See the revisers' prefaces.

In Germany some seventeen translations of the Bible, partly in the High German partly in the Low German dialect, appeared between the invention of printing and the Reformation. but they had all to make way for Luther's great translation — the New Testament in 1522, and the whole Bible in 1534.

Bibliog'raphy (Gr. biblion, a book, and grapho, I describe), the knowledge of books, in reference to the subjects discussed in them, their different degrees of rarity, curiosity, reputed and real value, the materials of which they are composed, and the rank which they ought to hold in the classification of a library. The subject is sometimes divided into general, national, and special, bibliography according as it deals with books in general, with those of a particular country, or with those on special subjects or having a special character (as, early printed books, anonymous books). A subdivision of each of these might be made into material and literary, according as books were viewed in regard to their mere externals or in regard to their contents. American literature has already given rise to a series of bibliographical works; e. g., Bibliographical Catalogue of Books, Translations of the Scriptures, and other publications in the Indian tongues of the U. S., 1849; Duyckinck's Cyclopedia of American Literature, 1856; Trübner's Bibliographical Guide to American Literature, 1856; and the General American Catalogue.

Bicarbonate, a carbonate derived from carbonic acid by replacing one of the atoms of hydrogen by a metal. Bicarbonate of sodium is used as an ant-acid, and effervescing liquors are usually produced by mixing it with tar-taric acid. It is also the chief ingredient of baking powder.

Bice, the name of two colors used in painting, one blue, the other green, and both native carbonates of copper, though inferior kinds are also prepared artificially.

Biceps, the large muscle in front of the up-

per arm. See Anatomy. Bichat (bö-shä), MARIE FRANCOIS XAVIER (1771-1802), French anatomist and physiologist, b. at Thoriette. Bichat was the first who recognized the identity of the tissues in the different organs.

Bicycle. In 1818 something in the nature of bicycle was introduced into England by Baron von Drais, a Frenchman, resident at Mannheim, and was known as the Draisnene (or Celerifere); while velocipedes or manumotive machines with three or more wheels were in occasional use in England even before that date, one of the earliest being an invention of Richard Lovell Edgeworth (1767). The Draisnene consisted of two wheels, about 30 inches

in diameter, running one in the wake of the other, and connected by a beam of wood, upon which, midway from each end, was placed a saddle or perch. At the fore-end of the beam an arm-rest was secured, and this roughly completed the apparatus. The rider placed his leg over the beam, got into the saddle, and, resting his arms upon the support referred to, pushed the "dandy-horse" ahead by kicking the ground with his right and left foot alternately. The fashioning of the first practical bicycle (1846) is credited to one Gavin Dalzell. a Scotch cooper, who lived at Lesmahagow, in Lanarkshire. It went by the name of the "wooden-horse," being constructed chiefly of wood; the saddle was low, and the pedal move-ments or "stirrups," which moved backward and forward alternately, were connected by iron rods with the cranked axle of the drivingwheel. The next revival of cycling may be said to date from 1867. A few years previous to this it occurred to an inventive genius, M.

The "Dandy-horse."

Michaux, to fit to the hobby-horse a pair of pedals by which the front wheel might be revolved with the feet. A transverse handle was affixed to the front wheel, which admitted of its being turned even to a right angle. This newcomer was known as the bicycle, but it is now irreverently alluded to in all quarters as the "boneshaker"—probably because it was made of wood and shod with iron tires instead of rubber. The utility of the cycle is proved beyond all question. It has become the poor man's carriage, and the rich man's hobby in more senses than one. Clergymen visit their parishioners, medical men their patients, and tens of thousands transact their business or follow their pleasures by its means, while it is next to impossible to pass through any of our towns without seeing that the cycle, in some of its numerous shapes, is ably ministering to the wants of the community. As with most other sports or pastimes, cycling is strong in a clubdom of its own. Hundreds of local clubs exist in different parts of the country. Cycleracing, by both amateurs and professionals, has developed into a fine art. Cinder-paths. specially constructed for the purpose, exist in nearly all the more important centers, and amateur race meetings are of frequent occurrence during the summer season. Cycling is not only extremely popular among the sterner sex, but ladies innumerable have taken to the pastime. Many devices for reducing the labor required to propel a machine over heavy roads and up steep gradients have from time to time been devised. A simple method of ascertaining how a machine is geared is to multiply the diameter of the driving-wheels by the number of teeth in the lower cog-wheel, and then divide by the number of teeth in the cog upon the main axle; e. g., a 40-inch wheel has 20 teeth upon its lower cog-wheel, and fifteen upon the upper; this gives a gearing of 53‡ inches.

Trick-riding is an art which the American riders assiduously practise, and in which they naturally excel; so much so, that many professors thereof have from time to time visited Europe to exhibit their provess to the multitude. Within the last few years skilled and competent engineers and mechanics have turned their attention to the perfecting of the cycle. There are a large number of flourishing cyclist clubs in the large cities, such as New York, Brooklyn, Philadelphia, Chicago, and Washington. As might be expected, manufacturing enterprise has kept pace with the demand; and America is also well supplied with cycling literature.

The parts of a bicycle that separately represent different allied industries are the chain, the pedals, the handle, the saddle, the rims, and the tires. Every part may be, and fre-quently is, bought of specialty makers and assembled in almost any make of machine that . is not an infringement of name. Many factories make all of the bicycle except the chain, saddle, pedals, steel bearing-balls, and the tires. The tubing that is used in the make-up of a bicycle comes to the factory in lengths of 12 to 20 feet. It is then cut into lengths needed The tubin the construction of the bicycle. ing employed in making a light bicycle is from a half inch to an inch and a quarter in diameter and varies from 20 to 24 gauge in respect to the thinness of the shell. **Tubing of** 24 gauge is very thin compared with the heavy material used a few years ago, and the tend-ency is to adopt tubings of large diameter and very light gauge. The cuts of tubing are sent to the forges and prepared for joining at the different points in putting together the frame of the bicycle. The frame consists of eight pieces of tubing, the upper, lower and middle braces, rear fork, rear brace, and the head, including the bracket or cylinder attached at the lower junction where the shaft turns. The frame is put together by the brazing process. This consists in joining together two pieces of metal by first covering the ends with borax and spelter, and then heating the joint in a furnace, until the spelter accomplishes a complete union of the parts. Spelter is copper and zinc or a high grade of brass in granulated form. The frame is then ready to receive the enamel. It is dipped into a vat of enamel, the ends having been first plugged with cork, and hung up to dry. The next step

is to bake it. It is put into an oven where a tremendous heat is brought to bear, and the enamel becomes so hard it is almost a part of the metal. The frames hang from brackets overhead until they are dry, and they are then brought to the department known as the assembling room. Pieces of steel for the hubs and other turned parts come in the form of bars, and are reduced to about the shape wanted by means of a machine that works automatically. The machines are started and allowed to run until the bars are cut into screws, hubs, or whatever is wanted. All these pieces are sent to the different departments to be tempered, polished, and nickeled, the hubs finally going to the room where the spokes are put in. Hollow material is employed wherever possible in order to decrease the weight of the machine. Crank brackets are made of tubing instead of forging, and wherever an ounce can be drilled out or turned off it is done in the search for lightness with attendant strength.

The manufacture of wooden rims like the manufacture of pneumatic tires constitute a separate industry. The bicycle wheel belongs to the order of suspension wheels. The wheel is made up of a drop-forged steel hub, steel wire spokes, and a steel or wooden rim. The wooden rims are brought into the factory where the spoke holes are drilled into them. A set of spokes require slanting holes in the rim, and every hole must slant in an opposite direction. There are 16 spoke holes in the front wheel, 18 in the rear wheel. The wire for the spokes comes in spools or bundles and must be straightened out before it is cut into proper lengths. The spoke at the tire and hub ends is twice as thick as the original wire. The metal is driven down on to itself, giving the spoke more body at the ends. Another machine cuts a thread on the rim, and still another bends the head or spoke end so that it will hook into the flange of The spokes are then plated with the hub. nickel, polished, and taken to the assembling room. The steel hub comes from the drop forge in a solid piece, but not bored out. A series of lathes shape the hub and bore it for the spindle, and a gang drill which bores eight holes at once fits it for receiving the spokes. The hub comes to meet the rim and spokes all fitted with ball-bearings. The wire spokes are slipped through the holes in the flanges, after which the rim is put on. The spokes are which the rim is put on. fastened on the outside of the rim by means of screws. After the rim has been put on, the wheel is put in a spindle which is perfectly The hub of the wheel is also perfectly true. true, and the hub will revolve squarely and evenly on this test spindle. The rim, however, does not at first revolve uniformly, or in other words, it is not true. A gauge is set near the edge of the rim, and the wheel is revolved. The fault is corrected by a workman who fastens and tightens first one spoke and then another until the tension is the same on all sides. The projecting ends of the spokes are ground down even, and the wheel is ready to receive the pneumatic tire. The polished steel balls,

which make the ball-bearings, are examined very closely with a magnifying glass and carefully sorted. If there are any imperfections in any of the balls, they are thrown out. In the assembling room the finished parts of the machine are all brought to the benches of the workmen, who quickly set up the bicycle and make it ready for the crate in which it is to be shipped.

Biddle, JAMES (1783-1848), American naval officer. He was educated at the University of Pennsylvania; entered the navy as a midshipman in 1800; served in the war with Tripoli; was captured in the frigate *Philadelphia*, and confined for four months. During the War of 1812 he was on the *Wasp*, and led in the action against the *Frolic*, which he com-manded after its capture. Both vessels were taken by the British ship Poictiers, and conveyed to the Bermudas. After his exchange in March, 1813, he was given command of a flotilla of gunboats on the Delaware, and transferred to the Hornet, in Decatur's squadron, blockaded at New London, Conn. He escaped and captured the Penguin off the island Tristan d'Acunha, in March, 1813, for which Congress gave him a gold medal. In February, 1815, he became captain. During his command of the Mediterranean squadron, 1831, he negotiated a commercial treaty with Turkey, and was engaged in diplomatic service in China in 1845.

**Biddeford,** York co., Me., on Saco River, 100 mi. n. of Boston. Railroads: Boston & Maine; Eastern & Electric. Industries: cotton mills, brass and iron foundries, lumber mills, shoe, box, and other factories. Surrounding country agricultural. The town was first settled in 1630 at the Pool, which was then "Winter Harbor," and embraced the city of Saco, directly across the harbor, until 1718 when it was incorporated as a town, and became a city in 1855. Pop. est. 1897, 16,000.

**Biddle**, JOHN (1615-1662), father of the modern Unitarians, Gloucestershire. He was educated at Oxford, and became master of a free-school at Gloucester. He was repeatedly imprisoned for his views. A general act of oblivion in 1652 restored him to liberty, when he immediately disseminated his opinions by his *Twofold Scripture Catechism*. He was again imprisoned, and the law of 1648 was to be put in operation against him when Cromwell banished him to St. Mary's Castle, Scilly, and assigned him 100 crowns annually. Here he remained three years. He then continued to preach his opinions till the death of Cromwell, and also after the Restoration, when he was committed to jail in 1662.

**Bideford** (bid'e-ford), a seaport of England, county Devon, 44 mi. n. of Plymouth, picturesquely situated on both sides of the Torridge, 4 miles from the sea. Its industries embrace coarse earthenware, ropes, sails, etc. Its shipping trade was formerly large, but is not now of much importance. Pop. 7,908.

**Bidery**, an alloy primarily, composed of copper, lead, tin, to every 3 oz. of which 16 oz. of spelter (zinc) are added. Many articles of Indian manufacture, remarkable for elegance of form and gracefully engraved patterns, are made of it. It is said not to rust, to yield little to the hammer, and to break only when violently beaten. Articles formed from it are generally inlaid with silver or gold and polished.

Biddle, NICHOLAS (1750-1778), American naval officer, b. in Philadelphia. He entered the British navy in 1770, but absconded and sailed under Nelson in the Carcass in the exploring expedition of Captain Phipps. At the beginning of the War of Independence he returned to Philadelphia, was made captain of the brig Andrew Doria, with 14 guns and 120 men; served in Commodore Hopkins's attack on New Providence, and cruised off Newfoundland. In February, 1777, he was appointed commander of the Randolph, a frigate of 32 guns. Soon afterward he was made commander of a small squadron and cruised in the West Indies, where he encountered the Yarmouth, a British frigate of 64 guns, and was wounded in the action. During the engagement the magazine of Commodore Biddle's vessel exploded, and he and his crew were blown up. Only 4 of the 315 men escaped.

**Biddle**, NICHOLAS (1786-1844), American banker. He studied law, became secretary to James Morroe, who was then minister to England, and was elected to the legislature of Pennsylvania in 1810. In 1819 he became a director, and four years later was president of the U. S. bank 1825-39. He had a protracted fight with General Jackson over the withdrawal of the government deposits in 1833. He was one of the founders of Girard College.

Blela's Comet (bč'la), discovered by M. Biela (1782-1856), an Austrian officer, in 1826. Its periodic time was determined as six years, thirty-eight weeks. It returned in 1832, 1839, 1846, and 1852. On the latter two occasions it was in two parts, each having a distinct nucleus and tail. It has not since been seen as a comet; but in 1872, 1870, and 1885, when the earth passed through the comet's track, immense flights of meteors were seen, which have been connected with the broken up and dispersed comet.

**Bielefeld** (bē'le-felt), a town of Prussia, in the province of Westphalia, 38 mi. e. of Münster; one of the chief places in Germany for flax spinning and linen manufacture. Pop. 39,950.

**Bienne** (bi-ān) (or Biel), a town, Switzerland, canton of Bern, 16 mi. n. w. of Bern, beautifully situated at the n. end of the lake of same name, and at the foot of the Jura. Pop. 18,487. The lake is about 10 mi. long by 3 broad. It receives the waters of Lake Neufchâtel by the Thiel and discharges itself into the Aar.

**Bienville**, JEAN BAPTISTE LE MOYNE, SIEUR DE (1680-1768), governor of Louisiana. He accompanied Iberville, who was commissioned by the French government to explore the mouth of the Mississippi and erect a fort there. They settled at Biloxi, 1609, and Bienville explored the country and erected a fort 54 mi. above the mouth of the river in 1700. In 1701 he became director of the colony, and removed its capital to Mobile, but was discharged from his office in 1707. A new colony having been formed by Law's Mississippi company. Bienville was made its governor, and founded the city of New Orleans in 1718. He transferred the capital of Louisiana to New Orleans in 1723, and in January, 1724, was called He was removed from his post on to France. Aug. 9, 1726, but in 1733 he was again made governor of Louisiana, with the rank of lieutenant general. He published a code which regulated the condition of slaves, prohibited every religion except the Roman Catholic, and banished Jews from the colony; this remained in force until Louisiana was purchased by the **U.** S

**Bierstadt**, ALBERT, painter, b. 1830 in Düsseldorf, Germany: came to America when a child. He studied art in Europe, but chose California and Colorado as the field for his work. His specialty is mountain scenery, and he painted Laramie Peak, Lander's Peak. Mt. Hood, and other peaks of the Rockies and the Sierra Nevada. He is a member of the National Academy and of the St. Petersburg Academy of Fine Arts.

**Bigelow**, JOHN, journalist, b. 1817 in Malden, N. Y.: became part owner of the New York *Erening Post* in 1849, and managed that paper until 1861. In 1861 he was sent to Paris as consul, and was U.S. minister there 1865-67. In 1867-68 he went over to the Democratic party, and was elected secretary of state of New York. Mr. Bigelow has written lives of Fremont, Bryant, and has edited Franklin's autobiography and Tilden's speeches.

**Biggar**, JOSEPH GILLIS (1828-1890), Irish politician. He was elected to Parliament from Cavan as a Home Ruler in 1874, and became known as the champion obstructionist of the House of Commons. He was twice prosecuted for sedition and conspiracy, but both juries disagreed.

**Big Horn**, a river of Wyoming and Montana, the largest tributary of the Yellowstone. Course, 400 mi.

**Big-horn;** the wild sheep of the Rocky Mountains, named from the size of its horns, which are 34 ft. long, the animal itself being of the same height at the shoulder. The bighorns are gregarious, going in herds of 20 or 30, frequenting the craggiest and most inaccessible rocks, and are wild and untamable. It is called also Rocky Mountain goat.

**Bigno' nia**, a genus of plants of many species, inhabitants of hot climates, usually climbing shrubs furnished with tendrils; flowers mostly in terminal or axillary panicles; corolla trumpet-shaped, hence the name of *trumpet-flower* commonly given to these plants. All the species are splendid plants when in blossom, and many of them are cultivated in our gardens.

**Big Rapids,** Mecosta co., Mich., on Muskegon River, 56 mi. n. of Grand Rapids. Railroads: G. R. & I.; C. & W. M.; and D. G. R. & W. Industries: furniture manufacturing, flour mill, and a number of smaller factories. Surrounding country agricultural. The town was first settled in 1854 and became a city in 1869. Pop. est. 1897, 5,000.

**Bikaner'**, a native state of Rájputána. India, under the superintendence of a political agent and the governor general's agent for Rájputána. Area 23,000 sq. mi.; pop. 831,955. BikANER, the capital, is surrounped by a fine wall 3j miles in circuit. It has a fort, containing the rajah's palace, is irregularly built, but with many good houses, and manufactures blankets, sugar candy, pottery, etc. Pop. including suburbs, 56,252.

**Bilaspur** (bi-läs-pör'), a district of the Central Provinces of India. Area 7,798 sq. mi.; pop. 1,017,327. The administrative headquarters of the district are at Bilaspur, which is also the principal town. Pop. 7,775.

**Bilba**'o, a city in Northern Spain, capital of the province of Biscay (or Bilbao), on the navigable Nervion, 8 miles from the sea. It has a cathedral and several convents; also manufactures of hardware, earthenware, leather, and paper, and possesses large shipyards and iron foundries. It exports large quantities of iron ore. Pop. 50,772.

**Bilboes** (bil'boz), an apparatus for confining the fect of offenders, especially on board ships, consisting of a long bar of iron with shackles sliding on it and a lock at one end to keep them from getting off, offenders being thus "put in irons."

Bile, a yellow, bitter liquor, separated from the blood by the primary cells of the liver, and collected by the biliary ducts, which unite to form the hepatic duct, whence it passes into the duodenum, or by the cystic duct into the gall bladder to be retained there till required for use. The most obvious use of the bile is to aid in the digestion of fatty substances and to convert the chyme into chyle. Everv kind of bile contains two essential constituents, the bile salts and the bile coloring matter associated with small quantities of cholesterine, fats, chloride of sodium, phosphates, and iron. When bile is not secreted in due quantity from the blood the unhealthy condition of biliousness results.

**Bil'iary Cal culus,** a concretion which forms in the gall bladder or bile-ducts; gallstone. It is generally composed of a peculiar crystalline fatty matter which has been called *cholexterine*.

**Bill**, a written or printed paper containing a statement of any particulars. In common use a tradesman's account, or a printed proclamation or advertisement, is thus called a bill. In legislation a bill is a draft of a proposed statute submitted to a legislative assembly for approval: but not yet enacted or passed and made law. When the bill has passed and received the necessary assent, it becomes an act.

Bill of Exchange (including promissory notes and inland bills or acceptances).—A bill of exchange is deflued as an order in writing addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a

fixed or determinable future time a certain sum of money to or to the order of a specified person or to bearer. Bills of exchange are divided into foreign and inland bills, but in mercantile usage the term bill of exchange is seldom applied to other than foreign bills. An inland bill of exchange, generally called a bill of acceptance, has more in common with a promissory note than with a foreign bill of exchange. We give the common forms of the three documents.

\$110.00.

## (1) Promissory Note.

Chicago, April 2, 1898.

Three months after date I promise to pay to the order of W. S. [or "to W. S. or his order"] the sum of One Hundred and Ten Dollars, for value received. (Signed) J. D.

(2) Inland Bill of Acceptance.

\$110.00.

Philadelphia, Jan. 1, 1898. Three months after date pay to our order [or "to the order of J. S."] the sum of One Hundred and Ten Dollars, for value received.

(Signed) F. G. & Co. To Messrs. A. B. & Co., Baltimore, Md.

This form is accepted by writing across the body of the bill:—

"Accepted.

A. B. & Co."

(3) Foreign Bill of Exchange.

\$110.00.

Lima, O., Jan. 1, 1898.

At sixty days' sight of this first of exchange (second and third of same tenor and date unpaid) pay to the order of W. S. the sum of One Hundred and Ten Dollars, value as advised [or, "which charge to our account," or "to account of — as advised."]

(Signed) F. & Co.

To F. B. & Co., Liverpool.

(Second and third drawn in same form as first, one only of the set being negotiable. Instead of three copies being used, which is called drawing a bill in parts, one only may be drawn, the form then used being "this sola of exchange.")

The acceptor of this bill writes across it the date on which it is presented, together with his signature, thus:—

# "Accepted, Feb. 4, 1898. F. B. & Co."

The person who makes or draws the bill is called the *draver*, he to whom it is addressed is, before acceptance, the *dravee*, and after accepting it, the *acceptor*; the person in whose favor it is drawn is the *payee*; if he endorse the bill to another, he is called the *endorser*, and the person to whom it is thus assigned is the *endorsee* or *holder*. A bill when properly stamped is negotiable, and may be discounted at a bank, or may pass from hand to hand by the process of endorsement; many names being frequently attached to one bill as endorsers,

each of whom is liable to be sued upon the bill if it be not paid in due time. The last phase in the negotiation of a bill is usually its being discounted with a banker. The merchant may either discount it with a billbroker, who re-discounts it with the banker, or he may take it direct to the banker. The broker or banker deducts (as do also the previous negotiators of a bill) a discount, or equivalent for the use of the money he pays until the due date of the bill, when he expects it will be repaid him. When a bill reached the date of payment, and was not duly paid, it used to be noted or protested, but this is now only done with foreign bills. Protesting is a legal form, in which the payee is declared responsible for all consequences of the non-payment of the bill. Noting is a temporary form, used as a preliminary to protesting. It consists in a record by a notary public of the presentation of the bill, and of the refusal of the payee to honor it. Unless a bill is noted for non-payment on the due date, the endorsers are freed from responsibility to pay it. In determining the due date of a bill, a legal allowance, varying in different countries, called *days of grace*, has to be taken into account. A bill of exchange drawn and accepted merely to raise money on, and not given, like a genuine bill of exchange, in payment of a debt, is called an accommodation bill.

Bill of Health, a certificate or instrument signed by consuls or other proper authorities, delivered to the masters of ships at the time of their clearing out from all ports or places suspected of being particularly subject to infectious disorders, certifying the state of health at the time that such ships sailed.

Bill of Indictment, a written accusation submitted to a grand jury. If the grand jury think that the accusation is supported by probable evidence, they return it to the proper officer of the court endorsed with the words "a true bill," and thereupon the prisoner is said to stand indicted of the crime and bound to make answer to it. If the grand jury do not think the accusation supported by probable evidence, they return it with the words "no bill," whereupon the prisoner may claim his discharge.

Bill of Lading, a memorandum of goods shipped on board a vessel, signed by the master of the vessel, who acknowledges the receipt of the goods and promises to deliver them in good condition at the place directed, dangers of the sea excepted. Bills of lading can be transferred by endorsement; the endorsement transfers all rights and liabilities under the bill of lading of the original holder or consignee.

Bill of Sale, a formal instrument for the conveyance or transfer of personal chattels, as household furniture, stock in a shop, shares of a ship. It is often given to a creditor in security for money borrowed, or obligation otherwise incurred, empowering the receiver to sell the goods if the money is not repaid with interest at the appointed time, or the obligation not otherwise discharged.

**Bli leting**, a mode of feeding and lodging soldiers when they are not in camp or barracks by quartering them on the inhabitants of a town. The necessity for billeting occurs chiefly during movements of the troops or when any accidental occasion arises for quartering soldiers in a town which has not sufficient barrack accommodation. The billeting of soldiers on private householders is prohibited in America except in war time.

Billiards is a well-known indoor game of skill, played on a rectangular table with ivory balls, which are driven by means of an ash rod or stick called a "cue" against each other according to certain defined rules. Of the origin of billiards comparatively little is known some considering that the game was invented by the French, and others that it was improved by them out of an ancient German diversion. Even the French themselves are doubtful on the point, some of their writers ascribing the game to the English. Billiards appear to be derived from the game of bowls. The strokes are all made with  $\bar{a}$  cue, which is a long stick of ash, or other hard wood, gradually tapering to the end, which is tipped with leather and rubbed with chalk to prevent it slipping off the surface of the ball struck. The mace or hammer-headed cue, once common, is now no longer used, even by ladies. The cue is taken in the right hand, generally between the fingers and the thumb, and is not grasped in the palm; and with the left hand the player makes a bridge, by resting the wrist and the tips of the fingers on the table, arching the latter, and extending the thumb in such a way as to allow a passage in which the cue may slide. The shape of the table has varied from time to time. At first it was square, with a hole or pocket at each corner to receive the balls driven forward with a cue or mace; then it was lengthened and provided with two other pockets; and occasionally it has been made round, oval, triangular, or octagonal, with or without pockets, according to the game required. It is covered by a fine green cloth, and surrounded by elas-tic india-rubber cushions. The table must be perfectly level and sufficiently firm to prevent vibration; and its usual height from the floor to the surface is three feet.

The game as played in America, has taken a distinctive character, both in regard to the manner in which, and the tables on which, it is played. The older American game was the four-ball game (now rarely played by experts), and it was at first played on a six-pocket table, after the English pattern, and then on a fourpocket table, and finally on a pocketless table. Formerly the caroms were combined with winning hazards, losing hazards counting against the player. Caroms and hazards counted two and three points respectively; but latterly, since the abolition of pockets, the points of the game number usually thirty-four, each carom uniformly counting one. At the commencement of the game the players "string for lead," which is done by each simultaneously driving his ball against the bottom cushion, the ball

approaching and resting nearer to the head cushion on the rebound deciding the winner both as to choice of balls and order of play. If the striker fail to hit any ball with his ball, he forfeits one to the opposing side, or if he drive his cue ball off the table he forfeits three. If, however, the player's ball be in contact ("froze") with another ball at the time he makes a stroke, he does not forfeit if he fail to strike some other ball. Foul strokes are made when one player plays another's ball, when he plays at a ball in motion; when a player does not withdraw his cue from his ball before that ball comes in contact with another; when a stroke is made while the red ball is off the table and its spot is unoccupied; when a player in making a shot touches his cue-ball twice; when a player in any way ob-structs the motion of a ball; when a player has not at least one foot on the floor while making a shot; when a player does not cause a ball in hand to pass outside the string before touching an object ball or a cushion, except when an object ball lies partly outside and partly inside the string; when a player plays directly at a ball inside the string; when a miss is given inside the string when a player is in hand; when a player at some one's suggestion alters his intended stroke.

The three-ball game is played with two white and one red ball. The table has two spots, one each at head and foot of table. The spot at head of table is called the white spot. and the one at the foot the red spot. The game is begun by stringing for lead as already described in the four-ball game. Should the first player fail to count, his opponent can play at either ball on the table. A carom consists in hitting both object balls with the cue ball. Each carom scores one. Each miss forfeits one to the opposite side. If a ball jumps off the table after counting, the count is good and the ball must be spotted. The foul strokes are about the same as have been given above. When the cue ball is in contact with another the balls are respotted and the player plays ball in hand as at the commencement of the game. The object balls are considered crotched when they lie within a four-and-one-half-inch square at either corner of the table. When in such position three counts only will be allowed unless one or both the object balls be forced out of the square. The crotch has at times on special occasions been enlarged to restrict rail play, but such enlargement is not generally accepted. The cushion carom game is a highly scientific play, it being necessary to a successful carom that the cue ball shall, in the course of the stroke, strike not only both object balls, but the cushion as well. The balk line is another limitation which has been imposed on the older game; in this form of the game a balk line either eight or fourteen inches from the rail is established, and the player is compelled to drive one or both object balls outside the line in order to count. The points of the game are usually thirty-four, fifty, or one hundred. In match games various handicaps are agreed on, but the social game is generally played as above.

In the English game the object of the player is to drive one or other of the balls into one or other of the pockets, or to cause the striker's ball to come into successive contact with two other balls. This game resembles the American game of pool more than billiards.

Billiard Balls are made usually from ivory. When a tusk reaches the manufacturer of billiard balls it is examined very carefully for flaws. If it be found perfect the workmen measure the tusk into proper distance to be cut into blocks. It is then sawed into lengths of 24 to 3 inches, according to the size of the balls to be made, and the turners take the blocks in hand. In order to save the corners, the turners cut a ring at each end and slowly deepen it until a rough ring drops off. Two rings are cut from each billiard ball block, after which it is almost round. It is then laid aside to dry for about six months. When it has been seasoned it is chiseled down smooth and exactly round. The ball is then polished by means of a machine, and treated to a rubbing with chalk and chamois skin, and finally with a plain, soft leather.

Every particle of sawdust and shavings from the ivory is carefully saved. These are treated with chemicals, submitted to an enormous hydraulic pressure, and molded into small articles so perfect that only an expert can tell them from solid ivory. The most expert carvers are the Japanese and Chinese, who spend years on a single piece.

**Bif lingsgate**, the principal fish market of London, on the left bank of the Thames, a little below London Bridge. It has been frequently improved, and was rebuilt in 1852 and again in 1874-76. From the character, real or supposed, of the Billingsgate fish-dealers, the term *Billingsgate* is applied generally to coarse and violent language.

**Billiton'**, a Dutch East Indian island between Banca and the s.w. of Borneo. It produces iron and tin, and exports sago, cocoanuts, pepper, tortoise-shell, trepang, edible birds'-nests, etc. It was ceded to the British in 1812 by the sultan of Palembang, but in 1824 it was given up to the Dutch. Area 1,863 sq. mi.; pop. 29,115.

**Bil fon**, an alloy of copper and silver, in which the former predominates, used in some countries for coins of low value, the object being to avoid the bulkiness of pure copper coin.

**Bimet' allism**, that system of coinage which recognizes coins of two metals (silver and gold) as legal tender to any amount; or in other words, the concurrent use of coins of two metals as a circulating medium, the ratio of value between the two being arbitrarily fixed by law. It is contended by advocates of the system that by fixing a legal ratio between the value of gold and silver, and using both as legal tender, fluctuations in the value of the metals are avolded, while the prices of commodities are rendered steadier.

**Binding-twine**. The best binding-twine is made of East India manilla hemp. This is a product of the banana palm which grows in the Philippine Islands. Some hemp is also grown in Southern Mexico and Yucatan. This is a product of the plant known as the American aloe. This hemp comes to the factory in bales containing 275 to 375 pounds. The bales are torn apart and the separate bunches, which They are knotted at the end, are shaken out. are nearly white and very coarse, the fibers varying from two to six feet in length. The hemp goes to the scutching frame, which is a broad wheel about eight feet in diameter, the outer surface being covered with short, sharp pegs set close together. This is covered all over with a shield which is pierced at one side with square holes. Through these holes the hemp bunches are switched until the teeth have combed the fibers out straight, tearing out a good deal of dust and valueless fibers. The hemp now goes to the first spreader or breaker. This consists of two sets of belts, both covered with short, metallic teeth or pegs, the first moving more slowly than the second. In this machine the hemp is spread out, carded, and straightened. The second belt pulls it apart longitudinally and makes the ribbon finer. From the end of the first spreader, the big, loose rope is guided into tin pails from which it is fed into the second spreading machine, and so on through eight of them until the hemp ribbon is smooth and thin and much finer than at first. It is then run over numerous spools and rollers which smooth it down, twist it, making it finer and more compact. It goes then to the spindles. Here the ribbon of hemp runs from the pails through a very small hole where it is pulled very fast so that it grows finer, at the same time being twisted to a certain extent. It is then fed on big spools or bobbins in the form of finished twine, 650 feet to a spool. The twine is tested by a binder adjustment to see if it is perfect. The bobbins are now sent to the balling department where the twine is wound by machines from the bobbins into the shape of twine balls. The balls are made so that the twine unwinds from the inside out instead of from the out-side in. They are then ready for use in the harvest field.

**Bind-weed**, the common name for plants of the genus Convolvulus, especially of C. arvensis, and also of plants of the allied genus Calystegia, especially C. Soldanella and C. sepium. The black bryony is called black bind-weed; smilax is called rough bind-weed. Solanum Dulcamara (the bittersweet) is the blue bind-weed of Ben Jonson.

**Bing'en**, a town of Germany, in the grand duchy of Hesse-Darmstadt, at the confluence of the Nahe with the Rhine. Pop. 7,654. The district is noted for the culture of the vine, and the exquisite Rudesheimer is produced in the neighborhood. There are manufactures of tobacco, glue, starch, and leather, besides a brisk retail and river trade. The *Bingerloch*, formerly a dangerous rapid in the Rhine, lay below the town; but blasting operations carried on by the Prussian government in 1834 have entirely removed the danger to the navigation of the river. A tower, the Mäusethurm,

### Bingham

in the middle of the Rhine, erected probably about the year 1000, by Willigis, archbishop of Mainz, as a defense for the district, is celebrated in legend as the scene of the destruction by rats of the hardhearted Bishop Hatto in 969, the subject of one of Southey's bestknown ballads. Restored in 1856, the tower now serves as a beacon, warning ships, by means of a flag, if the Bingerloch is clear. The town is familiar to every one from the poem, "Bingen on the Rhine," so popular in schools.

Bingham, JOHN A., lawyer, b. in Mercer, Pa., in 1815; became a lawyer, and was elected to Congress from Ohio as a Republican and served from 1855-1863. He became judgeadvocate in the army, and in 1864 solicitor of the Court of Claims. He took part in the trial of Lincoln's assassins. He returned to Congress 1865-1873, and was one of the managers of the impeachment proceedings against Andrew Johnson. He was U. S. minister to Japan, 1873-1885.

**Bing'hampton**, Broome co., N. Y., on Susquehanna river. Railroads: Erie; D. L. & W. and branches; and D. H. C. Co. Industries: cigar factory, four flouring mills, and two foundries, carriage, comb, button, whip, shirt, cigar box, brush, chair, glass, sleigh, bicycle, and other factories. Surrounding country agricultural. The town was first settled in 1787 and became a city in 1867. Pop. est. 1897, 45,000.

**Bin nacle** (or bittacle), a case or box on the deck of a vessel near the steering apparatus, containing the compass and lights by which it can be read at night.

**Binoc'ular**, a field-glass or opera-glass, or a microscope suited for viewing objects with both eyes at once.

**Bino' mial**, in algebra, a quantity consisting of two terms or members, connected by the sign + or -. The *binomial theorem* is the celebrated theorem given by Sir Isaac Newton for raising a binomial to any power, or for extracting any root of it by an approximating infinite series.

**Bin'tang**, an island of the Dutch East Indies, at the s. extremity of the Malay Peninsula; area 468 sq. mi.; pop. 12,430; yields catechu and pepper.

**Bi'obio**, a Chilean river, rises in Lake Huchueltui, flows in a n. w. direction for 180 miles, and falls into the Pacific at the city of Concepcion. It gives name to a province of the country, with 100,000 inhabitants; area 4,158 sq. mi.

**Biogen** esis, the history of life development generally; specifically, that department of biological science which speculates on the mode by which new species have been introduced; often restricted to that view which holds that living organisms can spring only from living parents.

**Biog'raphy**, that department of literature which treats of the individual lives of men or women: and also, a prose narrative detailing the history and unfolding the character of an individual written by another. When written by the individual whose history is told, it is called an autobiography. This species of writing is as old as literature itself. In the first century after Christ Plutarch wrote his Parallel Lives; Cornelius Nepos, the Lives of Military Commanders; and Suctonius, the Lives of the Twelve Casars. Modern biographical literature may be considered to date from the seventeenth century, since which time individual biographies have multiplied enormously. Dictionaries of biography have proved extremely useful, Moreri's Dictionnaire Historique et Critique, 1671, being perhaps the first of this class. During the present century have been published the Biographie Universelle, 85 vols., 1811-62; Nouvelle Biographie Generale, 46 vols., 1852-66; Chalmers's General Biographical Dictionary, 32 vols., 1812-17; Rose's Biographical Dictionary, 12 vols., 1848-50; Leslie Stephen's Dictionary of National Biography, to be completed in about 50 volumes, the first of which appeared in January, 1885; and Appleton's Cyclopædia of Amer-ican Biography, 6 vols. (1887-1889).

Biology, a composite science embracing all the sciences which bear on the phenomena of life. We study life in the vegetable (see Botany) and animal (see *Zoology*) kingdoms; we study it as it is manifested in function (see *Physiology*), or in form (see Embryology, Anatomy, Comparative Anatomy, Morphology) or as it is seen responding to the great general laws which govern the movements of all matter throughout the universe (see Evolution). Up to the latter half of the eighteenth century, Biology was not recognized as an important science; nor was it considered possible to formulate laws which would be equally applicable to all forms and manifestations of life, whether animal or vegetable. Through the labors of Kant, Lamarck, E. and C. Darwin, Cuvier, von Baer and many others, but more than all, through the general tendency to inductive reasoning, which was the chief glory of the science of the century ending 1850, we now know it is possible to include all life under one broad definition, and that its laws are the same in whatever shape or function we find it. A good example of the difference between the immature biological thought of the early eighteenth century, and the more complete life-study of the present generation, is found by comparing Bichat's definition of life, as "the sum of all those forces that go to resist death"-a mere play upon words, ---with Herbert Spencer's deeply philosophical state-ment, that it is "the definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with ex-ternal co-existences and sequences."

It is apparent from the definition by Mr. Spencer just cited, that the essence of life is the ability to change the organism from time to time — or rather, continuously, — in order to bring it into more favorable relations to the environments from which it must derive its sustenance. When this ability to change ceases, death must immediately ensue through starvation of the tissues. The simplest form of life is represented in the protozoa, in which the functions of reproduction, respiration, ali-

mentation, circulation, secretion, are all carried on within the walls of a single cell. With increased complexity of life, comes aggregation into cell-masses with specialization of function, certain duties being assigned to certain cells. Thus we see arising more or less highly differentiated cell-groups, to which we give the names of organs, as heart, liver, brain, lungs, kidney, stomach, etc.; or systems, as digestive, genito, urinary, muscular, vascular, nervous, etc. In response to a demand for cells of the varying sizes, shapes, resistances, tensile and contractile strengths, nervous energy, storage or metabolic qualities, etc., required in a complex animal, we find developing tissues which make up the above mentioned specialized cell groups, as bone, muscle, epithelium, nerves, connective tissue, blood vessels, fut. gland, etc.; or among plants, where cell differentiation fails to reach the perfection found in animals, we still find the parent cell modifying itself in the bark, trunk, leaf, root, or flower. Out of those variations in form, which changing environments and increase in cell numbers have forced the cell mass to assume in order that it may nourish, protect, and reproduce itself, have arisen species, genera, orders, classes, subkingdoms, and probably the animal and vegetable kingdoms themselves. Cells, or cell aggregations, thus possessed of life are said to be organic, in contradistinction to mineral substances, which are not capable of intelligent change in correspondence with environments, and are therefore lifeless and inorganic. Inseparably associated with these cell-masses endowed with life and function, we find the ability to develop, to grow, to reproduce, and the inevitable necessity to decay. These processes seem to exist as phases in a vito-chemical cycle, during the early stages of which, assimilation, repair and growth are in the ascendant, but in which, beyond the acme marked by the consummation of the reproductive functions, secretion, waste, and decay constitute the order of the day, until presently, the life-endowed molecules part entirely with their power to lead an organic existence, and sink back into the inorganic world. It is probable that the ability to appropriate the unstable element nitrogen from the surrounding media, constitutes the essential difference between living and the non-living matter. It is a matter of observation that those tissues and organisms containing the greatest admixture of this element seem to be associated with the most intense manifestations of life

The cell is at the foundation of all life, and all manifestations of life, however complex, must be regarded as originating therein, and produced through the reaction between cell and environments. The law, "omnis cellulæ cellulæ" (all cells from one cell), formulates this fact which was first made clear by the researches of Schleiden in Botany, and Schwann in Zoology (1838-39). These researches were made possible through the development of the compound microscope, by means of which the anatomy and physiology of the cell may be studied. Through the study of cellular

Biology, the active principle of life has been found not alone in the cell but also in a definite constituent of the cell itself. Every cell is made up of a clear substance known as protoplasm, enclosed within a cell-wall. Floating in the protoplasm and nourishing itself from it, is a nucleus made up of fine granular particles, tending to arrange themselves into threads, and called, from the fact that they stain more readily than the clear substance surrounding them, chromatin granules and filaments. It is within these granules that the life of the cell, and therefore the life of the entire organism, is now thought to reside. For it has been observed that the chromatin originates all the phenomena of cell life, and that, when the nucleus with its contained chromatin is removed, the cell presently perishes. Notwithstanding these morphological and physiological observations, which are distinct additions to our biological knowledge, we cannot be said to stand to-day any nearer to the secret of the motive power of life than did Aristotlethe first true student of Biology. We study its manifestations of form and function, and formulate laws therefrom; but the propelling force is still as mysterious to the philosopher as to the child.

The following table shows the comprehensibility of Biology:

W. H. ALLPORT. Biot (bē-ō), JEAN BAPTISTE (1774-1862), French mathematician and physicist. He became professor of physics in the Collège de France in 1800, in 1803 member of the Academy of Sciences, in 1804 was appointed to the Observatory of Paris, in 1806 was made member of the Bureau des Longitudes, in 1809 became also professor of physical astronomy in the University of Paris. In connection with the measurement of a degree of the meridian he visited Britain in 1817. He is especially celebrated as the discoverer of the circular polarization of light.

**Birch**, a genus of trees which comprises only the birches and alders which inhabit North America, Europe, and Northern Asia. The common birch is indigenous throughout the n., and on high situations in the s. of Europe. It is extremely hardy, and only one or two other species of trees approach so near to the n. pole. The wood of the birch, which is light in color, and firm and tough in texture, is used for chairs, tables, bedsteads, and the woodwork of furniture generally, also for fish-casks and

### **Bird-catching Spider**

hoops, and for smoking hams and herrings, as well as for many small articles. In France wooden shoes are made of it. The bark is

Branch Common Birch, in Flower.

whitish in color, smooth and shining, separable in thin sheets or layers. Fishing-nets and sails are steeped with it to preserve them. In some countries it is made into hats, shoes, boxes, etc. In Russia the oil extracted from it is used in the preparation of accent to it. In and imparts the well-known scent to it. In the been made from it. The it is used in the preparation of Russian leather. Lapland bread has been made from it. sap, from the amount of sugar it contains, affords a kind of agreeable wine, which is produced by the tree being tapped during warm weather in the end of spring or beginning of summer, when the sap runs most copiously. The dwarf birch, a low shrub, two or three feet high at most, is a native of all the most northerly regions. The cherry-birch of America, and the black birch of the same country, produce valuable timber, as do other American species. The largest of these is the yellow birch which attains the height of 80 ft. It is named from its bark being of a rich yellow color. The paper birch of America has a bark that may be readily divided into thin sheets almost like paper. From it the Indian bark canoes are made.

Bird-catching Spider, a name applied to

Bird-catching Spider.

# Birds

gigantic spiders, more especially to one, a native of Surinam and elsewhere which preys upon insects and small birds which it hunts for and pounces on. It is about two inches long, very hairy, and almost black; its feet when spread out occupy a surface of nearly a foot in diameter.

**Birdlime**, a viscous substance used for entangling birds so as to make them easily caught, twigs being for this purpose smeared with it at places where birds resort. It is prepared from holly-bark, being extracted by boiling; also from the viscid berries of the mistletoe.

Bird of Paradise, the name for members of a family of birds of splendid plumage allied to the crows, inhabiting New Guinea and the adjacent islands. The family includes eleven or twelve genera and a number of species, some of them remarkably beautiful. The largest species is over 2 ft. in length. The king bird of paradise is possibly the most beautiful species, but is rare. It has a magnificent plume of feathers, of a delicate yellow color, coming up from under the wings, and falling over the

The Great Bird of Paradise.

back like a jet of water. The feathers of two other species are those chiefly worn in plumes. These splendid ornaments are confined to the male bird

**Birds** form the second class of the great division of vertebrate animals, the connecting link between the Mammalia and Reptilia, but are more closely allied to the latter. In common with the Mammalia they have warm blood, though of a higher and uniform temperature (8° to 12° higher), a heart with two auricles and two ventricles, and breathe by lungs; but differ from them in having feathers for a covering, two feet, wings, by means of which most of them are enabled to fly, a horny bill, and reproduction by eggs. The feathers, the development of which resembles essentially that of hair, constitute appendages of a unique kind, as being developed only in connection with the bird-class. The under-plum-

age of most birds is formed by a thick coating of small shaftless feathers, embedded in the skin and called down. Various names are given to feathers according to their position; thus the long quills on the part of the wing corresponding to the hand are called primaries, those on the lower fore-arm secondaries, and those on the upper part of the fore-arm *tertiaries*, those on the shoulder-blade and humerus scapulars. The feathers covering the bases of the wingquills are called wing-coverts, and those covering the rectrices, or great feathers of the tail, tail-coverts. Birds molt or renew their feathers periodically, and in many cases the winter plumage displays a different coloring from the summer plumage. The plumage in most cases is changed frequently before it attains its characteristic and full-grown state.

The mouth of birds takes the form of a beak or bill; the jaws or mandibles are hard and horny, and more or less prolonged into a point, while there are no fleshy lips and no teeth (except in certain fossil birds); a horny sheathing, generally smooth, but sometimes serrated, takes the place of the latter. The beak is variously modified in accordance with the habits of the bird and the nature of the food on which it subsists. The sense of taste is not keen, their tongue being generally slender, pointed, and more or less horny, though some birds, as the parrots, have it fleshy. The nostrils open upon the side, or at the base of the beak. Their sense of smell is often very delicate. A circle of naked skin called the cere in many birds surrounds the base of the mandibles. The sight of birds is extremely keen, and equally adapted for near and for distant objects. A peculiar feature in the eye is the nictitating membrane, a sort of third translucent eyelid which rests in the inner angle of the eye, but can be drawn over it so as to protect from too strong a light. Birds have no external ear, with the exception of the nocturnal tribes; these have a large exterior conch in the form of a thin leathery piece of flesh. The internal ear is very large,

and the sense of hearing very quick. The bone-tissue of birds is light and com-pact. The bones are whiter and contain a larger proportion of phosphate of lime than those of the Mammalia and lower vertebrates. The bones of most birds are *pneumatic*; that is, contain air instead of marrow, to adapt them for flight; the air being admitted by means of special apertures which are connected with certain sacs, termed air-cells, filled with air from the lungs. In many birds, however, the long bones are filled with marrow, as are also all the bones of young birds. The humeri, cranial bones, and sternum are most generally pneumatic, the femora more rarely so. The vertebræ vary considerably in number in dif-ferent species. The neck is always more or less elongated and flexible, and consists of from 9 to 23 vertebræ. The dorsal region, or region of the back, is composed of from 4 to 9 vertebræ, and is generally firm, forming a sup-port for the movements of the wings. In all birds the neck is of sufficient length to reach

the oil-gland situated at the tail, the secretion of which is used for "preening" or dressing The vertebræ interposed bethe feathers. tween the dorsal vertebræ and those of the tail are united to form the sacrum, the number of vertebræ which may thus coalesce varying from 9 to 20. The caudal or tail vertebræ may number ten, the last two or more of which unite to form a bone, called from its shape "plowshare" bone. In some species this bone is absent, undeveloped, or modified. The bones of the skull become firmly united at an early period, so as to leave few or no sutures or lines of union, as in mammals, a complete bony case being thus formed. The skull is joined, as in reptiles, to the spinal column by a single process, or condyle, of the occipital bone or hindermost bone of the skull. The chest or thorax is enclosed posteriorly by the dorsal vertebræ, laterally by the ribs, and in front by the sternum or breast-bone and the sternal ribs. The ribs correspond in number with the dorsal vertebræ, from 6 to 9 pairs of ribs being thus found in birds, the first two being generally unattached, that is, they do not reach the sternum in front. The sternum is large and strong, and serves as the point of attachment for the most powerful of the muscles by which the wings are set in motion. It is provided with a medial crest or keel, which is most prominent in the birds of most powerful flight, and is altogether absent in the ostrich and cassowary, birds which do not fly. Upon the upper or anterior portion of the sternum the coracoid bones are borne, which form the chief supports of the fore-limbs. At its upper portion each coracoid bone articulates with the scapula or shoulder-blade, and with one of the clavicles. The clavicles, or collarbones are united in most birds to form the furculum or merry-thought. The wing of the bird exhibits the essential skeletal elements found in the fore-limb of all other vertebrates. The humerus, or bone of the upper arm, is generally short; the fore-arm, composed of the radius and ulna, being the longest segment of the fore-limb. The ulna is larger and better developed than the radius, which is slender and attenuated. In the bones which form the extremity of the wing we recognize the rudiments of a thumb and two fingers, one of which has two phalanges and the other only one. The femur or thigh is short, the tibia or shin bone forming the chief element in the leg; while the fibula is attenuated and generally ossified to the tibia. The toes generally number four; the hallux, or great toe, when present, being composed of two phalanges, and the other toes of three, four, and five phalanges respectively. The muscles of birds are firm and dense, and are generally colored deep red. The chief body-muscles are the pec-torals, or those of the breast, which are devoted to the movements of the wings.

There are three stomachs or stomachic dilatations in birds: the first is the *crop*, a considerable pouch attached to the *asophagus* or *gullet*; then the *ventriculus succenturiutus*, a slight dilatation of the *asophagus*, with thick and
glandular walls; then immediately after this is the gizzard, a strong and muscular cavity. In granivorous birds the crop is large, and serves as a reservoir for the seeds swallowed by them, which are here moistened by a secretion before passing into the gizzard. In these birds the gizzard is extremely strong, having to perform the task of grinding down the hard substances subjected to its action, a process which is facilitated by the small stones which these birds generally swallow. The ventriculus secretes the gastric juice, and so far represents a real stomach. In birds which live on flesh or fish the gizzard is weaker and less distinct from the ventriculus, while the crop becomes smaller, and in some species completely dis-appears. The intestinal canal is relatively smaller than in Mammalia and presents fewer circumvolutions. It terminates in an opening called the *cloaca*, which is also the common termination of the ureters and oviduct. The liver is generally large, and colored a distinct brownish hue, which is deepest in aquatic birds. A gall-bladder is absent in a few cases only, as in the ostrich, pigeons, and some parrots. The kidneys are two in number, of large size and elongated shape. The spleen is usually of small size, rounded or oval, but may also be elongated, or broad and flattened. The heart is highly muscular, four-chambered; the blood, deep red in color, circulates rapidly and vigorously. The lungs are confined to the back portion of the body, and are attached to the ribs, instead of being free, as in Mammalia. They are not divided into lobes, and are usu-ally of a bright red color. They are enveloped in a membrane pierced with large holes which permit the air to pass into the cav-ities in the breast and in the abdomen, and, in some species, even into the interior of the bones. The trachea or windpipe is of great relative length in birds, and is adapted to the length of the neck. The nervous system evinces a marked superiority over that of reptiles. The cerebrum, or true brain, is larger than in the latter, but its surface is not convoluted, as in most Mammalia. The eggs are hatched by the process of incubation. Very great differences exist in the size, form, and number of eggs which may be produced by birds, and in the time required for their hatching. The varieties of nests in which they are deposited, as to mode and materials used in construction, are endless.

Many birds migrate at certain seasons from one country to another, and a recent report on migration shows, that with very few exceptions, there is scarcely a bird of either the palæarctic or nearctic regions that is not, to a greater or less degree, migratory in some part or other of its range. See *Migration*.

As for the classification of birds many systems have been proposed. A common division is into seven orders, to which an eighth, the *Saururae* of Huxley, is often added, to include the extinct archæopteryx. These orders are:—

Order I.—RAPTORES (or Accipitres). Birds of prey, as eagles, vultures, hawks, and owls. Beak strong and curved, sharp at the edges.

Feet adapted for seizing and destroying other animals. Claws sharp, much hooked, and retractile. Hind toe on the same level with the others. Wings well developed. Order II.—INSESSORES (*Passeres*), or perching

Order 11.—INSESSORES (*Passeres*), or perching birds, by far the most numerous order. It includes all the singing birds, and indeed excluding the birds of prey, most birds which live habitually among trees. Feet formed for grasping and perching, claws moderately curved and not retractile. Hind toe on the same level as the rest. This order is usually divided into four *tribes* or sub-orders: conebilled; tooth-billed; slender-billed; cleft-billed.

Order III. — SCANSORES (or Zygodactyk). Climbing birds, as the parrots, woodpeckers, cuckoos, toucans, etc. Feet formed for climbing, two of the toes directed forward and two backward; powers of flight not in general great; bill variously shaped.

Order IV.--RASORES (or *Galling*). Domestic fowls, pheasants, pigeons, etc. Legs large and strong. Feet with the hind toe situated above the heel, suited for scratching. Bill short, thick, and arched above.

Order V.—CURSORES (or *Struthionidæ*). Running birds, as the ostrich, emu, cassowary, etc. Wings rudimentary, and quite useless for flight; legs long and strong; hind toe wanting or merely rudimentary; breast-bone without a ridge or keel.

Order VI. — GRALLATORES (or *Gralla*). Waders, as the cranes, herons, snipes, sandpipers, etc. Legs long, bare of feathers from above the knee; toes often half-webbed. Bill in general long and slender.

Order VII.—NATATORES (or *Palmipedes*). Swimmers: web-footed birds, as ducks, geese, gulls, etc. Feet formed for swimming, in general webbed, that is the toes connected by a membrane. Hind toe elevated above the plane of the others. Bill various, mostly flattened.

Mr. Sclater (partly following Huxley and others) has proposed a system of classification which has met with much acceptance, and is based partly on external, partly on internal features. Regarding the class Aves as divided into two subclasses, *Carin tia* and *Ratilia*, the former containing all birds that have a prominent keel on the sternum (Lat. *carina*), the latter having the sternum flat and raft-like (Lat. *ratis*, a raft), he divides the former into 23 and the latter into 3 orders, thus:—

CARINATE.—1. PASSERES, with four suborders (including more than half of all known birds, and substantially corresponding with the older order Passers, or Insessores). 2. PIC-ARLE, with six sub-orders (woodpeckers, swifts, goat-suckers, trogons, toucans, cuckoos, etc.) 3. PSITACCI (parrots). 4. STRIGES (owls). 5. Ac-CIPITRES (eagles, hawks, vultures, and other diurnal birds of prey). 6. STEGANOPODES (pelican, cormorant, gannet, etc.). 7. HERODIONES (herons, storks, bittern, etc.). 8. ODONTOG-LOSSÆ (flamingoes). 9. PALAMEDEÆ (screamers). 10. ANSERES (geese, ducks, swans). 11. COLUMBÆ (pigeons). 12. PTEROCLETES (sand-grouse). 13. GALLINÆ (fowls, partridges,

pheasants, grouse, etc.). 14. OPISTOHOCOMI (includes only one bird, the hoatzin). 15. HEMIFODII (hemipodes, a small group). 16. FULICARIÆ (rails, coots, etc.). 17. ALEC-TORIDES (cranes, bustards, trumpeter). 18. LIMICOLÆ (snipe, woodcock, curlew, plover, etc.). 19. GAVIÆ (gulls). 20. TUBINARES (petrels). 21. PYGOFODES (divers, auks, grebes). 22. IMPENNES (penguins). 23. CNYFURI (tinamous). Sub-class RATITÆ.—24. APTERYGES (apteryx). 25. CASUARII (cassowary and emu). 20. STRUTHIONES (ostrich, rhea).

Birds are not numerous as fossil organisms. Among the most important and interesting bird fossils we at present possess are the two specimens of archæopteryx found in the slatequarries of Solenhofen, Bavaria. This bird differed from all existing birds in the elongated reptilian nature of its tail, which was composed of simple vertebræ, each bearing a single pair of quill-feathers. It had also teeth. They certainly tend to prove the evolution of birds from reptiles. Other two most interesting fossil birds are the ichthyornis and the hesperornis, both found in the cretaceous formation of North America and both provided with teeth; but while the former must have had powerful wings the latter was quite wingless.

**Bird's-eye-l'laple**, curled maple, the wood of the sugar-maple when full of little knotty spots somewhat resembling bird's eyes, much used in cabinet-work.

**Bird's-nest**, a name popularly given to several plants, as, Indian pipe or bird's-nest, a yellowish-white plant, common in woods from Canada to Georgia and west to Illinois.

Birds'-nests, Edible, the nests of the salangane and other species of swifts (or swiftlets) found in the Indian seas. They are particularly abundant in the larger islands of the Eastern Archipelago. The nest has the shape of a common swallow's nest, is found in caves, particularly on the seashore, and has the appearance of fibrous, imperfectly concocted isinglass. When procured before the eggs are laid the nests are of a waxy whiteness and are then esteemed most valuable; when the bird has laid her eggs they are of second quality; when the young are fledged and flown, of third quality. They appear to be composed of a mucilaginous substance secreted by special glands, and not, as was formerly thought, made from a glutinous marine fucus or seaweed. The Chinese consider the nests as a great stimulant and tonic, and it is said that about  $8\frac{1}{2}$  millions of them are annually imported into Canton.

Birds of Passage, birds which migrate with the season from a colder to a warmer, or from a warmer to a colder climate, divided into summer birds of passage and winter birds of passage. Such birds always breed in the country to which they resort in summer; l. e., in the colder of their homes. In America the robin is a familiar example.

Bi'ren (or Bi'ron), ERNEST JOHN VON (1687-1772), duke of Courland. He gained the favor of Anna, duchess of Courland and niece of Peter the Great of Russia, and when she ascended the Russian throne (1730) Biren was loaded by her with honors, and introduced at the Russian court. He was made duke of Courland in 1737, and continued a powerful favorite during her reign, freely indulging his hatred against the rivals of his ambition. On the death of Anna he became regent, but he was exiled to Siberia in 1741. On the accession of Elizabeth to the throne she permitted his return to Russia, and in 1763 the duchy of Courland was restored to him.

**Bir'kenhead**, a town of England, in Cheshire, on the estuary of the Mersey, opposite Liverpool. It has commodious docks with a lineal quay space of over nine miles, and a complete system of railway communication for the shipment of goods and direct coaling of steamers. The principal industries are ship-building and engineering. Its commerce is in all respects a branch of that of Liverpool. The communication with Liverpool is by large steamboats and by a railway tunnel under the bed of the Mersey 44 miles long including the approaches, 21 feet high, 26 feet wide, the roof being about 30 feet below the bed of the river; cost \$6,250,000. Pop. 99,857.

**Birmingham**, Jefferson co., Ala., and the most important seat of the iron industry in the South, is 95 mi. n.n.w. of Montgomery, with foundries, mills, factories, and machine shops; iron has developed its growth from 3,000 in 1880 to 26,178 in 1890. Its property is over \$35,000,000.

**Bir' mingham**, a great manufacturing city of England, in the county of Warwick, 112 mi. n.w. of London, and 97 s.e. of Liverpool. It is the principal seat of the hardware manufacture in Britain, producing metal articles of all kinds from pins to steam engines. It manufactures fire-arms in great quantities, swords, jewelry, buttons, tools, steel pens, locks, lamps, bedsteads, gas-fittings, sewing machines, articles of papier-maché, railway carriages, etc. The quantity of solid gold and silver plate manufactured is large, and the consumption of these metals in electroplating is very great. Japanning, glass manufacturing, and glassstaining or painting form important branches of industry, as also does the manufacture of chemicals. Pop. 478,113.

**Bir' nam,** a hill in Perthshire, Scotland, 1,324 feet high, once covered by the royal forest immortalized by Shakespeare in Macbeth.

**Birs Nimrud**, a famous mound in Babylonia, on the west side of the Euphrates, 6 mi. s.w. of Hillah, generally identified as the remains of the Tower of Babel.

**Bis'cay**, a province of Spain near its n.e. corner, one of the three Basque provinces (the other two being Alava and Guipuzcoa); area 850 sq. mi.; pop. 235,659. The surface is generally mountainous; the most important mineral is iron, which is extensively worked; capital, Bilbao.

**Biscay**, Bay of, that part of the Atlantic which lies between the projecting coasts of France and Spain, extending from Ushant to Cape Finisterre, celebrated for its dangerous navigation.

Biscuit (bis'ket) (Fr. "twice baked"), a kind of hard, dry bread which is not liable to spoil when kept. Biscuits are either fermented or unfermented, the kinds in ordinary use being generally fermented, while the unfermented biscuit is much used at sea, and hence called sea-biscuit. More than a hundred different sorts of biscuit are manufactured, and owing to the immense demand manual labor has long since been superseded in the larger works by machinery. In making sea-biscuit the flour is mixed with water, converted into dough by a revolving shaft armed with knives, kneaded with rollers, cut, stamped, conveyed on a framework drawn by chains through an oven open at both ends, and thence passed to a drying room—all without being touched by hand. Two thousand lbs. weight of biscuits can thus be turned out of a single oven in a day of 10 hours. In many fancy biscuits the process is of course more elaborate, but even in these, machinery plays an important part. Sea-biscuit should continue sound for 18 months or two years; its nutritive properties are to those of bread as 18 to 24. Meat biscuits are made of flour mixed with the soluble elements of meat. The popular American name for most varieties of biscuits is crackers.

**Biscuit**, in pottery a term applied to porcelain and other earthenware after the first firing and before glazing. At this stage it is porous and used for wine-coolers, etc.

**Bishop,** SIR HENRY ROWLEY (1780-1855), English musical composer. From 1800, when his first opera, *The Circassian Bride*, was produced at Drury Lane, until his masque, *The Fortunate Isles*, written to celebrate Queen Victoria's marriage, he composed about a hundred works for the stage.

**Bis'kara** (or Biskra), a town, Algeria, the chief military post of the Sahara, with an important caravanserai. Pop. 8,000.

Bismarck, capital of North Dakota. Pop. 2,260.

**Bismarck Archipelago**, the name given by the Germans to New Britain, New Ireland, and other islands adjoining their portion of New Guinea.

Bismarck-Schönhausen (bis' märk-sheun'hou-zén), OTTO EDUARD LEOPOLD, Prince, one of the greatest statesmen of the nineteenth century; b. of a noble family of the "Mark' (Brandenburg), at Schönhausen, April 1, 1815; studied at Göttingen, Berlin, and Greifswald; entered the army and became lieutenant in the Landwehr. After a brief interval devoted to his estates and to the office of inspector of dikes, he became in 1846 a member of the provincial diet of Saxony, and in 1847 of the Prussian diet. In 1851 he was appointed representative of Prussia in the diet of the German Federation at Frankfort, where with brief interruptions he remained till 1859, exhibiting the highest ability in his efforts to checkmate Austria and place Prussia at the head of the German states. From 1859-62 he was am bassador at St. Petersburg, and in the latter year, after an embassy to Paris of five months' duration, was appointed first minister of the Prussian crown. The Lower House persistently refusing to pass the bill for the reorganization of the army. Bismarck at once dissolved it (October, 1862), closing it for four successive sessions until the work of reorganization was complete. When popular feeling had reached its most strained point, the Schleswig-Holstein question acted as a diversion, and Bismarckby the skillful manner in which he added the duchies to Prussian territory, checkmated Austria, and excluded her from the new German confederation, in which Prussia held the first place—became the most popular man in Germany. As chancellor and president of the Federal Council he secured the neutralization Luxemburg in place of its cession by ദ് Holland to France; and though in 1868 he withdrew for a few months into private life he resumed office before the close of the year. A struggle between Germany and France appearing to be sooner or later inevitable, Bismarck, having made full preparations, brought matters to a head on the question of the Hohenzollern candidature for the Spanish throne. Having carried the war to a successful issue, he became chancellor and prince of the new German empire. Subsequently, in 1872, he alienated the Roman Catholic party by promoting adverse legal measures and expelling the Jesuits. He then resigned his presidency for a year, though still continuing to advise the Toward the close of 1873 he reemperor. turned to power, retaining his position until, in March, 1890, he disagreed with the emperor and tendered his resignation. In 1878 he presided at the Berlin Congress, in 1880 at the Berlin Conference, and in 1884 at the Congo or Colonial Conference. He retired from the chancellorship in 1890, and since has been attending to his private affairs. In March, 1895, Emperor William II visited him on the occasion of the grand celebration of the old "Iron Chancellor's" eightieth birthday.

**Bis'muth**, a metal of a yellowish or reddish-white color, and a lamellar texture. It is somewhat harder than lead and not malleable, when cold being so brittle as to break easily under the hammer, so as to be reducible to powder. Its internal face or fracture exhibits large shining plates variously disposed. It fuses at 476 F., and expands considerably as it hardens. It is often found in a native state,

crystallized in rhombs or octahedrons. or in the form of dendrites. or thin laminæ investing the ores of other metals. particularly

Native Bismuth and Crystal.

cobalt. Bismuth is used in the composition of pewter, in the fabrication of printers' types, and in various other metallic mixtures. Eight parts of bismuth, 5 of lead, and 3 of tin, constitute the fusible metal sometimes called Newton's, from the discoverer, which melts at 2029 F., and may be fused over a candle in a piece of stiff paper without burning the paper. It forms the basis of a sympathetic ink; and a derivative from it is used in medicine. A special feature of interest is its diamagnetic property. The subnitrate or basic nitrate of bismuth is used as a paint and as a cosmetic, and is known as *Pearl White* or *Pearl Powder*.

Bi'son, the name applied to two species of One of these, the European bison or OX. aurochs is now nearly extinct, being found only in the forests of Lithuania and the Cau-The other, or American bison, imcasus. properly termed buffalo, was found only in the region lying north and south between the Great Slave Lake and the Yellowstone River, and in parts of Kansas and Texas, and has almost become extinct in the wild state, though formerly to be met with in immense herds. The two species closely resemble each other, the American bison, however, being for the most part smaller, and with shorter and weaker hind quarters. The bison is remarkable for the great hump or projection over its fore shoulders, at which point the adult male is almost six feet in height; and for the long, shaggy, rust-colored hair over the head, neck, and forepart of the body. In summer, from the shoulders backward, the surface is covered with a very short fine hair, smooth and soft as velvet. The tail is short and tufted at

American Bison.

the end. The American bison used to be much hunted for sport as well as for its flesh and skin. Its flesh is rather coarser grained than that of the domestic ox, but was considered by hunters and travelers as superior in tenderness and flavor. The hump is highly celebrated for its richness and delicacy. Their skins, especially that of the cow, dressed in the Indian fashion, with the hair on, make admirable defenses against the cold, and are known as buffalo robes; the wool has been manufactured into hats and a coarse cloth. The American bison has been found to breed readily with the common ox, the issue being fertile among themselves. The construction of the transcontinental railroads and the great extent to which they have been hunted has caused the almost complete extinction of the bison. Today the farmer plows where twenty years ago a million buffaloes wallowed. A few herds are in private possession and a herd is preserved in the Yellowstone National Park.

**Bisque** (bisk), a kind of unglazed white porcelain used for statuettes and ornaments.

**Bissell**, WILLIAM H. (1811-1860), b. near Cooperstown, N. Y., d. at Springfield, Ill. He practised medicine and afterward law. was a member of the legislature of Illinois in 1840, served in the Mexican War, and took a prominent part in the battle of Buena Vista. He served in Congress as an independent Democrat, 1849-55, but left the Democratic party over the Kansas-Nebraska bill, and was elected governor of Illinois as a Republican in 1856. He was reëlected but d. before his term expired. Jefferson Davis at one time challenged Bissell, but when the latter promptly accepted and named muskets at short range as the weapons, Mr. Davis backed down.

**Bissell**, WILLIAM S., American statesman, b. in Rome, N. Y., 1847, graduated at Yale College, 1869. He was Grover Cleveland's law partner when the latter became mayor of Buffalo. His reputation is that of a railroad attorney. President Cleveland appointed him postmaster general in 1893. He resigned in 1895.

**Bistre** (or bister), a warm brown pigment, a burned oil extracted from the soot of wood, especially beech. It furnishes a fine transparent wash, but is chiefly employed in the same fashion as sepia and Indian ink for monochrome sketches.

Bit, the part of a bridle which goes into the mouth of a horse, and to which the reins are attached. Also one of the movable boring tools used by means of the carpenter's brace. There is a great variety of forms, to which special names are given.

**Bithoor** (*bit-hör'*) (Bithur or Bittoor), a town, India, n.w. provinces, 12 mi. n.w. of Cawnpore, on the Ganges, long the abode of a line of Mahratta chiefs, the last of whom died without issue in 1851. His adopted son, Nana Sahib, who claimed the succession, was the instigator of the massacre at Cawnpore. Pop. 6,685.

Bithyn ia, an ancient territory in the n.w. of Asia Minor, on the Black Sea and Sea of Marmora, at one time an independent kingdom, latterly a Roman province. The cities of Chalcedon, Heraclea, Nicomedia, Nicæa, and Prusa were in Bithynia. In the eleventh century it was conquered by the Seljuks, and in 1298 a new kingdom was founded there by the Ottoman Turks, of which, prior to the capture of Constantinople, Prusa (Broussa) was the capital.

**Biton** to, a town, Italy, province of Bari, the seat of a bishop, with a handsome cathedral. The environs produce excellent wine. Pop. 27,060. Here, in 1734, the Spaniards won a victory over the Austrians which deeided the fate of Naples.

Bitter-ash, a tree, native of the West Indies, the bark of which is used as a tonic. Others of the same genus have also the same name, a species of Jamaica having wood almost as bitter as quassia, and being called Jamaica quassia.

Bitter-gourd, a plant, called also Colocynth. Bitter-king, a tree of the quassia order pe-

# Bittern

culiar to the Moluccas and Fiji Islands, the root and bark of which, bruised and macerated, are used in the East as an emetic and tonic.

Bit'tern, the name of several wading birds of the heron family. The common bittern is about 28 in. in length, about 44 in extent of wing; general color, dull yellowish-brown, with spots and bars of black or dark brown; feathers on the breast long and loose: tail short, bill about 4 in. long. It is remarkable for its curious booming or bellowing cry, from which come the provincial names of miredrum and butterbump, etc. The eggs (greenish-brown) are four or flve in number. The little bittern is not more than 15 in. in length. The American bittern has some resemblance to the common European bittern, but is smaller.

The Common Bittern.

**Bittern**, the syrupy residue from evaporated sea water after the common salt has been taken out of it. It is used in the preparation of Epsom salt (sulphate of magnesia), of Glauber's salt (sulphate of soda), and contains also chloride of magnesium, iodine, and bromine.

chloride of magnesium, iodine, and bromine. Bitter-nut, a tree of North America, of the walnut order, the swamp hickory, which produces small and somewhat egg-shaped fruits, with a thin, fleshy rind; the kernel is bitter and uneatable.

**Bitter-root**, a plant of Canada and part of the U. S., so called from its root being bitter though edible, and indeed esteemed as an article of food by whites as well as Indians. From the root, which is long, fleshy, and tapering, grow clusters of succulent green leaves, with a fleshy stalk bearing a solitary rose-colored flower rising in the center, and remaining open only in sunshine. Flower and leaves together, the plant appears above ground for only about six weeks. Californian bitter-root and Natal bitter-root both belong to the gourd family. Bitters, a liquor (frequently spirituous) in which bitter herbs or roots have been steeped. Gentian, quassia, angelica, bog bean, chamomile, hops, centaury, etc., are all used for preparations of this kind. The well-known Angostura bitters have aromatic as well as bitter properties. Bitters are employed as stomachics, anthelmintics, etc.

**Bitter-spar** (rhomb-spar), the crystallized form of dolomite or magnesian limestone.

**Bitter-wood**, the timber of two trees noted for the extreme bitterness of the wood. The name is also given to other bitter trees, as the bitter-ash.

Bitu'men, a mineral substance of a resinous nature, composed principally of hydrogen and carbon, and appearing in a variety of forms which pass into each other and are known by different names, from naphtha, the most fluid, to petroleum and mineral tar, which are less so, thence to maltha or mineral pitch, which is more or less cohesive, and lastly to asphaltum and elastic bitumen (or elaterite), which are solid. It burns like pitch, with much smoke and flame. It consists of 84 to 88 of carbon and 12 to 16 of hydrogen, and is found in the earth, occurring principally in the secondary, tertiary, and alluvial forma-tions. It is a very widely spread mineral, and is now largely employed in various ways. As the binding substance in mastics and cements it is used for making roofs, arches, walls, cellar-floors, etc., water-tight, for street and other pavements, and in some of its forms for fuel and for illuminating purposes. The bricks of which the walls of Babylon were built are said to have been cemented with bitumen, which gave them unusual solidity.

**Bituminous Shale** (or Schist), an argillaceous shale impregnated with bitumen and very common in the coal measures. It is largely worked for the production of paraffin, etc.

Bi'valves, molluscous animals having a shell consisting of two halves or valves that open by an elastic hinge and are closed by muscles; as the oyster, clam, mussel, cockle. etc.

Longitudinal Section through a Fresh-water Mussel.

a, edge of mantle; b, foot, with position of ganglion indicated; c, gills: d, mouth; c, tentacles or palps; f, posterior adductor muscle; g, anterior adductor; h, head-ganglion; f, ventricle of heart; f, auricle of heart; k, rectum; l, kidney; m, exhalent aperture; n, inhalent aperture.

Bivouac

Several Forms of Bivalves.

**A.** Avicula; **B.** Pectunculus, with extended foot (a); C. Venus, with respiratory siphons (a, b) and extended foot (c); D. Mya truncata, showing respiratory siphons (a, b) and foot (c).

**Bivouac** (biv'u-ak), the encampment of soldiers in the open air without tents, each remaining dressed and with his weapons at hand. It was the regular practise of the French revolutionary armies, but is only desirable where great celerity of movement is required.

**Bijörnson**, BJÖRNSTJERNE (byeurn'styer-ne byeurn'son), Norwegian novelist, poct, and dramatist, b. 1832. He entered the University of Christiania in 1852, and became known as a contributor of articles and stories to newspapers and as a dramatic critic. From 1857 to 1859 he was manager of the Bergen theater, producing during that time his novel Arne, and his tragedy of Halte Hulda. He was at Christiania part editor of the Aftenblad in 1860 became editor of the Norsk Folkellad. In 1869-72 he was co-director of a Copenhagen periodical, and much of his later life has been passed abroad. Among his tales and novels a number of which may be had in English, are: Synnare Solbakken; Arne; The Fishermaiden; A Happy Boy; Ruilways and Churchyards. Among his dramatic pieces are: The Newly Married Couple; Mary Stuart in Scotland; A Bankruptcy, etc. He has also written poems and songs.

etc. He has also written poems and songs. Black, the negation of all color, the opposite of white. There are several black pigments, such as *icory-black*, made from burned ivory or bones; *lamp-black*, from the smoke of resinous substance; Spanish-black or cork-black, from burned cork, etc.

**Black,** JEREMIAN SULLIVAN (1810-1883), born in Somerset co., Pa. After receiving a good education, Jeremiah studied law, was admitted to the bar in 1831, and made prosecuting attorney of Somerset co. In 1842 he was raised to the bench and made judge of his district, and became chief justice in 1851. In 1857 he was called to the cabinet by President Buchanan as attorney general. He succeeded General Cass as secretary of state in December, 1860, and held this place until the close of Buchanan's administration. He became reporter of the U. S. Supreme Court for a short time, after which he returned to the practise of his profession in York, Pa. He was one of the counsel against President Johnson. Among his noted cases were the Vanderbilt will case, the Milliken case, and the McGarrahan claim. He was a member of the Pennsylvania constitutional convention in 1873.

**Black**, JOSEPH (1728-1799), a distinguished Scotch chemist. In 1756 he was appointed professor of medicine and lecturer on chemistry at Glasgow, and at Edinburgh in 1766. His fame, however, chiefly rests on his theory of "latent heat."

Black, WILLIAM, novelist, b. in Glasgow in 1841. His first novel, Love or Marriage, was moderately successful, but his In Silk Attire, Kilmeny the Monarch of Mincing Lane, and especially A Daughter of Heth, gained him an increasingly wide circle of readers. His later works are The Strange Adventures of a Phaeton, A Princess of Thule, Three Feathers, Green Pastures and Piccadilly, Macleod of Dare, White Wings, The Beautiful Wretch, Judith Shakespeare, The Strange Adventures of a House-Boat, etc.

**Black' bird,** called also the *merle*, a wellknown species of thrush, common in England. It is larger than the common thrush, its length being about 11 inches. The color of the male is a uniform deep black, the bill being an orange-yellow; the female is of a brown color, with blackish-brown bill. The nest is usually in a thick bush, and is built of grass, roots, twigs, etc., strengthened with clay. The eggs,

#### Blackbird.

generally four or five in number, are of a greenish-blue, spotted with various shades of brown. The song is rich, mellow, and flutelike, but of no great variety or compass. Its food is insects, worms, snails, fruits, etc. The blackbirds or crow-blackbirds of America are quite different from the European blackbird, and are more nearly allied to the starlings and crows. The red-winged blackbird, belonging to the starling family, is a familiar American bird that congregates in great flocks.

**Black' burn**, a manufacturing town of England, in the county of Lancaster, 21 mi. n.n.w. from Manchester. Blackburn is one of the chief seats of the cotton manufacture, there being upward of 140 mills as well as works for making cotton machinery and steam engines. The cottons made in the town and

# Blackburn

vicinity have an annual value of about \$25,-000,000. Pop. 120,064.

**Blackburn**, JOSEPH CLAY STYLES, b. in Woodford co., Ky., 1838; practised law in Chicago 1858-60. He entered the Confederate army in 1861, and served through the Civil War. He was elected to the Kentucky legislature 1871 and 1873, and in 1875 entered Congress as a Democrat, was re-elected up to 1882, and in March, 1885, became U. S. senator, which position he held until 1897, when he was succeeded by Deboe.

**Blackcap**, a European bird of the warbler family, 6 in. long, upper part of the head black, upper parts of the body dark gray with a greenish tinge, under parts more or less silvery white. The female has its hood of a dull rust color. The blackcap is met with in

#### Blackcap.

England from April to September. Its nest is built near the ground; the eggs, from five to six, are reddish-brown, mottled with a deeper color. It ranks next to the nightingale for sweetness of song. The American blackcap is a species of titmouse, so called from the coloring of the head.

**Blackfeet Indians**, a tribe of Indians, partly inhabiting the U. S., partly Canada, from the Yellowstone to Hudson's Bay.

**Blackfish** (or tautog), a fish caught on the American coast, especially in the vicinity of Long Island, whence large supplies are obtained for the New York market. Its back and sides are of a bluish or crow black; the under parts, especially in the males, are white. It is plump in appearance, and much esteemed for the table, varying in size from 2 to 12 lbs. Another fish, found in the Mediterranean and on the coasts of Western Europe, is also called blackfish. It belongs to the mackerel family. In Scotland the term is applied to foul or newly-spawned fish. In America two species of small whale also get this name.

**Black Fly**, the name of two flies whose bite is very troublesome to man and beast in the northern states and Canada.

northern states and Canada. Black Forest, a chain of European mountains in Baden and Würtemburg, running almost parallel with the Rhine for about 85 mi. The Danube, Neckar, Kinzig, and other streams rise in the Black Forest, which is rather a chain of elevated plains than of isolated peaks; highest summit, Feldberg, 4,900 feet. The principal mineral is iron, and there are numerous mineral springs. The forests are extensive, chiefly of pines and similar species, and yield much timber. The manufacture of wooden clocks, toys, etc., is the most important industry, employing about 40,000 persons. The inhabitants of the forest are quaint and simple in their habits, and the whole district preserves its old legendary associations.

**Black Gum**, an American tree yielding a close-grained, useful wood; fruit a drupe of blueblack color, whence it seems to get its name of "black"; it has no gum about it. It is called also pepperidge, and has been introduced into Europe as an ornamental tree. Black Hawk (1767-1838), a chief of the Sac

and Fox tribes of Indians, b. in Kaskaskia, Ill., d. on the Des Moines River. He became a trusted brave and a successful chieftain in conducting sorties against the Osage and Cherokee tribes. He was grand-chieftain of the Sacs in 1788. In 1804 the Sacs and Foxes agreed to cede to the U.S. lands extending about 800 miles along the Mississippi River. This contract Black Hawk repudiated, and claimed that the chiefs had been made drunk before they signed the documents. During the War of 1812 Black Hawk, tempted by British agents, joined the enemy with about 500 warriors; but soon retired from British service. In 1823 most of the Sacs and Foxes, under the leadership of Keokuk, removed to their reservation beyond the Mississippi River: but Black Hawk, with part of the tribe, re-fused to emigrate. Early in 1832 Black Hawk, with a band of Indians, crossed the Mississippi River, but, after several encounters, the Indians were defeated, and Black Hawk and his two sons became captives. The three were confined in Fortress Monroe until 1833. Later Black Hawk was succeeded by Keokuk.

**Blackheath**, a village and heath, England, Kent, about 6 mi. s.e. of London Bridge. The *heath* contains about 70 acres within its present limits, and is much resorted to by pleasure partics. It has been the scene of many remarkable events, such as the insurrectionary gatherings of Wat Tyler and Jack Cade, and the exploits of various highwaymen.

**Black Hills, a** hilly region in South Dakota and n.e. Wyoming, rising to the height of 6,700 ft., rich in timber, but especially in gold, as well as other minerals.

**Black Hole of Calcutta**, a small chamber, 20 ft. square, in the old fort of Calcutta, India, in which after their capture by Surajah Dowlah, the whole garrison of 146 men were confined during the night of June 21, 1756. Only twenty-three survived. The spot is now marked by a monument.

**Blackie**, JOHN STUART, Scottish writer, long professor of Greek in the university of Edinburgh; b. at Glasgow in 1809; d. March, 1895. Both in writing and upon the platform his name has been associated with various educational, social, and political movements.

Blacking, for boots and shoes, etc., usually

contains for its principal ingredients oil, vinegar, ivory or bone black, sugar or molasses, strong sulphuric acid, and sometimes caoutchouc and gum-arabic. It is used either as liquid or in the form of paste, the only difference being that in making the paste a portion of the vinegar is withheld.

Black Lead. See Graphite.

**Black-letter**, the name commonly given to the Gothic characters which began to supersede the Roman characters in the writings of Western Europe toward the close of the twelfth century. The first types were in black-letter, but these were gradually modified in Italy until they took the later Roman shape introduced into most European states during the sixteenth century.

**Biackmail**, a certain rate of money, corn, cattle, or the like, anciently paid, in the north of England and in Scotland, to certain men who were allied to robbers, to be protected by them from pillage. It was carried to such an extent as to become the subject of legislation. Blackmail was levied in the districts bordering the Highlands of Scotland till the middle of the eighteenth century. The modern use of the term applies to money extorted from persons under threat of exposure in print for an alleged offense; hush money.

**Blackmore,** RICHARD DODDRIDGE, novelist, b. at Longworth, Berkshire, 1825; educated at Tiverton school and Exeter college, Oxford, where he graduated in 1847. In 1852 he was called to the bar at the Middle Temple, and afterward practised as a conveyancer. His greatest success was Lorna Doone, a Romance of Ermoor. Other novels by him are: Clara Vaughan, Cradock, Nowell, A Tale of the New Forest, The Maid of Sker, Alice Lorraine, a Tale of the South Downs, Cripps the Carrier, Erema, Mary Anerley, Christowell, and Sir Thomas Upmore.

**Black Mountains,** the group which contains the highest summits of the Appalachian system, Clingman's Peak being 6,701 ft.; Guyot's Peak 6,661.

**Black-quarter**, a kind of apoplectic disease which attacks cattle, indicated by lameness of the forefoot, one of the limbs swelling, and after death being suffused with black blood, which also is found throughout the body.

**Black Sea** (ancient Pontus Euxinus), a sea situated between Europe and Asia, and mainly bounded by the Russian and Turkish dominions, being connected with the Mediterranean by the Bosporus, Sea of Marmora, and Dardanelles, and by the Strait of Kertsch with the Sea of Azov, which is, in fact, only a bay of the Black Sea; area of the Black Sea and the Sea of Azov about 175,000 sq. mi, with a depth in the center of more than 150 fathoms and few shoals along its shores. The water is not so clear as that of the Mediterranean, and is less salt on account of the many large rivers which fall into it—the Danube, Dniester, Dnieper, Don, etc. Though not tidal, there are strong currents. The tempests on it are very violent, as the land which confines its agitated waters gives to them a kind of whirling motion, and in the winter it is scarcely navigable. During January and February the shores from Odessa to the Crimea are icebound. It contains few islands, and those of small extent. The most important ports are those of Odessa, Kherson, Eupatoria, Sebastopol, Batum, Trebizond, Samsun, Sinope, and Varna. The fisheries are of some value. After the capture of Constantinople the Turks excluded all but their own ships from the Black Sea until 1774, when, by the Treaty of Kainarji, they ceded to Russia the right also to trade in The same right was accorded to Austria it. in 1784, and by the Peace of Amiens to Britain and France in 1802. The preponderance thereafter gained by Russia was one of the causes of the Crimean War, in which she was compelled to cede her right to keep armed vessels in it, the sea being declared neutral by the Treaty of Paris, 1856. In 1871, however, when France could not attend, owing to the Franco-German War, the sea was deneutralized by a conference of the European powers at London in response to the Russian protest.

**Black-snake**, a common snake in North America, reaching a length of 5 or 6 feet, and so agile and swift as to have been named the *Racer*, with no poison fangs, and therefore comparatively harmless. It feeds on small quadrupeds, birds, and the like, and is especially useful in killing rats.

**Black' stone**, SIR WILLIAM (1723-80), an eminent English jurist. In 1765 he published the first volume of his famous *Commentaries* on the Laws of England, the other three volumes being produced at intervals during the next four years. Its merits as an exposition made it for a long period the principal textbook of English law.

**Blackstone**, Worcester co., Mass., a thriving manufacturing town, 216 mi. s.e. of Worcester: has 7 churches, a bank and public library. Pop. 6,137.

**Black Tin**, tin ore when dressed, stamped, and washed ready for smelting, forming a black powder.

**Biackwell**, ELIZABETH, the first woman who ever obtained the degree of M. D. She was born in England in 1821, and settled in America with her parents in 1831, where from 1838 to 1847 she was engaged in teaching. After numerous difficulties she was admitted into the College of Geneva, N. Y., and graduated M. D. in 1849. She afterward studied in Paris, and commenced practise in New York in 1851, where she has since chiefly resided. In 1854, with her sister Emily, she opened a hospital for women and children in New York.

**Black-wood**, or Indian Rosewood, a leguminous tree of Hindustan the timber of which is highly valued and much used in the manufacture of fine furniture. The Australian Black-wood is of the acacia species.

**Blackwood**, WILLIAM (1776-1834), an Edinburg publisher, b. at Edinburgh. He started as a bookseller in 1804, and soon became also a publisher. The first number of *Blackwood's Magazine* appeared April 1, 1817, and it has always been conducted in the Tory inter-

# Bladder-nut

. -

est. After his death the business, which has developed into a large publishing concern, was carried on by his sons, and the magazine still keeps its place among the leading periodicals.

**Bladder-nut**, a name of shrubs or small trees, natives of Europe, Asia, and North

Bladder-nut. a.-Flower. b.-Fruit.

America, the fruits of which consist of an inflated bladdery capsule containing the seeds.

**Bladderwort,** the common name of slender aquatic plants, species of which are natives of Britain, the U. S., etc., growing in ditchesand pools. They are named from having little bladders or vesicles, that fill with air at the time of flowering and raise the plant in the water, so that the blossoms expand above the surface.

**Biadensburg**, a town of Maryland, 6 mi. n.e. of Washington, D. C. It was the scene of a battle Aug. 24, 1814, where the vastly superior British invaders, under General Ross, defeated a force of American militia.

**Bladud'**, in legendary British history, the father of King Lear. He is said to have been the founder of the city of Bath, having been cured of his leprosy by its medicinal waters.

**Blacu** (Blacuw, or Blauw) (blä'u), a Dutch family celebrated as publishers of maps and books. William (1571-1638) established the business at Amsterdam, constructed celestial and terrestrial globes, and published some excellent works. His son John (d. 1673) published various topographical plates and views of towns. The works of this family are still highly valued.

**Blaine**, JAMES GILLESPIE (1830-1893), statesman, was b. at West Brownsville, Washington co., Pa. His father, Ephraim L., was a descendant of the old Scotch Covenanters and a rigid Presbyterian. His mother, Maria Gillespie, was of Irish and Scottish ancestry and a member of the Catholic church. Blaine was educated at Washington college, from which he graduated in 1847, being only seventeen years of age. He left college self-depend-ent, went to Blue Lick Springs, Ky., and entered the profession of teacher. In 1850 his father died. In 1851 at Pittsburg, Pa., he was married to Miss Harriet Stanwood, of Augusta, Me., a descendant of the Puritan stock. In 1852 he went to Philadelphia, where he taught in an asylum for the blind for two years. In 1854 he moved to Augusta, Me., and entered editorial work on the Kennebeo Journal, a weekly newspaper. From the Kennebec Jour-nal he took a more influential position on the Portland Daily Advertiser. In the fall election of 1858 he was elected to the state legislature where, by his speech-making, he attracted national attention. He served in the state legislature until 1862. In 1863 Blaine took his seat in the House of Representatives and thenceforward was a national man. In 1865 he visited Europe for his health. He was made speaker of the House in 1869, which position he held until 1874. While in Congress he made a number of important speeches on financial and taxation questions and participated in many celebrated debates. In 1876 he was second in his candidature for presidential nomination by the Republican Na-tional Convention. About this time he was accused of speculating in railroad bonds. The charge was agitated by his political opponents and undoubtedly caused his defeat. He was again unsuccessful in his candidature in 1880, and James A. Garfield was elected president. Blaine was made secretary of state by Gar-field. After the death of Garfield Blaine resigned and began his *Twenty Years in Con*gress, a work which has had a most favorable reception. In 1884 he was nominated for president, but was defeated by Cleveland. When Harrison was elected president he was made secretary of state for the second time. He resigned from Harrison's cabinet and became a candidate for the nomination of president in 1892, but was defeated in the convention. Blaine was for many years the recognized leader of the Republican party, and was a great exponent of the doctrine of reciprocity. He was prominent in the seal-fisheries dispute, the reorganization of the Brazilian republic, and in many other questions of national importance. Though a private citizen at the time of his death he was mourned by the whole nation.

**Blair,** FRANCIS PRESTON (1791-1876), American statesman, b. in Virginia. Originally a Whig, he became editor of the Washington *Glube*, the organ of Jacksonian Democracy 1829-45, and in 1856 was active in the organization of the Republican party, and presided over the Pittsburg convention which nominated Fremont. He was a leader in the Chicago convention of 1860, which nominated Lincoln. He endeavored to effect a peace with Jefferson Davis in 1864, but was unsuccessful. He opposed the reconstruction measures after Lincoln's death, and became a Democrat.

**Blair**, FRANCIS PRESTON (1821-1875), son of the foregoing, b. in Lexington, Ky. He served in the Mexican War, edited the Missouri

Democrat, and sat in the legislature of Missouri 1852-56. In 1856 he joined the Republican party, and was elected to Congress. He was reclected in 1860 and 1862. He entered the volunteer army as a colonel, became majorgeneral 1862, and resigned his seat in Congress in 1863. He commanded a division at Vicksburg, fought at Lookout Mountain and Missionary Ridge, and marched with Sherman to the sea. He returned to the Democratic party. In 1868 he was on the presidential ticket with Horatio Seymour. In 1871 he reentered the state legislature, and was elected to fill a vacancy in the U. S. Senate. In 1873 he became state superintendent of insurance.

Blair, HENRY WILLIAM, b. in New Hampshire, 1834, served in the Civil War, and from 1866 to 1868, in the state house of representatives and senate. He was in Congress from 1875 to 1879, became U. S. senator 1879, and was retlected in 1885. He is a strong advocate of prohibition and female suffrage. Mr. Blair in 1892 was elected to the fifty-third Congress.

Blair, JOHN INSLEY, b. in New Jersey 1802; organized the Lackawanna Coal and Iron Company, built the Delaware, Lackawanna & Western railroad, organized the railroad system of Iowa, and constructed 2,000 mi. of railroad in that state and Nebraska. He was one of the original directors of the Union Pacific. Mr. Blair was a Republican. He has given more than \$500,000 for schools and churches.

**Blair**, MONTGOMERY (1813-1883), son of Francis P. Blair, Sr., b. in Kentucky. He graduated at West Point in 1835, and served in the Seminole War. In 1839 he became U. S. district-attorney, and in 1842 mayor of St. Louis. He held various judicial offices in Missouri, and after 1852 in Maryland. He was of counsel for the plaintiff in the Dred Scott case. From March, 1861, to September 23, he was postmaster-general, but afterward became a Democrat.

**Biake,** EDWARD, Canadian lawyer and statesman, b. in 1833. He graduated from University College in 1857. In 1867 he became a member of the Canadian Parliament, and leader of the Liberal opposition. In 1871 he became premier of the Ontario legislature. In 1873 he became a member of the Canadian cabinet. Mr. Blake was chosen leader of the liberal party in place of Mr. Mackenzie (1880). He was one of the ablest speakers in the Dominion, and going to England was elected as a member of Parliament for an Irish constituency as a pronounced Home Rule candidate.

**Blake,** ROBERT (1599-1657), a celebrated British admiral, was b. at Bridgewater. He soon distinguished himself as a soldier in the Civil War, and in 1649 was sent to command the fleet with Colonels Deane and Popham. His greatest achievements were in the Dutch war which broke out in 1652. In November, 1654, he was sent with a strong fleet to enforce a due respect to the British flag in the Mediterranean.

Blanc, MONT. See Mont Blanc.

Blanchard (blan-shar), FRANÇOIS (1753-1809),

French aëronaut. In 1785 he crossed the English Channel in a balloon, for which feat he received a pension from the French king. He made many remarkable ascents in various parts of the world. His wife, b. 1778, was his companion in many of his voyages, and was killed by her balloon taking fire, 1819.

**Blanc-mange** (ble-mänzh'), in cookery, a name of different preparations of the consistency of a jelly, variously composed of dissolved isinglass, arrow-root, maize-flour, etc., with milk and flavoring substances.

**Bland,** RICHARD P., an American public man, b. near Hartford, Ky., Aug. 19, 1835; practised law in California and Nevada; has been member of Congress from Missouri since 1874. He was the author of the Bland silver bill, passed in 1878; and an advocate of free coinage of silver and of tariff reform.

**Blank Verse**, verse without rhyme, first introduced into English poetry (from the Italian) by the Earl of Surrey, who was beheaded in 1547. The most common form of English blank verse is the decasyllabic, such as that of Milton's *Paradise Lost*, or of the dramas of Shakespeare. From Shakespeare's time it has been the kind of verse almost universally used by dramatic writers, who often employ an additional syllable, making the lines not strictly decasyllabic. The first use of the term blank verse is said to be in Hamlet, ii. 2: "The lady shall say her mind freely, or the blank verse shall halt for't." The term is not applied to the Anglo-Saxon and early English alliterative unrhymed verse.

**Blanqui**, LOUIS AUGUSTE (1805–1881), b. at Nice. He took part in scores of political plots and insurrections under Louis Philippe, and was condemned to death several times. He returned to France in 1870, participated in the communist revolt, was elected to the chamber, and antagonized the republic as he had the monarchy and the empire.

**Blantyre** (-tir'), a populous mining parish in Lanarkshire, Scotland, containing several villages, at one of which Dr. Livingstone was b. Pop. 9,760. This parish has given its name to an African mission station founded in 1876 by the Established church of Scotland, on the heights which rise between the Upper Shiré River and Lake Shirwa, now the center of settlement and trade.

**Blap' sidæ**, a family of nocturnal black beetles, whose wings are generally obsolete and their elytra soldered together. They frequent gloomy, damp places, and when seized discharge, in self-defense, a liquid of a peculiar penetrating odor.

**Blar' ney**, a village, Ireland, four mi. n.w. of the city of Cork, with Blarney Castle in its vicinity. A stone called the *Blarney Stone*, near the top of the castle, is said to confer on those who kiss it the peculiar kind of persuasive eloquence alleged to be characteristic of the natives of Ireland. The "groves of Blarney" are extensive and interesting, and beneath the castle there are also some curious natural caves.

Blast-furnace, the name given to the common smelting-furnace used for obtaining iron

#### **Blast-furnace**

from its ores with the aid of a powerful blast This air-blast, which is propelled by a of air. powerful blowing-engine and is now invariably heated to a high temperature (600° to 900° F.) is injected by pipes called tuyeres, situated in the lowest part of the furnace, near to the hearth. The conical part next above the hearth is termed the boshes, and the interior is continued upward, sometimes in a tapered body or cone, sometimes as a perpendicular cylinder, which is surmounted by an opening for the introduction of the materials from an external gallery. The exterior consists of massive masonry of stone or firebrick, the body part being lined with two shells of firebricks separated by a thin space to allow for expansion, this space being generally filled with sand, ground fire-clay, or the like, to hinder the radiation of heat to the outside. When the body rises in the form of a perpen-dicular cylinder it is called the barrel. The cone or barrel is sometimes clasped round on the outside by numerous strong iron hoops, or is cased with iron plates fastened to the ma-sonry by iron bolts. The boshes are lined with firebrick or firestone, and the hearth is built with large blocks of refractory stone. The charging of the furnace goes on all day and night, one charge consisting of a bar-row-load of coal and a barrow-load of ore, char, and lime, the last mineral acting as a flux. These charges are constantly passing downward and undergoing a change as they come nearer the hotter parts of the furnace. Toward the lower part the earthy matter of the ore unites with the limestone and forms a slag, which finally escapes at an opening below the tuyeres, and the molten metal drops down and fills the lower part, to be drawn off at stated periods. This is done usually twice in the twenty-four hours by means of a round hole called a tap. The furnace is constantly kept filled to within about 2 feet of the top. The ore

of the top. The ore put in at the top takes about thirty-six hours before it comes out as iron. Hematite yields on an average about 55 per cent. of metal. and blackband about 40 to 50. In the newer forms of furnaces the top is closed, and the gases formerly burned at the top are conveyed by pipes to be utilized as fuel in heating the blast fuel in heating the blast

the blowing-engine. The principle adopted is to close the top by a bell-and-cone arrangement, which is opened and shut at pleasure by hydraulic or other machinery. The height of furnaces varies from 50 to 80, and even in some cases to upward of 100 feet, and the greatest width is about one third of this.

On the Egyptian tombs at Thebes metalworkers are represented as using the blow-pipe

# Blasting

more than 2,000 years before Christ, and Indian and other Oriental workers in metals still use a primitive bellows for this purpose, which was the germ of the blast furnace. Roman historians say that iron was employed by the Britons in manufacturing spears and lances, which re-quired some sort of blast. The Romans themselves, when they occupied Britain, employed iron to a considerable extent, as is evidenced by cinder heaps in the Forest of Dean, in Gloucestershire, and elsewhere. But so rude was their process, that those heaps in the Forest of Dean furnished the chief supply of ore for twenty furnaces during 200 or 300 years. The English iron founders who employed these remains melted them in furnaces of a simple form, called "air-bloomeries," which they erected on the tops of hills, in order to obtain the greatest possible blast of wind.

Blasting, the operation of breaking up masses of stone or rock in situ by means of gunpowder or other explosive. In ordinary operations holes are bored into the rock of from 1 to 6 inches in diameter, by means of a steelpointed drill, by striking it with hammers, or allowing it to fall from a height. After the hole is bored to the requisite depth it is cleaned out, the explosive is introduced, the hole is "tamped" or filled up with broken stone, clay. or sand, and the charge exploded by means of a fuse or by electricity. In larger operations. mines or shafts of considerable diameter take the place of the holes above described. Shafts are sunk from the tops of the rock to various depths, sometimes upward of 60 feet. This shaft joins a heading, or gallery, driven in from the face, if possible, along a natural joint; and from this point other galleries are driven some distance in various directions, with headings at intervals, returning toward the face of the rock and terminating in chambers for the charges. Enormous charges are frequently made use of, upward of twenty tons of gun-

Section of Hell Gate Tunnels.

powder having been fired in a single blast. One of the greatest blasting operations ever attempted was the removal of the reefs in the East River, near New York, known as Hell Gate. An entrance shaft was sunk on the Long Island shore, from which the reef projected. From this shaft nearly twenty tunnels were bored in all directions, extending from 200 to 240 feet, and connected by lateral gal-

leries. Upward of 52,000 lbs. of dynamite, rend-rock, and powder were used, and millions of tons of rock were dislodged. Numerous important improvements have been made in blasting by the substitution of rock-boring machines for hand labor. Of such machines, in which the "jumper" or drill is repeatedly driven against the rock by compressed air or steam, being also made to rotate slightly at each blow, there are many varieties.

**Blatchford**, SAMUEL, b. in New York, 1820; graduated at Columbia in 1837, and was admitted to the bar in 1842. He was law partner with William H. Seward, in 1867 became U.S. district judge for southern New York, and in 1882, associate justice of the U.S. Supreme Court.

**Blat'tidæ**, a family of insects of the order Orthoptera. They are extremely voracious, some species apparently eating almost everything that comes in their way. The type of the family is the well-known cockroach.

Bleaching, the act or art of freeing textile fibers and fabrics and various other substances (such as materials for paper, ivory, wax, oils) from their natural color, and rendering them perfectly white, or nearly so. The ancient method of bleaching by exposing the fabrics, etc., to the action of the sun's rays, and frequently wetting them, has been nearly superseded, at least where the business is carried on on the large scale, more complicated processes in connection with powerful chemical preparations being now employed. Among the latter the chief are chlorine and sulphurous acid, the latter being employed more especially in the case of animal fibers (silk and wool), while cotton, flax, and other vegetable fibers are operated upon with chlorine, the bleaching in both cases being preceded by certain clean-ing processes. The use of chlorine as a bleaching agent was first proposed by Berthollet in 1786, and shortly afterward introduced into Great Britain, where it was first used simply dissolved in water, afterward dissolved in alkali, and then in the form of bleachingpowder, commonly called chloride of lime, the manufacture of which was patented by Mr. Tennant of St. Rollox, Glasgow, in 1799. In modern calico bleaching the preliminary process is singeing by passing the fabric over red-hot plates or through a gas-flame to remove the downy pile and short threads from the surface of the cloth. The goods next pass to the *liming* process, when they are uniformly and thoroughly impregnated with a supersaturated solution of lime. The next process is the bouking or boiling for several hours, after which they are washed. They are then soured by being passed through a solution of hydrochloric acid for the purpose of dissolving any traces of free lime which may have been left in the washing, and to decompose the calcareous soap formed by the bowking process. After boiling in kiers with a solution of sodaash and rosin and another washing, the cloth is ready for the processes of chemicking or liquoring with bleaching-powder, and whitesouring with a very dilute sulphuric acid.

Another thorough washing concludes the operations of bleaching proper, after which the cloth goes through various finishing processes. Modifications of the same processes are adopted in bleaching linen, wool, silk, etc.

**Blende** (blend), an ore of zinc, called also *Mock-lead, False Galena*, and *Black-jack.* Its color is mostly yellow, brown, and black. There are several varieties, but in general this ore contains more than half its weight of zinc, about one fourth sulphur, and usually a small portion of iron. It is a native sulphide of zinc.

Blennerhassett, HARMAN (1764-1831), one of Aaron Burr's victims, b. in Hampshire, England. In 1797 he sailed for New York City. A year later, Blennerhassett purchased Backus Island, in the Ohio River, which thereafter became known by his name. In 1805 Aaron Burr, on his way down the Ohio and Mississippi Rivers, visited him, and succeeded in interesting Blennerhassett in his schemes. He advocated the plans of Burr, and contributed considerable money for boats, arms, provisions, etc. After President Jefferson issued a proclamation against the scheme, Blenner-hassett, fearing arrest, left the island to join Burr at the mouth of the Cumberland River. His island was overrun by a party of militia. Blennerhassett was arrested and imprisoned. From Lexington, Ky., he was taken to Rich-mond, Va., for trial but was discharged in 1807. He then went to Natchez. Miss., where he bought cotton lands near Port Gibson, Miss. This venture proved unsuccessful. In 1819 he removed to Montreal, where he vainly endeavored to acquire a legal practise. In 1822 he sailed for Ireland, where he retired into obscurity on the island of Guernsey, where he d.

**Blenheim**, a village in Bavaria on the Danube. Near it was fought Aug. 13, 1704, during the War of the Spanish Succession the famous battle of Blenheim, in which the allied forces of England and Germany gained a victory over the French and Bavarians. The residence of the dukes of Mariborough at Woodstock, Oxfordshire, was named from this victory. The estate of Woodstock, which belonged to the crown having been conferred by Queen Anne on the great commander, Parliament granted a perpetual pension of \$20,000 a year, and \$2,-500,000 to erect a suitable family seat. The present Duke of Mariborough, Count of Blenheim, is married to Consuelo, daughter of W. H. Vanderbilt, of New York.

Blenheim Dog, a variety of spaniel, bearing a close resemblance to the King Charles breed, but somewhat smaller, so named from having been bred by one of the dukes of Marlborough. It has a short muzzle, long silky hair without any curl, and long pendulous ears.

**Blesbok**, an antelope of South Africa with a white marked face, a general purplish-chocolate color, and a "saddle" of a bluish color; found in great numbers in the Transvaal and Orange Free State, and much hunted.

**Bligh** (bll), WILLIAM (1753-1817), the commander of the ship *Bounty*, when the crew mutinied in the South Seas and carried her off. He was b. at Plymouth, d. at London. The Bounty had been fitted out for the purpose of procuring plants of the bread-fruit tree, and introducing these into the West Indies. Bligh left Tahiti in 1789, and was proceeding on his voyage for Jamaica when he was seized, and, with eighteen men supposed to be well affected to him, forced into the launch, sparingly provisioned, and cast adrift not far from the island of Tofoa. By admirable skill and perseverance they managed to reach the island of Timor in forty-one days. Bligh, with twelve of his companions, arrived in England in 1790, while the mutineers settled on Pitcairn Island, where their descendants still exist. Bligh became governor of New South Wales in 1806, but was shortly deposed and sent back to England. He afterward rose to the rank of admiral

**Blight**, a generic name commonly applied to denote the effects of disease or any other circumstance which causes plants to wither or decay. It has been vaguely applied to almost every disease of plants whether caused by the condition of the atmosphere or of the soil, the attacks of insects, parasitic fungi, etc. The term is frequently limited to disease in cereal crops.

cereal crops. Blind, The, those who want, or are deficient in, the sense of sight. Blindness may vary in degree from the slightest impairment of vision to total loss of sight; it may also be temporary or permanent. It is caused by defect, disease, or injury to the eye, to the optic nerve, or to that part of the brain connected with it. Old age is sometimes accompanied with blindness, occasioned by the drying up of the humors of the eye, or by the opacity of the cornea, the crystalline lens, etc. There are several causes which produce blindness from birth. Sometimes the eyelids adhere to each other, or to the eyeball itself, or a membrane covers the eyes; sometimes the pupil of the eye is closed, or adheres to the cornea, or is not situated in the right place, so that the rays of light do not fall in the middle of the eye; besides other defects. The blind are often distinguished for a remarkable mental activity, and a wonderful development of the intel-Their touch and hearing, lectual powers.

particularly, become very acute. As early as 1260 an asylum for the blind was founded in Paris by St. Louis for the relief of the Crusaders who lost their sight in Egypt and Syria; but the first institution for the instruction of the blind was the idea of Valentin Hauy, brother of the celebrated mineralogist. In 1784 he opened an institution in which they were instructed not only in appropriate mechanical employments, as spinning, knitting, making ropes or fringes, and working in pasteboard, but also in music, in reading, writing, ciphering, geography, and the sciences. For instruction in reading he procured raised letters of metal; for writing he used particular writing-cases, in which a frame, with wires to separate the lines, could be fastened upon the paper; for ciphering there were movable figures of metal, and ciphering-boards in which the

figures could be fixed; for teaching geography maps were prepared upon which mountains, rivers, cities, and the boundaries of countries were indicated to the sense of touch in various ways, etc. Similar institutions were soon afterward founded in Amsterdam, Berlin, Brussels, Copenhagen, Dresden, Edinburgh, Liverpool, London, Vienna, and in many towns of the U.S. There are now comparatively few large cities that do not possess a school or in-stitution of some kind for the blind. The occupations in which the blind are found capable of engaging are such as the making of baskets and other kinds of wicker-work, brushmaking, rope and twine making, the making of mais and matting, knitting, netting, fancy work of various kinds, cutting firewood, the sewing of sacks and bags, the carving of articles in wood, etc. Piano-tuning is also successfully carried on by some, and the cleaning of clocks and watches has even been occasionally practised

by them. Various systems have been devised for the purpose of teaching the blind to read, some of which consist in the use of the ordinary Roman alphabet, with more or less modification, and some of which employ types quite arbitrary in form. In all systems the characters rise above the surface of the paper so as to be felt by the fingers. The type adopted by Hauy was the script or italic form of the Roman letter. Before this, Gall of Edinburgh made use of an embossed alphabet based on the ordinary Roman small letters, in which all curves were replaced by angular lines, and in 1834 he published the Gospel of St. John in this character. Subsequently he introduced various improvements, and in particular the letters were produced with serrated surfaces, thus giving greater distinctness. Alston of Glasgow, Howe of Boston, and others also used the Roman form; but the former (who was the first to print the whole Bible, in 1840) adopted the Roman capitals, while the latter adopted the small name in the second seco invented by Lucas of Bristol; another is a phonetic shorthand devised by Frere of Lon-In Doctor Moon's alphabet some of the don. characters are Roman, others are based on or suggested by the Roman characters. The Braille system is one in which the letters are formed by a combination of dots. Doctor Moon's system from its simplicity and the size of its characters is in very general use in books for the blind. There are also systems by which the blind are enabled to write. In the U.S.

almost every state has a school for the blind. Blind fish, the name of several species of fish, family Amblyopsidæ, inhabiting the American cave-streams. They are all small, the largest not exceeding five inches. In the typical species of the Mammoth Cave of Kentucky, the eyes are reduced to a useless rudiment hidden under the skin, the body is translucent and colorless, and the head and body are covered with numerous rows of sensitive

# Blind-worm

papillæ, which form very delicate organs of touch.

Blind Fish of Mammoth Cave.

**Blind-worm** (or slow-worm), a reptile, forming a connecting link between the lizards and the snakes, perfectly snake-like in form, having no appearance of external limbs, though the bones of the shoulders and pelvis exist in a rudimentary form: length about a foot, and of nearly equal thickness throughout. Its eyes, though brilliant, are small, and hence its common name. It is common in Great Britain, and is spread over almost the whole of Europe, Western Asia, and Northern Africa. It is perfectly harmless, living upon worms, insects, and snails, and hibernating during the winter.

Blind-worm.

It receives its specific name of *fragilis* from the fact that when frightened it stiffens its muscles to such an extent, and becomes so rigid, that its tail may be snapped off by a slight blow.

Bliss, CORNELIUS N., American merchant and statesman, b. in Mass. 1833. In 1866 he moved to New York City and became interested in manufactures. He arose to political prominence as treasurer of the Republican national campaign committee. He is director in several banks, trusts, etc. President McKinley appointed him secretary of the interior in 1897.

Bilss, PHILIP PAUL (1838–1876), an American evangelist, b. in Pa. In company with the evangelist Dwight L. Moody he held mission services in all parts of the U.S., leading in the singing of hymns of his own composition. Hold the Fort is the best-known of these. He was killed in the terrible Ashtabula, O., railroad wreck.

# Block-system

**Blister**, a topical application which, when applied to the skin, raises the cuticle in the form of a vesicle, filled with serous fluid, and so produces a counter-irritation. The Spanish fly-blister operates with most certainty and expedition, and is commonly used for this purpose, as well as mustard, hartshorn, etc.

**Bister-steel**, iron bars which, when converted into steel, have their surface covered with blisters, probably from the expansion of minute bubbles of air. Steel is used in the blister state for welding to iron for certain pieces of mechanism, but is not employed for making edge-tools. It requires for this purpose to be converted into cust or shear steel.

Block, a mechanical contrivance consisting of one or more grooved pulleys mounted in a casing or shell which is furnished with a hook, eye, or strap by which it may be attached to an object, the function of the apparatus being to transmit power or change the direction of motion by means of a rope or chain passing round the movable pulleys. Blocks are single, double, treble, or four-fold, according as the number of sheaves or pulleys is one, two, three, or four. A running block is attached to the object to be raised or moved; a standing block is fixed to some permanent support. Blocks also receive different denominations from their shape, purpose, and mode of application. They are sometimes made of iron as well as of wood. Blocks to which the name of dead-eyes has been given, are not pulleys, being unprovided with sheaves.

Blockade' is the rendering of intercourse with the seaports of an enemy unlawful on the part of neutrals, and it consists essentially in the presence of a sufficient naval force to make such intercourse difficult. It must be declared or made public, so that neutrals may have no-tice of it. If a blockade is instituted by a sufficient authority, and maintained by a sufficient force, a neutral is so far affected by it that an attempt to trade with the place invested subjects vessel and cargo to confiscation by the blockading power. The term is also used to describe the state of matters when hostile forces sit down around a place and keep possession of all the means of access to it, so as to entirely cut off its communication with the outside world, and so compel surrender from want of supplies.

**Block-house**, a fortified edifice of one or more stories, constructed chiefly of blocks of hewn timber. Block-houses are supplied with loopholes for musketry and sometimes with embrasures for cannon, and when of more than one story the upper ones are made to overhang those below, and are furnished with machicolations or loopholes in the overhung floor, so that a perpendicular fire can be directed against the enemy in close attack. Block-houses are often of great advantage, and in wooded localities readily constructed.

**Block-system**, a system of working the traffic on railways according to which the line is divided into sections, each section generally stretching from one station to the next, with a signal and telegraphic connection at

the end of each section. The essential principle of the system is that no train is allowed to enter upon any one section till the section is signaled wholly clear, so that between two successive trains there is not merely an interval of time, but also an interval of space.

**Biodgett**, HENRY WILLIAMS, b. 1821, in Amherst, Mass., an American jurist; studied law in Chicago, and began practice in 1845. In 1852 he was elected to the Illinois legislature as an anti-slavery Republican, and in the following year became state senator. He was for many years a railroad lawyer, and became president of the Chicago & Milwaukee Railroad. In 1870 he was appointed U. S. district judge for the northern district of Illinois, which office he still (1897) holds.

**Biodgett**, RUFUS, b. 1834, in Dorchester, N.H., American public man; became a banker and railroad superintendent, and was elected to the U. S. Senate from New Jersey in 1887.

**Bioemfontein** (blöm'fon-tin), the chief town and seat of government of the Orange Free State, South Africa, 680 mi. n. e. of Cape Town, situated in a high but healthy region. Pop, 5,817.

Blois (blwii), capital of the French dep. Loires-Cher, 99 mi. s.w. Paris, on the Loire. The old castle, which has played an important part in French history, was restored by the govern-ment in 1845. The main entrance is by a fine Gothic portal opening into a quadrangle, on the east side of which is a pillared cloister, on the north a pile of buildings in the Renaissance style, on the west some unfinished buildings, and on the south is the ancient part begun by the Dukes of Orleans. There is also a cathedral of late date, the Church of St. Nicholas (twelfth century), a bishop's palace, Roman aqueduct, etc. The castle was long occupied by the counts of the name; and became a favorite residence of the kings of France. Louis XII was born, Francis I, Henry II, Charles IX, and Henry III held their courts in it. Pop. 23,457.

**Bion' del**, a French minstrel and poet of the twelfth century, a confidential servant and instructor in music of Richard Cœur de Lion. While his master was the prisoner of the duke of Austria, Blondel, according to the story. went through Palestine and all parts of Germany in search of him. He sang the king's own favorite lays before each keep and fortress till the song was at length taken up and answered from the windows of the castle of Loewenstein, where Richard was imprisoned. This story is preserved in the chronicles of Rheims, of the thirteenth century.

**Biondin**, a noted French gymnast (1824-1897). was b. at St. Ouen, Pas de Calais. His real name was Jean François Gravelet. He had two brothers and three sisters, who were all tight rope performers. His first feat on the tight rope was in Lyons, when he was but six years old, and when he made an ascension to the height of 175 ft. Later he was placed by his father at the Ecole de Gymnase at Lyons, where he was trained to be an acrobat. Six months afterward he made his professional début, and his success was instantaneous. For years he traveled through France attending village fairs, with success and profit. In 1851 he joined the famous Ravel family of acrobats and came with them to America and appeared with them at Niblo's Garden. He remained with the Ravels eight years, and during his travels with them on this continent he visited Niagara for the first time. Blondin was at for his ambition, and he took up his abode near the Falls to study the practicability of his proposed feat. Then he set to work to bridge the distance with a hempen cord and made public the attempt. The rope was 1,100 ft. in length, and was stretched at an altitude of 160 ft. above the river at one side and crowned the seething torrent at a height of 175 ft. On Aug. 17, 1859, he made the trip in the presence of 50,000 spectators. Not content with simply walking across, he elaborated his performance, and made other trips blindfolded, and with a man on his back. His most daring feat, however, was when, at an engagement at the Crystal Palace, London, he trundled a wheelbarrow across a rope 200 ft. long, with his baby daughter in it. Then, he has since confessed, he felt the sensation of fear for the first time, not for himself, but for the child. The following year Blondin repeated his Niagara feat in the presence of the Prince of Wales. Blondin made a great deal of money during his career, but it is said that he lost the most of it in unfortunate speculation. The receipts of one performance in London reached the enormous sum of \$20,000.

**Blood**, the fluid which circulates through the arteries and veins of the human body and that of other animals, which is essential to the preservation of life and nutrition of the tissues. This fluid is more or less red in vertebrates, except in the lowest fishes. In insects and in others of the lower animals there is an analogous fluid which may be colorless, red, bluish, greenish, or milky. The venous blood of mam-mals is a dark red, but in passing through the lungs it becomes oxidized and acquires a bright scarlet color, so that the blood in the arteries is of a brighter hue than that in the veins. The central organ of the blood circulation is the heart (which see). The specific gravity of human blood varies from 1.045 to 1.075, and its normal temperature is 99° F. 1,000 parts contain 783.37 of water, 2.83 fibrin, 67.25 albu-men, 126.31 blood corpuscles, 5.16 fatty 15.08 various animal matters and matters, salts. When ordinary blood stands' for a time it separates into two portions, a red coagulated mass consisting of the fibrin, corpuscles, etc., and a yellowish watery portion, the serum. The blood corpuseles or globules are characteristic of the fluid. Those are minute, red and white bodies floating in the fluid of the blood. The red ones give color to the fluid, and are flattish discs, oval in birds and reptiles, and round in man and most mammals. In man they average 3300th inch in diameter, and in the Proteus, which has them larger than any other vertebrate,  $\frac{1}{\sqrt{2}}$  oth inch in length and  $\frac{1}{\sqrt{2}}$  d in breadth. The white or colorless

corpuscies are the same as the lymph or chyle corpuscies, and are spherical or lenticular, nucleated, and granulated, and rather larger than the red globules.

Blood has come to have many commercial uses. The Scandinavians were the first people who, when they butchered animals, preserved the blood. They used this in making bloodcake and blood sausage. All the large packing houses save every drop of blood. It is manufactured into fertilizers, and one large packing house in Chicago turns out from eight to twelve tons of it every day. This fertilizer is sold at from \$32 to \$45 a ton. The blood is caught in large pans in the slaughtering pen and is car-ried off to drying vats. Here it is heated in large caldrons at a temperature of 200 degrees, the water in the blood, amounting to over 70 per cent. of the whole, is driven off in the form of steam, and the albumen is coagu-lated into a thick mass. This mass is run off into a great hydraulic press. The power is put on and more of the water is forced off through the burlap which forms the bottom of the press. When the pressure is released the blood comes out in solid, moist chunks. The chunks are then fed through huge revolving rollers. The rollers are heated by steam and still more water is pressed out of the blood. The product then comes out dry for the most part and hard. The finer dust and crumbs fall through a sieve and the large rough pieces which remain are carried along to the attrition mills where they are ground into fine powder. The attrition mill consists of two upright cylinders revolving in opposite directions, one in-side the other. The cylinders are made of steel rods set both together, and when the chunks of dried blood are put in at the top they are crushed against the rod and ground together, so that by the time they reach the bottom, they are as fine as powder. The product is placed in air-tight compartments until it is ready for mixing with potash and phosphoric acid to make a complete fertilizer. On account of the large amount of nitrogen which it contains in the form of ammonia this is very valuable as a fertilizer. Ordinary blood contains about 17 per cent. of ammonia, of which about 131 per cent. is pure hydrogen. Blood is also used in the manufacture of sugar. It is first dried at a temperature of 110 degrees in order to prevent the coagulation of the albumen. This is a long process, but when it is completed the product is in the form of big cakes. It is then taken to the sugar refinery, dissolved in warm water, and added to the sugar as a clarifier. The albumen collects all the floating products in the sugar and carries them to the bottom of the tank. Blood is also coming into use as a medicine, and nearly all drug stores keep defibrinated blood, and many physicians prescribe it in cases where the pa-tient's blood is "thin," or lacks the necessary amount of red corpuscles. The preparation is simple. The warm blood is caught in pans as it comes from the animal, and is whipped rapidly until all the fibrin clings to the wood. The fibrin is then taken out and thrown away.

#### Bloodroot

The remaining part, the albumen and serum, are dried hard at a temperature of about 105 The mass which remains is cut up degrees. and rolled into little pills and is then ready for use. Blood is also used in the manufacture of buttons. Many of the dark, rich-colored buttons are made of blood pressed into the proper form by means of hydraulic machines. Imitation tortoise shell articles are composed largely of blood, and it is used extensively by The use of the Japanese in lacquer work. warm blood of higher animals is considered beneficial in the treatment of consumption It is important that the blood and anæmia. be obtained before it has been exposed enough to coagulate it. The blood should be drunk as it comes from the animal. Since the introduction of defibrinated blood the use of warm blood has fallen off.

**Bioodhound**, a variety of dog with long, smooth, and pendulous ears, remarkable for the acuteness of its smell, and employed to recover game or prey which has escaped wounded from the hunter, by tracing the lost animal by the blood it has spilt; whence the

Bloodhound.

name of the dog. There are several varieties of this animal, as the English, the Cuban. and the African bloodhound. In former times bloodhounds were not only trained to the pursuit of game, but also to the chase of man. In America they used occasionally to be employed in hunting fugitive slaves, but are now only used occasionally for tracking criminals and escaped convicts.

**Blood-money**, the compensation by a homicide to the next of kin of the person slain, securing the offender and his relatives against subsequent retaliation; once common to Scandinavian and Teutonic countries, and still a custom among the Arabs. The term is also applied to money earned by laying or supporting a charge implying peril to the life of an accused person.

**Bloodroot**, a plant of Canada and the U. S. belonging to the poppy order, and so named from its root-stock yielding a sap of a deep orange color. Its leaves are heartshaped and deeply lobed; the flower grows on a scape and is white or tinged with rose. The

# Bloodwood

plant has acrid narcotic properties, and has been found useful in various diseases. Another American plant used as a mild tonic, is also known as bloodroot.

**Bloodwood**, a name of several trees. Indian bloodwood is a large tree of the henna family with wood of a blood-red color, used for many purposes. It is called also *jarool*. **Bloody Assizes**, those held by the English

**Bloody Assizes**, those held by the English Judge Jeffreys in 1685, after the suppression of Monmouth's rebellion. Upwards of 300 persons were executed after short trials; very many were whipped, imprisoned, and fined; and nearly 1,000 were sent as slaves to the American plantations.

**Bloom,** a lump of puddled iron, which leaves the furnace in a rough state, to be subsequently rolled into the bars or other material into which it may be desired to convert the metal. Also a lump of iron made directly from the ore by a furnace called a "bloomery."

**Biomer Costume**, a style of dress adopted about the year 1840 by Mrs. Bloomer of New York, who proposed thereby to effect a complete revolution in female dress, and add materially to the health and comfort of women. It consisted of a jacket with close sleeves, a skirt reaching a little below the knee, and a pair of Turkish pantaloons secured by bands round the ankles. An improvement of this costume has obtained considerable popularity among female bicyclists.

**Bloomington,** McLean co., Ill., 45 mi. s.e. of Peoria. Railroads: Illinois Central; Chicago & Alton; C. C. & St. L.; and Lake Eric & Western. Industries: railroad shops, two iron foundries, flour mill, candy and medicine factories. Surrounding country agricultural. One coal shaft in vicinity. The town was first settled in 1826 by two families from Ohio, and became a city in 1831. Pop. est. 1897, 24,500.

**Blouse** (blouz), a light, loose upper garment, resembling a smock-frock, made of linen or cotton, and worn by men as a protection from dust or in place of a coat. A blue linen blouse is the common dress of French workmen.

Blowfly, a name for the various species of

air in confined spaces, and the like. This may consist of a single pair of bellows, but more generally two pair are combined to secure continuity of current. The most perfect blowingmachines are those in which the blast is produced by the motion of pistons in a cylinder,

### Blowpipe

or by some application of the fan principle. For smelting and refining furnaces, where a blast with a pressure of 3 or 4 lbs. to the square inch is required, blowing-engines of large size and power, worked by steam. are employed.

Blowpipe, an instrument by which a current of air or gas is driven through the flame of a lamp, candle, or gas jet, and that flame

glass, or other substance, usually 7 in. long and 4 in. in diameter at one end, and tapering so as to have a very small aperture at the other, within 2 in. or so of which it is bent nearly to a right angle, so that the stream of air may be directed sideways to the operator. The flame is turned to a horizontal direction, assumes a conical shape, and consists of two parts of different colors. The greatest heat is obtained at the tip of the inner blue flame. Here the substance subjected to it is burned or oxidized, a small piece of lead or copper, for instance, being converted into Hence the name of the oxidizing its oxide. flame. By shifting the substance to the interior blue flame, which is wanting in oxygen, this element will be abstracted from the substance, and a metallic oxide, for instance, will give out its metal; hence this is called a reducing flame. Thus various minerals can be either oxidized or reduced at pleasure, and the pipe forms a ready test in the hands of the mineralogist, who may use fluxes along with substances tested, watch how they color the flame, what vapor they give out, etc. The blowpipe may be provided with several movable nozzles to produce flames of different The current of air is often formed by sizes. a pair of bellows instead of the human breath, the instrument being fixed in a proper frame for the purpose. The most powerful blowpipe is the oxyhydrogen or compound blowpipe, an instrument in which oxygen and hydrogen (in the proportions necessary to form water, propelled by hydrostatic or other pressure, and coming from separate reservoirs, are made to form a united current in a capillary, orifice at the moment when they are kindled. The heat produced is such as to consume the diamond, and to dissipate in vapor or in gase-

## Blubber

ous forms most known substances. The blowpipe is used by goldsmiths and jewelers in soldering, by glass-workers in sealing the ends of tubes, etc., and extensively by chemists and mineralogists in testing the nature and composition of substances.

The name is also given to the pipe or tube through which poisoned arrows are blown by the breath, used by South American Indians and natives of Borneo. The tube or blowpipe is 8 to 12 ft. long, with a bore scarcely large enough to admit the little finger; and the arrow is forced through by a sudden expulsion of air from the lungs (like a pea from a boy's pea-shooter), being sometimes propelled to a distance of 140 yards.

**Blubber,** the fat of whales and other large sea animals, from which train oil is obtained. The blubber lies under the skin and over the muscular flesh. It is eaten by the Eskimo and the sea-coast races of the Japanese islands, the Kuriles, etc. The whole quantity yielded by one whale ordinarily amounts to 40 or 50, but sometimes to 80 or more cwt.

Blücher (blü'her), GEBHARD LEBERECHT von (1742-1819), distinguished Prussian general. He entered the Swedish service when 14 years of age and fought against the Prussians but was taken prisoner in his first campaign, and was induced to enter the Prussian service. He commanded with distinction on the Rhine in 1793 and 1794. In 1802, he took possession of Erfurt and Mühlhausen. Oct. 14, 1806, he fought at the battle of Auerstädt. After the peace of Tilsit he labored in the department of war at Königsberg and Berlin. In the campaign of 1812, when the Prussians assisted the French, he took no part. When seventy years old, he was appointed commander-in-chief of the Prussians and the Russian corps under General Winzingerode. His hero-ism in the battle of Lutzen (May 2, 1813) was rewarded by the Emperor Alexander with the order of St. George. He led the Prussian army which invaded France early in 1814, and entered the capital of France. On the renewal of the war in 1815 the chief command was again committed to him, and he led his army into the Netherlands. June 15 Napoleon threw himself upon him, and Blücher, on the 16th, was defeated at Ligny. In the battle of the 18th Blücher arrived at the most decisive moment upon the ground, and taking Napoleon in the rear and flank assisted materially in completing the great victory of Waterloo. His energy and rapid movements procured him the name of "Marshal Vorwärts" (Forward).

**Blue**, one of the seven colors into which the rays of light divide themselves when refracted through a glass prism, seen in nature in the clear expanse of the heavens; also a dye or pigment of this hue. The substances used as blue pigments are of very different natures, and derived from various sources; they are all compound bodies, some being natural and others artificial. They are derived almost entirely from the vegetable and mineral kingdoms. The principal blues used in painting

# Bluefish

are ultramarine, which was originally prepared from lapis-lazuli or azure-stone-a mineral found in China and other oriental countriesbut, as now prepared, it is an artificial compound of china clay, carbonate of soda, sul-phur, and charcoal: Prussian, or Berlin blue, which is a compound of cyanogen and iron; blue bice, prepared from carbonate of copper; indigo blue, from the indigo plant. Besides these, there are numerous other blues used in art, as blue-verditer, smalt- and cobalt-blue, from cobalt, lacmus, or litmus, etc. Before the discovery of aniline or coal-tar colors dyers chiefly depended for their blues on woad, archil, indigo, and Prussian blue, but now a series of brilliant blues are obtained from coal tar, possessing great tinctorial power and various degrees of durability

**Bluebeard**, the hero of a well-known tale, originally French, founded, it is believed, on the enormities of a real personage, Giles de Laval, Count de Retz a great nobleman of Brittany, put to death for his crimes in 1440.

**Bluebird**, a small bird, very common in the U.S. The upper part of the body is blue, and the throat and breast of a dirty red. It makes

Bluebird.

its nest in the hole of a tree or in the box that is so commonly provided for its use by the friendly farmer. The bluebird is the harbinger of spring; its song is cheerful, continuing with little interruption from March to October, but is most frequently heard in the serene days of spring. It is also called *blue robin* or *blue redbrenst*, and is regarded with the same sort of sentiments as the robin of Europe.

**Blue books**, the official reports, papers, and documents printed for the British government and laid before the Houses of Parliament. They are so-called from being stitched up in dark-blue paper wrappers, and include bills presented to and acts passed by the house; all reports and papers moved for by members, or granted by government on particular subjects; the reports of committees; statistics of the trade, etc., also, in America and England, a book containing the names of all persons holding public offices, with other particulars.

**Bluefish**, a fish common on the eastern coasts of America, allied to the mackerel, but larger, growing to the length of three feet or more, and much esteemed for the table. It is very destructive to other fishes. It is also called

horse mackerel, greenfish, skipjack, etc. Blue grass, an American pasture grass of great excellence, especially abundant in Kentucky. It is exceedingly thrifty.

Blue Laws, a name for certain laws said to have been made in the early government of New Haven, Conn., anent breaches of manners, morality, and religion. There were several codes enacted at different times. The most important of the Blue Laws are as follows:

"No Quaker or dissenter from the established worship of this dominion shall be allowed to give a vote for the election of magistrates or any officer.

"No food or lodging shall be offered to a Quaker, adamite, or other heretic.

"If any person turns Quaker, he shall be banished, and not suffered to return, but upon pain of death.

"No priest shall abide in the dominion; he shall be banished and suffer death on his return. Priests may be seized by any one without a warrant.

"No one to cross a river but an authorized ferry man.

"No one shall run on the sabbath day, or walk in his garden, except reverently to and from meeting.

"No one shall travel, cook victuals, make beds, sweep house, cut hair, or shave on the sabbath day.

"No woman shall kiss her child on the sabbath or fasting day.

"The sabbath shall begin at sunset on Saturday.

"To pick an ear of corn growing in a neighbor's garden shall be deemed theft.

"A person accused of trespass in the night, shall be judged guilty, unless he clear himself

by his oath. "When it appears that an accused has confederates, and he refuses to discover them, he may be racked.

"No one shall buy or sell lands without permission of the selectmen.

"A drunkard shall have a master appointed by the selectmen who are to debar him from the liberty of buying and selling.

"Whoever publishes a lie to the prejudice of his neighbor shall sit in the stocks, or be whipped fifteen stripes.

"No minister shall keep a school.

"Men stealers shall suffer death.

"Whoever wears clothes trimmed with gold, silver, or bone lace above two shillings by the yard, shall be presented by the grand jurors, and the selectmen shall tax the offender at 300 pounds estate.

"A debtor in prison, swearing he has no estate, shall be let out and sold, to make satisfaction.

"Whoever brings cards or dice into this dominion shall pay a fine of 5 pounds.

'No one shall read common prayer, keep Christmas, or saint-days, make minced pies,

dance, play cards, or play on any instrument of music, except the drum, trumpet, and Jew's-harp.

"No gospel minister shall join people in marriage; the magistrates only shall join in marriage, as they may do it with less scandal to Christ's church.

"A man that strikes his wife shall pay a fine of 10 pounds. A woman that strikes her husband shall be punished as the court directs.

"A wife shall be deemed good evidence against her husband.

"Married persons must live together or be imprisoned.

Every male shall have his hair cut round according to a cap."

Blue Mountains, the central mountain range of Jamaica, the main ridges of which are from 6,000 to 8,000 ft. high. Also a mountain chain of New South Wales, part of the great Dividing Range. The highest peaks rise over 4,000 ft. above the sea. The range is now traversed by a railway, which attains a maximum height of 3,494 ft.

Blue Peter, a blue flag having a white square in the center, used to signify that the ship on which it is hoisted is about to sail.

Blue Pill, a preparation of mercury for medicinal use. It consists of two parts by weight of mercury triturated with three parts of conserve of roses till it loses its globular form. This is mixed with one part by weight of licorice-root powder, so that 5 grains of the mixture contain 1 grain of mercury

Blue Ridge, the most easterly ridge of the Alleghany (or Appalachian) Mountains. The most elevated summits are the Peaks of Otter (4.000 ft.) in Virginia.

Bluewing, a genus of American ducks, so called from the color of the wing coverts. One series is brought in great quantities to market, the flesh being highly esteemed for its flavor.

Boa, a genus of serpents, having the jaws so

Head of Boa.

constructed that these animals can dilate the mouth sufficiently to swallow bodies thicker

than themselves. They are also distinguished by having a hook on each side of the vent; the tail prehensile; the body compressed and largest in the middle, and with small scales, at least on the posterior part of the head. The genus includes some of the largest species of serpents, reptiles endowed with immense muscular power. They seize sheep, deer, etc., and crush them in their folds, after which they swallow the animal whole. The boas are peculiar to the hot parts of South America. The *Boa Constrictor* is not one of the largest members of the genus, rarely exceeding 20 ft. in length; but the name boa or boa constrictor is often given popularly to any of the large serpents of similar habits, and so as to include the pythons of the Old World and the anaconda and other large serpents of America.

Boab' dil, ABU-ABDULLAH, last Moorish king of Granada, gained the throne in 1481 by expelling his father, Muley Hassan; and became the vassal of Ferdinand of Aragon. By his tyranny he provoked the hostility of his own subjects, and Ferdinand, taking advantage of the dissensions which prevailed, laid siege to Granada. The Moors made a valiant defense, but Boabdil capitulated, and retired to a domain of the Alpujarras assigned him by the victor. He afterward passed into Africa, and fell in battle while assisting the king of Fez in an attempt to dethrone the king of Morocco. Boadice'a, queen of the Iceni, in Britain,

**Boadice'a**, queen of the Iceni, in Britain, during the reign of Nero. Having been treated in the most ignominious manner by the Romans, she headed a general insurrection of the Britons, attacked the Roman settlements, reduced London to ashes, and put to the sword all strangers to the number of 70,000. Suetonius, the Roman general, defeated her in a decisive battle (A. D. 62), and Boadicea. rather than fall into the hands of her enemies, put an end to her own life by poison.

Wild Boar.

**Boar**, the male of swine. The wild hog, the original of the domestic pig, is generally spoken of as the *wild boar*.

**Board of Trade** (or Chamber of Commerce), is an association of merchants, traders, producers, and other persons engaged in commercial pursuits for the purpose of facilitating trade by united action, of acting as a species of

court of arbitration in commercial questions, and generally of attaining, by combination, advantages in trade beyond the reach of individual enterprise or responsibility. Marseilles, in France, was the first city in the world to establish a Board of Trade, or Chamber of Commerce. This partook partly of a political character, and shared in the control of municipal affairs. In 1700 the chamber of commerce in Paris was established, and a few years thereafter corresponding institutions were organized in the other leading cities of France. The Chamber of Commerce of Glasgow is the oldest in Great Britain, having been established in 1783; the Edinburgh Chamber was next organized, having taken the lead in the movement for the abolition of the Corn laws. The London Chamber of Commerce, or the Royal Exchange, is the grand center of the commerce of the Old World. Next to it in importance stands the Liverpool Exchange with which American commercial dealers have the most direct connection. The Manchester, Hull, Leeds, and other exchanges do an immense business and exercise a great influence over the trade of that kingdom.

The Chamber of Commerce of New York was established in 1768, and was an important adjunct of the municipal government. The order in rank as to financial importance of the great metropolitan grain and produce exchanges of the country may be thus stated: 1, New York; 2, Chicago: 3, Boston: 4. Philadelphia; 5, Baltimore. The produce exchange of New York City has now over 3,000 members, but the actual volume of trade done by it is not as great as that of the Chicago Board of Trade with its 1,840 members. The latter body was organized in 1848, with 82 members. The principal boards of trade in the West in regard to volume of business rank, after the Chicago board, as follows: 1, St. Louis; 2, Milwaukee; 3, Detroit: 4, Cleveland; 5, Toledo; 6, Cincinnati; 7, Buffalo.

The modern practise of trading on margins has grown to be a leading feature of the business of all boards of trades in this country. and to a large extent also of those in the Old World. This system consists in the trader putting up with his broker a sufficient amount to cover the ordinary fluctuations of the security. and the broker furnishes the rest of the capital necessary. When the margin is exhausted the broker notifies his principal, and if it is not made good, the whole amount "put up' by the trader is forfeited. and the broker "closes out" the "deal." The distinction between "long" and "short" transactions is that in the former the trader buys for an advance, and in the latter he sells for a decline. Carry-ing charges are in favor of the short seller. These charges are made up of storage, interest, and insurance, and are represented by the excess of the price for future delivery over the cash price.

The method of trading, specifically, is substantially the following on all boards of trade in the U. S. Suppose it to be in January, and the trader wishes to buy 5,000 bushels of wheat

21

for February delivery. If he buys at \$1 a bushel, he advances his broker \$250, which is five cents a bushel margin. If it advances to \$1.05 he can order the broker to sell it, and if he chooses withdraw his margin and profit to the amount of \$250. If the price recedes, he must either deposit enough margin with his broker to cover the falling off or lose what he has advanced.

The prices of wheat have in the past ten years fluctuated as follows on the Chicago Board of Trade, which, of course, is an index to the fluctuations throughout the country, and it may also be added, to those in Europe as well:—

Years.	Months the lowest prices were reached.	Range for the entire year.	Months the highest prices were reached.
1887	August	\$ .66% @ \$ .94%	June
1888	April	.71% @ 2.00	September
1889	June	.75% @ 1.08%	February
1890	February	.745 @ 1.085	August
1891	July	.85 @ 1.16	April
1892	October	.69% @ .91%	February
1893	July	.54 @ 1.88	April
1894	September	.50 @ .65	April
1895	January	.48% @ .55%	May
1896	August	.53 @ .931%	December

Most boards of trade have their own clearing houses, and the rule that prevails in the clearing house of the Chicago Board may be taken as representative of the entire system in the U.S., to-wit: Parties whose reports show a net balance against them must accompany the report with a certified check for such balance made payable to the order of the clearing house. The regulations of this clearing house are as thorough and strict as those of the bankers' clearing houses. By common consent a basis of grading and inspection of grains and provisions has been established throughout the U. S., in which all the boards of trade unite. White winter wheat is divided into Nos. 1, 2, 3, and 4; long red winter into Nos. 1 and 2; hard winter wheat into Nos. 1, 2, and 3; red winter into Nos. 1, 2, 3, and 4; and Colorado wheat into Nos. 1, 2, and 3. There is also the Turkish red winter wheat. Spring wheat is classed: No. 1 northern spring, No. 1 spring, No. 2 spring, No. 3 spring, No. 4 spring, Nos. 1, 2, and 3 white spring. Black Sea and flinty Fife wheat, and rice wheat. The same careful and close discrimination is made with regard to corn. oats, rye, barley, and all other articles. The most stringent regulations are made to prevent fraudulent inspection, and the present system may be considered one of almost absolute perfection. The least "crookedness " on the part of any member, however prominent he may be, is visited with immediate suspension, and his trial is prosecuted with a rigid impartiality not surpassed by the courts of law.

While there is a considerable amount of cash buying and selling, the great preponderance of business is done on margins, like that on the stock exchanges. Thousands of persons trade "on 'change" who never see the inside of the board of trade. An immense amount of trading is done by mail, telegraph, and telephone. There is a widespread misunderstanding in regard to transactions on the board, many persons believing that no property passes on purchases and sales on margins, whereas the rules of the board not only contemplate the delivery of all property bought and sold on the floor, but express provision has been made therefor, and strict penalties prescribed for all damages that may arise in case of nondelivery upon the maturity of a contract. A board of trade contract matures on the last day of the term mentioned in it, and all transactions between members for the purchase or sale of grain, etc., on the floor of the board are strictly contracts under its rules.

A corner is an artificial scarcity in grain, pork, or other commodity, created by a combination organized for the purpose of holding the article affected off the market in order to extort abnormally high prices. The principal wheat corners on the Chicago Board of Trade, which have been mostly participated in to a large extent by dealers in other markets, east and west, have occurred on the following dates:—

1867-On May 18 prices of wheat were forced to \$2.85, closing at \$2.16.

1871—In August prices were advanced to \$1.30, but closed at \$1.10<sup>1</sup>.

1872—During August wheat sold at \$1.61, and closed at \$1.19.

1880—During May the price ranged from \$1.12 to \$1.19, closing at \$1.14.

1881—In August prices advanced from \$1.19 to \$1.38, and closed at \$1.38.

1882—Corners were run in April, June, July. and September.

1887—In June the memorable Cincinnati combination to corner wheat developed. Prices were advanced from 80% to 94% to 94% but the corner collapsed, and the price declined to 68c.

 $1888-\Lambda$  successful corner was operated in September, wheat selling from  $89\frac{1}{2}$ c to 32.00, the latter price being reached on the closing day.

Life on the board of trade of a great metropolis is intensely exciting. The fact that fortunes are sometimes made or lost in a day gives a feverish tenor to the career of a man who follows trading "on 'change" as his occupation. At the same time, the discipline of the experience which he has to undergo gives him a quickness of perception and a capability of prompt decision which he can scarcely gain anywhere else. The brokers on the Chicago Board of Trade, for example, have a nomenclature peculiar to themselves, and to facili-tate operations in the "pits" (the circular depressions on the Board), they have a complete system of signs and motions by which they can make themselves understood above the din constantly prevailing. A sign made with open hand of the broker toward the person he is in communication with signifies "sell"; if he shows the back of his hand, it means "buy"; one finger raised means 5,000 bushels or other units of the article dealt in; two fingers raised signifies 10,000 bushels, etc. So

that, in the midst of all the noise and confusion which the outsider observes on the floor of the board during the hours when it is in session, there is a vast and thoroughly systematized volume of business being transacted with a facility and celerity utterly incomprehensible to the uninitiated.

Boat, a small open vessel or water craft usually moved by oars or rowing. The forms, dimensions, and uses of boats are very various, and some of them carry a light sail. The boats belonging to a ship of war are the launch or longboat, which is the largest, the barge, the pinnace. the yawl, cutters, the jolly-boat and the gig. The boats belonging to a merchant vessel are the launch or longboat, before mentioned, the skiff, the jolly-boat or yawl, the stern boat, the quarterboat, and the captain's gig. Every passenger ship is re-quired to carry a number of boats according to the following scale: two boats for every ship of less than 200 tons, three, when 200 and less than 400; four, 400 and less than 600; five, 600 and less than 1,000; six, 1,000 and less than 1.500; seven, 1.500 and upwards. One of such boats must in all cases be a longboat, and one a properly fitted lifeboat.

**Boatbill**, a South American bird of the family of herons, about the size of a common fowl.

Boatbill.

with a bill not unlike a boat with the keel uppermost; its chief food is fish.

Boat fly, an aquatic hemipterous insect which swims on its back: the hind legs aptly

Water Boat Fly.

enough resembling oars, the body representing a boat; hence the name.

#### Boccaccio

**Boat** 'swain (commonly pronounced  $b\bar{v}$ 'su). a warrant-officer in the navy who has charge of the sails, rigging, colors, anchors, cables, and cordage. His office is also to summon the crew to their duty, to relieve the watch, etc. In the merchant service one of the crew who has charge of the rigging and oversees the men.

**Bob** bin, a reel or other similar contrivance for holding thread. It is often a cylindrical piece of wood with a head, on which thread is wound for making lace; or a spool with a head at one end or both ends, intended to have thread or yarn wound on it, and used in spinning machinery (when it is slipped on a spindle and revolves therewith) and in sewing machines (applied within the shuttle).

Bobolink.

**Bobolink,** a name given to two distinct birds. The first, also known by the name rice-bunting, a bird of the bunting family, which migrates over N. A. from Labrador to Mexico, appearing in Massachusetts about the beginning of May. Their food is insects, worms, and seeds, including rice in South Carolina. The song of the male is singular and pleasant. When fat their fiesh is of a fine flavor. The other species is known as the rice bunting, also as the Java sparrow, and paddy bird. It belongs to the true finches, a group nearly allied to the buntings. It possesses a largely developed bill; the head and tail are black, the belly rosy, the cheeks of the male white, and the legs flesh-colored. It is dreaded in Southern Asia on account of the ravages it commits in the rice fields. It is frequently brought to Europe, and is found in aviaries.

**Boccaccio** (bok-kåt'chō), GIOVANNI (1313-1375), Italian novelist and poet, son of a Florentine merchant. He spent some years unprofitably in literary pursuits and the study of the canon law, but in the end devoted himself entirely to literature. In 1831 Boccaccio fell in love with Maria, daughter of King Robert. His first work, a romantic love tale in prose; *Filocopo*, was written at her command, as was also the *Tescide*, the first heroic epic in the Italian language. In 1341 he returned to Florence. In 1344 he returned to Naples. *Dicameron*, on which his fame rests, consists of 100 tales represented to have been related in equal portions in 10 days by a party of ladies and gentlemen at a country house near Florence while the plague was raging in that city. In 1373 he was chosen by the Florentines to occupy the chair which was established for the exposition of *Dante's Dirina Comedia*. His lectures continued till his death.

**Bocca Tigris** (or Bogue), the embouchure of the principal branch of the Chu Kiang, or Canton River, China.

**Bochum** (boh' um), a Prussian town, prov. of Westphalia, 5 mi. e.n.e. of Essen; manufactories of iron, steel, hardwares, etc. Pop. 47,601.

**Bock**, Bochbier, a variety of German beer made with more malt and less hops than ordinary German beer, and therefore sweeter and stronger.

**Bockenheim** (-hīm), town of Germany, forming almost a suburb of Hamburg; flourishing manufactures of machinery, etc. Pop. 18,730.

manufactures of machinery, etc. Pop. 18,730. **Bode** (bo'de). JOHN ELERT (1747-1826), German astronomer. His best works are his Astronomical Almanac and his large Celestial Atlas, giving a catalogue of 17,240 stars (12,000 more than in any former chart). Bode's Law is the name given to an arithmetical formula, previously made known by Kepler and Titius of Wittenberg, expressing approximately the distances of the planets from the sun. The law has no theoretical foundation.

**Bodleian Library** at Oxford, founded by Sir Thomas Bodley in 1598, opened 1602. It claims a copy of all works published in Britain, and for rare works and MSS. it is said to be second only to the Vatican. It contains over 1,500,000 volumes.

Bochmeria (bē-mē'ri-a), a genus of plants,

Bœhmeria. a.-male flower; b.-glomerule of female flowers; c.-single female flower; d.-pericarp.

#### Bogardus

closely resembling the stinging nettle. A number of the species yield tenacious fibers, used for making ropes, twine, net, sewing thread. One species is the Chinese grass, the Malay ramee which is shrubby and 3 or 4 ft. high. It is a native of China, Southeastern Asia, and the Asiatic Archipelago, where, and in India, it has long been cultivated. The plant has been introduced into cultivation in parts of the U. S., Algeria, France, etc., under its Malay name of ramee (or ramie).

**Baco' tia**, a division of ancient Greece. lying between Attica and Phocis. Along with Attica, Bacotia now forms a nomarchy of the kingdom of Greece, with a pop. of 185,364. Area 1,119 sq. mi. See *Greece*.

Boers (börz; Dutch, boer, a peasant or husbandman), the Cape-Dutch name for the farmers of Dutch origin in South Africa. In 1836-37 large numbers of the Boers, being dissatisfied with the British government in Cape Colony, migrated northward to what is now Natal. Here their ill-treatment of the natives soon led to war, and the British had to interfere and ultimately (1843) annex the country. The Boers again migrated, but their new settle-ment was annexed in 1848. They then began to form the present Transvaal, where their illtreatment of the colored races has caused the British government again and again to interfere. They now occupy the Transvaal and the Orange State. The Boers, who are all rigid Calvinists, are described as frugal, industrious, and hospitable, but distrustful of foreigners, especially of the English. The Boers are by no means scrupulous and humane in their dealings with the natives; but remarkable for courage, love of freedom, sobriety, and industry, of strong and well-developed physique, good horsemen, and splendid marksmen.

Bog, a piece of wet, soft, and spongy ground, where the soil is composed mainly of decaying and decayed vegetable matter. Such ground is valueless for agriculture until reclaimed, but often yields abundance of peat for fuel. Bogs are generally divided into two classes; red bogs, or peat mosses, and black bogs, or mountain mosses. The former class are found in extensive plains frequently running through several counties, such as the Chatmoss in Laucashire, England, and the Bog of Allen in Ireland, the depth varying from 12 to 42 ft. Their texture is light and full of filaments. and is formed by the slow decay of mosses and plants of different kinds. The lower parts. being more entirely decayed, approach nearer to the nature of the humus than the upper portion, and, as being more carbonaceous, are more valuable for fuel. Black bog is formed by a more rapid decomposition of plants. It is heavier and more homogeneous in quality, but is usually found in limited and detached portions, and at high elevations where its reclamation is difficult.

**Bogar' dus,** JAMES (1800-1874), an American inventor, b. in Catskill, N. Y. Among his inventions were the "ring-flyer" or "ring-spinner" used in cotton manufacture, the eccentric

mill, an engraving machine, and the first dry gas meter. In 1830 he gained the reward offered by the British government for the best plan for carrying out the penny postage system by the use of stamps. In 1847 he built the first complete cast-iron structure in the world, and the first wrought-iron beams were made from his design. His delicate pyrometer and deep-sea sounding machine were valuable additions to scientific instruments.

Bog oak, trunks and large branches of oak found imbedded in bogs and preserved by the antiseptic properties of peat, so that the grain of the wood is little affected by the many ages during which it has lain interred. It is of a shining black or ebony color, derived from its impregnation with iron, and is frequently converted into ornamental pieces of furniture and smaller ornaments as brooches, earrings, etc.

**Bogotá** (formerly Santa Fé de Bogotá), a city of South America, capital of Colombia, and of the state or department of Cundinamarca. The inhabitants are mostly Creoles. Bogotá is an emporium of internal trade, and has manufactures of soap, cloth, leather, etc., not of great importance. It was founded in 1538. Pop. 726,000.

**Bogue** (bög), DAVID (1750-1825), the originator of the London Missionary Society. He studied at Edinburgh, and was licensed as a preacher of the church of Scotland. In 1771 he was employed as usher in London, and afterward became minister of an Independent chapel at Gosport, where he formed an institution for the education of young men for the Independent ministry. He then began the formation of the grand missionary scheme which afterward resulted in the London Missionary Society, and took an active part in the foundation of the British and Foreign Bible Society and the Religious Tract Society.

Bohe' mia, a province with the title of kingdom belonging to the Austro-Hungarian monarchy. Area 20,000 sq. mi.: pop. 5,837,603, of whom more than 2,000,000 are Germans, the rest mostly Czechs. The language of the country is the Czech dialect of the Slavonic. All sorts of grain are produced in abundance, as also large quantities of potatoes, pulse, sugarbeet, flax, hops, and fruits. The raising of sheep, horses, swine, and poultry is carried on to a considerable extent. The mines yield silver, copper, lead, tin, zinc, iron, cobalt, arsenic, uranium, antimony, alum, sulphur, plumbago, and coal. There are numerous mineral springs, but little salt. Spinning and weaving of linen, cotton, and woolen goods are extensively carried on; manufactures of lace, metal and wood work, machinery, chemical prodand work, beet-root sugar, pottery, porcelain, etc., are also largely developed. Large quantities of beer are exported. The glassware of Bo-hemia, which is known all over Europe, employs 50,000 workers. The largest towns are Prague, Pilsen, Reichenberg, Budweis, Teplitz, Aussig, and Eger. The educational establishments include the Prague university and upward of 4,000 ordinary schools. The

province sends 92 representatives to the Austrian Parliament; the provincial diet consists of 241 members.

Bohemia possesses a literature of considerable bulk, including in it also works written in Czech by Moravian and Hungarian writers. The earliest fragment is doubtfully referred to the tenth century, and it was not till after the thirteenth century that it attained to any development. The next century was a period of great activity, and to it belong versified legends, allegorical and didactic poems, historical and theological works, etc. The most flourishing period of the older literature falls within 1409-1620, John Huss (1639-1415) having initiated a new era, which, however, is more fertile in prose works than in poetry.

Bohemia was named after a tribe of Gallic origin, the Boii, who were expelled from this region by the Marcomans at the commence-ment of the Christian era. The latter were in turn obliged to give place to the Germans, and these to the Czechs, a Slavic race who had established themselves in Bohemia by the middle of the fifth century, and still form the bulk of the population. The country was at first divided into numerous principalities. Christianity was introduced about 900. In 1092 Bohemia was finally recognized as a kingdom under Wratislas II. In 1230 the monarchy, hitherto elective, became hereditary. The monarchs received investiture from the German emperor, held one of the great offices in the imperial court, and were recognized as among the seven electors of the empire. Frequently at strife with its neighbors, Bohemia was successively united and disunited with Hungary, Silesia, Moravia, etc., according to the course of wars and alliances. Ottokar II (1253-78) had extended his conquests almost from the Adriatic to the Baltic, when he lost them and his life in contest with Rudolph, the founder of the house of Hapsburg. After the close of the Przemysl dynasty (which had held sway for about six centuries) by the assassination of Ottokar's grandson, Wenceslas III, the house of Luxemburg succeeded in 1310, and governed Bohemia till 1437, the reign of Charles II (1346-78) being especially prosperous. Toward the close of this second dynasty civil wars were excited by the spread of the Hussite movement, the central figure of the struggle being John Ziska, the leader of the Taborites. A temporary union between the moderate Hussites and the Catholics having proved a failure, the reformed party elected as king, in 1433, the Protestant noble, George Podibrad. On his death in 1471 they chose Wladislas, son of Cassimir, king of Poland, who also obtained the crown of Hungary. His son Louis lost both crowns with his life in the battle of Mohacz against the Turks, and Ferdinand of Austria became in 1527 sovereign of both kingdoms. Bohemia then lost its separate existence, being declared a hereditary possession of the house of Austria; and its subsequent history pertains to that of the Austrian Empire. In 1848 an attempt was made to assert its ancient inde-

pendence against the Austrian dominion; a conflict took place, Prague was bombarded, and the insurrection suppressed.

**Bohemian Forest**, a mountain ridge extending from the Fichtelgebirge southward toward the confluence of the IIz and the Danube, and separating Bavaria from Bohemia. The highest peaks are the Arber (4,320 ft.) and the Rachel.

Bohemond, MARC (1056-1111), son of the Norman adventurer, Robert Guiscard, who rose to be Duke of Apulia and Calabria. Bohemond threw his energy into the Crusades. He took a leading part in the campaign in Asia Minor, captured Antioch (1098), and assumed the principality, but was taken prisoner in 1101 and held captive for two years.

**Bohn** (bon), HENRY GEORGE (1796-1884), English bookseller. He was the publisher of the well-known *Libraries*, or collection of standard works at moderate prices, to which he contributed some translations and works edited by himself.

**Bol'ars** (or Boy'ars), an order of the old Russian aristocracy next in rank to the ruling princes. The order was abolished by Peter the Great, who gave its members a place in the Russian nobility.

**Boil**, to heat a fluid up to the point at which is converted into vapor. The conversion it is converted into vapor. takes place chiefly at the point of contact with the source of heat, and the bubbles of vapor rising to the surface, and breaking there, produce the commotion called *ebullition*. At the ordinary atmospheric pressure ebullition commences at a temperature which is definite for each liquid. The escape of the heated fluid in the form of vapor prevents any further rise of temperature in an open vessel when the boiling point has been reached. The exact definition of the boiling-point of a liquid is "that temperature at which the tension of its vapor exactly balances the pressure of the atmosphere." The influence of this pressure appears from experiments. In an exhausted receiver the heat of the human hand is sufficient to make water boil; while, on the contrary, in Papin's digester, in which it is possible to subject the water in the boiler to a pressure of three or four atmospheres, the water may be heated far above the normal boiling point without giving signs of ebulli-From this relation between the ebullition. tion of a liquid and atmospheric pressure the heights of objects above sea-level may be calculated by comparing the actual boiling point at any place with the normal boiling point. The boiling point of water as marked on Fahrenheit's thermometer is 212<sup>o</sup>: on the Centigrade, 100°: on the Réaumur, 80°. Ether boils at about 96<sup>°</sup>, mercury at 662<sup>°</sup>.

**Boil**, a small, painful swelling of a conical shape on the surface of the body. Its base is hard, while its apex is soft and of a whitish color. Boils are generally indicative of depressed health, intemperate habits, or disorder of the digestive organs.

Boileau-Despréaux (bwä-lö-dā-prā-ō), NICH-OLAS (1636-1711), a French poet. He studied in the Collége d'Harcourt and in the Collége de Beauvais, and entered the legal profession, but soon left it to devote himself entirely to belles-lettres. In 1660 appeared his first satire, Adieux d'un Poete à la Ville de Paris, followed rapidly by eight others, and ultimately by three more, to complete the series. In 1664 he wrote his prose Dialogue des Heros de Roman. His epistles appeared at various times from 1669 onward. His masterpieces were the L'Art Poétique and Le Lutrin, published in 1674. In many respects his writings determined the trend of all subsequent French poetry, and he left, through his influence upon Dryden, Pope, and their contemporaries, a permanent mark upon English literature.

Boiler, a vessel constructed of wrought iron or steel plates riveted together, with needful adjuncts, in which steam is generated from water for the purpose of driving a steam engine, or for other purposes. The first important point in preparing a steam boiler is to secure strength to resist the internal pressure of steam and prevent explosions; and accordingly the globular or spherical shape was very early adopted as one of greatest capacity, and as a shape which was not liable to distortion by pressure. It was set over an open fire, and the steam was confined until it was raised by the heat to the required pressure. But the open fire was wasteful of fuel, and the next step was to enclose the globular boiler in brickwork. and conduct the flames in a flue winding round the boiler, in contact with it. The next form of boiler was the cylindrical, which stood upright like a bottle, the fire being placed at the bottom, and the flue winding round that part of the sides or walls of the boiler covered with water. For the sake of strength to resist the pressure of the steam, the bottom was hollowed or arched upward, and it presented a concave dome to the radiant heat of the fire and the impact of the flames; and the top was made hemispherical. In process of time boilers of much larger size came to be required, and the horizontal wagon-shaped boiler of James Watt was produced, and was succeeded by the cylindrical boiler having hemispherical ends, in which simplicity and strength of design for higher pressures were combined. This is a boiler that does not require any stays, and is valuable where there is plenty of room.

But, for the sake of economy of fuel as well as of space, one or two cylindrical flues are commonly constructed within the boiler, into which one flue tube is fixed traversing the boiler from end to end. The internal flue was first applied by James Watt. The burning gases from the fire after having traversed the bottom of the boiler, return through the internal flue to the front, where the current is divided, and returns toward the chimney along both sides of the boiler. In the Cornish boiler similarly constructed, the internal tube is made sufficiently large to receive the furnace inside the boiler; the boiler being "internally fired," in contrast with the other boilers which have been described, and are "under-fired." When two large furnace tubes for internal

firing are applied within the boiler it is known as the Lancashire boiler, and is the most generally prevailing type of boiler for purposes on land.

The shell of the boiler, or outer part, is of iron or steel plates. The steam chest or dome, on the upper side of the boiler, is a reservoir, whence the steam is supplied to the engine by the steam pipe, which is fitted with a stop valve. The *furnace* is the chamber for the combustion The flues or conduits for the of the fuel. burnt gases are either external or internal; cylindrical metal flues are flue tubes, and they are fixed at the ends into tube plates. The manhole is the entrance to the boiler for inspection, etc.; and it is closed by a manhole door or lid. Mudholes are placed at or near the bottom of the boiler, for the discharge of sediment, etc. The water is supplied by the feed apparatus; its level is indicated by a *float*. The water gauge also shows the level of the water; it may be a glass tube at the front of the boiler, connected to it by two horizontal tubes, one at the upper end and one at the lower end of the glass tube, or it may be a series of two or three gauge cocks, connected at different levels. The boiler is emptied by the blow-off cock; the surface of the water is cleared by the scum cock. Brine pumps may be used instead of blow-off cocks to draw off the brine from marine boilers. Surplus steam escapes by the safety values. Vacuum valces admit air into the boiler, when the pressure is less than that of the atmosphere. Fusible plugs are inserted in the boiler, over the fire, which melt and give vent to the steam when the pressure and temperature of the steam in the boiler become excessive and dangerous. The degree of pressure is indicated by the pressure gauge. The boiler is strengthened by stays, which may consist of rods, bolls, or gussets. The boiler is covered with clothing or cleading. The fire grate carries the fuel, and it consists of grate bar or fire bars, usually of cast iron, supported by crossbearers or bar frames. The mouthpiece is the entrance to the furnace, and it rests on the *dead plate.* The fire door or pair of fire doors are fitted to and hung by it. The *heating sur*face is the surface of the boiler exposed to the flame and burned gases from the furnace. The boiler room or internal capacity of the boiler is divided into the water room, occupied by water; and the steam-room, occupied by steam.

There are many varieties of boilers specially adapted to circumstances. The marine boiler is of the shape of a cheese, standing upright, containing the furnace tubes in the lower part, and small flue tubes — the multitubular flue — in the upper part. By inserting many small tubes in place of one or two large tubes, the body of water is subdivided, and the heat is effectively and rapidly distributed to the water. Locomotive boilers, also, are constructed with the multitubular flue, and the furnace or firebox, surrounded with water, is placed at one end. There are many forms of upright or vertical boilers, consisting of upright cylindrical shells, containing a fire-box at the lower part, from which the burned gases are carried up through a single, vertical flue, to the chimney above. In another form of upright boiler, cross water tubes are inserted in the upper part of the furnace, which absorb heat, both radiated and convected, and promote the circulation of the water in the boiler.

Boil'ing, in cookery, is one of the most frequent and important operations connected with the preparation of food. It is a process applicable to almost all varieties of food and every kind of culinary preparation, and the necessary appliances are simple and inexpensive. In the boiling of animal food, if it is desired to retain the nutritive juices within the substance, the meat to be boiled should be suddenly plunged entire into boiling water, and briskly boiled a few minutes. This coagulates the albuminous matter in the outer portions of the meat, and prevents the exudation of the fluid juices within. Thereafter the water should be maintained somewhat under the boiling point till the meat is sufficiently dressed, a period which varies according to the amount being operated on. By this means the meat is kept at once juicy, tender, and nutritious. The boiling of food starches such as arrowroot, corn flour, etc., ruptures the starch granules, and renders them digestible; and the same thing occurs in boiling meal, flour, and vegetables generally, which all contain starch in large proportions. Boiled food is more digestible than the same either roasted or stewed, but it wants the empyreumatic odor and sapidity communicated by these processes.

Bois de Boulogne (bwä-de-bö-lon), a pleasant grove near the gates on the w. of Paris, so named after the suburb Boulogne-sur-Seine. Its trees were more or less destroyed during the Franco-German War. It is still, however, one of the pleasantest Parisian holiday promenades.

Boisé City, capital of the state of Idaho. It is situated on the site of an old trading post of the Hudson Bay Company, 285 mi. n.w. of Salt Lake City; contains the state capitol, penitentiary, and U. S. assay office. Pop. 800.

**Bois-le-duc,** (bwä-li-duk), a fortified city, North Brabant, Holland, founded by Godfrey of Brabant in 1184; has manufactures of cloth, hats, cotton goods, etc., and a good trade in grain, its water traffic being equal to that of a considerable maritime port. The cathedral is considerable maritime port. The cathedral is one of the finest in the Netherlands. Pop. The Duke of York was defeated here 25,517. by the French in 1794.

Bojador', a cape on the West Coast of Africa, one of the projecting points of the Sahara; till the fifteenth century the southern limit of African navigation. The coast of the Sahara from Cape Blanco to this cape and a considerable portion of the interior has been proclaimed Spanish territory.

Bojol (bo-hol'), one of the Philippine Is-ands, n. of Mindanao, about 40 mi. by 30
mi. Woody and mountainous. Pop. 187.000.
Boker, GEORGE HENRY (1823-1890), American poet and man of letters. He published

several volumes of poems, notably war songs, and was the author of the tragedies of, Calaynos, Anne Boleyn, and Francesca da Rimini. In 1872 he became U. S. Minister at Constantinople; in 1876 was sent to St. Petersburg and remained there two years. His last literary work, a volume of sonnets, appeared in 1886. Of his war-poems the most famous is that of the Black Regiment, founded on an incident at Port Hudson.

**Bokhara** (Bochara) (bo-ha'-rå), a khanate of Central Asia, vassal to Russia. Area 100,000 sq. mi.; pop. 2,500,000. The only two towns of importance are the capital, Bokhara, and Karshi. The rule of the Emir is theoretically absolute. The manufactures are unimportant, but there is a very considerable caravan trade, cotton. rice, silk, and indigo being exported, and woven goods, sugar, iron, etc., being imported.

Bokhara was the ancient Sogdiana (or Maracanda), capital Samarkand; was conquered by the Arabs in the eighth century, by Genghis Khan in 1220, and by Timur in 1370, and was finally seized by the Usbeks in 1505. It has recently suffered much from the advances of the Russians, who, in 1868, compelled the cession of Samarkand and important tracts of territory. Since then the Emir Muzaffer-Eddin has sunk more and more into a position of dependency on Russia. After the Russian expedition to Khiva in 1873 an agreement was come to between Russia and Bokhara by which Bokhara received a portion of the territory ceded by Khiva to Russia, while the Russians received various privileges in return. Bokhara, the capital of the khanate, is 8 or 9 mi. in circuit, and surrounded by a mud wall. The trade was formerly large with India, but has been almost completely absorbed by Russia. Pop. 70,000.

**Boian' Pass**, a celebrated defile in the Hala Mountains, n.e. of Beluchistan, on the route between the Lower Indus (Scinde) and the table-land of Afghanistan. It is about 60 mi. long, hemmed in on all sides by lofty precipices, and in parts so narrow that a regiment could defend it against an army. It is traversed by the Bolan river. The crest of the pass is 5,800 feet high.

**Bolas** (that is, "balls"), a form of missile used by the Paraguay Indians, the Patagonians, and especially by the Gauchos of the Argentine Republic. It consists of a rope or line having at either end a stone, ball of metal, or lump of hardened clay. When used it is swung round the head by one end, and then hurled at an animal so as to entangle it.

**Bole**, an earthy mineral occurring in amorphous masses, and composed chiefly of silica with alumina, iron, and occasionally magnesia. It is of a dull yellow, brownish, or red color, has a greasy feel, and yields to the nail. In ancient times, under the name of Lemnian bole or earth, one variety of it had a place in the materia medica. At present the best known bole of commerce is a coarse pigment known as Berlin and English red.

Boler'o, a popular Spanish dance of the bal-

let class, for couples, or for a single female dancer. The music, which is in triple measure, is generally marked by rapid changes of time, and the dancers mostly accompany the music with castanets. The interest of these dances largely depends upon the pantomime of passion, which forms an essential part of them.

Boleyn (bul'in), ANNE (1501-1536), second wife of Henry VIII of England. She attended Mary, sister of Henry, on her marriage with Louis XII to France, as lady of honor, returning to England about 1522, and becoming lady of honor to Queen Catharine. The king, who soon grew fond of her, without waiting for the official completion of his divorce from Catharine, married Anne in January, 1533. having previously created her Marchioness of Pembroke. Then Cramner declared the first marriage void and the second valid, and Anne was crowned at Westminster with unparal-leled splendor. On Sept. 7, 1533, she became the mother of Elizabeth. She was speedily. however, in turn supplanted by her own lady of honor, Jane Seymour. Suspicions of infidelity were alleged against her, and in 1536 the queen was brought before a jury of peers on a charge of treason and impropriety of conduct. Smeaton, a musician, who was arrested with others, confessed, and on May 17 she was condemned to death. The clemency of Henry went no further than the substitution of the scaffold for the stake, and she was beheaded Whether she was guilty on May 19, 1536. or not has never been decided; that she was exceedingly indiscreet is certain.

Bo'lingbroke, HENRY ST. JOHN, Viscount (1678-1751), a famous English tory statesman of the eighteenth century. In 1701 he obtained a seat in the House of Com-mons, attaching himself to the Tories. He became secretary of war in 1706, though he retired with the ministry in 1708. In 1710 he became one of the secretaries of state. In 1712 he was called to the House of Lords by the title of Viscount Bolingbroke, and in 1713 concluded the Peace of Utrecht. Queen Anne made Bolingbroke prime minister, but died herself four days later. Bolingbroke, dismissed by King George while yet in Germany, fled to France in March, 1715, to escape the inevitable impeachment by which, in the autumn of that year, he was deprived of his peerage and banished. James III, the Pretender, invited him to Lorraine and made him his secretary of state. but dismissed him in 1716 on a suspicion of treachery. In 1723 he was permitted to return to England. He withdrew entirely from politics and spent the last years of his life in qui-etude at Battersea. Pope was indebted to him for suggestions for his Essay on Man. He was clever and versatile, but unscrupulous and insincere.

Bolivarey Ponte, SIMON (1783-1830), liberator and leader in the South American struggle for independence. He studied law in Madrid, and was married in 1801. Returning from Europe to South America (1809) he passed through the United States. He took part in

the revolutionary uprising in Caracas (April 19, 1810). After an unsuccessful attempt for Venezuelan independence (1811), B. went to Granada to operate against the Royalists. With his cousin, Rebas, he reached the Venezuelan border and kindled anew the fires of revolution. Jan. 13, 1813, he issued his famous proclama-tion of "war to the death." General Montverde was defeated by Rebas, General Bolivar entering Caracas in triumph, Aug. 4, 1814, proclaimed himself liberator and dictator. Caracas was retaken by the Royalists 1814. B. peaceably transferred the general government to Bogota and went to Kingston, Jamaica, (1815). His next victory was over Morillo at Barcelona (December, 1816). He fixed his head-quarters at Angostura (1817) and set out to effect a junction with Gamma Santandez who effect a junction with General Santander, who commanded the Republican forces in New Granada. He gained the splendid victory of Bojaca (Aug. 7, 1819), and was welcomed at Santa Fé as a deliverer. On Dec. 7, 1819, was promulgated the law uniting Venezuela and New Granada under the Republic of Colombia with B. as president. He practically ended the war in Venezuela when he defeated La Torre in the battle of Carabobo. B. entered Caracas (June 29, 1820), having for the third time rescued his native city from its oppressors. A constitution was adopted (Aug. 30, 1829), and B. elected president. The constitution of Bolivia, framed by Bolivar and presented to Congress, May 25, 1826, excited the fear that he wished to make himself perpetual dictator over united Colombia, Peru, and Bolivia. The Peruvians abjured the Bolivian code and organized a provisional government for them-selves. From 1828-1830 B. exercised supreme power in Colombia. One of the states or departments of Colombia is named after him Bolivar. Its area is 21,345 sq. miles; its pop. 24,400. Capital Carthagena.

Boliv'ia, formerly called Upper Peru, a republic of S. A. Area 567,360 sq. mi.; pop. 2,-300,000. An unascertained proportion of the inhabitants belong to aboriginal races (the Aymaras and the Quichuas); the larger portion of the remainder being Mestizos or descendants of the original settlers by native women. The largest town is La Paz, but the executive government has its seat at Sucre (or Chuquisaca); other towns are Potosi, Oruro, and Cochabamba. The broadest part of the Andes, where these mountains, encompassing Lakes Titicaca (partly in Bolivia) and Aullagas, divided into two chains, known as the Eastern and Western Cordilleras, lies in the western portion of the state. Here are some of the highest summits of the Andes, as Sorata, Illimani, and Sajama. The two chains enclose an extensive table-land, the general elevation of which is about 12,500 ft., much of it being saline and barren, especially in the s. The climate, though ranging between extremes of heat and cold, is very healthy, and cholera and yellow fever are unknown. The elevated regions are cold and dry, the middle temperate and delightful, the lower valleys and plains quite tropical. Among animals are the llama, alpaca, vicuña, chin-

chilla, etc.; the largest bird is the condor. Bolivia has long been famed for its mineral wealth, especially silver and gold, the total value of these metals produced between 1545 and 1875 being estimated at nearly \$2,000,000,-000. The annual produce is still several millions in value. The celebrated Potosi was once the richest silver district in the world. The country is capable of producing every product known to S. A., but cultivation is in a very backward state. Coffee, coca, cacao, tobacco, maize, and sugar-cane are grown, and there is an inexhaustible supply of india-rubber. The imports and exports are roughly estimated at about \$6,000,000 and \$9,000,000 respectively. The chief exports are silver (two thirds of the whole), cinchona or Peruvian bark, cocoa, coffee, caoutchouc, alpaca wool, copper, tin, and other ores. Roads are few and bad; and until these are improved and extended, railways built (there is one short line connecting La Paz with Titicaca and thus with the Peruvian Puno-Islay line), and the water communication by way of the Amazon and its tributaries taken advantage of, the trade must remain small. Accounts are kept in bolivianos or dollars, value about 83 cts.

By its constitution Bolivia is a democratic republic. The executive power is in the hands of a president elected for four years, and the legislative belongs to a congress of two chambers, both elected by universal suffrage. The The refinances are in a disorganized state. ligion is the Roman Catholic, and public worship, according to the rites of any other church is prohibited. Education is at an exceedingly low ebb. Bolivia under the Spaniards long formed part of the viceroyalty of Peru, latterly it was joined to that of La Platta or Buenos Ayres. Its independent history commences with the year 1825, when the republic was founded. The constitution was drawn up by Simon Bolivar, in whose honor the state was named Bolivia, and was adopted by congress. in 1826. It has since undergone important modifications. But the country has been almost continually distracted by internal and external troubles, and can scarcely be said to have had any definite constitution. It suffered severely in the war which, with Peru, it waged against Chile in 1879 and subsequent years, and which ended in a serious loss of territory; and also from a continued state of anarchy since the close of that war.

**Bologna** (bo-lön'ya), an important city of Italy, capital of the province of same name. It is the see of an archbishop, and has extensive manufactures of silk goods, velvet, artificial flowers, etc. Among the principal buildings are the Palazzo Pubblico, the Palazzo del Podesta; and the church or basilica of St. Petronio. Among the hundred other churches, S. Pietro, S. Salvatore, S. Domenico, S. Giovanni in Monte, S. Giacomo Maggiore, --all possess rich treasures of art. The leaning towers Degli Asinelli and Garisenda, dating from the twelfth century, are among the most remarkable objects in the city: and the market is adorned with the colossal bronze Neptune of

# **Bolor-Tagh**

Giovanni da Bologna. An arcade of 640 arches leads to the church of Madonna di S. Lucca, situated at the foot of the Apennines, near Bologna, and the resort of pilgrims from all parts of Italy. Bologna has long been re-nowned for its university, claiming to have been founded in 1038, and having a library, at one time in the care of Cardinal Mezzofanti, which numbers over 200,000 volumes and 9,000 The Instituto delle Scienze has a li-MSS. brary which numbers about 160,000 volumes, with 6,000 manuscripts. The Church of San Domenico has a library of 120,000 volumes. The Academy of Fine Arts has a rich collection of paintings by native artists, such as Francia, and the later Bolognese school, of which the Caraccis, Guido Reni, Domenichino, and Albano were the founders. Bologna was founded by the Etruscans under the name of Felsina; became in 189 B. c. the Roman colony Bononia: was taken by the Longobards about 728 A. D.; passed into the hands of the Franks, and was made a free city by Charlemagne. In the twelfth and thirteenth centuries it was one of the most flourishing of the Italian republics; but the feuds between the different parties of the nobles led to its submission to the papal see in 1513. Several attempts were made to throw off the papal yoke, one of which, in 1831, was for a time successful. In 1849 the Austrians obtained possession of it. In 1860 it was annexed to the dominions of King Victor Emmanuel. Pop. 142,460. The province of Bologna, formerly included in the papal territories, forms a rich and beautiful

Balance Area 1,390 sq. mi.; pop. 457,474. Bolor-Tagh (also Bilaur. or Belut Tagh), a mountain range formerly imagined to exist in Central Asia between Eastern and Western Turkestan as the axis of the continent. At that point, however, there is really a lofty table-land called the Pamirs.

**Bolton** (or Bolton-le-Moors), a manufacturing town of Lancashire, England, 10 mi. n. w. of Manchester. Its main growth has been of recent date, and in part due to the inventions of its residents Arkwright and Crompton. In manufacturing industries it is now surpassed by few places in Britain, and it contains some of the largest and finest cotton mills in the world. There are large engineering works, besides collieries, paper mills. foundries, chemical works, etc. Pop. 115,002.

**Bolt-ropes,** ropes used to strengthen the sails of a ship, the edges of the sails being sewn to them. Those on the sides are called *leech-ropes*, the others *head* and *foot ropes*.

**Boma**, a trading station on the right bank of the lower Congo River in Africa and seat of government of the Congo Free State.

**Bomarsund'**, a Russian fortress on the Aland Islands at the entrance of the Gulf of Bothnia, bombarded and forced to capitulate to the allied French and English in 1854 during the Crimean War, and then destroyed.

Crimean War, and then destroyed. **Bomb** (bom), a large, hollow iron ball or shell, filled with explosive material and fired from a mortar. The charge in the bomb is exploded by means of a fuse filled with pow-

# Bombay

der and other inflammable materials, which Tare ignited by the discharge of the mortar. Conical shells shot from rifled cannon have supplanted the older bomb. The use of bombs and mortars is said to have been invented in the middle of the fifteenth century.

#### Bombardier Beetles.

Bombardier Beetle, a name given to a species of beetle because of the remarkable power they possess of being able to defend themselves by expelling a pungent acrid fluid, which explodes with a pretty loud report on coming in contact with the air.

Bombay' (Portuguese, "good harbor"), chief seaport on the west coast of India, and capital of the presidency of the same name. Bombay has many handsome buildings, both public and private, as the cathedral, the university. the secretariat, the new high court, the post and telegraph offices, etc. Various industries. such as dyeing, tanning, and metal-working, are carried on, and there are large cotton factories. The commerce is very extensive, exa total value of over \$300,000,000 annually. The harbor is one of the largest and safest in India, and there are commodious docks. There is a large traffic with steam vessels between Bombay and Great Britain, and regu-lar steam communication with China, Aus-tralia, Singapore, Mauritius, etc. The island of Bombay, which is about 11 mi. long and 3 mi. broad, was formerly liable to be overflowed by the sea, to prevent which substantial walls and embankments have been constructed. After Madras, Bombay is the oldest of the British possessions in the East, having been ceded by the Portuguese in 1661. Pop. 821,-764

**Bombay'**, one of the three presidencies of British India. It is divided into a northern, a central, and a southern division, the Sind division, and the town and island of Bombay. The northern division contains the districts of Ahmedabad, Kaira, Panch Mahals, Broach, Surat, Thana, Kolába; the central, Khandesh, Nasik, Ahmednagar, Poonah, Sholapur, Satara; the southern, Belgaum, Dharwar, Kaladgi, Kanara, Ratnagiri. Total area 124, 192 sq. mi.; pop. 18,901, 123, including the city and territory of Aden in Arabia, 70 sq. mi. (pop. 34,860). The native or feudatory states connected with the presidency (the chief being Kathiawar) have an area of 73,753 sq. mi., and a population of 6,941,249. The climate varies, being unhealthy in the capital, Bombay, and vicinity,

but at other places, such as Poonah, very favorable to Europeans. The chief productions of the soil are cotton, rice, millet, wheat, barley, dates, and the cocoa-palm. The manufactures are cotton, silk, leather, etc. The great export is cotton. The administration is in the hands of a governor and council. The chief source of revenue is the land, which is largely held on the ryotwar system.

**Bombazine** (-zēn') is a mixed tissue of silk and worsted, the first forming the warp, and the second the weft. It is fine and light in the make, and may be of any color, though black is now most in use.

**Bona**, seaport and fortified city of Algeria, with manufactures of burnooses, tapestry, and saddles, and a considerable trade. Pop. 30,806. **Bonan'za** (Sp. "fair weather," "a favoring

**Bonan'za** (Sp. "fair weather," "a favoring wind"), a term applied in the U. S. to an abundance of precious metal or rich ore in a mine.

Bonaparte (bon'a pärt), the French form which the great Napoleon was the first to give to the original Italian name Buonaparte, borne by his family in Corsica. As early as the twelfth and thirteenth centuries there were families of this name in Northern Italy, members of which reached some distinction as governors of cities, envoys, etc. But the connection between the Corsican Bonapartes and these Italian families is not clearly established. though probably the former were descended from a Genoese branch of the family, which transplanted itself about the beginning of the sixteenth century to Corsica, an island then under the jurisdiction of Genoa. From that time the Bonapartes ranked as a distinguished patrician family of Ajaccio. About the middle of the eighteenth century there remained three male representatives of this family at Ajaccio, viz., the archdeacon Luciano Bonaparte, his brother Napoleon, and the nephew of both, Carlo, the father of the em-peror Napoleon I. Carlo or Charles Bonaparte, b. 1746, studied law at Pisa university, and on his return to Corsica, married Letizia Ramolino. He fought under Paoli for the independence of Corsica, but when further re-sistance was useless he went over to the side of the French, and was included by Louis XV amongst the 400 Corsican families who were to have rights in France as noble. In 1777 he went to Paris, where he resided for several years, procuring a free admission for his second son Napoleon to the military school of Brienne. He d. in 1785 at Montpellier. By his marriage with Letizia Ramolino he left eight children: Giuseppe (or Joseph) (see below), king of Spain; Napoleon I, emperor of the French (see Na*poleon I*); Lucien (see below), prince of Canino; Maria Anna, afterward called Elise, princess of Lucca and Piombino, and wife of Prince Bacciocchi (see Bacciocchi); Luigi (or Louis) (see below), king of Holland; Carlotta, afterward named Marie Pauline, princess Borghese (see Borghese); Annunciata, afterward called Caroline, wife of Murat (see Murat), king of Naples; and Girolamo (or Jerome) (see below), king of Westphalia.

Bonaparte, Elizabeth Patterson (1785-1879). Her father, William Patterson, emi-grated from Ireland to this country. At a ball in Baltimore, Miss Elizabeth Patterson met Jerome Bonaparte, a youth of nineteen, who had been serving in the French navy in the West Indies. He made a proposal of marriage, which she accepted. The marriage ceremony was performed in Baltimore, Dec. 24, 1803. Napoleon declared the marriage null and void, excluded Jerome from his dynasty, and threatened him with imprisonment unless he consented to repudiate his wife. In 1805 Jerome and Elizabeth embarked for Europe and arrived in Lisbon. She was not permitted to land, and leaving her, Jerome met Napoleon at Alessandria. The emperor declared that if Miss Patterson would return to the U.S., he would give her a pension of \$12-000. Her vessel went to Amsterdam, but was prevented from landing, and Mme. Bonaparte sought refuge in England, where her son. Jerome Napoleon Bonaparte, was b. at Cam-berwell, near London, 1805. Mme. Bonaparte returned to Baltimore. Mme. Bonaparte, although obtaining a divorce in the Maryland courts, employed every means to maintain the legality of her marriage, and the legitimacy of her son, but Jerome appealed to the counsel of state to forbid Jerome "Patterson" from calling himself Jerome Bonaparte. Louis XVIII invited Mme. Bonaparte to court. In 1819 she visited the Princess Borghese (Pauline Bonaparte) in Rome. She left a fortune of \$1,500,000 to her grandsons, Jerome Napo-leon Bonaparte, now in the French army, and Charles Joseph Bonaparte, a lawyer in Baltimore.

**Bonaparte**, JEROME (1784-1860), youngest brother of Napoleon I, b. at Ajaccio; at an early age entered the French navy as a midshipman. In 1801 he was sent out on an expedition to the West Indies, but the vessel, being chased by English cruisers, was obliged to put in to New York. During his sojourn in America Jerome Bonaparte became acquainted with Miss Elizabeth Patterson, and though still a minor, married her in spite of the protests of the French consul on Dec. 24, 1803. After considerable service both in the army and navy, in 1807 he was created king of Westphalia, and married Catherine Sophia, princess of Würtemberg. His government was not wise or prudent, and his extravagance and his brother's increasing exactions nearly brought the state to financial ruin. The battle of Leipsic put an end to Jerome's reign, and he was obliged to take flight to Paris. He remained faithful to his brother through all the events that followed till the final overthrow at Waterloo. After that, under the title of the Comte de Montfort, he resided in different cities of Europe, but latterly chiefly at Florence. After the election of his nephew, Louis Napoleon, to the presidentship of the French Republic, in 1848, he became successively gov-ernor general of Les Invalides, a marshal of France, and president of the senate. He died in 1860. Of Jerome Bonaparte's second mar-

#### Bonaparte

riage two children remain, Prince Napoleon Joseph, who assumed the name of Jerome, and the Princess Mathilde. From the marriage of Prince Napoleon, well-known by the nickname "Plon-Plon," with Clotilde, daughter of King Victor Emmanuel of Italy, were b. three children — Victor (b. July 18, 1862), Louis, and Marie, the first of whom since the death of Napoleon III's son, the Prince Imperial, is generally recognized by the Bonapartist party as the heir to the traditions of the dynasty. Both had to leave France in 1886, a law being passed expelling pretenders to the French throne and their eldest sons.

Bonaparte, JOSEPH (1768-1844), the eldest brother of Napoleon I, was b, in Corsica, educated in France at the college of Autun, returned to Corsica in 1785, on his father's death, studied law, and in 1792 became a member of the new administration of Corsica under Paoli. In 1793 he emigrated to Marseilles, and married the daughter of a wealthy banker named Clari. In 1796, with the rise of his brother to fame after the brilliant campaign of Italy, Joseph began a varied diplomatic and military career. At length in 1806, Napoleon, having himself assumed the imperial title in 1804, made Joseph king of Naples, and two years afterward transferred him to Madrid as king of Spain. His position here, entirely dependent on the support of French armies, became almost intolerable. He was twice driven from his capital by the approach of hostile armies, and the third time, in 1813, he fled, not to re-After Waterloo he went to the U.S., turn. and lived for a time near Philadelphia, assum-ing the title of Count de Survilliers. He subsequently went to England, finally repaired to Italy, and died at Florence.

**Bonaparte**, LETIZIA RAMOLINO (1750-1836), the mother of Napoleon I, and, after Napoleon's assumption of the imperial crown, dignified with the title of Madame Mère, was b. at Ajaccio, and was married in 1767 to Charles Bonaparte. She was a woman of much beauty, intellect, and force of character. Left a widow in 1785, she resided in Corsica till her son became first consul, when an establishment was assigned to her at Paris. On the fall of Napoleon she retired to Rome, where she died.

Napoleon she retired to Rome, where she died. Bonaparte, LOUIS (1778–1846), second younger brother of the Emperor Napoleon I, and father of Napoleon III, was b. in Corsica. He was educated in the artillery school at Chalons, accompanied Napoleon to Italy and Egypt, and subsequently rose to the rank of a brigadier general. In 1802 he married Hortense Beauharnais, Josephine's daughter, and in 1806 was compelled by his brother to accept, very reluctantly, the Dutch crown. He exerted himself in promoting the welfare of his new subjects, and resisted as far as in him lay the tyrannical interference and arbitrary procedure of France; but disagreeing with his brother in regard to some measures of the latter, he abdicated in 1810 and retired to Grätzunder the title of the Count of St. Leu. He d. at Leghorn. He was the author of several works which show considerable literary ability. Bonaparte, Louis. See Napoleon III.

Bonaparte, LUCIEN (1775-1840), Prince of Canino, next younger brother of Napoleon I. was b. at Ajaccio. He emigrated to Marseilles in 1793, and having been appointed to a situation in the commissariat at the small town of St. Maximin in Provence, he married the innkeeper's daughter. Here he distinguished himself as a republican orator and politician, and was so active on this side that after Robespierre's fall he was in some danger of suffering as a partisan. His brother's influence, however, operated in his favor, and in 1798 we find him settled in Paris and a member of the newly elected Council of Five Hundred. Shortly after Napoleon's return from Egypt in 1799 he was elected president of the Council, in which position he contributed greatly to the fall of the Directory and the establishment of his brother's power, on the famous 18th Brumaire (Nov. 9). Next year. as Napoleon began to develop his system of military despotism, Lucien, who still held to his republican principles and candidly expressed his disapproval of his brother's conduct, fell into disfavor and was sent out of the way as ambassador to Spain. Eventually, when Napoleon had the consulate declared hereditary, Lucien withdrew to Italy, settling finally at Rome, where he devoted himself to the arts and sciences, and lived in apparent indifference to the growth of his brother's power. In vain Napoleon offered him the crown, first of Italy and then of Spain; but he came to France and exerted himself on his brother's behalf, both before and after Waterloo. Returning to Italy, he spent the rest of his life in literary and scientific researches. Pope Pius VII made him prince of Canino. He was the author of several works, among which are two long poems. His eldest son, Charles Lucien Laurent Bonaparte (1803-1857). achieved a considerable reputation as a natu-ralist, chiefly in ornithology. He published ralist, chiefly in ornithology. He published a continuation of Wilson's Ornithology; Icono-grafia della Fauna Italica; Conspectus Generum Arium, etc. Another son, Pierre (1815-1881), led an unsettled and disreputable life, and became notorious in 1870 by killing, in his own house at Paris, the journalist Victor Noir, who had brought him a challenge. He got off on a plea of self-defense, but had to leave France.

Bonaparte, NAPOLEON. See Napoleon I.

**Bond**, an obligation in writing to pay a sum of money, or to do or not to do some particular thing specified in the bond. The person who gives the bond is called the obligor, the person receiving the bond is called the obligee. A bond stipulating either to do something wrong in itself or forbidden by law, or to omit the doing of something which is a duty, is void. No person who cannot legally enter into a contract, such as an infant or lunatic, can become an obligee. No particular form of words is essential to the validity of a bond. A common form of bond is that on which money is lent to some company or corporation, and by which the borrowers are bound to pay the lender a certain rate of interest for the money. Goods liable to customs or excise duties are said to be *in bond* when they are temporarily placed in vaults or warehouses under a bond by the importer or owner that they will not be removed till the duty is paid on them. Such warehouses are called *bonded* warehouses.

Bone, a hard material constituting the framework of mammalia, birds, fishes, and reptiles, and thus protecting vital organs such as the heart and lungs from external pressure and injury. In the fetus the bones are formed of cartilaginous (gristly) substance, in different points of which earthy matter-phosphates and carbonates of lime - is gradually deposited till at the time of birth the bone is partially formed. After birth the formation or bone continues, and, in the temperate zones, they reach their perfection in men between the ages of twenty and twenty-five. From this age till fifty they change but slightly; after that period they grow thinner, lighter, and more brittle. Bones are densest at the surface, which is covered by a firm membrane called the *periosteum;* the internal parts are more cellular, the spaces being filled with marrow, a fatty tissue, supporting fine bloodvessels. Bone consists of nearly 34 per cent. organic material and of 66 per cent. inorganic substances, chiefly phosphate, carbonate, and fluoride of lime and phosphate of magnesium. The organic material is converted into gelatin by boiling. It is this which makes bones useful for yielding stock for soup. The inor-ganic substances may be dissolved out by steeping the bone in dilute hydrochloric acid. Bones, from the quantity of phosphates they contain, make excellent manure. The value of bones as manure arises chiefly from the phosphates and nitrogenous organic matters they contain; and where the soil is already rich in phosphates bone is of little use as ma-It is of most service therefore where nure. the soil is deficient in this respect, or in the case of crops whose rapid growth or small roots do not enable them to extract a sufficient supply of phosphate from the earth,-turnips, for instance, or late-sown oats and barley. There are several methods for increasing the value of bones as manure, by boiling out the fat and gelatin, for instance, the removal of which makes the bones more readily acted on by the weather and hastens the decay and distribution of their parts, or by grinding them to dust or dissolving them in sulphuric acid, by which latter course the phosphates are rendered soluble in water. Before being utilized in agriculture they are often boiled for the oil or fat they contain, which is used in the manufacture of soap and lubricants.

**Bone-ash** (bone-earth), the earthy or mineral residue of bones that have been calcined so as to destroy the animal matter and carbon. It is composed chiefly of phosphate of lime, is used for making cupels in assaying, etc.

Bone black, ivory black, or animal charcoal, is obtained by heating bones in close retorts till they are reduced to small, coarse grains of a black carbonaceous substance. This possesses the valuable property of arresting and absorbing into itself the coloring matter of liquids which are passed through it. Hence it is extensively used in the process of sugar-refining, when cylinders of large dimensions filled with this substance are used as filters. After a certain amount of absorption the charcoal becomes saturated and ceases to act. It has then to be restored by reheating or other methods. Bone black has also the property of absorbing odors, and may thus serve as a disinfectant of clothing, apartments, etc.

**Boneset** (or thoroughwort), a useful annual plant, indigenous to America, and easily recognized by its tall stem, 4 or 5 ft. in height, passing through the middle of a large, double, hairy leaf, and surmounted by a broad, flat head of light purple flowers. It is much used as a domestic medicine in the form of an infusion, having tonic and diaphoretic properties.

**Bonham**, Fannin co., Tex., on Bois de Arc Creek, 70 mi. n. e. of Dallas. Railroad: Texas & Pacific. Industries: oil mines, 2 flouring mills. 2 ice factories, carriage and wagon, and a mattress factory. The town was first settled in 1837 and was called Old Fort Inglish, a fort having been built here to protect the settlers against the Indians. Bonham became a city in 1880. Pop. est. 1897, 5.500.

**Bonheur** (bo-neur), ROSA, b. 1812; a distinguished French artist and painter of animals. When only eighteen years old she exhibited two pictures, *Goats and Sheep*, and *Two Rabbits*, which gave clear indications of talent. Since that time a long list of pictures, *Tillage in Nivernais* (1849), *The Horse Fair* (1853), *Haymaking* (1865), etc., have made her name famous throughout Europe.

**Bonifaccio** (bō-nē-fách 'ō), a seaport in Corsica, on the strait of same name, which separates Corsica from Sardinia. Wine and oil are exported, and a coral fishery is carried on. Pop. 3,594. The Strait of Bonifaccio is 7 mi. broad, and contains several small islands.

Bon' iface. Nine popes have been so named, of whom only three are conspicuous in history. B. I (418-422), memorable as the earliest bishop of Rome who assumed the title of the first bishop of Christendom. B. VIII (1228-1303). In 1281 he was raised to the cardinalate, and was elected pope Dec. 24, 1294, when the kings of Hungary and Sicily held his bridle reins as he rode to the Lateran, and waited on him at table, wearing their crowns. The great principle of B.'s policy was to assert papal supremacy over states as well as over the church. There was hardly a question in which B. did not interfere. In the Scoto-English wars, in the affairs of Sicily, Denmark, Germany, Bohemia, etc., we see him meddling. His simony was well known, and he has found an unenviable immortality in Dante's Inferno. Β. IX (1389-1404). He practised simony without concealment or restriction; trafficked in indulgences and dispensations; overawed Rome by fortresses; and to protect himself against the enemies whom his imperious spirit had raised against him, he had to purchase the

services of powerful allies by granting them as flefs portions of the patrimony of the church.

**Boniface,** ST. (680-755), the apostle of Germany, whose original name was Winfrid, was b. in Devonshire of a noble Anglo-Saxon family. In histhirtieth year he took orders as a priest. In 723 he was made a bishop, and in 732 an archbishop and primate of all Germany. He was slain in West Friesland by some barbarians, and was buried in the abbey Fulda.

**Bonito** (bo  $n\bar{e}$  'to), a name applied to several fishes of the mackerel family, one of which, the bonito of the tropics, or stripe-bellied tunny, is well known to voyagers from its persistent pursuit of the flying-fish. It is a beautiful fish, steel blue on the back and sides, silvery on the belly, with four brown longitudinal bands on each side. It is good eating, though rather dry.

Bon Marché, an immense retail store in Paris on the Rue du Bac. About 3,000 persons are employed in the store and the annual business amounts to about \$30,000,000. It was founded in 1852 by M. Jacques Boucicaut, who introduced the system of sharing the profits with the employees. Madame Boucicaut carried on the business after the death of her husband, and instituted a retiring fund for the old employees. The business is now in the hands of a joint stock company.

Bonn, an important German town in Rhenish Prussia, situated on the left bank of the Rhine. It has some trade and manufactures, but is chiefly important for its famous university founded in 1777 by Elector Maximilian Frederick of Cologne. Enlarged and amply endowed by the king of Prussia in 1818, it is now one of the chief seats of learning in Europe, with a library of more than 200,000 volumes, an anatomical hall, mineralogical and zoological collections, museum of antiquities, a botanical garden, etc. The teachers in the five faculties are above a hundred, and the students number about 1,100. Lane, Niebuhr, Ritschl, Brandis, and other names famous in science or literature are connected with Bonn. and Beethoven was b. there. Bonn was long the residence of the electors of Cologne, and finally passed into the hands of Prussia by the arrangements of the Congress of Vienna in 1815. Pop. 39,805.

**Bonner**, ROBERT (1824-), American publisher, b. near Londonderry, Ireland, came to the U. S. when a boy, and became a compositor in Hartford, Conn. In 1844 he went to New York, and in 1851 purchased the New York *Ledger*, which he built up to a great circulation. He had a fondness for fast horses, although he refused to let them race; and owned Maud S. and Dexter. Of late years Mr. Bonner has devoted himself to treatises on the diseases of the horse's hoof.

**Bonnet-rouge** (bo-nā-rözh; Fr. "red-cap"). the emblem of liberty during the French Revolution, and then worn as a head-dress by all who wished to mark themselves as sufficiently advanced in democratic principles; also called *cap of liberty*.

Bonnivard (bon-ē-vär), FRANÇOIS DE (1496-

1570), the "prisoner of Chillon," of Byron's famous poem. An ardent republican, he took the side of the Genoese against the pretensions of the dukes of Savoy. In 1530 he fell into the hands of the duke, and was imprisoned till 1536 in the castle of Chillon, when the united forces of the Genevese and the Bernese took Chillon.

**Bonny**, a river of Western Africa, one of the mouths of the Niger, where a considerable trade is done.

**Bon'tebok**, the pied antelope of South Africa, with white markings on the face. allied to the blesbok.

**Bonus**, something given over and above what is required to be given, especially an extra dividend to the shareholders of a jointstock company, holders of insurance policies, etc., out of accrued profits.

Bony Pike (or gar-fish), a remarkable genus of fishes inhabiting North American lakes and rivers, and one of the few living forms that now represent the order of ganoid fishes so largely developed in previous geological epochs. The body is covered with smooth enameled scales, so hard that it is impossible to pierce them with a spear. The common gar-fish attains the length of five feet, and is easily distinguished by the great length of its jaws. See Gar-fish.

**Bonzes**, the name given by Europeans to the priests of the religion of Fo (or Buddha) in Eastern Asia, particularly in China, Burmah, Tonquin, Cochin-China, and Japan. They do not marry, but live together in monasteries. There are also female bonzes, whose position is analogous to that of nuns in the Roman Catholic church.

**Booby**, a swimming bird nearly allied to the gannet, and so named from the extraordinary stupidity with which, as the older voyagers tell, it would allow itself to be knocked on the head without attempting to fly. The

booby lives on fish, which it takes, like the gannet, by darting down upon them when swimming near the surface of the water.

**Book,** the name applied to a printed composition forming a volume. The tree is sometimes called the parent of the book, as the words from which the name is derived mean tree. The earliest writings were upon monu-

ments, chosen because they would last longest. The idea of perpetuity in architecture is found in the pyramids; in the two columns mentioned by Josephus, one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries; in the pillars of Crete; in the leaden tablets containing the works of Hesiod; in the commandments of stone delivered to Moses; and in the laws of Solon inscribed on planks of wood. The notion of a literary production surviving the materials on which it was written was unknown before the discovery of substances for systematic transcription. Tablets of ivory or metal were in common use among the Greeks When made of wood, someand Romans. times citron, but usually of beech or fir, their inner sides were coated with wax on which the letters were traced with a pointed pen or stylus, one end of which was used for erasure. It was with his stylus that Cæsar stabbed Cassius in the arm when attacked by his murderers. Two such tablets joined together at the back with wires which act as hinges, furnish our earliest specimen of book-binding. A raised margin was left around the pages to prevent rubbing. The oldest specimen of these tablets is found in the museum at Florence and belongs to the year 1301.

The leaves of the palm, the inner bark of lime, ash, maple, and elm were all used in-stead of tablets. The earliest flexible material of importance was the inner part of the Egyptian papyrus, from which is derived our word paper. The length of the papyri is from eight to sixteen inches, although some have been found as long as thirty-two. They were written on with reeds dipped in gum-water, colored with soot of resin. The writing could be obliterated easily with a sponge. It is worthy of note that our printer's ink of to-day is made principally of the same material, oil and resin. The papyri were sometimes coated with a wash or varnish. Pliny mentions the ink of the cuttlefish, and also a decoction of lees of wine for writing. Red ink consisted of a preparation from cinnabar. The next material employed was a parchment made from the skins of the sheep or lamb. Vellum, a finer substance, was made from calfskin. Writing on skins is mentioned by Herodotus. The parchment superseded the use of papyrus about the seventh century. At first parchment was written on one side only and the other side stained; afterward it was written on both sides. Its costliness in classical times led to the practise of erasing the original writing for the purpose of substituting new.

Paper made from cotton came into use about the end of the ninth century, and opportunely checked the total destruction of old manuscripts, which the scarcity of parchment and demand for books of devotion threatened. Cicero's *De Republica* was discovered in the Vatican library written under a commentary of St. Augustine on the *Psalms*, and other valuable writings were discovered in the same manner. The invention of linen paper gave the first real impetus to book production. This

date is disputed but is about 1300. The invention is credited by various writers, to the Germans, Italians, the Greeks, Chinese, and the Saracens in Spain. The form of ancient books differed with the material used. Flexible material was rolled upon a staff as are our maps of to-day; the pieces of parchment or papyrus being joined together, the complete roll was called a volumen, hence our volume. Ovid speaks of his fifteen books as so many volumen, as too bulky to be rolled upon one stick. The title was either written upon the outside or suspended like a ticket from the roll. The volumen usually contained much less matter than is in the ordinary octavo book of to-day. The libraries or rooms in which the rolls were kept were lined with shelves, and the rolls were laid horizontally upon them. Copyists were employed to write the books which the spread of civilization demanded, and the prices for loan or purchase were exorbitant. A catalogue of the books in the Sarabone in Paris, in 1792, consisting of 1,000 volumes, was valued at \$19,000, and the French library of 825 volumes sent to England in 1425 was valued at \$11,115. The sizes of early printed books were usually quarto or folio on account of the large type used when the art of printing was in its infancy. The size of a book was taken from the dimensions of the paper and the number of leaves into which it was folded. The ordinary sizes were royal, the largest demy and crown. A sheet of royal (about 19x24 inches) folded in the center making two leaves (four pages) was a royal folio, if folded a second time, making four leaves each 94 x 12 inches (eight pages) it was a royal quarto, if folded again making eight leaves  $6 \times 9\frac{1}{2}$  inches (16 pages) it was a royal octavo. The number of leaves was represented by the folio, quarto, or octavo, and the size of the page by the size of the paper, that is, royal, demy, or crown. At this time the sizes of both paper and press were limited, and these terms were explicit; but with improvements in machinery, which made larger sheets of paper and power presses possible, the terms, octavo, quarto, etc., are almost meaningless as far as designating the size of the book is concerned. In England the sizes are still expressed as above, but in our country the size in inches is given by most publishers. If you wish to determine what size the book is, count the number of leaves, not pages, from the binder's thread, in the middle of the sheet to the next This rule will not apply, however, to like one. old black-letter books.

**Bookbinding** is the art of fastening together the sheets of a book and enclosing them in cases of binder's board covered with leather, cloth, or other material to protect them while in use. When books were rareties and expensive on account of the patient labor of copying or the slow productions of the printing press during the infancy of typography, they were very highly prized, and as much labor was expended in the binding as would build a house to-day. The wooden cover of a book with its metal hinges, bosses, guards, and clasps, seems in all but dimensions fit for a church door: but

# Bookbinding

the improvement in all mechanical arts, the extension of education to all classes and consequent demand for books, has led to radical changes in the art of bookbinding. From the fifth to the end of the fifteenth century books were exceedingly rare and costly, and few bindings illustrating the art during the Dark Ages have been preserved. From the patient tasks of slaves during the Roman Empire, the transcribing of books became the duty of monks, who copied and bound the works, which were among their chief treasures. The monastic bindings were thick, heavy, solid, and, according to our ideas, clumsy. Books for common use were encased in boards covered with leather, with metallic bosses, corner plates, and clasps. The literary treasures of kings and the church were encased with ivory sides and carved with appropriate designs. Silver and gold were gems and jewels, and encased in boxes or cases also richly adorned. Silk and velvet for

Byzantine Style of Bookbinding.

binding came into use about the time of the Renaissance. Thin sides covered with leather, parchment, and vellum came into use with the invention of printing. LeGascon, Gibson, and Roger Payne among others have left behind works of art in bindings which are much sought after by book-lovers of to-day. The operations of bookbinding are now carried on upon a scale which could not have been thought of at the beginning of this century. Then the only machine necessary was a small but powerful screw press. To-day improved machinery is used for every possible operation, the former labor of weeks has become a matter of hours, and the elaborate binding of the last century is almost a lost art.

Modern bookbinding is divided into two principal branches, leather work and cloth casing. The sheets of an octavo book are

# Bookbinding

usually printed with 32 pages on each side and delivered to the binder flat. The sheets with the pages from 1 to 32 upon them, duplicated upon each side, are piled upon the feed table of the folding machine, which rises automatically as the sheets are fed into it. Each sheet is picked up by an automatic feeder and pushed into the folder. It is straightened by contact with a gauge, and a dull blade descends upon the center of the sheet, the long way, and pushes it down between two rollers which pinch it together, folding it in the center. The sheet is carried forward on endless tapes and cut in two by a revolving knife. These pass under another blade similar to the first, and a second fold and cut is made, the sheet descending with the width of the rollers at each operation. Here the sheets separate, two going to the right and two to the left. The third rollers, set at right angles to the first, are passed in like manner, and the four pieces with 16 pages properly folded are dropped into wooden holders and carried to tables near by. When the sheets of the entire book are folded, they are laid upon a revolving table, each 16 pages (or section as it is usually called) in a pile. The belt is thrown on and the table revolved. The girls seated along the side pick off each section as it passes and when one revolution of the table is made. they have sheets for a complete book in their hands. This is called "gathering." Other girls grasp the gathered book at the front and run over the sections rapidly, watching the signature number on the bottom of the first page of every 16-page section, to guard against omissions or duplications. This is called "collating." The sheets are then carried to a large, heavy press constantly opening and closing, called a smasher, and the loose, bulky sheets are pressed into compact form. The books next go to the sewing machines, which are marvels of ingenuity, and are described under that head. When the book is sewed it is returned to the smasher, and again passed through, then goes to the lining-up table, when the end sheets are tipped on to the front and last sections, and the book goes to the cutting machine. The books are placed back to back upon a revolving table, and a knife descends cutting the edges, one edge at a time, as the table is turned around. The book is then ready to have the edges either sprinkled, colored, marbled, or gilded. Sprinkling is done by mixing the desired colors with a thin paste or size, and spattering it on to the edges of the books by passing a stiff brush dipped into the mixture over a sieve. In uniform coloring the books are put into a press and the coloring matter applied with a sponge. Marbling is a separate trade and requires consider-able skill. The different colors are thrown with a brush into a shallow trough filled with prepared gum-water and float upon the surface usually in the form of spots. To make a wave pattern a stick is drawn from side to side of the trough and the colors follow the motion of the stick. If a comb pattern is desired the stick is followed by a comb drawn through the

trough from end to end. When the proper pattern is formed upon the mixture, the edges of the book are dipped into it, and upon removal the colors adhere to the edge of the book. After one dip, the colors are removed, and the operation is again repeated. In gilding, the front edge is first operated on. The books are fastened into a large laying press and the edges scraped smooth with a flat, steel knife, and a mixture of white of egg and water, called glaire, is spread on with a camel's hair brush. The gold leaf is laid on. When the covered edge becomes dry, it is rubbed with bloodstone and agate burnishers. The top and bottom edges are then treated in the same way. Gilt edges in early books had designs pressed upon them (gaffre), but very little such work is now done. The book then goes to the forwarder. It is straightened up and the back glued. When dry it is rounded by beating on the back with a hammer. It is then placed between the jaws of a roller-backer which press it very tight, and a roller is passed back and forth over the back, which forms the joint for the boards to flt into. The boards, which are then laced on, fit into these grooves. The back is then covered with glue, and a thin piece of cloth, projecting over the sides about an inch, is put on. A strip of paper, almost the length of the book, and double the width, is then glued on to one side, and the back is covered with it and the other edge turned back. This forms what is usually, though improperly, termed a spring back. This serves to strengthen the book. The board used to cover the sides is received from the mill in large sheets, and is cut into strips, by rotary knives adjusted to the proper width, and then trimmed in the same manner to the required length. These are next fastened to the book by lacing the cords back and forth through the board, and the ends are opened out and beaten down. The book is then placed in press until it is thoroughly dry. The materials for covering are very numerous. Skins of the calf, kid, sheep, goat, and cow are all used. Some are dyed with various colors and grained to represent different patterns. The leather, cut to the size wanted, is beveled on the edges by passing through a machine cov-ered with sandpaper fastened upon a roller which revolves at a speed of about 2,500 revolutions a minute. It is then moistened with water, covered on the inside with paste or glue and is pulled tight over the back of the book and the edges turned in by the forwarder, and concealed from view by the end sheets, which are afterward pasted to the board. After thoroughly drying, the book is ready for the finisher who washes the back with thin paste, and covers it with two coatings of glaire. When dry the gold leaf is laid on and the lettering stamped with hot, brass type. Other gold work, such as ornaments or rolls, is applied in the same manner. The superflu-ous gold is cleaned off and the back polished with a hot iron. The end sheets are then pasted up and the book placed in press until dry, when it is wrapped ready for delivery.

# Bookkeeping

In cloth work the operation is the same up to the time the edges are finished; the case, however, is made by the case-makers apart from the book. The boards and cloth cut to the proper size are laid in a pile. The cloth is glued upon the wrong side and the board laid into the right angles of a gauge which is set to the thickness of the back of the book. The edges of the cloth are then turned in, the space for the back is lined with a strip of paper, the case run through between rollers to smooth it, and it is then laid out to dry. The cases are then taken to the embossing room, where they are finished. This is done by a large, heavy stamping press. If the design is in several colors of ink a brass die for each color is required. This is placed in the press, heated by gas or steam and the design blended or creased into the cloth. Afterward the same design and press, cold, is used for inking each color of ink, passing through the press twice. If gold or other metal is used, the case is sized with a powdered albumen, the leaf of metal is laid on, and the heated design is stamped in by the press. The surplus metal is brushed off. and the case is ready for the inside of the book which has been working its way through the bindery. The books are piled upon a table, the sides covered with paste and passed to a workman who places them properly in the case. They are then placed into the large standing presses. A board with a projecting brass edge is fitted into the hinge between each layer of books. Here they dry under a pressure of about two tons to the square inch. The books are then sent to the shipping room for wrapping and delivery.

Bookkeeping is the art or method of recording mercantile or pecuniary transactions, so that at any time a person may be able to ascertain the details and the extent of his business. It is divided according to the general method pursued, into bookkeeping by single or by double entry. Bookkeeping by single entry is comparatively little used, except in retail businesses of small extent, where only the simplest record is required. In its simplest form debts due to the trader are entered in the day-book at the time of the transaction to the debit of the party who owes them; and debts incurred by the trader to the credit of the party who gave the goods. From this book the accounts in a summarized form are transferred to the ledger, where one is opened for each different person, one side being for Dr., and the other for Cr. When a balance-sheet of the debts owing and owed is made, this. together with stock and cash in hand, shows the state of the business.

Bookkeeping by double entry, a system first adopted in the great trading cities of Italy, gives a fuller and more accurate record of the movement of a business, and is necessary in all extensive mercantile concerns. The chief feature of double entry is its system of checks, by which each transaction is twice entered, to the Dr. side of one account and then to the Cr. side of another. An important feature of the system consists in adopting, in addition to the

22
### Bookkeeping

personal accounts of debtors and creditors contained in the ledger, a series of what are called book accounts, which are systematic records in the form of debtor and creditor of particular classes of transactions. For every debt incurred some consideration is received. This consideration is represented under a particular class or name in the ledger, as the debtor in the transaction in which the party from whom the consideration is received is the creditor. Thus A buys goods to the value of \$500 from B. He enters these in his journal—Stock Acct. Dr. \$500 (for goods purchased) To B, \$500. The first \$500 appears in the Dr. column of the journal, and is posted in the ledger to the debit of Stock Account; the second appears in the Cr. column, and is posted in the ledger to the Cr. of B. In like manner, when the goods are paid, Cash, for which an account is opened in the ledger, is credited with \$500, and B is debited with the same. When the goods are sold (for cash) Stock is credited, and Cash is debited. If the amount for which they sell is greater than that for which they were bought, there will be a balance at the debit of Cash, and a balance at the credit of Stock. The one balance represents the cash actually on hand (from this transaction), the other the cause of its being on hand. If there is a loss on the transaction, the balance will be on the other side of these accounts. Ultimately the balance thus arising at Dr. or Cr. of Stock is transferred to an account called Profit and Loss, which makes the stock account represent the present value of goods on hand, and the profit and loss account, when complete, the result of the business. In this system the risk of omitting any entry, which is a very common occurrence in single bookkeeping, is reduced to its smallest, as unless a particular transaction is omitted in every step of its history, the system will inexorably require that its whole history should be given to bring the different accounts into harmony with each other.

In keeping books by double entry, the books composing the set may be divided into two classes, called principal and subordinate books. The subordinate books are those in which the transactions are first recorded, and vary both in number and arrangement with the nature of the business and the manner of recording the facts. The most important of these (all of which are not necessarily to be found in the same set) are Stock Book, Cash Book, Bill Book, Invoice Book, Account Sales Book. The principal books are made up exclusively from the subordinate books and classified documents of the business. In the most perfect system of double entry they consist of two, the Journal and Ledger. The journal contains a periodical abstract of all the transactions contained in the subordinate books, or in documents not entered in books, classified into debits and credits. The ledger contains an abstract of all the entries made in journal classified under the heads of their respective accounts. It is an index to the information contained in the journal, and also a complete abstract of the actual state of all accounts,

but gives no further information; while the journal gives the reason of each debit and credit, with a reference to the source where the details of the transaction are to be found.

Book-trade, the production and distribution of books commercially. Even in ancient times, before the invention of printing, this trade had attained a high degree of develop-ment at Alexandria, and later at Rome. Copies of books were readily multiplied in those times, as we hear of as many as a thousand slaves being employed at one time in writing to dictation. After the fall of Rome down to the twelfth century, the trade in books was almost entirely confined to the monasteries. But with the rise of the universities the trade received a new development, and in all university towns booksellers and book agents became numerous. The invention of printing had a powerful effect on the trade of bookselling. The printers were originally at the same time publishers and booksellers, and they were in the habit of disposing of their books at the chief markettowns and places frequented by pilgrims.

For the most part these two departments of the trade are carried on separately, but it is not uncommon for them to be united. Very frequently books are printed at the cost of the author or some learned society, and published on commission. The publisher brings himself into connection with the retail booksellers, who are the direct means of distributing the book to the public. Second-hand booksellers belong to a special department of the retail book-trade. The book-trade of North America, the chief seats of which are Chicago, New York, Philadelphia, and Boston, is now very large. Canada and Australia are also developing a considerable business of this kind. The largest bookselling business in the world is in Australia, in the city of Melbourne. This store has over a million books in stock. The shelves are crowded from floor to ceiling, and stretch away from the entrance into the far People are allowed to go in and distance. read, and spend hours on the comfortable lounges\_provided by the owner for his pat-The greater number of those who avail rons. themselves of this permission go away with-out making a single purchase. This privilege involves a certain amount of risk and loss to the bookseller, but he finds that on the whole it pays him well. The great center of the German book-trade is at Leipsic, and the fair held in the latter city at Easter is the occasion on which all the accounts made in the book-trade during the past year are settled.

In publishing new books, besides the expense of copyright, paper, presswork, etc., the publisher has to consider the number of presentation copies required for reviews, the percentage off the price allowed to the retail bookseller, and the expenses of advertising.

**Boom**, a long pole or spar run out from various parts of a ship or other vessel for the purpose of extending the bottom of particular sails. Also a strong beam, or an iron chain or cable, fastened to spars extended across a river or the

### Boomerang

. .

mouth of a harbor, to prevent an enemy's ships from passing. A noted boom was made across the Hudson River at West Point in the Revolutionary War.

**Boo'merang**, a missile instrument used by the Australian aborigines, and by some peoples of India, made of hard wood, about the size of a common reaping-hook, and of a peculiar curved

### Forms of Boomerang.

shape, sometimes resembling a rude and very open V. The boomerang, when thrown as if to hit some object in advance, instead of going directly forward, slowly ascends in the air, whirling round and round to a considerable height, and returns to the position of the thrower. If it hits an object, of course it falls. The Australians are very dextrous with this weapon, and can make it go in almost any direction, sometimes making it rebound before striking.

Boone, DANIEL (1735-1820), a famous American pioneer. His grandfather emigrated from Bradninch, near Exeter, England. His father, Squire Boone, moved to North Carolina about 1748. Boone's education was limited to reading and writing. Skilled in woodcraft, strong and brave, he was the peer of any Indian in sagacity and fearlessness. Incited by the accounts of John Finley, with a company of six kindred spirits he penetrated into the unknown regions of Kentucky, starting on his journey May 1, 1769. He built a fort called Boones-borough on the Kentucky River, and there brought his family and about thirty volunteers. Boone was captured by the Indians and carried to Old Chillicothe on the Miami, where he was adopted by a Shawnese chief. Learning of an intended raid upon Boonesborough, he escaped (June 16), and reached home in four days, having but one meal during his journey. He found his family gone, but with others repelled the attack of the Indians. In 1780 he brought his family back to Kentucky. The battle of "Blue Licks," in which Boone's sons fought by his side, took place 1782. Kentucky was admitted into the Union Feb. 4, 1791, and in the survey of the state the title to Boone's land was disputed. He sought a new home at Point Pleasant, and in 1795 moved to Missouri, then a Spanish province. There he received a grant of 8,000 acres of land. When the Spanish possessions passed into the hands of the U.S.,

Boone again lost his land. Congress granted him 850 acres. The charm of woodcraft clung to him to the last, and in his 82d year he went on a hunting excursion. In 1845 the remains of Boone and his wife were removed to the Frankfort cemetery a few miles from the fort of Boonesborough. Enoch Boone, his son, was the first white male child b. in Kentucky.

Boots and Shoes .- The sandal is the simplest form of foot protector, and consists of a sole attached to the foot by a leather thong. Primitive races made a shoe out of a single piece of untanned hide, which was laced with a thong. Shoes laced and ornamented and extending far up the leg were in use by the ancient Egyptians, Greeks, and Romans. Boot means a leather covering for the foot and leg. Half-boots were worn by Anglo-Saxons and Normans. In the reign of Edward IV the boot proper was a part of the knightly dress. In the reign of Charles I a boot made of Spanish leather was used. The highly decorated French boot was introduced in the reign of Charles II, and the jack-boot was worn by cavalry soldiers and by horsemen gen-erally. The jack-boot was strongly made, extended above the knee with a capacious top, had a high heel, and around the ankle was a leather band bearing the spur. Boots with yellow tops were so commonly worn in the eighteenth century as to be a distinguishing feature of the Englishman's dress. Even in the earlier years of the present century top-boots were seen in the House of Commons. They still remain in use by fox-hunters and jockeys. The Hessian boot, worn over tight pantaloons, was a handsome article of gentleman's attire, and, as it contributed an elegant appearance to the nether costume, easily supplanted the top-boot. This in turn was supplanted by the Wellington boot, introduced by the great gen-eral and worn under the trousers. Even this has now given place to the short ankle boot or shoe. In the Cluny Museum, Paris, is a col-lection illustrating the innumerable forms of foot-covering of ancient, mediæval, and mod-ern times. The wooden shoe made from a single piece of wood is largely used in Europe. Clogs, or pattens, are wooden soles to which uppers of heavy leather are attached. Clogs are used by agricultural laborers on the Continent, and in England and the U.S. by dyers, bleachers, tanners, etc. Fancy clogs are used for clog-dancing.

Until lately shoemaking was pure handcraft, but now machinery performs almost every operation in the art. The difficulty of fastening together the soles and uppers by machinery was overcome in a measure by the David Reed Randolph patent, 1809, which provides for fastening the soles and heels to the insoles by little nails. The last used was covered at the bottom with plates of metal, and the nails when driven through the inner soles were turned and clinched by coming against the metal plate. This invention laid the foundation for machine-bootmaking. In 1810 M. I. Bunel patented machinery for fastening soles to uppers by means of metallic

pins or nails. The use of screws and staples was patented by Richard Woodman, 1810. Besides sewing by hand, there are three different methods for attaching soles to uppers. "Pegging" is done by driving small wooden pegs throughout sole and insole, catching between them the edges of the uppers. In "riv-eting, or clinching" iron or brass nails are used. "Screwing" has come into extensive use since the introduction of the screwing machine, which is an American invention. The screw, making its own hole, fits tightly in the leather, and the two soles, being both compressed and screwed together, make a perfectly water-tight and solid sole: In 1858 Lyman R. Blake, U. S., took the first step in the difficult problem of sewing together by machinery soles and uppers. This machine was ultimately perfected as the Mackay solesewing machine, one of the most successful and lucrative inventions of modern times. Blake secured his first patent in England in 1859. His original machine was incapable of sewing in the toe of the shoe, but Gordon Mackay and Blake together effected improvements, and in 1860 took out a patent which secured to them the monopoly for 21 years. In 1873 the income from rovalties in the U.S. alone amounted to \$589,973 and continued to rise until the patent expired in 1881. Numerous inventors have appeared, and there is not a single operation in shoe-making for which a machine has not been devised. In the modern American shoe factory, division of labor is carried to the greatest extent. Uppers and linings are generally stitched in one department, where the buttonholes are worked, buttons put on, and eyclets punched for laced shoes. The first process in bottoming is to wet the soles, which, after being partially dried, are passed under a heavy roller. They are then, if for machine-sewing, run through the channeling machine, which takes out a thread of leather from the outside edge in the bottom of the sole, leaving a thin, narrow flap all around, so that when the stitches are laid in the place of the removed leather, the bottom may be hammered down so smoothly as hardly to indicate where the surface was raised. The upper is then drawn over the last and tacked on the insole, and the outsole is tacked on. The last is now withdrawn and the shoe passed to the sewing-machine, where the stitch is made through both outsole and insole, the edge of the upper being between them. The flap is then laid and comented over the seam. The heel is put on in the rough, and the edges of both heel and sole trimmed and burnished. In making a "turn " shoe, the sole is shaped before tacking to the last: the upper, with the stiffening in, is then pulled over, wrong side out, then lasted and sewed, the last being taken out, after sewing, and the surplus upper cut away. The shoe is then turned right side out, the last again put in, and the sole and stiffening hammered into proper form. A "team" of shoemakers comprises from four to nine men,—lasters, heelers, trimmers, burnishers, and finishers. These

complete the shoe after the uppers are made and the soles cut. The number of men in a "team" varies with the kind of work. A

"team" varies with the kind of work. A very considerable trade exists in boots and shoes with outer sole of gutta-percha; the headquarters of the trade being in Glasgow. Scotland. The manufactory of india-rubber galoshes, shoes, fishing-boots, etc., forms an important branch of the india-rubber trade. Making of shoes right and left began shortly after the deginning of the nineteenth century.

Booth, BARTON (1681-1733), an English actor of celebrity in the reigns of Queen Anne and George I. He eloped from school at the age of seventeen, and joined a company of strolling players. After performing in the Irish capital with great applause, he returned in 1701 to London, where, having joined the Drury Lane Company, his reputation reached its height with the performance of Cato in Addison's famous tragedy. He was buried in Westminster Abbey.

Booth, EDWIN THOMAS (1833-1893), an American actor, son of the distinguished English actor, Junius Brutus Booth (1796-1852; spent most of his life in the U. S.). He was b. in Bel Air, Md., and made his first appearance at Boston in 1849. He is eminent for his personation of Shakespearian characters,—Othello, Richard III, Iago, Shylock, etc.,—and is regarded as the leading American tragedian. In 1882 he made a professional tour in Europe, and was favorably received.

Booth, JOHN WILKES (1838-1865), the assassin of President Lincoln, brother of Edwin Booth. As an actor he never rose to distinction. He inherited from his father a touch of insanity that rendered his life erratic. During the Civil War his sympathies were for negro slavery, and early in 1865 he formed a conspiracy with others to murder President Lincoln and the principal officers of the government. On the evening of April 15 he entered Ford's theater, in Washington, where the president was sitting in a private box, and shot him. He shouted "Sic semper tyrannie," leaped on the stage below, breaking his leg in the effort, and in the confusion escaped through a back door, mounted a horse that was held in waiting, and fled to Virginia. Here he was concealed for a time by sympathizers; but, on being discovered in a barn, he refused to surrender and was shot.

Booth, WILLIAM, general of the Salvation Army, b. at Nottingham, England, April 10, 1829. He was reared in the Episcopalian Church, but being converted in a Wesleyan chapel, he joined the Methodist Church, and in 1850 became a minister, He was appointed to hold special evangelistic services in connection with his other work until 1861, when, being requested to settle in the ordinary circuit work, he resigned and began his career as an evangelist proper. In 1855 he had married Miss Catherine Mumford, who, in this new departure, proved an able coadjutor. Until her death in 1890 she was always by the general's side, encouraging him in all his undertakings, at the same time caring for their family.

## **Boothia** Felix

General Booth organized in London (1865) "The Christian Mission," which grew into the military organization re-christened the "Salvation Army"in 1878. Under this name that useful organization has spread itself into many parts of the world. It is widely known for the zeal and self-denial of its rank and file. A distinctive feature of the Salvation Army is what has been called "the ministry of all the talents;" that is, giving every convert some part in the work. The *War Cry*, a weekly publi-cation, was established in 1880 and has a wide circulation, General Booth has published many hymns for the use of the army, and it has gone forth "singing itself around the world." In *Darkest England*, published in 1890, Gen-eral B. outlines his plans for the suppression of poverty and vice. General B.'s sons and daughters have been trained in the work and have been associated with him in the army. Ballington, his second son, after carrying on the work in America for a number of years, withdrew, and in 1896 formed a new organization called The American Volunteers, with headquarters in New York City.

**Boo' thia Felix,** a peninsula of British North America, stretching northward from the Arctic Circle, discovered by Captain Ross in 1830. In the west coast of this country Ross was able to localize the north magnetic pole.

Boo'tle, a town of England, in Lancashire, adjoining Liverpool, the docks of which great seaport extend into the borough, so that Bootle may be looked upon as a Liverpool suburb. Pop. 49,217.

BO'ra, KATHARINA VON (1499-1552), wife of Martin Luther. She took the veil early; but applied, with eight other nuns, to Luther. The nuns were released from their convent, and in 1525 Luther married her, having himself by this time laid aside the cowl. After Luther's death she kept boarders for her support. She died at Torgau.

Boracic Acid, boric acid, a compound of the element boron, with hydrogen and oxygen. Boracic acid is found as a saline incrustation in some volcanic regions, is an ingredient in many minerals, and is contained in the steam which, along with sulphurous exhalations, issues from fissures in the soil in Tuscany. The steam from the fumaroles here is now an important source of the acid, a system of con-densation and evaporation being employed. The acid forms white, shining, scaly crystals, which on heating melt into a transparent mass, when cooled resembling glass. It dissolves in water, and has a slight acid taste: it colors blue litmus purple, and the yellow color-ing matter turmeric brown. The chief use of the acid is as a source of borax, the biborate of sodium.

Bor'age, a genus of plants having rough hairy foliage and blue, panicled, drooping flowers, and characterized by mucilaginous, and emollient properties. Borage officinalis, a common plant, gives a coolness to beverages in which its leaves are steeped, and was ranked formerly as one of the cordial flowers.

### Bordeaux

Borax, bibor-

ate of sodium.

Native borax

has long been obtained under

the name of tincal, from In-

dia, the main

source being not India but a

series of lakes in Thibet. As

imported it is

in small pieces

of a dirty yellowish color, and is covered

with a fatty or soapy matter. Tincal, which

contains various impurities.

was formerly

the only source

Common Borage. a .- flower.

of borax; but besides Tuscany, other sources of boracic acid, more particularly in North and South America, and the salt mines at Stassfurt, etc., in Germany, have been rendered available. America yields large deposits, there being rich deposits of borax and boracic minerals on the Pacific slope and especially noticeable are the vast depos-its in Death Valley. Pure borax forms large transparent, six-sided prisms which dissolve readily in water, effloresce in dry air, and when heated melt in their water of crystallization, swell up, and finally fuse to a transparent glass. Borax has a variety of uses. In medicine it is employed in ulcerations and skin diseases. It has valuable antiseptic and disinfecting properties, and is now much used for the preservation of meat, fish, and milk. It is also employed in soldering metals, and in making fine glaze for porcelain, as it renders the materials more fusible. It is used in enameling, and in making beads, glass, and cement.

Bor'da, JEAN CHARLES (1733-1799), a French mathematician and physicist. He served in the army and navy, and distinguished himself by the introduction of new methods and instruments connected with navigation, ge-odesy, astronomy, etc., being in particular the inventor of the reflecting circle. He was one of the men of science who framed the new system of weights and measures adopted in France.

**Bordeaux** (bor- $d\overline{o}'$ ), one of the most important cities and ports of France, capital of the dep. of Gironde, on the Garonne, about 70 mi. from the sea. In the old town are the Cathe-dral of Saint André, St. Michael's Church, with its superb front of florid Gothic, the Hotel de Ville, and the Palais de Justice. The chief exports are wine and brandy; sugar and other colonial produce and wood are the chief imports. Ship-building is the chief industry, and there are sugar refineries. woolen and cotton mills, potteries, soap works, distilleries, etc. Bordeaux is the *Burdigala* of the Romans. By the marriage of Eleanor, daughter of the last Duke of Aquitaine, to Henry II of England, Bordeaux was transferred to the English crown. Under Charles VII in 1451, it was restored again to France. Montaigne and Montesquieu were born in the neighborhood; the latter is buried in the Church of St. Bernard. Pop. 252,415.

Bordelais Wines, the wines of Bordeaux and district, the name of vin de Bordeaux being generally given to the wines made in the eleven departments of the s.w. of France, Gironde, Landes, Lot, Tarn et Garonne, etc., though it is in the Gironde alone that the famous growths are found. The soil of Médoc (a sandy and calcareous loam) produces such famous wines as Bhâteau-Margaux, Château-Lafitte, and Château-Latour. The wines of this country are the best which France produces. Their characteristics are fine bouquet, velvety softness on the palate, and the faculty of acting beneficially on the stomach without mounting too readily to the head. Besides the red wines of the Bordelais, known under the general name of *claret*, there are also white wines, of which the finest growths are Sauterne, Preignac, Barsac, etc.

Borden, GAIL (1801-1874), American inventor. Early in life he lived in Covington, Ky., and later in Madison, Ind. In 1822 young Borden went to Mississippi, where he became schoolteacher, county surveyor, and U. S. deputy surveyor. In 1829 he visited Texas and took charge of the official surveys of that territory. When the republic of Texas was established he became the first collector of the port of Galveston; in 1837 made the first surveys of that city. About 1849 he produced "pemmi-can" and the "meat-biscuit." The latter gained him a medal at the World's Fair in London, and he was chosen an honorary member of the London Society of Arts. Unsuccessful, pecuniarily, with his biscuit, he lost his entire means. In 1853 he applied for a patent for concentrating milk by evaporation, but did not receive it until 1856. Soon afterward the New York Condensed Milk Company was formed, and its works were established at Brewster's Station, N. Y., and Elgin. Ill. This enterprise proved an immense success, and enriched the inventor. Afterward Mr. Borden established an extract-of-beef factory at Borden, Tex., and also produced condensed preparations of tea, coffee, cocoa, and various kinds of fruit.

Bor' dentown, Burlington co., N. J., on Delaware River, 28 mi. e. of Philadelphia. Railroads: Penn. Junction to N. Y. via Trenton (2) via South Amboy; routes to the seaside resorts. Industries: worsted mills, flouring mills, three iron foundries, woolen mill, shirt factory, sawmill, shipyard, and steam forge. Steamboats ply between Bordentown and Philadelphia daily. The town was first settled in 1776 by Quakers and Dutch, and became a city in 1849. Pop. est. 1897, 5,000.

Border (or Borders), The, the territory ad-

jacent to the frontier line between England and Scotland, the scene of frequent fights and forays, among neighboring clans and families from the eleventh till the end of the seventeenth century. The dividing line varied at different times, shifting according to the surging of the tide of war or diplomacy. At present the line consists partly of natural and partly of imaginary outlines from near the mouth of the Tweed to the Solway.

**Bore** (or Eagre), a sudden influx of the tide into the estuary of a river from the sea, the inflowing water rising to a considerable height and advancing like a wall against the current. The most celebrated bores in the Old World are those of the Ganges, Indus, and Brahmaputra. The last is said to rise to a height of 12 ft. In some rivers in Brazil it rises to the height of 12 to 16 ft.

**Bo'reas**, the name of the north wind as personified by the Greeks and Romans.

Borghese (bor-ga'ze), a Roman family, originally of Sienna, where it held the highest offices from the middle of the fifteenth century. Pope Paul V, who belonged to this family, and ascended the papal chair in 1605, loaded his relations with honors and riches. He bestowed, among other gifts, the principality of Sulmone on Marco Antonio Borghese, the son of his brother Giovanni Battista, from whom is descended the present Borghese family. Bor-GHESE, CAMILLO, PRINCE (1775-1832). When the French invaded Italy he entered their service, and in 1803 he married Marie Pauline, the sister of Napoleon (b. at Ajaccio 1780, d. at Florence, 1825). In 1806 he was created Duke of Guastalla, and was appointed governor general of the provinces beyond the Alps. After the abdication of Napoleon he broke up all connection with the Bonaparte family, and separated from his wife. The *Borghese Palace* at Rome was begun in 1590, and completed by Paul V. It contains one of the richest collections of art in the city. The Villes Borghese. a celebrated country-house just outside the Porta del Popolo, Rome, belonging to the Borghese family, also contains a valuable art collection, and the surrounding grounds are very beautiful

Borgla, CESARE (Che'zåre-bor'jå) (1478-1507), the natural son of Pope Alexander VI and of a Roman lady named Vanozza. He was raised to the rank of cardinal in 1402, but afterward divested himself of the office, and was made Duc de Valentinois by Louis XII. In 1490 he married a daughter of King John of Navarre, and accompanied Louis XII to Italy. He found means to get the treasures of his father into his possession, and assembled his troops in Rome; but enemies rose against him on all sides, one of whom was the new pope, Julius II.

Borgia, LUCRETIA (1480-1523), daughter of Pope Alexander VI, and sister of Cesare Borgia. In 1403 she was married to Giovanni Sforza, lord of Pesaro, but after she had lived with him four years, Alexander dissolved the marriage, and gave her to Alphonso, nephew of Alphonso II of Naples. Two years after,

this new husband was assassinated by the hired ruffians of Cesare Borgia. Her third husband was Alphonso d'Este, son of the duke of Ferrara. She was accused by contemporaries of incest, poisoning, and almost every species of enormous crime. She was a patroness of art and literature.

Boring, the process of perforating wood, iron, rocks, or other hard substances by means of instruments adapted for the purpose. For boring wood the tools used are awis, gimlets, augers, and bits of various kinds, the latter being applied by means of a crank-shaped intransverse-handle, or drilling machine. Bor-ing in metal is done by drills or boring bars, revolved by boring machines. Boring in the earth or rock for mining, geologic, or engi-neering purposes is effected by means of augers, drills, or jumpers, sometimes wrought by hand, but now usually by machinery driven by steam or frequently by compressed air. In ordinary mining practise a bore-hole is usually commenced by digging a small pit about 6 ft. deep, over which is set up a shearlegs with pulley, etc. The boring rods are from 10 to 20 ft. in length, capable of being jointed together by box and screw, and having a chisel inserted at the lower end. A lever is employed to raise the bore-rods to which a slight twisting motion is given at each stroke, when the rock at the bottom of the hole is broken by the repeated percussion of the cutting tool. Various methods are employed to clear out the triturated rock. The work is much quickened by the substitution of steam power, water power, or even horse power, for manual labor. Of the many forms of boring machines now in use may be mentioned the diamond boring machine, invented by Leschot, a Swiss engineer. In this the cutting tool is of a tubular form, and receives a uniform rotatory motion, the result being the production of a cylindrical core from the rock of the same size as the inner periphery of the tube. The boring bit is a steel thimble, about 4 in. in length, having two rows of Brazilian black diamonds firmly embedded therein, the edges projecting slightly. The diamond teeth are the only parts which come in contact with the rock, and their hardness is such that an enormous length can be bored with but little appreciable wear.

Bor'neo (the name of a state on its n.w. coast), one of the islands of the Malay Archipelago, and the third largest in the world. Area 306,800 sq. mi.; pop. 1,700,000. There are several chains of mountains ramifying through the interior, the culminating summit (13,698 ft.) being Kini-Balu, near the northern extremity. The rivers are very numerous, and several of them are navigable for a considerable distance by large vessels. There are a few small lakes. Borneo contains immense forests of teak and other trees, besides producing various dye-woods, camphor, rattans and other canes, gutta-percha and india-rubber, honey and wax, etc. Its wild animals comprise the elephant, rhinoceros, tapir, leop-

ard, buffalo, deer, monkeys (including the orang-outang), and a great variety of the birds. The mineral productions consist of gold, antimony, iron, tin, quicksilver, zinc, and coal, besides diamonds. It is only portions of the land on the coast which are well cultivated. Among cultivated products are sago, gambier, pepper, rice, tobacco, etc. Edible birds'-nests and trepang are important articles of trade. The climate is not considered unhealthy. The southwestern, southern, and eastern portions of the island are possessed by the Dutch, under whom are a number of semi-independent princes. On the n.w. coast is the Malay kingdom of Borneo, or Bruni. Its chief town is Bruni, on the river of the same name, a place of considerable trade, and the residence of the sultan. Since 1841 there has been a state under English rule (though not under the British crown) on the w. coast of the island, namely, Sarawak, founded by Sir James Brooke, while Labuan, an island off the n.w. coast, is a British colony. Recently an English commercial company, with a charter from the British government, has acquired sovereign rights over the northern portion of the island, including some adjacent islands. British North Borneo has an area of about 31.000 sq. mi. (slightly greater than Scotland), several splendid harbors, a fertile soil, and a good climate. At present the population is sparse, and a large part of the territory consists of virgin forests. The soil is believed to be well adapted for coffee, sago, tapioca, sugar, tobacco, cotton, etc. Probably there are valuable mineral deposits also, gold having been already found. The chief settlement is Sandakan, the capital, on Sandakan Bay. The government is similar to that of British colonies. The revenue is from customs and excise duties, licenses, etc. Birds'-nests, rattans, gutta-percha, timber, etc., are exported, the trade being chiefly with Singapore and Hong Kong. Pop. est. at 150,000.

**Bor' nu**, a negro kingdom of the Central Soudan, Africa, on the w. side of Lake Chad, with an area of about 79,000 sq. mi., and a pop. est. at 5,000,000. The people practise agriculture and also various arts and manufactures. They are Mohammedans. The *Mai*, or sultan, has an army of 30,000 men, many armed with firearms. Kuka, the capital (pop. 60,000), near the western shore of Lake Chad, is one of the greatest markets in Central Africa, a large trade being done in horses, the breed of which is famed throughout the Soudan. Another large town, on the shore of the lake, is Ngornu. The whole policy of the state is based on slavery.

**Borodino'**, BATTLE or (called also battle of the Moskwa), a sanguinary battle fought near a village of this name on the river Moskwa, Sept. 7, 1812, between the French under Napoleon and the Russians under Kutusoff. Each party claimed the victory. At the end of the day the Russians retreated in good order, no pursuit taking place. The French numbered about 150,000; the Russians, some less; 50,000 dead and dying covered the field. **Borrome o, CARLO, COUNT (1538-1584), a celebrated Roman Catholic saint and cardinal.** He improved the discipline of the clergy, founded schools, libraries, hospitals, and was indefatigable in doing good. His nephew, Count Federigo Borromeo (1564-1631), also cardinal and archbishop of Milan, equally distinguished for the sanctity of his life and the benevolence of his character, is celebrated as the founder of the Ambrosian Library.

**Bor'row**, GEORGE (1803-1881), English writer. He had a passion for foreign tongues, stirring scenes, and feats of bodily prowess. He associated much with the gypsies, and acquired an exact knowledge of their language, manners, and customs. As agent for the British and Foreign Bible Society he traveled France, Germany, Russia, and the East; spent five years in Spain, and published *The Gypsies in Spain* (1841), and *The Bible in Spain* (1842), the best known of his works.

**Bosch-bok** (bosh'bok), the bush-buck, a name given to several South African species of antelope.

**Bosch-vark** (bosh'värk), the bush hog or bush pig of South Africa, one of the swine family, about five feet long, and with very large and strong tusks. The Kaffirs esteem its flesh as a luxury, and its tusks, arranged on a piece of string and tied around the neck, are considered great ornaments.

**Bos' cobel**, locality in Shropshire, England, remarkable historically as the hiding place of Charles II for some days after the battle of Worcester, Sept. 3, 1651. At one time he was compelled to conceal himself among the branches of an oak in Boscobel Wood, where it is related that he could actually see the men who were in pursuit of him, and hear their voices. The "royal oak," which now stands at Boscobel, is said to have grown from an acorn of this very tree.

**Bosna-Serai** (or Serajevo) (se-ri', se-r-á yā'võ), the capital of Bosnia, 570 mi. w.n.w. of Constantinople. It contains a serai, or palace, built by Mohammed II, to which the city owes its name. It was formerly surrounded with walls, but its only defense now is a citadel, built on a rocky height at a short distance east from the town. Bosna-Serai is the chief mart in the province, the center of the commercial relations between Turkey, Dalmatia, Croatia, and South Germauy, and has, in consequence, a considerable trade, with various manufactures. Pop. est. at 46,000.

**Bos' nia**, a Turkish province in the northwest of the Balkan Peninsula, w. of Servia, by the Treaty of Berlin (1878) to be administered for an undefined future period by the Austrian government; area (including Herzegovina and Novi-bazar), 20,177 sq. mi. (of which Bosnia proper occupies 16,000), with 1,454,365 inhabitants, mostly of Slavonian origin, and speaking the Serbian language. They are partly Mohammedans, partly Roman and Greek Catholics. The country is level toward the north, in the south mountainous. Its chief rivers are the Save, the Verbas, the Bosna, Rama, and Drina. About half the area is covered with forests. Tillage is carried on in the valleys and low grounds; maize, wheat, barley, rye, buckwheat, hemp, tobacco, etc., being grown. Fruits are produced in abundance. Sheep, goats, and swine are numerous. The minerals include coal, which is worked in several places, manganese, antimony, iron, etc. Among the manufactures are iron goods, arms, leather, linens, and woolens. Bosnia had been subject to Turkey from the beginning of the fifteenth century till 1875, when an insurrection of the inhabitants led indirectly to the Russo-Turkish war of 1877-78 and the subsequent dismemberment of the Turkish Empire.

**Bos porus** (or Bosphorus), the strait, 19 mi. long, joining the Black Sea with the Sea of Marmora, called also the Strait of Constantinople. It is defended by a series of strong forts; and by agreement of the European powers no ship of war belonging to any nation shall pass the Bosporus without the permission of Turkey. Over this channel (about 3,000 ft. wide) Darius constructed a bridge of boats on his Scythian expedition. (See Constantinople.) The Cimmerian Bosporus was the name given by the ancients to the strait that leads from the Black Sea into the Sea of Azov. There was also anciently a kingdom of the name of Bosporus, so called from this strait, on both sides of which it was situated.

**Boss**, in architecture an ornament placed at the intersection of the ribs or groins in vaulted or flat roofs; it is frequently richly sculptured with armorial bearings or other devices.

**Bossuet** (bos-u-ā), JACQUES BENIGNE (1627-1704), illustrious French preacher and theologian. At the age of fifteen he entered the College of Navarre, where he studied Greek and the Holy Scriptures, read the ancient classics, and investigated the Cartesian philosophy. In 1652 he was ordained priest, and made a canon of Metz. In 1670 he was appointed preceptor to the Dauphin, and in 1681 he was raised to the see of Meaux. In his latter years he opposed Quietism, and prosecuted Madame Guyon. He was unrivalled as a pulpit orator.

a pulpit orator. **Bos'ton**, a town of England, in Lincolnshire, on the Witham, about 5 mi. from the sea. The name stands for Botolph's town, St. Botolph having founded a monastery here about the year 650. The trade is increasing through the improvement of the accommodation for shipping. The town contains some fine buildings, the parish church being a very large and handsome Gothic structure, with a tower nearly 300 ft. high. Ropes, sails, agricultural implements, etc., are made. Pop. 14,593.

**Boston**, the largest city in New England, and capital of Massachusetts, lies 234 mi. n. e. from New York, on Massachusetts Bay. It has a harbor, covering 75 sq. mi. protected by a great number of islands. The scenery is varied and picturesque. The streets are mostly narrow and irregular in the older parts of the town, but in the newer parts are many fine,

#### Boswell

spacious streets. There are many small parks, and a series of connecting parks is in process of formation; at present the Common and the Public Garden in the heart of the city are the chief pleasure grounds. Among the principal buildings are the statehouse; the county courthouse; the post-office; Feneuil Hall (from Peter Faneuil, who presented it to the city in 1742), famous historically as the meeting-place of the Revolutionary patriots; the city hall, or old statehouse, now used as public offices; the splendid granite customhouse, of Grecian architecture; public halls, theaters, etc. Harvard University, situated at Cambridge, which may be regarded as a Boston suburb, was founded in 1638. The library has 260,000 vol-The medical branch of this instituumes. tion is in Boston. The Boston Athenæum has two large buildings-one containing a library, and the other a picture gallery, a hall for public lectures, and other rooms for scientific purposes. The library consists of about 100,-Boston University, founded 000 volumes. principally by Isaac Rich, and incorporated in 1869, consists of the college of liberal arts; college of music; college of agriculture; school of theology; school of laws; school of medicine; and the school of all sciences. It is as open to women as to men; average number of students 600. A prominent feature in Boston is the number of good libraries. Besides those already mentioned, there is the Public Library, founded in 1852, which already contains 400, 000 volumes; the State Library, with 50,000 volumes; and others. The new public library building has just been completed. Boston carries on an extensive home and foreign trade, and is also largely engaged in the fisher-ies. Many manufactures are carried on, one ies. of the principal being that of boots and shoes. The first American newspaper was set up here The book trade of the city is imporin 1704. tant, and some of the periodicals are extensively circulated. Boston was founded in 1630 by English emigrants, and received its name from Boston in Lincolnshire, whence several of the settlers had come. Notwithstanding its increasing size and importance, the affairs of Boston for nearly two hundred years were administered by the townspeople, assembled in "town's meeting." In the War of Independence it played an important part. It was here that the opposition to the British measures of colonial taxation were strongest. The defiance reached its height when the Stamp Act was repealed, and the Tea Act denounced by three cargoes being thrown into the harbor. Here the Battle of Bunker Hill was fought, June 17, 1775. Pop. 450,000.

Bos' well, JAMES (1740-1795), the friend and biographer of Dr. Johnson, was the eldest son of Lord Auchinleck, one of the supreme judges of Scotland. He was educated at Edinburgh and Cambridge, became a member of the Scottish bar. In 1763 he became acquainted with Johnson. He afterward visited Voltaire at Ferney, Rousseau at Neuchâtel, and Paoli in Corsica. In 1785 he settled at London, and was called to the English bar. In 1773 he accompanied Johnson on a tour to the Scottish highlands and the Hebrides, and he published an account of the excursion after their return. His Life of Samuel Johnson, one of the best pieces of biography in the language, was published in 1701. His son Alexander, b. in 1775, created a baronet in 1821, killed in a duel in 1822, excelled as a writer of Scotch humorous songs, and was also a literary antiquary of no inconsiderable erudition.

**Bos' worth, a** small town in the county of Leicester, England, about 3 mi. from which is Bosworth Field, where was fought, in 1485, the battle between Richard III and the Earl of Richmond, afterward Henry VII. This battle, in which Richard lost his life, put a period to the Wars of the Roses. Pop. 1,149.

Botan' ic Gardens, establishments in which plants from all climates are cultivated for the purpose of illustrating the science of botany, and also for introducing and diffusing useful or beautiful plants from all parts of the world. Until modern times their sole design was the cultivation of medicinal plants. In Britain the chief gardens are those of Kew, Edinburgh, and Dublin. On the European continent the chief are the Jardin des Plantes at Paris, founded 1634; and those of Berlin, Copenhagen, Florence, etc. In America the chief are those of New York, Philadelphia, and Cambridge.

Botany, from the Greek word Botane, meaning herb or plant. There are in nature three great kingdoms, the mineral, animal, and vegetable. Botany is the science or study of the vegetable kingdom. Animals and plants have in common that strange thing which we call The difference between plants and anilife. mals consists chiefly in three things-1, in power of motion; 2, in will power; 3, in their food. Plants feed upon earth, air, and water. Animals feed upon plants or upon other animals. The great use of plants is as food for animals. To make its own life as complete as possible and to prepare seed which shall produce other plants like itself are the two objects of every plant. To attain these objects plants seek the sunshine and send their roots deep into the earth in search of moisture and fasten themselves firmly in order to resist the force of the wind.

There is in every seed a small point called the embryo, which under the microscope is seen to be the future plant, carefully folded and packed among starch granules which are to be its first food and supply its needs until it is strong enough to gather its food from the earth around it. When a seed is put into the ground the plant is not newly formed but only developed by the moisture and warmth and nourished by the surrounding starch. Before the embryo is formed in the seed there is in every seed a small point which is known as the nucleus. Under a strong microscope this is found at first to be a tiny cell or sac containing a granular liquid substance known as protoplasm. Protoplasm consists of albumen, granules of faity matter and water. It is called "the physical basis of life." Growth is the increase of a living thing in size and substance. Growth begins in the germ in one tiny cell usually not more than one four hundredth of an inch in diameter. This cell enlarges and divides by putting a little partition across between its two walls; these in turn put in partitions in both directions; each divides again and again, forming a cluster or mass of cells essentially like the first and all proceeding from the first. Soon the embryo begins to shape itself. A tiny root end is formed and the other end is notched into two lobes and shaped into the seed-leaves of the future plant. Later when the seed is placed in the earth and the plant springs from the ground its growth continues in the same manner. Vegetable growth consists of two things-1, the expansion of each cell till it reaches its full size; 2, the multiplication of cells in number by division. These cells become countless millions in number. This is organic structure, and because it is composed of cells the substance of plants is called cellular tissue. The cells of ordinary plants vary in size from  $\frac{1}{30}$  to  $\frac{1}{1000}$  of an inch in diameter. The usual size is from  $\frac{1}{360}$  to  $\frac{1}{560}$  of an inch so that there are from 27,000,000 to 125,000,000 in each cubic inch of substance.

The vegetable kingdom has been classified in several different ways. The two chief being the natural and the artificial system. Linnæus, a Swedish naturalist, made an artificial classification of the vegetable kingdom about 1750. He classified plants with reference only to the number of their stamens and pistils. The natural system classifies all plants with reference to the whole structure according to their points of similarity. The natural system divides the vegetable kingdom into four great growths of plants although many naturalists make only three divisions, grouping the ferns and mosses into one large group.

The first great group known as the Thallophytes, includes the plants lowest in organization. They have no wood properly so called, and the stems and leaves are undistinguishable. They are mere masses of cells. This class includes the Algæ, and the Fungi. These are the seaweeds, the diatons, nostoc, bacteria, pond scums, molds, rust, mushrooms, toadstools, yeast, and ferments.

The second group, known as the Archegoniates, includes the branching but not flowering plants. This division includes all the mosses and fern-like plants and cone-bearing trees and shrubs. It is this division that is sometimes divided in two, forming the group of mosses, and the fern group.

The third group, the Angiosperms, includes the true flowering plants. This division includes the palms, water plantain, orchids, sedges, and grasses, also the poplar, willow, oak, beech, etc., and the rose, the pea, and other flowering plants. The difference which distinguishes the last group from the others is that here we find the formation of seed.

Seaweeds were probably the first forms of life upon the earth, because they are able to assimilate purely organic food substances,

while the fungi seem to have appeared later and are dependent upon other plants to provide them with carbon. Slime-fungi clearly resemble the rhizopods of the animal kingdom. On this border line between animals and plants the distinction is made chiefly in regard to their methods of taking food, and upon these simplest forms of life only an artificial boundary can be drawn. Mold begins life only as a single cell consisting of colorless protoplasm covered with a cell-wall. Yeast increases so rapidly that the daughter cells commence to form buds before they are sepa-rated from the mother cell. The simplest rated from the mother cell. form of green plant known may be found in a drop of rain water which has stood for some little time. It will become green because there are small, round green bodies floating in Each of these is a distinct plant known as it. This substance may also be protococcus. seen on trees, and fences. When bacteria or microbes were first discovered by Ehrenburg he classed them with the infusoria of the animal kingdom, and afterward for a long time their true nature was a matter of doubt. They are now generally regarded as belonging to the simplest form of vegetable life. The cells of bacteria are constructed like other plant cells. As far as animal life is concerned some of the species are harmless, or even perhaps beneficial, while others are the source of the most contagious diseases. Microbes are found everywhere in the air, in surface water, and in the upper layers of the soil. Leprosy, smallpox, scarlet fever, measles, yellow fever, and many other diseases owe their origin to bacteria. Ferns, usually considered flower-less, have spores instead of seed. Spores are single cells which are dehisced from the plant for purposes of reproduction. The third great class of plants is the flowering and seed producing plants with which we are familiar.

*Roots.*—The first root is that sent down from the embryo. This may be seen in the morning glory, buckeye, maple, beech, and many other plants. In some trees as the oak, it is the main root for many years. In many plants several roots start so near together from the base of the seedling stem that they form a bundle or cluster of roots instead of one main root. This is the case with Indian corn, the pumpkin, and pea. Besides fastening the plant to the soil, the use of roots is to absorb moisture from the earth. Frequent branching increases the surface of the root and its power of absorption. Many roots are storehouses of food for the future plant, as the carrot, beet, and parsnip root. Plants that live two or three years or more usually have such roots. The finest examples of air-roots occur in warm and damp climates, as the mangrove, the sugar cane, and the banvan tree of India. Some of our common plants send out small air-roots by which they fasten themselves to the wall. The trumpet creeper and the ivy are examples. Air plants fasten themselves by their roots to the bark of trees and live wholly upon what is fur-nished by the air. To this class belong the orchids and the black moss of the South. Para-

site plants use their roots not only to fasten themselves upon other plants for support, but also to penetrate their substance and feed upon their juices. The mistletoe is such a shrub. The root penetrates the bark of the tree upon which the seed has fallen and fastens itself as firmly as if it were a natural branch. The dodder, a parasitic plant, grows a few inches from the ground and winds itself around some plant upon which to live. It attaches itself by a small root, and having no further use for its own ground roots or supporting stem, they are allowed to die and the dodder lives upon its victim. It needs only flower for seed and roots to gather its support from its afflicted neighbor.

Stems, Branches, and Leaves.—When the stems and branches rise above the ground the plant is said to have a true stem, but when there are only leaves or leaf-stalks or flower-stalks the plant is said to be stemless. The common violet is an example. Suckers are branches that grow from the stem under ground, as the rose, raspberry, and many trees. Stolons are trailing branches that take root when they strike the ground, as the currant and the gooseberry. Runners are long and slender. leafless, creeping branches, of which the strawberry is an example. Tendrils are branches of a very slender kind intended for climbing. The grapevine, Virginia-creeper, and cucumber are examples. Thorns (or spines) are stunted and hardened branches. Thorns sometimes branch as in the honey locust. Prickles, as those of the rose, are wholly different from thorns. Thorns are connected with the stem and are changed branches, while prickles are only attached to the bark. The particular use of leaves is to furnish the plant with a large surface exposed to the light and air. The Washington elm at Cambridge, Mass., is not a remarkably large tree, but it has been estimated that it produced 7,000,000 leaves, having a surface of 200,000 sq. ft. or about five acres of foliage. Leaves consist of a woody framework, the green pulp, and the leaf-skin which covers the whole. The green of leaves (chlorophyll) is a compound made up of substances which vary in color from blue to yellow and orange. As these substances do not occur in the same proportions we have a great variety in the tints of leaves. These substances are also affected by the action of light and the supply of nourishment. Leaves are supplied with breathing mouths which open into the air passages of leaves. They are chiefly on the under side of the leaf. Leaves are said to be simple when the blade is all of one piece; compound when the leaf consists of two or more separate pieces borne upon one leaf-stalk.

Fourers.—The leaves of the flower are usually in two circles. The outer circle is called the calyx and the leaves are usually green. The inner circle, which is usually highly colored, is the corolla. Each separate part of the corolla is called a petal, and each separate part of the calyx is called a sepal. The corolla and calyx serve to protect and nourish the parts within, but do not themselves make a

perfect flower. The essential organs are the stamens or fertilizing organs of the flower and the pistils which are to be fertilized and produce the fruit and seed. Some flowers by high cultivation are made to consist only of flower leaves, that is, of calyx and corolla, and have lost their essential organs and do not produce seed. The hydrangea and snowball are examples. A stamen consists of a delicate stalk or filament and the anther. The anther is a case commonly of two lobes which contain a dust-like substance called pollen. The anther discharges this pollen when it becomes ripe, and the whole office of the stamen is to produce this pollen. A grain of pollen is made up of two coats. The outer coat is thick but weak and decorated with lines or bands or studded with points, while the inner coat is extremely delicate and its cavity is filled with a thick fluid often made turbid by an immense number of minute grains that float in it. A pistil consists of three parts-1, the top, called the stigma, which receives the pollen grains from the stamen; 2, the stalk, that supports the stigma, called the style; 3, the hollow case at its base, called the ovary, which contains the young seeds or ovules. In the colors and shapes of flowers beauty and use are combined. Insects are attracted by brilliant colors, while moths are attracted in the evening and at night by white flowers. The veins of flowers serve as honey guiders. They al-ways converge to the nectaries. Night-opening flowers are found not to possess veins as they would not be visible in the darkness. Intensity of color is due to the necessity of attracting insects which carry the pollen, and frequently the inside of the flower is more highly colored than the outside in order to tempt an insect to enter. Nodding flowers bend in order to prevent their honey from being dissolved away by the rain or the dew. Flowers with a large lower lip are so formed that insects may alight upon the lip and creep into the flower leisurely. Wind-fertilized flowers are usually borne upon shrubs and trees where their elevation above the ground allows the wind to carry the pollen more freely. The odor, like the bright color, is also to attract insects. The perfume of flowers proceeds from the honey or nectar. If honey and perfume were not associated insects would soon discern the cheat and cease to be attracted by the perfume. The honey of flowers is secreted by special glands called nectaries. The position of these glands varies in different orders of flowers. In the crown imperial lily there are deep pits for the honey at the base of the corolla. The hellibore uses its small, folded petals as nectarines. In the orchids and larkspur the honey is borne in the spur of the flower while in some orchids the sweetness seems to be in the tissues of the spur which must be gnawed in order to secure it. Flowers which are not conspicuous for form or color are generally most attractive for perfume. There is a large class of flowers whose odor is disagreeable and it is found that these attract flies and not bees or butterflies. Raf-

flesia, the largest flower known, has a strong odor of decaying flesh and is usually surrounded by a swarm of flies. Only the seedvessel and the seed which it contains are called fruit. Mulberries, figs, and pineapples are masses of fruit with a pulpy flower-stalk. The strawberry is the enlarged and pulpy receptacle. There are three kinds of fruit: flesh fruit, stone fruit, and dry fruit. All berries belong to the first class. To the stone fruit belong the cherry, plum, and peach. In the raspberry and blackberry each grain is one of the dry fruits. A grain is a fruit in which the covering of the fruit and the fruit itself are so closely unlted that they cannot be separated. Wheat, Indian corn, and other grains belong to this class. A nut is a dry fruit with a hard, bony covering, as the cocoanut, hazelnut, chestnut, and acorn. Seeds have usually two coats and the various markings of seed depend upon the outer coat. In the trumpet creeper the outer coat is expanded as a wing so that the wind may carry it easily. The soft hairs of the milkweed and the silkweed are for the same purpose. All trees and most shrubs have a strong, tough texture which is called wood. Wood consists of threads of fiber, separated by ducts. In fine wood the small tubes are about  $\frac{1}{3}$ , of an inch in diame-ter, but in the tough bark of basswood they are only  $\frac{1}{3}$ , of an inch. Milk vessels, tur-pentine vessels, and oil vessels are canals formed among the cells and filled with the peculiar product of these plants. Plants Doing Work.—Plants change inorganic

Plants Doing Work.—Plants change inorganic matter into organic matter. Carbonic acid gas is one of the component parts of the atmosphere, but it is only  $\frac{1}{1300}$  of the air and in this proportion it is not enough to injure animal life, to which it is a poison, but it is enough for plants of which it is the food. The atmosphere around us consists of oxygen and nitrogen. Nitrogen does not support animal life, it only dilutes the oxygen gas, making it the proper strength for animals to breathe. Plants take in carbon chiefly through the breathing mouths with which the lower surface of the leaves is covered. Decayed vegetable matter in the soil also furnishes carbon to living plants.

Many plants store up quantities of starch for future use. Some plants as the turnip, carrot, and dahlia accumulate starch in the root. The ice-plant and century-plant store it up in the fleshy leaves, and the cactus in the whole thickened body. In Indian corn and horse chestnut it is placed in the seed. Sugar is a product of plants. Morphine, strychnine, and quinine are principally found in the cells or spaces in the bark. They seem to have no part in the growth of the plant but are the completest results of vegetation. Almost 2,000 years ago Pliny observed certain motions in plants at evening and at morning, which indicated that during the night they had a period of rest or sleep. The position of the leaves is changed in such a way as to protect the upper surface of the leaf. The common wood-sorrel, the white clover, and cultivated nasturtium are among the best examples. Some plants feed upon insects. The little sum-up and with these plants. The leaves are covered with small bristle-like glands which secrete a sweet. sticky fluid. This attracts small insects and as soon as the slightest touch is felt upon the leaf these hairs bend toward the center and close in upon the object. As soon as an insect is caught the secretion from the glands is rapidly increased, and as insects breathe by means of pores these pores are so filled by this secretion that the insect dies from suffocation. After the insect is caught a change is made in the secretion and it becomes acid and digests the little animal. The pitcher plant and the Venus fly-trap are other flesh-eating plants. The largest known flower is one discovered in the East Indies by Sir S. Raffles and named after him Rafflesia; it is a large, fleshy parasite drawing upon the roots of other plants. It has five petals measuring in length about 12 in. from the base to the point. The bowl in the center of the plant would hold about twelve pints and the weight of the flower is about fifteen pounds. The bamboo is a species of grass which grows so large and so hard that it is used for building and for all sorts of furniture, for water pipes and for supporting The smaller stalks are used for walkbeams.

ing sticks, flutes, etc. Botany Bay, a bay in New South Wales, so called by Cuptain Cook on account of the great number of new plants collected in its vicinity. The English penal settlement, founded in 1788, and once popularly known as Botany Bay, was formerly located at Port Jackson, some miles to the northward, near where Sydney now stands.

Botau'rus, the bittern genus of birds.

Botetourt, NORBORNE BERKELEY (1738-1770), an English colonial governor. In 1761 he was colonel of militia, and became a peer in 1764. In July, 1769, he became governor of Virginia. In May, 1769, the Virginia assembly complained of parliamentary taxation, and of sending accused persons to England for trial; in reply Lord Botetourt dissolved the legislature. The trouble between the governor and the people gradually subsided, but they would not assent to parliamentary taxation. Lord Botetourt asked to be relieved, and died a short time afterward.

**Botfly**, Gadfly, and Warble-fly, names common to many insects of the family Estridæ, the genus Estrus of Linnæus. The name bot is sometimes restricted to the parasitic and

Ox Botfly.

a.-larva, full grown, natural size; b.-pupa; c.-perfect insect (magnified.)

# Bothnia

destructive larvæ, which appears to have been its original use, the other names being given to the perfect adults, and the name gadily often to blood-sucking insects of the very different genus Tabanus (q. v.), to which some try to restrict it. The insects of this family are now supposed not to be those which were called (Estrus by the ancients, although, like them, extremely troublesome to cattle. They are Dipterous (two-winged) (q.v.) insects, nearly allied to the Muscides (house-fly, flesh-fly, blow-fly, etc.).

The head is large, and as if blown out; the antennæ are short and spring from deep pils: the proboscis and palps are degenerate; the eyes are small, and there are three eye-spots; the posterior part of the body is rounded; the hindmost legs are often very long. The larvæ have toothed body-rings, and are parasitic in the nose, throat, stomach, or under the skin of mammals, and are unfortunately more familiar than the bee-like adults.

Both 'nia, Gulf of, the northern part of the Baltic Sea, which separates Sweden from Finland. Length about 450 mi., breadth 90 to 130 mi., depth from 20 to 50 fathoms. Its water is but slightly salt, and it freezes in the winter, so as to be passed by sledges and carriages.

**Both' well,** a village of Lanarkshire, Scotland, on the Clyde, 8 mi. e. of Glasgow. Here is Bothwell Bridge, where a decisive battle was fought in 1679, between the Scottish Covenanters and the royal forces commanded by the Duke of Monmouth, in which the former were totally routed. Near by are the fine ruins of Bothwell Castle, once a stronghold of the Douglases.

Both' well, JAMES HEPBURN, EARL of (1520-1576), known in Scottish history by his marriage to Queen Mary. It is believed that he was deeply concerned in the murder of Darnley, Mary's husband, and that he was even supported by the queen. He was charged with the crime and tried, but, appearing along with 4,000 followers, was readily acquitted. He was now in high favor with the queen, and with or without her consent he seized her at Edinburgh, and carrying her a prisoner to Dunbar Castle prevailed upon her to marry him after he had divorced his own wife. A confederacy was formed against him, and in a short time Mary was a prisoner in Edinburgh, and Bothwell had been forced to flee to Denmark, where he died.

**Bo-tree**, the pipal, or sacred fig-tree of India and Ceylon venerated by the Buddhists and planted near their temples. One specimen at Anurajahpoora in Ceylon is said to have been planted before 200 B. c. It was greatly shattered by a storm in 1887.

Botrychium (bo-trik'i-um), a genus of ferns, one species of which, the common moonwort, is a native of Britain, growing on elevated heaths and pastures where other ferns are seldom found. The largest species is a native of North America, New Zealand, the Himalayas, etc.

Botta, PAUL EMILE (1800-1870), French trav-

eler and archæologist. He discovered the ruins of ancient Nineveh in 1843 while acting as consular agent for the French government at Mosul. As the result of his investigations he published two important works—one on the cuneiform writing of the Assyrians and the other upon the monuments of Nineveh—the latter of which is a work of great splendor and marks an era in Assyriology.

**Böttger** (or Böttiger) (bout'ger or beu'tiger), JOHANN FRIEDRICH (1682-1719), German alchemist; the inventor of the celebrated Meissen porcelain. His search for the philosopher's stone or secret of making gold led him into many difficulties. At last he found refuge at the court of Saxony, where the elector erected a laboratory for him, and forced him to turn his attention to the manufacture of porcelain. resulting in the invention associated with his name.

Botticelli (bot-tē-chel'lē), SANDRO (for Allessandro) (1447-1515), an Italian painter of the Florentine school. Working at first in the shop of the goldsmith Botticelli, from whom he takes his name, he showed such talent that he was removed to the studio of the distinguished painter, Fra Lippo Lippi. From this master he took the fire and passion of his style, and added a fine fantasy and delicacy of his own. He painted flowers, especially roses, with incomparable skill. In his later years Botticelli became an ardent disciple of Savonarola, and is said by Vasari to have neglected his painting for the study of mystical theology.

Bottle, a vessel of moderate or small size, and with a neck, for holding liquor. By the ancients they were made of skins or leather; they are now chiefly made of glass or earthenware. The common black bottles of the cheapest kind are formed of the most ordinary materials, sand with lime, and sometimes clay and alkaline ashes of any kind, such as kelp, barilla, or even wood ashes. This glass is strong, hard, and less subject to corrosion by acids than flint-glass. In bottle making the glass is blown instead of pressed into form. In smelting, the glass is gathered upon pipes or tubes. When taken from the furnace the ball is rolled upon a slab of iron, the operator blowing through the pipe meanwhile. This forms a long, hollow, pear-shaped mass which is then swung into an open mold, the mold closed upon it, and the glass forced into every detail of the pattern by the lungs of the blower. The extra glass above the mold is broken off, the bottle removed, and the mouth shaped up by softening in the oven and working with a special tool. It is then sent through the tempering oven. The molds are kept very cool by a blast of air from a large air tube overhead. It is important that the proper amount of glass be gathered for a bottle, otherwise the bottles are too thick or too thin. The lettering on bottles is done by a plate engraved reverse and placed in the mold. Bottle making is not considered high-class work and is largely done by cheap labor.

Bouches-du-Rhône (bösh-dü-ron), "Mouths

of the Rhone," a dep. in the s. of France, in ancient Provence. Chief town, Marseilles. Area, 1,971 sq. mi., of which about one half is under cultivation. The Rhone is the principal river. The climate is generally very warm; but the dep. is liable to the *mistral*, a cold and violent n. e. wind from the Cevennes ranges. Much of the soil in unfruitful, but the fine climate makes the cultivation of figs, olives, nuts, almonds, etc., very successful. The manufactures are principally soap, brandy, olive oil, chemicals, vinegar, scent, leather, glass, etc. The fisheries are numerous and productive. Pop. 630.622.

**Boucleault** (b5'si-kō), Diox (1822-1890), dramatic author and actor. He was intended for an architect, but the success of a comedy, the well-known *London Assurance*, which he wrote when only nineteen years old, determined him for a career in connection with the stage. In 1853 he went to America, where he was scarcely less popular than in England. On his return in 1860 he produced a new style of drama, of which the *Colleen Bauen* and Arrah-na-Pogue are the best examples. As an actor he was clever, but not highly gifted. His dramatic pieces are snid to number upward of 150.

**Boufflers** (or Bouffers) (bö-flår), LOUIS FRANcors, DUC DE (1644-1711), Marshal of France, one of the most celebrated generals of his age. He learned the art of war under such renowned generals as Condé, Turenne, and Catinat. His defense of Namur against King William of England, and of Lille against Prince Eugene, are famous, and he conducted the retreat of the French at Malplaquet with such admirable skill as quite to cover the appearance of defeat.

**Boudinot,** ELIAS (1740–1821), American patriot and philanthropist. During the troubles of the Revolution he united with the patriots, and in 1777 became commissary general of prisoners. He was chosen a delegate to Congress from New Jersey in 1777, and served in 1778 and 1770, and again from 1781 until 1784. On Nov. 4, 1782, he became president of Congress, and as such signed the treaty of peace with Great Britain. Later he resumed the practise of law, and served in Congress from 1789–1795. He was director of the mint in Philadelphia 1795–1805. He was a trustee of Princeton and in 1505 endowed it with a cabinet of natural history. He was the first president of the American Bible Society.

**Bougainville** (bö-gan-vēl), Louis ANTOINE DE, (1729-1811), a famous French navigator. At first a lawyer he afterward entered the army and fought bravely in Canada under the Marquis of Montcalm, and it was principally owing to his exertions, in 1758, that a body of 5,000 French withstood successfully a British army of 16,000 men. After the battle of Sept. 13, 1759, in which Montcalm was killed and the fate of the colony decided, Bougainville returned to France and served with distinction in the campaign of 1761 in Germany. After the peace he entered the navy, and became a distinguished naval officer. In 1763 he undertook the command of a colonizing expedition to the Fakland Islands, but as the Spaniards had a prior claim the project was abandoned. Bougainville then made a voyage round the world, which enriched geography with a number of new discoveries. In the American Revolutionary War he distinguished himself at sea, but withdrew from the service after the French Revolution and died in retirement.

**Bougainville Island,** an island in the Pacific Ocean belonging to the Solomon group (area 4,000 sq. mi.), and under German protection. It is separated from Choiseul Island by *Bouyainville Strait.* 

Bouguer (bö-gā), PIERRE (1698-1758), a French mathematician and astronomer. He was associated with Godin and La Condamine in an expedition to the South American equatorial regions to measure the length of a degree of the meridian. The main burden of the task fell upon Bouguer, who performed it with great ability, and published the results. He also invented the heliometer, and his researches about light laid the foundation of photometry.

**Bouillon** (bö-yōu), originally a German duchy, now a district in Belgium, 9 mi. wide and 18 long, on the borders of Luxemburg and Liége, a wooly and mountainous tract, with some 21,000 inhabitants. The small town of Bouillon was once the capital of the duchy, which belonged to the famous crusader Godfrey of Bouillon.

**Bouillon,** GODFREY DE, Duke of Lower Lorraine (1061-1100), "a worthy representative of Charlemagne, from whom he was descended in the female line." Bouillon gained distinction in the armies of the Emperor Heinrich IV, and was the great leader of the first Crusade. He took the title of Defender and Baron of the Holy Sepulcher. At Ascalon, with 20,000 men, he defeated the sultan of Egypt with 400,000. He then devoted himself to organize his government, and drew up, for his courts of justice, the Assizes of Jerusalem, a code of laws which was the fullest embodiment of feudal jurisprudence. He was buried on Mount Calvary. His many virtues are justly extolled in Tasso's Jerusalem Delivered.

**Boulak'**, a town of Lower Egypt, a suburb and port of Cairo. It has cotton, sugar, and paper factories, and till recently had a famous museum of antiouities. Pop. 10.000.

museum of antiquities. Pop. 10,000. Boulanger, GEORGE ERNEST JEAN MARIE (1837-1891), a French soldier. He served in Algeria, Italy, and Cochin China, fought under the republic during the Franco-Prussian War, and became brigadier general in 1880. He was minister of war 1886-87. In this capacity he was active in procuring the expulsion of the Orleans princes from the army and from France. He successfully contested several seats in the Chamber of Deputies, and 1889. was elected deputy for Paris by a very large vote. Two months later the government, claiming to have evidence of his intended treason, began a prosecution, and Boulanger fied to Brussels, and thence to the Isle of Jersey. He was convicted in his absence and remained an exile. He committed suicide in Brussels

on the grave of a lady to whom he had been deeply attached.

**Boulder** (böl'dèr), a rounded water-worn stone of some size; in geol. applied to ice-worn and partially smoothed blocks of large size lying on the surface of the soil, or embedded in clays and gravels, generally differing in composition from the rocks in their vicinity, a fact which proves that they must have been transported from a distance, probably by ice. When lying on the surface they are known as *erratic blocks*. The *boulder-clay* in which these blocks are found belongs to the post-tertiary or quaternary period. It occurs in many localities, consists of a compact clay often with thin beds of gravel and sand interspersed, and is believed to have been deposited from icebergs and glaciers in the last glacial period.

**Boulder,** Boulder co., Colo., on Boulder Creek, 29 mi. n.w. of Denver. Railroads: Union Pacific, and Union Pacific, Denver, & Gulf. Industries: flouring mills, iron foundry, two cigar factories and other small industries. Surrounding country agricultural and mineral. Boulder is the seat of the University of Colorado. It was first settled in 1853 and became a city in 1873. Pop. est. 1897, 6,000.

Boulogne (bö-lon-ye or bö-lon) (or Boulognesur-Mer), a fortified seaport of France, dep. Pas de Calais, at the mouth of the Lianne. In the castle, which dates from 1231, Louis Napoleon was imprisoned in 1840. Boulogne has manufactures of soap, earthenware, linen and woolen cloths; wines, coal, corn, butter, fish, linen. and woolen stuffs, etc., are the articles of Steamboats run daily between this export. place and England, crossing over in two or three hours. Napoleon Bonaparte, after deepening and fortifying the harbor, encamped 180,000 men here with the intention of invading Britain at a favorable moment; but upon the breaking out of hostilities with Austria, 1805, they were called to other places. Pop. 42,205.

Boulogne-sur-Seine, a town of France, dep. Seine, s.w. of Paris, of which it is a suburb. It is from this place that the celebrated Bois de Boulogne gets its name. Pop. 30,084. Boulton (bol'ton), MATTHEW (1728-1809), a

**Boulton** (böl'ton), MATTHEW (1728-1809), a noted English mechanician. He engaged in business as a manufacturer of hardware, and invented and brought to great perfection inlaid steel buckles, buttons, watch-chains, etc. The introduction of the steam engine at Soho led to a connection between Boulton and James Watt, who became partners in trade in 1769.

**Bounty**, in political economy, is a reward or premium granted for the encouragement of a particular species of trade or production, the idea being that the development of such trade or production will be of national benefit. The same name is given to a premium offered by government to induce men to enlist in the public service, especially to the sum of money given in some states to recruits in the army and navy. During the Civil War in America the bounty was at one time as high as \$900.

**Bourbon** (bör-bön), an ancient French family which has given three dynasties to Europe, the

Bourbons of France, Spain, and Naples. The first of the line known in history is Adhemar, who, at the beginning of the tenth century, was lord of the Bourbonnais (now the dep. of Allier). The power and possessions of the family increased steadily through a long scries of Archambaulds of Bourbon till in 1272 Beatrix, daughter of Agnes of Bourbon and John of Burgundy, married Robert, sixth son of Louis IX of France, and thus connected the Bourbons with the royal line of the Capets. Their son Louis had the barony converted into a dukedom and became the first Duc de Bourbon. Two branches took their origin from the two sons of this Louis, duke of Bourbon, who died in 1341. The elder line was that of the dukes of Bourbon, which became extinct at the death of the Constable of Bourbon in 1527, in the assault of the city of Rome. The younger was that of the counts of La Marche, after-ward counts and dukes of Vendôme. From these descended Anthony of Bourbon, duke of Vendôme, who by marriage acquired the kingdom of Navarre, and whose son Henry of Navarre, became Henry IV of France. Anthony's younger brother, Louis, prince of Condé, was the founder of the line of Condé. There were, therefore, two chief branches of the Bourbons -the royal, and that of Condé. The royal branch was divided by the two sons of Louis XIII, the elder of whom, Louis XIV, continued the chief branch, while Philip, the younger son, founded the house of Orleans as the first duke of that name. The kings of the elder French royal line of the house of Bourbon run XVI, XVI, XVII, AND Charles X, III, XIV, XV, XVI, XVII, XVII, AND Charles X. The last sovereigns of this line, Louis XVI, Louis XVII, and Charles X (Louis XVII, son of Louis XVI, and Charles X). never obtained the crown), were brothers, all of them being grandsons of Louis XV. Louis XVIII had no children, but Charles X, had two sons, viz., Louis Antoine de Bourbon, duke of Angoulême, who was dauphin till the revolution of 1830, and died without issue in 1844, and Charles Ferdinand, duke of Berry, who d. Feb. 14, 1820, of a wound given him by a political fanatic. The duke of Berry had two children: 1, Louise Marie Thérèse, called Mademoiselle d'Artois; and 2, Henri Charles Ferdinand Marie Dieudonné, b. in 1820, and at first called duke of Bordeaux, but afterwards Count de Chambord, who was looked upon by his party until his death (in 1883) as the legitimate heir to the crown of France.

The branch of the Bourbons known as the House of Orleans was raised to the throne of France by the revolution of 1830, and deprived of it by that of 1848. It derives its origin from Duke Philip I of Orleans (d. 1701), second son of Louis XIII, and only brother of Louis XIV. A regular succession of princes leads us to the notorious Egalité Orleans, who in 1793 died on the scaffold, and whose son Louis Philippe was king of France from 1830 to the revolution of 1848. His grandson, Louis Philippe, Count de Paris, b. Aug. 24, 1838, is the present head of the family, and since the death of Count de Chambord, the last male representative of the elder Bourbons, unites in himself the claims of both branches to the throne of France.

The Spanish-Bourbon dynasty originated when in 1700 Louis XIV placed his grandson Philip, duke of Anjou, on the Spanish throne, who became Philip V of Spain. From him descends the present infant occupant of the Spanish throne, Alphonso XII, b. in 1886.

The royal line of Naples, or the Two Sicilies, took its rise when in 1735 Don Carlos, the younger son of Philip V of Spain, obtained the crown of Sicily and Naples (then attached to the Spanish monarchy), and reigned as Charles III. In 1759, however, he succeeded his brother Ferdinand VI on the Spanish throne, when he transferred the Two Sicilies to his third son Fernando (Ferdinand IV), on the express condition that this crown should not be again united with Spain. Ferdinand IV had to leave Naples in 1806; but after the fall of Napoleon he again became king of both Sicilies under the title of Ferdinand I, and the succession remained to his descendants until 1860, when Naples was incorporated into the new kingdom of Italy.

**Bourbonnais** (bör-bon-ā), a former province of France, with the title first of a county, and afterward of a duchy, lying between Nivernais, Berry, and Burgundy, and now forming the department of the Allier.

**Bourdaloue** (bör-dà-lö), Louis (1632-1704), one of the great church orators of France, entered the order of the Jesuits, becoming teacher of rhetoric, philosophy, and morals in the Jesuit college of his native place. The lofty and dignified eloquence with which he assailed the vices of contemporary society brought him fame even at a time when Paris was ablaze with the feasts of Versailles, the glory of Turenne's victories, and the masterpieces of Corneille and Racine. His sermons are among the classics of France.

**Bourg** (börg) (or Bourg-en-Bresse), a town of Eastern France, capital of the dep. of Ain, well built, with a handsome parish church, public library, museum, monuments to Bichat, Joubert, and Edgar Quinet, and near the town the beautiful Gothic church of Brou, built in the early sixteenth century; some manufactures and a considerable trade. Pop, 18,968. **Bourgelat** (börzh-lä), CLAUDE (1712-1779),

**Bourgelat** (börzh-lä), CLAUDE (1712-1770), creator of the art of veterinary surgery in France. He established the first veterinary school in his native town in 1762, and his works on the art furnished a complete course of veterinary instruction.

**Bourgeois** (bur-j $\delta'$ ), a size of printing type larger than brevier and smaller than long-primer, used in books and newspapers.

**Bourgeoisle** (börzh-wá-zē), a name applied to a certain class in France, in contradistinction to the nobility and clergy as well as to the working classes. It thus includes all those who do not belong to the nobility or clergy, and yet occupy an independent position, from financiers and heads of great mercantile establishments at the one end to master tradesmen at the other. It corresponds pretty nearly with the English term "middle classes." Etymologically the word refers to the old class of freemen or burgesses residing in towns.

**Bourges** (börzh), an ancient city of France, capital of the dep. of Cher, situated at the confluence of the Auron and Yèvre, 124 mi. s. of Paris, formerly surrounded with ramparts, now laid out as promenades. It has crooked and gloomy streets, and houses built in the old style. The most noteworthy building is the cathedral (an archbishop's) of the thirteenth century, and one of the finest examples of Gothic in France. Bourges is a military center and has an arsenal, cannon foundry, etc., manufactures of cloth, leather, etc. Pop. 45,-342.

**BOURTMONT** (bör-mön), LOUIS AUGUSTE VIC-TOR DE GHAISNE, COMTE DE (1773-1846), marshal of France. Entering the republican army he distinguished himself under Napoleon, who made him a general of division. After the restoration he readily took service with the new dynasty, and in 1830 commanded the troops which conquered Algiers, a success which gained for him the marshal's baton. After the revolution of 1830 he followed the banished Charles X into exile, but latterly retired to his estate in Anjou, where he died.

**Bourrienne** (bö-rē-ān), FAUVELET DE (1769-1834), a French diplomatist, was educated along with Bonaparte at the school of Brienne. where a close intimacy sprang up between them. Bourrienne went to Germany to study law and languages, but returning to Paris in 1792, renewed his friendship with Napoleon, from whom he obtained various appointments, and latterly that of minister plenipotentiary at Hamburg. On the abdication of Napoleon he paid his court to Louis XVIII, and was nominated a minister of state. The revolution of July, 1830, and the loss of his wealth, affected him so much that he lost his reason, and died in a lunatic asylum. His Memoirs of Napoleon are valuable.

**Boussa** (bös'a) (or Bussang), a city of Africa, in the Soudan, on the Niger. It was here that Mungo Park met his death in 1805. Pop. est. 12,000 to 18,000.

Boutwell, GEORGE SEWALL (1818-), American statesman. In 1842 he was elected as a Democrat to the Massachusetts state legislature, where he sat until 1851. In 1851 and again in 1852, he was elected governor on the Free-soil ticket. He joined the Republican party in 1854. In 1862 he organized the internal revenue department, of which he was first commissioner. In 1863 he became member of Congress and was re-elected in 1865 and 1867. He was chairman of the committee to report articles of impeachment against Andrew Johnson, and one of the seven managers of the trial. He became secretary of the treasury in Grant's cabinet, which office he held until March, 1873, when he was chosen U.S. senator. Mr. Boutwell afterward practised in Washington, D. C., and in 1877 codified and tor. edited the statutes at large.

Bov'idæ, the ox family of animals, including the common ox, the bison, buffalo, yak,

zebu, etc. They are hollow-horned, ruminant animals, generally of large size, with broad, hairless muzzles and stout limbs, and most of them have been domesticated.

Bow, the name of one of the most ancient and universal weapons of offense. It is made of steel, wood, horn, or other elastic substance. The figure of the bow is nearly the same in all countries. The ancient Grecian bow was somewhat in the form of the letter  $\Sigma$ . In drawing it, the hand was brought back to the right breast, and not to the ear. The Scythian bow was nearly semicircular. The long-bow was the favorite national weapon in England. The battles of Crécy (1346), Poitiers (1356), and Agincourt (1415) were won by this weapon. It was made of yew, ash, etc., of the height of the archer, or about 6 ft. long, the arrow be-ing usually half the length of the bow. The arbalist, or cross-bow, was a popular weapon with the Italians, and was introduced into England in the thirteenth century, but never was so popular as the long-bow. In England the strictest regulations were made to encourage and facilitate the use of the bow. Merchants were obliged to import a certain proportion of bow-staves with every cargo; town councils had to provide public shooting butts near the town. Of the power of the bow, and the distance to which it will carry, some remarkable anecdotes are related. Thus Stuart (Athenian Antiquities i.) mentions a random shot of a Turk, which he found to be 584 yards. In the journal of King Edward VI it is mentioned that 100 archers of the king's guard shot at a 1-inch board, and that some of the arrows passed through this and into another board behind it, although the wood was extremely solid and firm.

**Bower-bird**, a name given to certain Australian birds of the starling family from a remarkable habit they have of building bowers to serve as places of resort. The bowers are

The Spotted Bower-bird.

constructed on the ground and usually under overhanging branches in the most ratired parts of the forest. They are decorated with variegated feathers, shells, small pebbles, bones, etc. At each end there is an entrance left open. These bowers do not serve as nests at all, but seem to be places of amusement and resort, especially during the breeding season. *The Satin Bower-bird* is so called from its beautiful glossy plumage, which is of a black color. Another common species is the *Spotted Bower-bird*, which is about 11 in. long, or rather smaller than the first mentioned, and less gay in color, but is the most lavish of all in decorating its bowers.

**Bowie**, JAMES (1790-1836), American frontiersman. He was notorious as a duelist, and, in 1827, was engaged in a médee at Natchez, in which six men were killed, and fifteen wounded. The knife with which he killed his opponent on this occasion was fashioned from a blacksmith's file, and was the original bowie-knife. He was killed by Mexican soldiery at the Alamo.

**Bowie-knife**, a long kind of knife like a dagger, but with only one edge, named after Colonel James Bowie, and used in America by hunters and others.

**Bow Instruments** are all the instruments strung with catgut from which the tones are produced by means of the bow. The most usual are the double-bass, the small bass, the tenor, and the violin proper. In reference to their construction the several parts are alike; the difference is in the size.

**Bow**, in music is the name of that wellknown implement by means of which the tone is produced from violins, and other instruments of that kind. It is made of a thin staff of elastic wood, tapering slightly till it reaches the lower end, to which the hairs (about 80 or 100 horsehairs) are fastened, and with which the bow is strung. At the upper end is an ornamental piece of wood or ivory called the *nut*, and fastened with a screw, which serves to regulate the tension of the hairs.

**Bow Bells**, the peal of bells belonging to the church of St. Mary-le-Bow, Cheapside, London, and celebrated for centuries. One who is born "within the sound of Bow Bells" is considered a genuine cockney.

is considered a genuine cockney. **Bow' ditch**, NATHANIEL, LL.D., F.R.S. (1773– 1838), an eminent American mathematician and astronomer, and president of the American Academy. His two principal works are *The American Practical Navigator* (1802), and an excellent translation of La Place's Mecanique *Céleste* (1829-38).

Bowdoin, JAMES(1727-1790), American statesman. He was a grandson of a French Huguenot who came to Portland, Me., in 1687, and went to Boston in 1690. James graduated af Harvard in 1745. He early manifested a scientific tendency of mind, and corresponded with Benjamin Franklin. He was a member of the general court of Massachusetts (1753-1756), and became councilor. The Bostonians thereafter elected him to the assembly. In 1774 he was elected a member of the Continental Congress; in 1775 he became president of the Massachusetts council, and in 1779 presided over the State Constitutional convention. In 1785 he became governor of the state of Massachusetts. He was a member of the convention that framed the Federal constitution.

23

#### Bowell

He was one of the founders and became the president of the American Academy of Arts and Sciences, and also a founder of the Massachusetts Humane Society. *Bocdoin College*, Brunswick, Me., was named after him. It is a flourishing institution, which has had among its students Longellow and Hawthorne.

**Bowell,** MACKENZIE (1823-), Canadian statesman, b. in Suffolk, England; came to Canada when a boy, and became editor of the Belleville, Ontario, *Intelligencer*. In 1867 he was returned to Parliament as a Conservative, was frequently re-elected, and became minister of customs and a member of the Privy Council in 1878.

Bowling Green, Warren co., Ky., on Barren River, 114 mi. s. of Louisville. Railroads: Louisville & Nashville, and Bowling Green & Memphis. Industries: two flouring mills, two iron foundries, five saw mills, two distilleries, and three planing mills. Surrounding country agricultural, some natural gas in vicinity. The town was first settled in 1797 and became a city in 1824. Pop. est. 1897, 12,000.

Bowls (Bowling), an ancient British game, still extremely popular. It is played on a smooth, level piece of greensward, generally about 40 yards long, and surrounded by a trench or ditch about 6 in. in depth. A • small, white ball called the jack is placed at one end of the green, and the object of the players, who range themselves in sides at the other, is so to roll their bowls that they may lie as near as possible to the jack. Each bowl is biased by being made slightly conical so as to take a curvilinear direction; and in making the proper allowance for this bias, and so regulating the cast of the ball, consist the skill and attraction of the game. The side which owns the greatest number of bowls next the jack, each bowl so placed constituting a point, carries off the victory.

**Bowsprit** (bū-'), the large boom or spar which projects over the stem of a vessel, having the foremast and fore-topmast stays and staysails attached to it, while extending beyond it is the jib boom.

**Box-elder**, the ash-leaved maple, a small but beautiful tree of the U. S., from which sugar is sometimes made.

**Boxing**, a manner of fighting with the fists. The art of boxing consists in showing skill in dealing blows with the fist against one's opponent, especially on the upper part of the body, while at the same time one protects one's self. In England professional boxers, who made a livelihood out of their skill in the art, were at one time common, especially during the reigns of the Georges, when persons of the highest rank were sometimes to be seen at pugilistic combats, and "professors" of the art frequently had members of the nobility among their pupils. Byron relates in his diary that he received instruction in boxing from the celebrated Jackson, who made a fortune as a pu-gilist. Boxing, has, however, now fallen in a great measure into disrepute, and prize fights are illegal in England, and both the principals and spectators may be proceeded against. At

### Boycotting

the gladiatorial shows of the Greeks and Romans boxing was common, but in a more dangerous form, the fist being armed with leather appliances loaded with iron or lead.

**Boxing the Compass,** in seaman's phrase, the repetition of all the points of the compass in their proper order—an accomplishment required to be attained by all sailors.

**Box-tortoise**, a name given to one or two North American tortoises that can completely shut themselves into their shell.

**Box-tree**, a shrubby evergreen tree, twelve or fifteen feet high, a native of England, Southern Europe, and parts of Asia, with small oval and opposite leaves, and greenish, inconspicuous flowers, male and female on the same tree. It was formerly so common in England as to have given its name to several places--Boxhill, in Surrey, for instance, and Boxley, in Kent. The wood is of a yellowish color, close grained, very bard and heavy, and admits of a beautiful polish. On these accounts it is much

Branch of the Common Box.

used by turners, wood carvers, engravers on wood (no wood surpassing it in this respect), and mathematical instrument makers. Flutes and other wind instruments are formed of it. The box of commerce comes mostly from the regions adjoining the Black Sea and Caspian, and is said to be diminishing in quantity. In gardens and shrubberies box trees may often be seen clipped into various formal shapes. There is also a dwarf variety reared as an edging for garden walks and the like.

Boyaca', in South America, one of the departments or provinces of Colombia. On the west side the country is traversed by a chain of the Andes, from which it slopes toward the east into immense plains or *Uanos*, mostly uncultivated, and watered by the tributaries of the Orinoco. Area 33,351 sq. mi.; pop. 609,874.

**Boy'cotting**, a name given to an organized system of social and commercial ostracism employed in Ireland in connection with the Land League and the land agitation of 1880 and 1881

and subsequently. Landlords, tenants, or other persons who are subjected to boycotting find it difficult or impossible to get any one to work for them, to supply them with the necessaries of life, or to associate with them in any way. It took its name from Captain James Boycott, a Mayo landlord, against whom it was first put in force. The practise has been legislatively declared illegal in many states of the Union.

Boy'dell, JOHN (1719-1804), an English engraver, but chiefly distinguished as an encourager of the fine arts. He engaged Reynolds, Opie, West, and other celebrated painters to illustrate Shakespeare's works, and from their pictures was produced a magnificent volume of plates, the Shakespeare Gallery.

**Boyden**, SETH (1758-1870), American inventor. He improved a machine for leather-splitting. In 1813 he and his brother established a leather-splitting business in Newark, N. J., and in 1819 made improved patent leather, which he sold until 1831. From 1831 until 1835 he engaged in producing malleable iron castings, and became interested in steam engines. He produced a variety of strawberries unequaled in size and flavor, and patented a hat-body doming machine.

**Boyer** (bwä-yā), ALEXIS (1757-1833), French surgeon. He had a brilliant career as a student, and was appointed first surgeon to Napoleon, receiving at the same time the title of Baron of the Empire.

**Boyer** (bwä-yā), JEAN PIERRE (1776-1850), president of the Republic of Hayti. It was largely by his efforts that in 1821 all parts of Hayti were brought under one republican government, of which he was chosen president. His administration in its earlier years was wise and energetic; but latterly financial difflculties and other causes made the Haytians dissatisfied with his rule, and a revolt drove him into exile in 1843.

**Boyesen,** HJALMAR HJORTH (1848–1896), Norwegian-American author: came to the U. S. in 1860. He was professor of languages at Urbana University, Ohio, from 1874 to 1880, then professor of German at Cornell, and filled a similar post at Columbia College, New York. He published *Gunnar* and other novels, *Idyls* of *Norway*, and many translations from the Scandinavian tongues.

**Boyle,** ROBERT (1620-1691), a celebrated natural philosopher, was the seventh son of Richard the first earl of Cork. He was one of the first members of the Royal Society. At Oxford, 1652, he occupied himself in making improvements on the air pump, by means of which he demonstrated the elasticity of air. Bovle was interred in Westminster Abbey.

**Boyle's Law,** otherwise called *Mariotte's Law*, a law in physics to the effect that the volume of a gas will vary inversely to the pressure to which it is subjected.

**Boyne**, a river of Ireland, which rises in the Bog of Allen, and after a course of sixty miles falls into the Irish Sea four miles from Drogheda. On its banks was fought the battle between the adherents of James II and William III in 1690, in which the latter proved victorlous, James being obliged to flee to the Continent. The anniversary of this victory (July 12) is still joyfully celebrated by Irish Protestants, and the playing of the "Orange" tune *Boyne Water*, is apt to excite the ire of Irish Catholics.

Bozzaris (bot-sä'ris), MARCO (1788–1823), a hero of the Greek war of independence against the Turks. After the fall of Suli he retired to the Ionian Islands, from whence he made a vain attempt to deliver his native country. In 1820, when the Turks were trying to reduce their overgrown vassal, Ali Pasha of Janina, to submission, the latter sought aid from the exiled Suliotes, and Marco Bozzaris returned to Epi-On the outbreak of the war of independrus. ence he at once joined the Greek cause, and distinguished himself as much by his patriotism and disinterestedness as by his military skill and personal bravery. In the summer of 1823, when he held the commander-in-chief of the Greek forces at Missolonghi, he made a daring night attack on the camp of the pasha of Scutari, near Karpenisi. The attack was successful; but the triumph of the Greeks was clouded by the fall of the heroic Bozzaris. His deeds are celebrated in the popular songs of Greece.

Brabançonne (brå-bån-son), the national song of the Belgians, written during the revolution of 1830 by Jenneval, an actor at the theater of Brussels, and set to music by Campenhout.

Brabant', the central district of the lowlands of Holland and Belgium, extending from the Waal to the sources of the Dyle, and from the Meuse and Limburg plains to the lower Scheldt. It is divided between the kingdoms of Holland and Belgium into three provinces: 1, Dutch, or North Brabant, area 1,977 sq. mi., pop. 480,996; 2, Belgian province of Antwerp, area 1,095 sq. mi., pop. 577,232; and 3, the Belgian province of South Brabant, area 1,276 sq. mi., pop. 985,274. In the north the inhabitants are Dutch; in the middle district, Flemings; in the south Walloons. Southward of Brussels the language is French; northward, Dutch and Flemish. In the fifth century Brabant came into possession of the Franks, and after being alternately included in and separated from Lorraine it emerges at length in 1190 as a duchy under a duke of Brabant. It eventually came by marriage into possession of the dukes of Burgundy, and passed with the last representative of that line, Mary of Burgundy, to the house of Austria, and finally to Philip II of Spain. In the famous revolt of the Netherlands, caused by the cruelties of King Philip and his agent, the Duke of Alva, North Brabant succeeded in asserting its independence, and in 1648 it was incorporated with the United Provinces. South Brabant remained. however, in possession of the Spaniards, and at the peace of Utrecht in 1714 passed again. along with the other southern provinces of the Netherlands, to the imperial house of Austria. Brabourne, Edward KNATCHBULL-HUGES-

sen, Lord (1829- ). English statesman; sat in

#### Braces

the House of Commons as a Liberal, 1857-1880. During this time he held several secretaryships and became a privy councillor. Mr. Gladstone gave him a peerage in 1880, and in 1885 he went over to the Conservatives. He is best known as the author of some delightful fairy stories.

**Braces,** in ships, ropes passing through blocks at the ends of the yards, used for swinging the latter round so as to meet the wind in any desired direction.

**Brachycephalic** (bra-ki-se-fal'ik), a term applied in ethnology to heads whose diameter from side to side is not much less than from front to back, as in the Mongolian type; opposed to *dolichocephalic*.

Bracken (Brake), a species of fern very common in Àmerica and Europe generally, and often covering large areas on hillsides and on un tilled grounds. It has a black creeping rhiwith < zome, branched pinnate fronds growing to the height often of several feet, and it

forms an ex- End of Branch, Common Brake.

cellent covert for game. The rhizome is bitter, but has been eaten in times of famine. The plant is astringent and anthelmintic; when burned it yields a good deal of alkali. The rhizome, a native of New Zealand, was formerly a staple article of food among the Maoris.

Bracket, a short piece or combination of pieces, generally more or less triangular in

Ornamental Brackets.

outline, and projecting from a wall or other surface. They may be either of an ornamental order, as when designed to support a statue, a bust, or such like, or plain forms of carpentry, such as support shelves, etc. Brackets may

# Braddock

also be used in connection with machinery, being attached to walls, beams, etc., to support a line of shafting.

**Brac' teates** (-&is), old coins of gold or silver. with irregular figures on them, stamped upon one surface only, so that the impression appears raised on one side, while the other appears hollow. *Bracteated* coins, coins of iron, copper, or brass, covered over with a thin plate of some richer metal, such as gold or silver.

**Bracton**, HENRY DE, one of the earliest writers on English law flourished in the thirteenth century. He studied law at Oxford, became a judge, and afterward chief-justice of England.

**Braddock,** Allegheny co., Pa., on the Monongahela River, 10 mi. s.e. of Pittsburg. Railroads: B. & O.; Pennsylvania; P. & L. E. Here are the Edgar Thomson Steel Works and other manufacturing concerns. Pop. est. 1897, 15,000.

Braddock, EDWARD (1695–1755), British soldier. He entered the Coldstream Guards. 1710, and was made lieutenant in 1716. After more than forty years of service he was made major general, March 29, 1754, and in September, commander of all British troops in America. He arrived at Hampton, Pa., Feb. 20, 1755. and debarked at Alexandria, where he met the Virginia levies for the expedition against the French at Fort Duquesne (near Pittsburgh, Pa.). By April 24, he had reached Frederick, Md., when he was forced to wait for wagons to transport his stores. He was joined there by Washington, whom he invited to be his aide-de-camp; and Benjamin Franklin, then postmaster-general of the colonies. He scorned the advice of Franklin regarding danger from the ambuscades of the Indians, saying: "These savages may, indeed, be a formidable enemy to raw American military, but upon the king's regular and disci-plined troops, sir, it is impossible that they should make an impression." He set out for Fort Cumberland, where all the forces were to assemble, and on June 7 they started by the path marked out by Washington two years earlier. Braddock's army consisted of 1,000 regulars, 30 sailors, 1,200 provincials, and a few friendly Indians, and on July 9 the advance division under Colonel Gates (afterward General Gates) was attacked by a band of French and Indians. Frightened by the warwhoop which they heard for the first time, the British fell back in confusion, and Braddock tried to rally them against their invisible foes. Familiar with Indian warfare, the Virginians separated, and sought shelter behind rocks and trees, but Braddock, dispensing with the "military instruction of a Virginia colonel" named George Washington, kept his men drawn up in platoons, and they fired at random into the forest, killing many of the Americans, and falling themselves with great rapidity. Braddock's personal bravery was conspicuous. Five horses were killed under him, and he was mortally wounded and borne from the field to die. The battle ended in a

rout, and of 1,460 men, including 89 commissioned officers, who had entered the field, 827 were killed or wounded. Of Braddock's aides Washington alone escaped, and he covered the retreat.

**Braddon,** MARY ELIZABETH (Mrs. John Maxwell) (1837-), a well-known novelist, born in London, and daughter of a solicitor there. After publishing some poems and tales, in 1862 she brought out Lady Audley's Secret, the first of a series of many clever sensational novels. She conducted the London magazine. Belgravia.

**Brad'ford**, an important manufacturing town in West Riding of Yorkshire, England. There is a large number of scientific, educational, and charitable institutions, among which may be mentioned the technical college, the free grammar school, endowed by Charles II, the fever hospital, built at a great cost, and the almshouses of the Tradesmen's Benevolent Society. There are several public parks, and an extensive system of waterworks which afford a supply of about 10 million gallons a day. Bradford is the chief seat in England of the spinning and weaving of worsted yarn and woolens. Pop. 216,361.

land of the spinning and weaving of worsted yarn and woolens. Pop. 216,361. **Bradford**, McKean co., Pa., 63 mi. s.e. of Dunkirk, N. Y. Railroads: Erie; W. N. Y. & P. Bradford is the center of the Northwestern Pa. oil fields. Industries: oil well supplies, tank factories, a refinery, railroad machine shops, saw and planing mills, nitroglycerine works, torpedo and sucker works, and a toothpick factory. Pop. est. 1897, 12,000.

pick factory. Pop. est. 1897, 12,000. **Brad'ford**, WILLIAM (1588-1657), a pilgrim father, the second governor of Plymouth Colony, b. at Austerfield, Yorkshire. He had a good patrimony, and is one of the few pilgrims who can be clearly shown to have had a gentle ancestry in England. B. went with the first colonists in the *Mayflower*, 1620, was the second governor of Plymouth Colony, New England. He wrote a history of the colony.

Bradlaugh (brad'la), CHARLES (1833-1891), English secularist, atheist, and advocate of republicanism. He is well known by his writings and lectures, and more especially by his efforts to gain admission to Parliament. Being elected for Northampton in 1880 he claimed the right to make affirmation simply instead of taking the oath which members of Parliament take before they can sit and vote, but being a professed atheist this right was denied him. Though he was repeatedly re-elected by the same constituency, the majority of the House of Commons continued to declare him disqualified for taking the oath or affirming; and it was only after the election of a new Parliament in 1885 that he was allowed to take his seat without opposition as a representative of Northampton. He was editor of the Nutional Reformer.

Brad ley, JAMES (1692-1762), English astronomer. He was appointed, in 1721, professor of astronomy at Oxford. Six years afterward he made known his discovery of the aberration of light, and his researches for many years were chiefly directed toward finding out methods for determining precisely that aberration. In 1741 Bradley was made astronomer-royal, and removed to Greenwich.

**Bradley**, JOSEPH P. (1813-1892), American jurist; graduated at Rutgers College in 1836, and was admitted to the bar in 1839. He practised as a railroad and insurance lawyer, and on March 21, 1870, was called to the supreme bench of the U. S. In early days he was a Whig in politics, became a Republican about 1856, and contested the sixth congressional district of New Jersey unsuccessfully in 1862. Justice Bradley was a member of the Hayes-Tilden electoral commission, where his expression in giving the decision to Hayes procured for him the nickname of "Aliunde Joe."

**Bradshaw**, JOHN (1586-1659), president of the High Court of Justice which tried and condemned Charles I. He studied law at Gray's Inn and attained a fair practise. When the king's trial was determined upon, Bradshaw was appointed president of the court; and his stern and unbending deportment at the trial did not disappoint expectation. Afterward he opposed Cromwell and the Protectorate, and was in consequence deprived of the chief-justiceship of Chester. On the death of Cromwell he became lord president of the council. At the restoration his body was exhumed and hung on a gibbet with those of Cromwell and Ireton.

**Bradstreet,** ANNE (1612-1672), the first American poet. She was a daughter of Gov. Thomas Dudley, and was married to Governor Bradstreet in 1628. Her complete works, prose and verse, have been published in Charlestown, Mass., 1868. In 1666 a fire destroyed her entire library. Her verses are founded on good English models, but lack originality, ease, and novelty.

Bradstreet, SIMON (1603-1697), early colonist. He was educated at Emmanuel College, Cambridge, and emigrated in 1630. He was chosen assistant judge of the court to be established in Massachusetts, and later was appointed secretary and agent of the colony, and commissioner of the United Colonies. He became one of the founders of Cambridge and of Andover, himself residing at Salem, Ipswich, and Boston. In 1653 he opposed the proposed making of war on the Hollanders of New York and the eastern tribe of Indians. In 1660 he went to England on the restoration of King Charles II, and acted as agent for the colony. From 1630 until 1679 he served as assistant, and from 1679 until 1686 he was governor of the colony. He was opposed to the severe measures of Governor Andros, after whose imprisonment he again became governor, and continued in office until 1692. When Sir William Phipps arrived with a new charter he became first councilor.

**Bra'dy**, NICOLAS (1659-1726). He was rector of the church of St. Catherine Cree, London, and latterly of Richmond, Surrey. He made a translation of the Æneid; but is only remembered now as the collaborateur of Nahum Tate in that version of the Psalms commonly used in the Episcopal Church. **Braga**, an ancient town in Northern Portugal, the seat of an archbishop who is primate of Portugal. There still exist remains of a Roman temple, amphitheater, and aqueduct. Pop. 20,258.

**Braganza** (or Bragan'ca), a town of Portugal, capital of the former province Trasosmontes, with a castle, the ancient seat of the dukes of Braganza from whom the present reigning family of Portugal are descended. Pop. 5,500.

**Braemar'**, a subdivision of the old district of Mar, in the s.w. of Aberdeenshire, Scotland, remarkable for the romantic grandeur of its scenery. It lies among the Grampian Mountains, and contains among other heights, Ben Macdhui (4,296 ft.), Cairntoul (4,245), Braeriach (4,225), Cairngorm (4,090), Ben-a-Buird (3,809), Ben Avon (3,826), and Lochnagar (3,786). B. is traversed by General Wade's great military road from Blairgowrie to Fort George. Pop. 482. Balmoral, the highland residence of the queen of England, lies toward the e., and in the heart of the parish is the village of Castleton, the great resort of tourists.

Bragg, BRAXTON. soldier (1817-1876), b. in North Carolina. He graduated at the U.S. military academy in 1837, appointed second lieutenant of the third artillery, and served against the Seminoles in Florida. In 1846, he was brevetted captain for gallant conduct in defending Fort Brown, Texas, and was made He served in the Mexican War and captain. fought at Monterey and Buena Vista. In 1856 he resigned from the army and engaged in planting in Louisiana. At the beginning of the Civil War he was appointed brigadier general in the Confederate army, and placed in command at Pensacola, Fla. In 1862, he became major general in command of the second division of the Confederate army. At the battle of Shiloh, April 6, 7, 1862, he commanded the entire Southern army. After the evacuation of Corinth he succeeded General Beauregard in command of the department. After the bat-tle of Perryville, October 8, he retreated to He was removed from his com-Tennessee. mand, and placed under arrest, but was restored to his division, and fought with Rosecrans at Stone River, at Murfreesboro, Dec. 31, 1862, and Jan. 2, 1863, and was defeated. He encountered Rosecrans again at Chickamauga. Sept. 19, 20, 1863, and was victorious. General Grant defeated him at Chattanooga, Nov. 23-25, 1863, and in December, General Bragg was relieved from command at his own request. He was called to Richmond to act as military adviser to Jefferson Davis, with whom he was a favorite. In 1864 he led a small force from North Carolina to Georgia to operate against General Sherman, but was unsuccessful. After the war he passed his life in retirement, but at one time he was chief engineer for the state of Alabama, and he superintended the improve-ments in Mobile Bay. His brother Thomas (1810-1872) was governor of North Carolina in 1854-58, U. S. senutor in 1859, and attorney general of the Confederacy 1861-63.

Bragg, EDWARD S. (1827), removed to Fond

du Lac, Wis., in 1849. practised law there, and in 1854 became district attorney. He was commissioned captain May 5, 1861, fought in the Army of the Potomac, and came out of the war a brigadier general. Bragg's "Iron Brigade" will be long remembered. General Bragg, who is as good a talker as he showed himself a fighter, was always a Democrat, and in 1877 served a term in the Wisconsin legislature. In 1876 he was sent to Congress, served by re-election until March, 1883, and was again elected in November, 1884.

Braham (brā'am), JOHN (1771-1856), a celebrated tenor singer of Jewish extraction. He appeared with great success on the leading stages of France. Italy, and the U. S., as well as in his own country. He excelled mainly in national songs, such as *The Bay of Biscay*, O, and *The Death of Nelson*, and continued to attract large audiences even when eighty years of age.

Brahe (brä'ä), TYCHO (1546–1601), Danish astronomer. He studied law at Copenhagen and Leipsic, but from 1565 gave himself up to astronomy, and in 1580 built an observatory on the island of Hveen in the sound, providing it with the best implements then procurable. Here he excogitated the planetary system associated with his name, the earth, by his theory, being regarded as the center of the heavenly bodies. He is chiefly remarkable for his services to practical astronomy, his observations being superior in accuracy to those of his predecessors.

**Brah** ma, a Sanskrit word signifying (in its neuter form) the Universal Power or ground of all existence, and also (in its masculine form with long final syllable) a particular god, the first person in the Triad (Bramā, Vishnu, and Siva) of the Hindus. The personal god Brahmā is represented as a red or goldencolored figure with four heads and as many arms, and he is often accompanied by the swan or goose. He is the god of the Fates, master of life and death, yet he is himself created, and is merely the agent of Brahmā, the Universal Power. His moral character is no better than that of the Grecian Zeus.

Brah' manism, a religious and social system prevalent among the Hindus, and so-called because developed and expounded by the sacerdotal caste known as the Brahmans. It is founded on the ancient religious writings known as the Vedas and regarded as sacred revelations, of which the Brahmans as a body became custodians and interpreters, being also the officiating priests and the general directors of sacrifices and religious rites. As the priestly caste increased in numbers and power they went on elaborating the ceremonies, and added to the Vedas other writings tending to confirm the excessive pretensions of this now predominant caste, and give them the sanction of a revelation. In time the caste of Brahmans came to be accepted as a divine institution, and an elaborate system of rules defining and enforcing by the severest penalties its place, as well as that of the inferior castes, was promulgated. Other early castes

were the Kshattriyas or warriors, and the Vaisyas or cultivators, and it was not without a struggle that the former recognized the superiority of the Brahmans. It was by the Brahmans that the Sanskrit literature was developed; and they were not only the priests, theologians, and philosophers, but also the poets, men of science, lawgivers, administrators, and statesmen of the Aryans of India.

The sanctity and inviolability of a Brahman are maintained by severe penalties. The murder of one of the order, robbing him, etc., are inexpiable sins; even the killing of his cow can only be explated by a painful penance. A Brahman should pass through four states: First, as Brahmachari, or novice, he begins the study of the sacred Vedas, and is initiated into the privileges and the duties of his caste. He has a right to alms, to exemption from taxes, and from capital and even corporal punishment. Flesh and eggs he is not allowed to eat. Leather, skins of animals, and most animals themselves are impure, and not to be touched by him. When manhood comes he ought to marry, and as Grihastha enter the second state, which requires more numerous and minute observances. When he has begotten a son and trained him up for the holy calling he ought to enter the third state, and as Vanaprastha, or inhabitant of the forest, retire from the world for solitary praying and meditation, with severe penances to purify the spirit; but this and the fourth or last state of a Sannyasi, requiring a cruel degree of asceticism, are now seldom reached, and the whole scheme is to be regarded as representing rather the Brahmanical ideal of life than the actual facts.

The worship represented in the oldest Vedic literature is that of natural objects: the sky, personified in the god Indra; the dawn, in Ushas; the various attributes of the sun, in Vishnu, Surya, Agni, etc. These gods were invoked for assistance in the common affairs of life, and were propitiated by offerings which, at first few and simple, afterward became more complicated and included animal sacrifices. In the later Vedic hymns a philosophical conception of religion and the problems of being and creation appears struggling into existence; and this tendency is systematically developed by the supplements and commentaries known as the Brahmanas and the Upanishads. In some of the Upanishads the deities of the old Vedic creed are treated as symbolical. Brahma, the supreme soul, is the only reality, the world is regarded as an emanation from him, and the highest good of the soul is to become united with the divine. The necessity for the purification of the soul in order to its reunion with the divine nature gave rise to the doctrine of metempsychosis or transmigration.

This philosophical development of Brahmanism gave rise to a distinct separation between the educated and the vulgar creeds. While from the fifth to the first century B.c. the higher thinkers among the Brahmans were developing a philosophy which recognized that there was but one god, the popular creed had concentrated its ideas of worship round three

great deities-Brahmä, Vishnu, and Siva, who now took the place of the confused old Vedic Pantheon. Brahmä, the creator, though considered the most exalted of the three, was too abstract an idea to become a popular god, and soon sank almost out of notice. Thus the Brahmans became divided between Vishnu, the preserver, and Siva, the destroyer and re-producer, and the worshipers of these two deities now form the two great religious sects of India. Siva, in his philosophical significance, is the deity mostly worshiped by the conventional Brahman, while in his aspect of the destroyer, or in one of his female manifestations, he is the god of the low castes, and often worshiped with degrading rites. But the highly cultivated Brahman is still a pure theist, and the educated Hindu in general professes to regard the special deity he chooses for worship as merely a form under which the One First Cause may be approached.

The system of caste originally, no doubt, represented distinctions of race. The early classification of the people was that of "twiceborn" Aryans (priests, warriors, husbandmen) and once-born non-Aryans (serfs); but intermarriages, giving rise to a mixed progeny, and the variety of employments in modern times, have profoundly modified this simple classification. Innumerable minor distinctions have grown up, so that among the Brahmans alone there are several hundred castes who cannot intermarry or eat food cooked by each other.

The Brahmans represent the highest culture of India, and as the result of centuries of education and self-restraint have evolved a type of man distinctly superior to the castes around them. They have still great influence, and occupy the highest places at the courts of princes. Many, however, are driven by need or other motives into trades and employments inconsistent with the original character of their caste.

Brahmaputra, a great river of India. Rises in Thibet, flows through Assam and Bengal and falls into the Bay of Bengal. It is navigable for about 800 mi. from the sea, its total length being, perhaps, 1,800 mi.

Brahmo-Somaj or the Theistic Church of India, was founded in 1830 by an enlightened Brahman, who sought to purify his religion from impurities and idolatries. This church, while accepting what religious truth the Vedas may contain, rejects the idea of their special infallibility, and founds its faith on principles of reason. The members do not in principle recognize the distinction of caste, and have made great efforts to weaken this as well as other prejudices among their countrymen.

Brahms, JOHANNES, (1833-1897). a great German composer, introduced to the world by Schumann and a bitter opponent of Wagner and the Wagnerian school of music.

**Braila**, a town in Roumania, formerly a fortress on the Danube. The export of grain and the sturgeon fisheries are among the principal industries in Braīla. Pop. about 32,000.

Brain, the center of the nervous system, and

the seat of consciousness and volition in man and the higher animals. See Anatomy.

**Brainerd**, Crow Wing co., Minn. on the Mississippi River, 115 mi. w.s.w. of Duluth. Railroad: Northern Pacific. Brainerd is a trade center and has railroad shops and a saw-mill. Pop. est. 1897, 6,500.

Brake, a contrivance for retarding or arresting motion by means of friction. In machinery it generally consists of a simple or compound lever, that may be pressed forcibly upon the periphery of a wheel, fixed upon a shaft or axis. A similar contrivance is attached to road and railway carriages, but continuous brakes applied to every pair of wheels in a railway train, and operated by air either by the compression or vacuum method, are now generally used on railways. By the first method, of which the Westinghouse brake is an example, the air is compressed by a pump on the locomotive and conveyed by pipes and tubes to cylinders which are under each car, and the pistons of which act on the brake-levers. In the *racuum* method, exemplified in the Lough-ridge brake, the air is exhausted from the device beneath the car, and the pressure of the atmosphere operates the brake-levers.

**Bram'ah**, JOSEPH (1749-1814), the inventor of the Bramah lock, the Bramah press, etc. He set up business in London as manufacturer of various small articles in metal-work, and distinguished himself by a long series of inventions, such as improvements in paper making, fire engines, printing machines, etc. He is especially known for an ingeniously constructed lock and for the hydraulic press (which see).

**Bramante** (brå-mån'tā), FRANCESCO LAZZARI (1444-1514), a great Italian architect. He was patronized by the popes, and his first great work at Rome was the union of the straggling buildings of the Vatican with the Belvedere gardens, so as to form one fine whole. But his greatest work was the part he had in the building of the new church of St. Peter at Rome, of which he was the first architect.

**Bram'ble**, the name commonly applied to the bush with trailing prickly stems which

Branch of Common Bramble. a.-Flower; b.-Fruit.

bears the well-known berries usually called in Scotland brambles, and in England black-

berries. It is similar to the raspberry, and belongs to the same genus, natural order Rosaceæ. It is rarely cultivated, but as a wild plantit grows in great abundance. The flowers do not appear till late in the summer, and the fruit, which is deep purple or almost black in color, does not ripen till autumn.

**Bran**, the husky part of wheat separated by the bolter from the flour. Its components are: water, 13; gluten, 19.5; fatty matter, 5; husk with starch, 55; and ashes, 7.5; but the results of different analyses vary considerably. It is employed in feeding cattle, and has also been found useful as a manure.

**Bran denburg**, a province of Prussia. The province produces much grain, as well as fruits, hemp, flax, tobacco, etc., and supports many sheep. The forests are very extensive. Berlin is locally in Brandenburg. Area 15,400 sq. mi.; pop. 4,120,577, including the city of Berlin. The Old Mark of Brandenburg was bestowed by the emperor Charles IV on Frederick of Hohenzollern, and is the center round which the present extensive kingdom of Prussia has grown up. The town Brandenburg is on the Havel 35 mi. w.s.w. of Berlin, and has considerable manufactures, including silk, woolens, leather, etc. Pop. 33,129.

Brandy, the liquor obtained by the distillation of wine, or of the refuse of the winepress. It is colorless at first, but usually derives a brownish color from the casks in which it is kept, or from coloring matter added to it. The best brandy is made in France, particularly in the Cognac district in the department of Charente. Much of the so-called brandy sold in Britain and America is made there from more or less coarse whisky, flavored and colored to resemble the real article; and France itself also exports quantities of this stuff. Brandy is often used medicinally as a stimulant, stomachic, and restorative, or in mild diarrhœa. In America various distilled liquors get the name of brandy, as cider brandy, peach brandy.

Brandywine Creek, a small river which rises in the state of Pennsylvania, passes into the state of Delaware, and joins Christiana Creek near Wilmington. It gives its name to a battle fought near it Sept. 11, 1777, between the British and Americans, in which the latter were defeated.

**Brank** (or Branks), an instrument formerly in use in Scotland, and to some extent also in England, as a punishment for scolds. It consisted of an iron frame which went over the head of the offender, and had in front an iron plate which was inserted in the mouth, where it was fixed above the tongue, and kept it perfectly quiet.

perfectly quiet. Brant, JOSEPH (1742-1807), Indian chief, b. in Ohio. At the age of thirteen he accompanied his two elder brothers, who participated in Sir William Johnson's campaign against the French at Lake George. He was sent to the Rev. Eleazar Wheelock's Indian school at Lebauon, Conn., became interpreter to a missionary in 1772, and was frequently employed by Sir William Johnson as au agent

among various tribes. During the Revolution the Mohawks adhered to the British, and Brant went to England. In 1776 he returned to Canada, and received a commission in the British army, in which he attained the rank of colonel, but was always known as captain. He participated in the battle of Oriskany, Aug. 6, 1777, one of the bloodiest engagements of the war, and led the Indians in many raids on the borders of New York. He was not present at the massacre of Wyoming. Brant laid waste the Mohawk Valley with 300 Indians and Tories. After the war the Six Nations found that they had no mention in the treaty, and Brant asked for a tract of land on the north shore of Lake Erie, which was granted. Here he labored for the improvement of his people, and tried to form a confed-eracy of tribes in Western Canada, but failed. He visited England again in 1785, raised funds to build a church, and received compensation to repair the losses his nation had incurred in sustaining the English. He held that his people had a right to the territory n.w. of the Ohio. He was present at the defeat of Gen. Arthur St. Clair on the Miami River in 1791. Later he visited the U.S. His youngest son. John, became a chief, and took part in the War of 1812.

**Brant' ford,** a flourishing town of Canada, prov. Ontario, on the Grand River (which is navigable) 24 mi. w.s.w. of Hamilton; it has railway machine shops, foundries, and an active trade. Pop. 12,753.

Brass is an alloy of copper and zinc, of a bright yellow color, and hard, ductile, and malleable. The best brass consists of two parts by weight of copper to one of zinc; but any degree of variation may be obtained by altering the proportions; thus by increasing the quantity of zinc we may form tombac and pinchbeck, and with nearly a seventh more of zinc than copper the compound becomes brittle and of a silver-white color. By increasing the copper, on the other hand, the compound increases in strength and tenacity. Brass which is to be turned or filed is made workable by mixing about 2 per cent. of lead in the alloy, which has the effect of hardening the brass and preventing the tool being clogged. For engraving purposes a little tin is usually mixed with the brass. Brass is used for a great variety of purposes, both useful and ornamental. The working of brass requires considerable skill. First the brass is roughly cast in the foundry. It is brought thence to the finishing bench, where an alloy of copper and tin is cast in molding-sand. The brass molders work at troughs in which is kept the molding-sand which is so cohesive that it may be formed as desired. The flask in which the sand is packed around the pattern is made of two frames. one fitting over the other. One frame has little legs of wood called dowels, and the other has holes in which these dowels fit, so that when these frames are brought together one will remain over the other. The frames are made of four pieces of wood fitted up with hinge-like corner-pieces so that the frame can be un-

locked and taken away from the sand without disturbing it. The molder fills one of the frames with sand. In the center and on top of the sand he lays the pattern and presses it into the sand and then fits the other frame over it. He shakes some fine sand over the pattern and fills the upper frame with molding-sand which he rams down hard. He then scrapes the surplus sand from the top frame with a stick and runs a pointed wire into the sand toward the pattern, thus providing escapes for the gases which form when the molten metal is poured in. He then turns over both frames and carefully lifts the bottom frame exposing the pattern imbedded in the same. The pattern is withdrawn by driving a steel pin into the wood or by means of a screw pin made for the purpose. If the casting is to be hollow the cores are now put in place. A core is made of sand and paste and rammed into molds and afterward baked in a large oven. When the cores are laid in place in the hollow space left by the pattern the channels are scooped out, the frames placed together, and the woodwork taken off and the short board with a block of sand on it, is laid on the floor. False core work is required for some purposes. A false core is a part of the mold built up separate from the mold proper, and, as it is in small pieces it can be taken out without removing the pattern. Thus a bust can be buried in the sand, but its rounded irregular form, ifs deep cut and incurving impressions, make it impossible to withdraw it from the sand without bringing part of the mold with it. This is avoided by making a mold out of sand packed so tight and hammered so close into the different parts of the pattern that each part can be taken away. and when the pattern is removed can be properly put together again to form the mold. The brass is melted in crucibles which are lifted out of the furnace, carried to the molds and emptied into the gate, thus filling the hollow in the sand. The castings which are to be polished are cleaned in water and acids and then buffed or burnished. Sometimes they are finished by being dipped into solutions of nitric acid and water. If a dead finish is desired the acid solution is much weaker than if a bright finish is wanted. In burnishing, the brass is brought to a high finish by being rubbed with polished steel tools, or it is held against buffing wheels which are made of cotton. A red polish mixture is put on the wheel and the high speed polishes the brass. This wheel however, can be used only on smooth and regular surfaces. The brilliancy and polish of brass may be preserved by lacquer, which is put on and dried in an oven. Brass is spun, stamped, pressed, and drawn in the same manner as copper, gold, or silver.

**Brasses** (Sepulchral or Monumental), large plates of brass inlaid in polished slabs of stone, and usually exhibiting the figure of the person intended to be commemorated, either in a carved outline on the plate or in the form of the plate itself. In place of the figure we sometimes find an ornamented cross. The earliest example of these monumental slabs now existing in England is that on the tomb of Sir John D'Abernon (d. 1277) at Stoke D'Abernon in Surrey. These brasses are of great value in giving an exact picture of the costume of the time to which they belong.

**Brassey,** THOMAS (1805-1870), an English railway contractor. His operations were on an immense scale, and extended to most of the European countries, as well as to America, India, and Australia, one of his greatest works being the Grand Trunk Railway of Canada, with the great bridge over the St. Lawrence at Montreal. His son, Thomas, b. 1836, now Lord Brassey, was civil lord of the admiralty in 1880-84. His wife wrote Voyage of the Sunbeam and other works descriptive of yachting cruises and travels. She d. in 1888.

Brattleboro, Windham co., Vt., is one of the richest towns in the state; site of the state insane asylum; has 2 banks, several churches and factories, 4 papers. Pop. 6,900. Brazil, a country of South America, and the

**Brazil**, a country of South America, and the third largest political division of the Western Continent, having a length of 2,660 mi., and a breadth of 2,705 mi. between extreme points. Its coast line extends from Cape Orange on the north to Rio Chuy on the south, a distance of nearly 4,000 mi. It borders on every state in South America except Chile, but the boundary lines with some of them are still in dispute. The area of Brazil is about 3,219,000 sq. mi., or nearly one half of the South American continent.

Physical Features .- Brazil is a triangularshaped country, occupying the eastern angle of the continent. It lies almost wholly within the tropics, and is still in great part unexplored and unsettled. On the north and west are the great depressions of the Amazon and Paraguay rivers, which comprise large areas of floodplains and swamps, heavily wooded, and al-most uninhabitable. The upper coast is bordered by low, alluvial bottom-lands and sandy plains, full of lakes, and in places very sterile; while the southern angle of the country is rolling campo land, bordered by a low sandy coast. Above its eastern angle a large area of coastlands and neighboring plateau is subject to periodical devastating droughts. The interior of the country, however, is a high plateau, with a general elevation of 1,000 to 3,000 feet, irregularly ridged by mountains and deeply cut by large rivers. The mountainous ranges of the maritime system form the eastern margin of this plateau, the easternmost of which is known as the Serra do Mar. This range plays an important part in the development of Brazil, for it is a costly barrier to communication with the interior, and turns nearly all the great rivers inland to find outlets through the distant Amazon and La Plata. To the west of the maritime system the elevated table-lands of the Paraná and San Francisco make great bay-like indentations in the northern and southern margins of the mountainous area, nearly uniting about the headwaters of the latter. To the westward of these plains there is a second range, nearly parallel with the maritime system, constituting the mountains

of Goyaz. To the westward of these come the great elevated plains of the Amazonian and Upper Paraguayan regions. The mountains are composed almost exclusively of uplifted strata of great geological age, gneiss and metamorphic schists, with granite and other eruptive rocks. The great elevated plains are composed of horizontal strata dating from the Silurian Age, so profoundly modified by the deep excavations of the valleys that this part of the country is generally, but erroneously, represented as mountainous. Brazil possesses Plata, and San Francisco. The Amazon, La its tributaries drain fully a half of the country. To the east of the Madeira these tributaries are table-land rivers, broken by rapids and freely navigable for comparatively short dis-West of the Madeira they are lowland tançes. rivers, sluggish, bordered by extensive floodplains, and afford free navigation for long dis-The La Plata system drains nearly tances. one fifth of the country through its three branches—the Paraguay, Parana, and Uruguay. The first of these is a lowland river, freely navigable for a long distance, while the other two are table-land rivers, full of obstructions, and without free outlets for their upperlevel navigation. The San Francisco is a table-land river, flowing northeast between the Goyaz and maritime mountains, and then, breaking through the latter, southeast to the Atlantic. Its tributaries are comparatively short, and nearly disappear along the lower river in the region of slight rainfall. It is not freely navigable because of the Paulo Affonso short, the longest being the Parahyba, and have but little utility for navigation. The climate of Brazil varies greatly—the lowlands of the Amazon and a great part of the coast being hot, humid, and unhealthy, while the tablelands and some districts of the coast swept by the tradewinds are temperate and healthy.

The vegetation of Brazil is luxuriant and varied. The vast forests of the Amazon contain hundreds of species of trees, draped and festooned by climbing plants, lianas, orchids, etc. Rosewood, Brazilwood, and others supply valuable timber; tropical fruits are abundant, and other products are noted in the section on commerce. The number of species of animals is also very large, but the individuals in each are comparatively few. Beasts of prey are the jaguar, puma, tiger-cat, and ocelot; the other animals include the monkey, tapir, capybara. peccary, ant-eater, sloth, and boa-constrictor. Alligators, turtles, porpoises, and manatees swarm in the Amazon; and among birds, the parrots and humming-birds are especially numerous.

*Population.*—The population of Brazil is about 13,540,000. The proportion of non-producers is very large, the natural conditions of the country rendering labor but slightly necessary to meet the ordinary requirements of life. The institution of slavery has had much to do with this state of things, by degrading manual labor,

Digitized by Google

. . . . .

and making idleness respectable. The African slave trade was prohibited in 1831, but did not actually cease until 1854. In 1871 a gradual emancipation law was adopted, which declared the children b. thereafter of slave mothers to be free, but obliged to serve the mother's master until the age of twenty-one years. It also provided for a fund with which to liberate slaves by purchase. The number of slaves registered in 1873 under this law was 1,540,796. Through the operations of the fund 30,014 slaves had been ransomed up to the beginning of 1887. The number of slaves voluntarily liberated and ransomed through private efforts was very large, and two provinces (Ceará and Amazonas) had been declared entirely free. In 1885 a second law was adopted, providing for a new registry, declaring all sexagenarians free, but with obligatory service until the age of sixty-five years, and fixing an official valuation on all slaves, to prevent further abuses of the emancipation fund. The official returns of the registry under this law (closed March 31, 1887), gave 723,419: the number of sexa-genarians liberated was about 100,000, and the number enrolled for obligatory service under the law was 18,946. Finally, by the law of May 13, 1888, immediate and unconditional emancipation was decreed, although Brazil had been unable wholly to replace the system of slave labor. Immigrant labor was still limited, the poorer rural population was both untrained and opposed to habits of industry, and the labor of freed slaves had hitherto been utilized only to a limited extent. Recent events, however, have proved that kind treat-ment and good pay will keep a very large percentage of the freedmen on the plantations.

The Roman Catholic is the established religion and is supported by the state: but all other sects are tolerated. There are, however, less than 30,000 non-Catholics in the country. Education is compulsory in several provinces, but is still in a very backward condition. The language is Portuguese, with different dialects. *Political Divisions.*—The government of Bra-

Political Divisions.—The government of Brazil, or the United States of Brazil, comprises twenty states and a federal district. These states are Alagoas, Amaxonas, Bahia, Ceara', Esprito Santo, Goyaz, Maranhao, Matto Grosso, Minas Geraes, Para, Parahyba, Parana, Pernambuco, Piauby, Rio de Janeiro (city), Rio de Janeiro, Rio Grande do Norte, Rio Grande do Sul, Sao Paulo, Santa Catharina, and Sergipe. Each state has a local republican government with governor and legislature elected by the people. The executive and legislative officers of the general government consist of a president and a vice-president chosen by electors, a chamber of deputies, elected by the people, and a senate elected by the legislatures of the states. Each state is entitled to three senators and one member of the chamber of deputies for each 70,000 population. The army of Brazil consists in time of peace of 13,500 men, and the navy of 43 vessels with about 6,000 officers and men.

Commerce.—Agriculture, mining, and forest products are the principal industries of Brazil.

.

Manufacturing is as yet little developed. The coast fisheries have been neglected, although Brazil is a large consumer of cod fish. Forest products are rubber, mate, nuts, cocoa, medicinal plants, cabinet and dye woods. Coffee is the greatest of the agricultural products, and furnishes about two thirds of the total exports of the nation. Sugar ranks second in importance as an export, and the production of cotton and tobacco has decreased, and that of tapioca has nearly disappeared. Rice, maize, and other products are grown to a limited extent. Gold and diamonds are found in some of the states, but the annual production at present is not large. There are a few iron mines producing ore of superior quality, but the absence of coal is a serious obstacle to the development of this industry. The inhabit-The inhabitants of the southern states of the republic are much more industrious and energetic than those who live in the northern states. Several German colonies are located in the southern states. Brazil is now in steamship and telegraphic communication with all the world. The first railway was opened in 1854, and there are now about 8,000 miles completed and in process of construction. The roads have been constructed for the most part directly or indirectly by government aid. There are about 10,000 miles of telegraph lines in the country.

History.—Brazil was first discovered in 1500, by Pinzon, who landed at Cape St. Augustine and then followed the coast north to the mouth of the Orinoco. In the same year a Portuguese expedition to the East Indies, under Pedro Alvarez Cabral, discovered the Brazilian coast near Porto Seguro. Cabral took formal possession, and named his new discovery "Terra da Vera Cruz." Two Portuguese expeditions were sent out in 1501 and 1503, exploring the coast and planting a colony, and bringing back a rich cargo of brazilwood.

In 1530 the Portuguese government resolved upon the definite settlement of Brazil, and the plan adopted was its division into hereditary captaincies, which should be granted to private individuals, with ample powers for the founding of colonies on their own account. Many of the earliest colonies failed through lack of means, and from inability to hold their ground against the natives. In 1567 a Huguenot colony, established on the bay of Rio de Janeiro 12 years before, was overthrown by the Portuguese, who then founded the present capital of Brazil. Portugal and her colonies having become dependencies of Spain, a squadron sent out by the Dutch in 1623 to seize Brazil captured the colonial capital, Ba-The Dutch lost the city in 1625, but in hia. 1630 they captured Pernambuco, which, with several neighboring places, they held for over 20 years. In 1640 Portugal regained her independence, and in 1654 her former possessions, but without any definite settlement of her boundary disputes with Spain. To strengthen her claim to the territory on the eastern shore of the La Plata, the town of Colonia, opposite Buenos Ayres, was founded in 1679; this was the beginning of a bitter struggle for the

present republic of Uruguay, lasting nearly 150 years, until the independence of that territory was formally recognized in 1827 by Dom Pedro I. The discovery of gold in Minas Geraes in 1693, and of diamonds in 1729, gave a new impetus to the growth of the country, one result of which was the removal of the colonial capital from Bahia to Rio de Janeiro. The cultivation of cotton, tobacco, and sugar cane had already attained great prominence and prosperity in the northern captaincies. The colonial system of Portugal, however, was one of selfish exclusion and greedy exlortion. The colony was rigidly closed to foreigners, industry was burdened by restrictions and monopolies, the taxes were farmed out, the authorities were arbitrary and grasping, the administration of justice was slow and corrupt, printing was forbidden, the people were grossly ignorant, turbulent, and immoral, and internal communication was slow and difficult. In 1808 the royal family of Portugal was expelled by the French and took refuge in Brazil, and the very first act of Dom João VI was to open Brazilian ports to foreign commerce. He then removed various restrictions on domestic industries, founded a printing office and library, created new courts, and opened various schools and public institu-tions. All these acts greatly stimulated the tions. growth of the country. In 1821 he returned to Portugal, leaving his eldest son in Brazil as prince regent. Personal ambition, and the advice of men opposed to government from Lisbon, led the young prince to declare for Brazilian independence, Sept. 7, 1822. He was proclaimed and crowned emperor-as Dom Pedro I-before the end of the year, the small Portuguese force in the country being quickly and easily expelled. The constitution was ratified and sworn to early in 1825, and some amendments were added in 1835. The new empire, however, did not start smoothly, nor was the reign of Dom Pedro I a fortunate one. Vexed with the opposition encountered, he in 1831 voluntarily abdicated in favor of his eldest son, and withdrew to Portugal. During the next nine years Brazil was governed by regencies, but in 1840 a popular agitation led to the declaration of the young prince's majority, at 15 years of age, and to his coronation the following year as Dom Pedro II. The reign of this sovereign was one of almost unbroken peace (save for one or two insignificant revolutionary outbreaks and disputes with neighboring states) until Nov. 15, 1889, when he was dethroned, he and his family exiled, and Brazil declared a republic, under the title of the United States of Brazil.

**Brazil**, Clay co., Ind., 16 mi. e.n.e. of Terre Haute. Railroads: Vandalia; C. & E. I. In the Indiana block coal district. Has numerous collieries and extensive iron blast furnaces. Also manufactures of boilers, chairs, terra cotta, etc. Pop. est. 1897, 7,000.

**Brazilwood,** a kind of wood yielding a red dye obtained from several trees native of the West Indies and Central and South America. The wood is hard and heavy, and as it takes on a fine polish it is used by cabinet-makers for various purposes, but its principal use is in dyeing red. The dye is obtained by reducing the wood to powder and boiling it in water, when the water receives the red coloring principle, which is a crystallizable substance called *brazilin*. The color is not permanent unless fixed by suitable mordants.

**Brazos** (brä'zōs), a large river of Texas, rising in the w. part of the state and flowing into the Gulf of Mexico after a course of 900 mi., 40 mi. w.s.w. Galveston. During the rainy season, from February to May inclusive, it is navigable by steamboats for about 300 miles.

**Brazza** (bråt'så), an island in the Adriatic, part of Dalmatia, 24 mi. long and from 5 to 7 broad, mountainous and well wooded. It produces good wines and oil, almonds, silk, etc. Pop. about 20,000.

Bread is the flour or meal of grain kneaded with water into a tough and consistent paste and baked. There are numerous kinds of bread, according to materials and methods of preparation; but all may be divided into two classes: fermented, learened, or raised, and unfermented, unlearened, not raised. The latter is the simplest, and no doubt was the original kind. and is still exemplified by biscuits, the oat cakes of Scotland, the corn bread of America, the dampers of the Australian colonies, and the still ruder bread of savage races. It was probably by accident that the method of bringing the paste into a state of fermentation was found out, by which its toughness is almost entirely destroyed, and it becomes porous, palatable, and digestible. All the cereals are used in making bread, each zone using those which are native to it. Thus maize, millet, and rice are used for the purpose in the hotter countries, rye, barley, and oats in the colder, and wheat in the intermediate or more temperate regions. In the most advanced countries bread is made from wheat, which makes the lightest and most spongy bread. The fermentation necessary for ordinary loaf-bread is generally produced by means of leaven or yeast. Most bakers use the compressed yeast, which is dissolved in scalding water and poured into the "mixer." Enough flour is added to make a thin paste. This is left two or three hours to ferment and then the sponge is ready to be made into dough. Salt is put in the sponge, then milk, lard, and sugar, and finally enough flour to make a good stiff dough. The mixer is a semicylindrical trough about four feet long, in which is a shaft with iron arms running spirally around it, and this becomes a kneading machine, when the dough is made up and the sponger shifts the belt to the tight pulley. The iron arms revolve in the trough, working the dough over and over. The dough is sliced from the arms of the machine as it drags through the mass, thus allowing it to work every particle of dough. From this trough the dough is put into deep wooden troughs, where it is kept covered up for two or three hours. During this time it is carefully watched, and now and then it is "beaten down" by two men, who pass their arms into

### Breadfruit

the dough. The dough is then taken from the trough and thrown on to a bench. One of the benchmen cuts off a batch of dough weighing about fifteen pounds, which is placed in a dividing machine, which forces a number of cutting edges up through the dough, dividing it into twelve equal parts. These are torn apart and tossed on to a bench, where they are quickly kneaded and molded into round loaves. The balls of dough are placed in wooden boxes about 5 ft. long, 3 ft. wide, with sides 4 in. high. A dozen loaves are put in each box, so separated that when they swell up they will not touch each other. These boxes filled are piled up one on the other, and after remaining thus for some time the dough is taken out and worked again, after which the dough is nicely molded into loaves and placed in pans 9 in. long, 41 in. high, and 41 in. wide. In a short time they are placed in the oven. An ordinary baker's oven is about 16 ft. in diameter, and is circular in shape. The bottom of the oven is made of soapstone, and revolves over the fire. The pans containing the dough are placed in the oven by means of a large wooden paddle. The oven will hold about 350 loaves. and requires about a half hour for baking. As soon as the loaves are brought from the oven they are removed from the pans and taken to a cool, dry room, whence they go to the wagons for delivery. Vienna bread is made by a process which differs from the above in some respects. Instead of putting the dough into boxes it is rolled up into long, slim pieces, and each piece is wrapped up in canvas bagging and laid away until ready for the oven. Then the canvas is removed and the loaves are laid directly on the bottom of the oven, and not in pans. Before the loaves are placed in the oven each loaf is washed with a cornstarch preparation. Three slices are made along the top of the loaf with a keen razor. When the loaves are laid on the soapstone the oven is charged with steam, and this, with the cornstarch preparation, gives Vienna bread that peculiar crisp crust. About 250 loaves of bread are made from a barrel of flour, and the average loaf is supposed to weigh about a pound. Aërated bread is so called because made with aërated water, that is, water strongly impregnated with carbonic acid under pressure, the dough being also worked up under pressure and caused to expand by the carbonic acid when the pressure is removed.

Brown or whole-flour bread is considered to be very wholesome. It is made from undressed wheat, and consequently contains the bran as well as the flour.

**Breadfruit**, a large globular fruit of a palegreen color, about the size of a child's head, marked on the surface with irregular six-sided depressions, and containing a white and somewhat fibrous pulp, which when ripe becomes juicy and yellow. The tree that produces it belongs to the order Artocarpaceæ (nearly allied to the Urticaceæ or nettle tribe), and grows wild in Otaheite and other islands of the South Seas, whence it was introduced into the West Indies and S. A. It is about 40 ft. high

# Breakwater

with large and spreading branches, and has large, bright, green leaves deeply divided into seven or nine spear-shaped lobes. The fruit is generally eaten immediately after being gathered, but is also often prepared so as to keep for some time either by baking it whole in close underground pits or by heating it into paste and storing it underground, when a

Breadfruit.

slight fermentation takes place. The eatable part lies between the skin and the core, and is somewhat of the consistence of new bread. Mixed with cocoanut milk it makes an excellent pudding. The inner bark of the tree is made into a kind of cloth. The wood is used for the building of boats and for furniture. The jack much used in India and Ceylon is another member of this genus.

**Bread-nuts**, the seeds of the *Brosimum ali*castrum, a tree of the same order as the breadfruit (which see). The bread-nut tree is anative of Jamaica. Its wood, which resembles mahogany, is useful to cabinetmakers, and its nuts make a pleasant food, in taste not unlike hazelnuts.

Break' water, a work constructed in front of a harbor to serve as a protection against the violence of the waves. The name may also be given to any structure which is erected in the sea with the object of breaking the force of the waves without, and producing a calm within. Breakwaters are usually constructed by sinking loads of unwrought stone along the line where they are to be laid, and allowing them to find their angle of repose under the action of the waves. When the mass rises to the surface, or near it, it is surmounted with a pile of masonry, sloped outwards in such a manner as will best enable it to resist the action of the waves. The great breakwaters are those of Cherbourg in France, Plymouth in England, and Delaware Bay in the U.S. In less im-portant localities floating breakwaters are occasionally used. These are built of strong open woodwork, partly above and partly under water, divided into several sections, and secured by chains attached to fixed bodies. The

breakers lose nearly all their force in passing through the beams of such a structure. A breakwater of this kind may last for twentyfive years.

Breath, the air which issues from the lungs during respiration through the nose and mouth. A smaller portion of oxygen and a larger portion of carbonic acid are contained in the air which is exhaled than in that which is inhaled. There are also aqueous particles in the breath, which are precipitated by the coldness of the external air in the form of visible vapor; likewise other substances which owe their origin to secretions in the mouth, nose, windpipe, and lungs. These cause the changes in the breath which may be known by the smell. A bad breath is often caused by local affections in the nose, the mouth, or the windpipe; viz., by ulcers in the nose, cancerous polypi, by discharges from the mouth, by sores on the lungs, or peculiar secretions in them. It is also caused by decayed teeth, by impurities in the mouth, and by some kinds of food.

**Bréche-de-Roland** (brāsh-dè-rō-län), that is, "the breach of Roland," a mountain pass in the Pyrenees, between France and Spain, which, according to a well-known legend, was opened up by Roland, one of the paladins of Charlemagne, with one blow of his sword Durandal, in order to afford a passage to his army. It is an immense gap in the rocky, mountain barrier 43 mi. to the n. of Huesca.

Breckenridge, WILLIAM C. P., American congressman and orator, b. 1837, at Baltimore, Md. He was graduated from Center College, Ky., in 1855, and two years later was graduated in law from the University of Louisville. He served as colonel of the Ninth Kentucky cavalry in the Confederate army. He was a member of the Forty-ninth, Fiftieth, Fiftyfirst, Fifty-second and Fifty-third Congresses. A breach of promise suit was instituted against him and his political career was practically ended.

Breckenridge, JOHN CABELL (1821-1875), American soldier and statesman. He was the grandson of John Breckenridge, U. S. senator, was educated at Center College. Ky., and prac-tised law in his native town. He served in the war with Mexico as major of a volunteer regiment. On his return he was elected to the Kentucky legislature, and elected to Congress in 1831 and 1853 as a Democrat. In 1856 he became vice-president of the U.S., with Buchanan as president, and in 1860 was nominated for president by the extreme Southern Democrats, who withdrew from the national convention that was held in Charleston, S. C. He received the electoral vote of all the slave states, except Virginia, Kentucky, Tennessee, and Missouri. In 1861 he took his seat in the U. S. Senate as successor to John J. Crittenden, but was expelled Dec. 4, 1861, on account of his political opinions, and went south to enter the Confederate army, in which he was appointed a brigadier general. He was appointed a major general in 1862, and commanded the Confederate reserve at Shiloh. He commanded the right wing of Gen. Braxton Bragg's reserve at Murfreesboro. He served at Chickamauga and Chattanooga; defeated Gen. Franz Sigel at Newmarket, Va.; joined General Lee's army, and served at Cold Harbor; served under Gen. Jubal Early in his advance on Washington, and shared in his defeat by Sheridan near Winchester, Va., September, 1864. From January till April, 1865, he was secretary of war in Jefferson Davis's cabinet, and after the downfall of the Confederacy he went to Europe by way of Cuba. He returned to Kentucky in 1868, where he died.

**Breda** (brā-dā'), a town in Holland, province of North Brabant. Pop. 22,987. Breda was once a strong fortress and of great military importance as a strategical position. From the sixteenth to the end of the eighteenth century Breda has an interesting military history of sieges, assaults, and captures, with which the names of the most famous generals of their time, the Duke of Parma. Maurice of Orange, the Marquis of Spinola, Dumouriez, and Pichegru, etc., are connected. It was the residence for a time of the exiled Charles II of England, and it was in the Declaration of Breda that he promised liberty of conscience, a general amnesty, etc., on his restoration.

The breech is **Breech** (Breech-Loading). the solid mass of metal behind the bore of a gun, and that by which the shock of the explosion is principally sustained. In breechloading arms the charge is introduced here, there being a mechanism by which the breech can be opened and closed. In small arms the advantages of breech-loading for rapidity of fire, facility of cleaning, etc., have recently recommended it to general use, and its efficacy for military purposes was effectively demon-strated by the Prussian campaign against Denmark and Austria in 1864 and 1866. Since that time every government has adopted the new system, both in small arms and heavy ordnance, while breech-loading sporting arms The chief difficulty are also in general use. in breech-loading is to close the breech so as to prevent the escape of the highly elastic gas to which the force of the explosion is due, but the appliances of modern science and mechanical art may be said to have effectually met this difficulty.

Breeding, the art of improving races or breeds of domestic animals, or modifying them in certain directions, by continuous attention to their pairing, in connection with a similar attention to their feeding and general treatment. Animals (and plants no less) show great susceptibility of modification under systematic cultivation; and there can be no doubt that by such cultivation the sum of desirable qualities in particular races has been greatly increased, and that in two ways. Individual specimens are produced possessing more good qualities than can be found in any one specimen of the original stock; and from the same stock many varieties are taken characterized by different perfections, the germs of all of which may have been in the original stock but could not have been simultaneously developed in a single specimen. But when an effort is

made to develop rapidly, or to its extreme limit, any particular quality, it is always made at the expense of some other quality, or of other qualities generally, by which the intrinsic value of the result is necessarily affected. High speed in horses, for example, is only attained at the expense of a sacrifice of strength and power of endurance. So the celebrated merino sheep are the result of a system of breeding which reduces the general size and vigor of the animal, and diminishes the value of the carcass. Much care and judgment, therefore, are needed in breeding, not only in order to produce a particular effect, but also to produce it with the least sacrifice of other qualities.

<sup>A</sup> Breeding, as a means of improving domestic animals, has been practised more or less systematically wherever any attention has been paid to the care of live stock, and nowhere have more satisfactory results been obtained than in Britain. One of the earliest improvers in Britain was Robert Bakewell. of Dishley, in Leicestershire, who commenced his experiments about 1745, and was very successful, especially with sheep, the celebrated Dishley breed of Leicestershire sheep having since maintained a high reputation. Quantity of meat, smallness of bone, lightness of offal; in cows, yield and quality of milk; in sheep, weight of fleece and fineness of wool, have all been studied with remarkable effects by modern breeders.

**Breitenfeld** (bri'tn-felt), a village in Germany, in Saxony, 4 mi. n. of Leipsic, notable as the scene of two battles of the Thirty Years' War, the first gained by Gustavus Adolphus over Tilly and Pappenheim in 1631; the second by the Swedish general Torstenson over the Imperialists commanded by Archduke Leopold and Piccolomini in 1642. It was also the scene of one of the great group of battles between the allies and Napoleon, Oct. 16, 1813.

Bremen (brā'men), a free city of Germany, an independent member of the empire, one of the three Hanse towns, on the Weser, about 50 mi. from its mouth, in its own small territory of 98 sq. mi., besides which it possesses the port of Bremerhaven at the mouth of the Here are the cathedral, founded about river. 1050, the old Gothic council house, with the famous wine cellar below it, the townhall, the merchants' house, and the old and the new ex-change. The manufacturing establishments consist of tobacco and cigar factories, sugar refineries, rice mills, iron foundries, machine works, rope and sail works, and ship-building yards. Its situation renders Bremen the emporium for Hanover, Brunswick, Hesse, and other countries traversed by the Weser, and next to Hamburg it is the principal seat of the export and import and emigration trade of Germany. Pop. 125,684. The principal port is Bremerhaven. Pop. 17.040.

Bremen was made a bishopric by Charlemagne about 788, was afterward made an archbishopric, and by the end of the fourteenth century had become virtually a free imperial city. The constitution is in most respects republican. The legislative authority is shared by a senate of eighteen citizens elected for life, and an assembly of 150 citizens elected for six years. The executive lies with the senate and senatorial committees.

Bremer (brö'mer), FREDERIKA (1802-1865), a Swedish novelist. She wrote an account of her travels; but her fame chiefly rests on her novels, which were translated into German and French, and into English by Mary Howitt. Among the chief of these are Neighbors, The President's Daughters, Nina, and Strife and Peace.

Brenham, Washington co., Texas, near Brazos River, 71 mi. n. of Houston. Railroads: Houston & Texas Central, and Gulf Colorado & Santa Fé. Industries: electric light and oil plant, two iron foundries, furniture, cigar, cotton gin, and farm-implement factories. Surrounding country agricultural. The town was first settled in 1844 and became a city in 1873. Pop. est., 1807, 7,500.

**Brenner**, a mountain in the Tyrolese Alps between Innsbruck and Sterzing; height 6,777 ft. The road from Germany to Italy, traversing this mountain, reaches an elevation of 4,658 ft., and is one of the lowest roads practicable for carriages over the main chain of the Alps. A railway through this route was opened in 1867.

Brennus, the name or title of several princes of the ancient Gauls, of whom the most famous was the leader of the Senones, who invaded the Roman territory about the year 390 B. C. He conquered Etruria from Ravenna to Picenum, besieged Clusium, defeated the Romans near the Allia, sacked Rome, and besieged the capital for six months, but ultimately retired on payment of a large amount of gold. Connected with this invasion are the well-known stories of the massacre of about eighty venerable senators who awaited the Gauls in their chairs of office in the Forum; of the salvation of the capital by the cackling of geese; and of the throwing of the sword of Brennus into the scales when the Romans complained that the weights used by the Gauls were false. According to Polybius the Gauls returned home in safety with their booty; but according to Livy, Brennus was disastrously defeated by Camillus, a distinguished Roman exile who arrived with succor in time to save the capital.

Brent Goose, a wild goose, smaller than the common barnacle goose and of much darker plumage, remarkable for length of wing and extent of migratory power, Leing a winter bird of passage in France, Germany, Holland, Great Britain, the U. S., Canada, etc. It breeds in high northern latitudes; it feeds on drifting seaweeds and saline plants, and is considered the most delicate for the table of all the goose tribe.

Brescia (bra'shi-à), a city of North Italy, capital of the province of the same name. Its public buildings, particularly its churches, are remarkable for the number and value of their frescoes and pictures. Among its chief edifices are the new cathedral, a handsome structure of white marble, begun in 1604, the Rotonda, or old cathedral, the townhall (La Loggia), and the Broletto, or courts. The city contains a museum of antiquities, picturegallery, botanic garden, a fine public library, a theater, hospital, etc. An aqueduct supplies water to its numerous fountains. Near the town are large iron works, and its firearms are esteemed the best that are made in Italy. It has also silk, linen, and paper factories, tan yards, and oil-mills, and is an important mart for raw silk. Brescia was the seat of a school of painting of great merit, including Alessandro, Bonvinco, commonly called "Il Moretto," who flourished in the sixteenth century. The city was originally the chief town of the Cenomanni, and became the seat of a Roman colony under Augustus about B. c. 15. It was burned by the Goths in 412, was again destroyed by Attila, was taken by Charlemagne in 774, and was declared a free city by Otho I of Saxony in 936. In 1426 it put itself under the protection of Venice. In 1796 it was taken by the French, and was assigned to Austria by the Vienna treaty of 1815. In 1849 its streets were barricaded by insurgents, but were carried by the Austrians under General Haynau. It was ceded to Sardinia by the Treaty of Zürich, 1859. Pop. 58,641. The province has an

area of 1,644 sq. mi.; pop. 484,565. Breslau (bres'lou), the third city in the German Empire and the second in the Prussian dominions, being excelled in population only by Berlin and Hamburg, is the capital of the province of Silesia, and is situated on both sides of the Oder. The public squares and buildings are handsome, and the fortifications have been converted into fine promenades. The cathedral, built in the twelfth century, and the Rathhaus, or townhall, a Gothic structure of about the fourteenth century, are among the most remarkable buildings. There is a flourishing university, with a museum, library of 400,000 volumes, observatory, etc. Breslau has manufactures of machinery, railway carriages, furniture and cabinet ware. cigars, spirits and liquors, cotton and woolen yarn, musical instruments, porcelain, glass, etc., and carries on an extensive trade. Breslau was the seat of a bishopric by the year 1000; an independent duchy from 1163 to 1335; then belonged to Bohemia; and was ceded to Austria in 1527. In 1741 it was conquered by Fred-erick II of Prussia. Pop. 335,174.

**Brest**, a seaport in the n.w. of France, dept. of Finisterre. It has one of the best harbors in France, and is the chief station of the French marine, having safe roads capable of containing 500 men-of-war in from 8 to 15 fathoms at low water. The entrance is narrow and rocky, and the coast on both sides is well fortified. The design to make it a naval arsenal originated with Richelieu, and was carried out by Duquesne and Vauban in the reign of Louis XIV, with the result that the town was made almost impregnable. Brest stands on the summit and sides of a projecting ridge, many of the streets being exceedingly steep. Several of the docks have been cut in the solid rock, and a breakwater extends far into the roadstead. The manufactures of Brest are inconsiderable, but it has an extensive trade in cereals, wine, brandy, sardines, mackerel, and colonial goods. It is connected with America by a cable terminating near Duxbury, Mass. The English and Dutch were repulsed at Brest in 1604. In 1794 it was blockaded by Howe, who won a great victory off the coast over the French fleet. Pop. 75,846.

**Brest-Litowski**, a fortified town of Russia, prov. of Grodno, on the Bug, an important railway center, and with a large trade. Pop. 35,424.

Bretigny (brè-tēn-yō), a village of France, dept. Eure-et-Loire. By the treaty of Bretigny (May 8, 1360), between Edward III of England and John II of France, the latter, who had been taken prisoner at Poitiers, recovered his liberty on a ransom of 3,000,000 crowns, while Edward renounced his claim to the crown of France, and relinquished Anjou and Maine, and the greater part of Normandy, in return for Aquitaine, Gascony, Poitou, Saintonge, Périgord, Limousin, etc.

Bretwal'da, a title applied to one of the Anglo-Saxon tribe-chiefs or kings, who it is supposed was from time to time chosen by the other chiefs, nobility, and ealdormen to be a sort of dictator in their wars with the Britons.

**Brevier** (bre-vēr'), a kind of printing type, in size between bourgeois and minion, now called 8 point, the same as the type of this book.

Brewer, DAVID JOSIAH, American jurist; b. 1837; son of an American missionary. He graduated at Yale in 1856, studied law with his uncle, David Dudley Field, graduated at Albany law school in 1858, and practised in Leavenworth, Kan.. where in 1862 he was elected a probate judge, and in 1864 judge of the first judicial district of Kansas. In 1870 he became associate justice of the State Supreme Court, was reflected in 1876 and again in 1882, and resigned in 1884, to become U. S. circuitjudge for the eighth circuit. President Harrison nominated him associate justice of the U. S. Supreme Court in 1889 in succession to Stanley Matthews.

Brewing, the process of extracting a saccharine solution from malted grain and con-verting the solution into a fermented and sound alcoholic beverage called ale or beer. The preliminary process of malting (often a distinct business to that of brewing) consists in promoting the germination of the grain for the sake of the saccharine matter into which the starch of the seed is thus converted. The barley or other grain is steeped for about two days in a cistern and then piled in a heap, or couch, which is turned and re-turned until the radicle or root, and acrospire or rudimentary stem, have uniformly developed to some little extent in all the heap of grain. This treatment lasts from seven to ten days, by which time the grain has acquired a sweet taste; the

life of the grain being then destroyed by spreading the whole upon the floor of a kiln to be thoroughly dried. At this point begins the brewing process proper, which in breweries is generally as follows: The malt is crushed or roughly ground in a malt-mill, whence it is carried to the mashing-machine, and there thoroughly mixed with hot water. The mixture is now received by the mash-tun-a cylindrical vessel with a false perforated bottom held about an inch from the true one. In the mash-tun the useful elements are extracted from the malt in the form of the sweet liquor known as wort, and the tun, therefore, is fitted with an elaborate system of revolving rakes for thoroughly mixing the malt with hot The mixing completed, the mash-tun water. is covered up and allowed to stand for about three hours, when the taps in the true bottom are opened and the wort or malt-extract run off. The wort being drained into a copper the hops are now added, and the whole boiled for about two hours, the boiling, like the addition of hops, tending to prevent acetous and putrefactive fermentation. When sufficiently boiled the contents of the copper are run into the hop-back-a long, rectangular vessel with a false bottom 8 or 9 in. from the true bottom. The hot wort leaving the spent hops in the hop-back runs through the perforations in the false bottom and thence into the cooler-a large flat vessel where the worts are cooled to about 100° F. From the cooler the liquor is admitted to the refrigerator-a shallow rectangular vessel, which reduces the temperature to almost that of the cold water, or about 58°. The worts are next led by pipes into the large wooden fermenting tuns, where yeast or barm is added as soon as the wort begins to run in from the refrigerator. During the operation of fermentation, by which a portion of the saccharine matter is converted into alcohol, the temperature rises considerably, and requires to be kept in check by means of a coil of copper piping with cold water running through it lowered into the beer. When the fermentation has gone far enough, and the liquor has been allowed to settle, the beer be-comes comparatively clear and bright, and may be run off and filled into the trade casks or into vats.

The various beers manufactured from grain have sometimes been classified under the three heads of beer, ale, and porter ; but at the present day this classification will not hold, as beer, though it occasionally may have a specific meaning, is often used as the general name for all malt liquors. Both terms belong to the early or Anglo-Saxon period of the English language but in more modern times the term beer seems to have been applied more especially to malt liquor flavored with hops, wormwood, or other bitters. Ale was originally made from barley malt and yeast alone, and the use of hops was first introduced in Germany, which is still a great brewing country. One of the kinds of German beer now widely known and consumed is lager beer - that is, store beer, the name being given to it because it is usually kept for four to six months before being used. In brewing it the fermentation is made to go on rather slowly and at a low temperature. Much lager beer is now made in the U.S., the largest breweries in the world are located at Milwaukee, Wis., and at St. Louis, Mo.

The manufacture of ale or beer is of very high antiquity. Herodotus ascribes the invention of brewing to Isis, and it was certainly practised in Egypt. Xenophon mentions it as being used in Armenia, and the Gauls were early acquainted with it. Pliny mentions an intoxicating liquor made of corn and water as common to all the nations of the west of Europe, and in England ale-booths were regulated by law as early as the eighth century. A rude process of brewing is carried on by many uncivilized races; thus chica or maize beer is made by the South American Indians, millet beer by various African tribes, etc.

Brew'ster, SIR DAVID (1781-1868), one of the greatest physicists of this century; was attracted by the lectures of Robson and Playfair to science. In 1807 he became M.A. of Cambridge, LL.D. of Aberdeen, and member of the Royal Society of Edinburgh. In 1808 he became editor of the Edinburgh Encyclopædia and in 1819, in conjunction with Jameson, founded the Edinburgh Philosophical Journal, of which he was sole editor from 1824-32. Brewster was one of the founders of the British Association, and its president in 1850. In 1832 he was knighted and pensioned. From 1838 to 1859 he was principal of the united colleges of St. Leonard's and St. Salvador at St. Andrews and in the latter year was chosen principal of the University of Edinburgh. Among his inventions were the "polyzonal lens," the kaleidoscope, and the improved stereoscope. His chief works are a Treatise on the Kaleidoscope, Letters on Natural Magic, etc.

**Brewster**, WILLIAM (1566-1664), the leader of the *Mayflower* Pilgrims, was born at Scrooby, and educated at Cambridge. He left the Established Church, and founded a separate society in his house. In 1608 he went to Holland, and opened a school at Leyden. He was made ruling elder, and conducted the Pilgrims in the *Mayflower* to Plymouth, Mass., in 1620. B. was their only spiritual teacher for some years, but he did not administer the sacraments. He is venerated as the ruling spirit in the earliest New England colony.

Bri'an, a famous chieftain of the early 1rish annals, who succeeded to Munster in 978, defeated the Danes of Limerick and Waterford, attacked Malachi, nominal king of the whole island, and became king in his stead (1002). He was slain at the close of the battle of Clontarf, near Dublin, in 1014, after gaining a signal victory over the revolted Maelmora and his Danish allies.

**Briançon** (brē-ån-sön), a town and fortress of France, department of Hautes Alpes, on the right bank of the Durance. It occupies an eminence 4,284 ft. above sea level, and has been called the Gibraltar of the Alps. Pop. 6,850.

Brick, a sort of artificial stone, made principally of argillaceous earth formed in molds, dried in the sun, and baked by burning, or, as in many eastern countries, by exposure to the sun. Sun-dried bricks of great antiquity have been found in Egypt, Assyria, and Babylonia, and in the mud walls of old Indian towns. Under the Romans the art of making and building with bricks was brought to great perfection, and the impressions on Roman bricks, like those on the bricks of Babylonia, have been of considerable historic value. In fact the chief source of knowledge of the ancients lies in the inscriptions of this kind. The Roman brick was afterward supersoded in England by the smaller Flemish make. Of the various clays used in brickmaking, the simplest, consisting chiefly of silicates of alumina, are almost infusible, and are known as fire-clays, the Stourbridge clay being specially famous. Of such clays fire-bricks are made. Clays containing lime and no iron burn white, the colors of others being due to the presence in varying proportions of ferric oxide, which also adds to the hardness of bricks. The clay should be dug in autumn and exposed to the influence of frost and rain. It should be worked over repeatedly with the spade and tempered to a ductile, homogeneous paste, and should not be made into bricks until the ensuing spring. The making of bricks by hand in molds is a simple process. After being made and dried for about nine or ten days they are ready for the burning, for which purpose they are formed into kilns, having flues or cavities at the bottom for the insertion of the fuel, and interstices between them for the fire and hot air to penetrate. Much care is necessary in regulating the fire, since too much heat vitrifies the bricks and too little leaves them soft and friable. Bricks are now largely made by machines of various constructions. In one the clay is mixed and comminuted in a cylindrical pugmill by means of rotatory knives or cutters working spirally and pressing the clay down to the bottom of the cylinder. From this it is conveyed by rollers and forced through an opening of the required size in a solid rect-angular stream, which is cut into bricks by wires working transversely. Machine-made bricks are heavier, being less porous than hand-made bricks, and are more liable to crack in drying; but they are smoother, and, when carefully dried, stronger than the hand-made.

**Bricklaying.**—In many countries the only available material for house-building is brick. The solidity and durability of a brick building depends largely upon the manner in which the brick are laid. In laying the foundations of walls, the first courses should be thicker than the intended superstructure, and the projections thus formed, usually of quarter brick on each side, are called "set-offs." Mortar composed of lime and sand is the common cement for brick-work. It should be equally and carefully applied. The most important thing in bricklaying is to see that the wall is properly bonded. The bricks of every course should cover the joints of the course below it, or, to use the bricklayer's phrase, the work must "break bond." A layer or stratum of bricks is called a course. Bricks laid with their lengths in the direction of the course, and their sides to the wall face, are called stretchers; those laid transversely, with their ends forming the wall face, headers; a layer of headers, a heading course; of stretchers, a stretching course.

The two kinds of bond almost exclusively used consist of alternate stretching and heading courses; and of a stretcher and header laid alternately in each course. The first bond is the strongest, but the second bond is the more ornamental; and they are used accordingly. There are two other kinds of bond occasionally used for thick walls. In both the center of the wall is filled up with bricks laid diagonally, by what is called in the one case raking courses, and in the other herring-bone work. In order to strengthen the bond, bands of hoopiron, tarred and sanded, are sometimes laid This "hoopflat-wise between the courses. iron bond" has superseded the old practise of using bond-timbers. Walls of brick are frequently built hollow, and these dry quicker and perhaps more thoroughly than those built solid. In such walls there is a thin outer and inner face of brick with hollow spaces between. Different ways are adopted for bonding or tying these walls. Hollow bricks are also used for walls, partitions, floor arches, and other work. Neat pointing of the joints often gives a very pretty appearance to brick-work.

Bricks of the ordinary rectangular shape are often used for arches, leaving the gaping interstices at the upper ends to be filled with mortar or chips of brick. Such an arch cannot be strong. As the joints radiate to a center, the arch bricks should be made of or cut to the proper form, just as arch stones are cut to the right shape. In all kinds of bricklaying the walls should be built up level throughout, in order that the settlement may be equal.

Bridge, a structure of stone, brick, wood, or iron, affording a passage over a stream, valley, or the like. The earliest bridges were no doubt trunks of trees. The arch seems to have been unknown among most of the nations of an-tiquity. Even the Greeks had not sufficient acquaintance with it to apply it to bridge building. The Romans were the first to employ the principle of the arch in this direction, and after the construction of such a work as the great arched sewer at Rome, the Cioaca Maxima, a bridge over the Tiber would be of comparatively easy execution. One of the finest examples of the Roman bridge was the bridge built by Augustus over the Nera at Narni, the vestiges of which still remain. It consisted of four arches, the longest of 142 ft. span. The most celebrated bridges of ancient Rome were not generally, however, distinguished by the extraordinary size of their arches, nor by the lightness of their piers, but by their excellence and durability. The span of their arches seldom exceeded 70 or 80 ft., and they were mostly semicircular, or nearly so. The Romans built bridges wherever their conquests extended, and in Britain there are still a number of bridges dating from Roman times. One of the

most ancient post-Roman bridges in England is the Gothic triangular bridge at Croyland, in Lincolnshire, said to have been built in 860. having three archways meeting in a common center at their apex, and three roadways. The longest old bridge in England was that over the Trent at Burton, in Staffordshire, built in the twelfth century, of squared free-stone, and recently pulled down. It consisted of thirtysix arches, and was 1,545 ft. long. Old London Bridge was commenced in 1176, and finished in 1209. It had houses on each side like a regular street till 1756-58. In 1831 it was altogether removed, the new bridge, which had been begun in 1824, having then been finished. The art of bridge building made no progress after the destruction of the Roman Empire till the eighteenth century, when the French architects began to introduce improvements, and the constructions of Perronet (Nogent-sur-Seine; Neuilly; Louis XVI bridge at Paris) are master-Within the last half century or so the pieces. use of steam and iron, the immense development of all mechanical contrivances, and the great demand for railway bridges and viaducts have given a great.stimulus to invention in this department.

Stone bridges consist of an arch or series of arches, and in building them the properties of the arch, the nature of the materials, and many other matters have to be carefully considered. It has been found that in the construction of an arch the slipping of the stones upon one another is prevented by their mutual pressure and the friction of their surfaces; the use of cement is thus subordinate to the principle of construction in contributing to the strength and maintenance of the fabric. The masonry or rock which receives the lateral thrust of an arch is called the *abutment*, the perpendicular supports are the *piers*. The width of an arch is its span; the greatest span in any stone bridge is about 250 feet. A one-span bridge has, of course, no piers. In constructing a bridge across a deep stream it is desirable to have the smallest possible number of points of support. Piers in the waterway are not only expensive to form, but obstruct the navigation of the river, and by the very extent of resisting surface they expose the structure to shocks and the wearing action of the water. In building an arch, a timber framework is used called the center or centering. The centering has to keep the stones or roussoirs in position till they are keyed in, that is, all fixed in their places by the insertion of the keystone.

The first iron bridges were erected from about 1777 to 1700. The same general principles apply to the construction of iron as of stone bridges, but the greater cohesion and adaptability of the material give more liberty to the architect, and much greater width of span is possible. At first iron bridges were erected in the form of arches, and the material employed was cast iron; but the arch has now been generally superseded by the beam or girder, with its numerous modifications; and wrought-iron or steel is likewise found to be much better adapted for resisting a great

tensile strain than cast-metal. Numerous modifications exist of the beam or girder, as the lattice girder, bowstring girder, etc.; but of these none is more interesting than the tubular or hollow girder, first rendered famous from its employment by Robert Stephenson in the construction of the railway bridge across the Meneai Strait, and connecting Anglesey with the main land of North Wales. This is known the main land of North Wales. as the Britannia tubular bridge. The tubes are of a rectangular form, and constructed of riveted plates of wrought-iron, with rows of rectangular tubes or cells for the floor and roof respectively. The bridge consists of two of these enormous tubes or hollow beams laid side by side, one for the up and the other for the down traffic of the railway, and extending each to about a quarter of a mile in length. Other tubular bridges of importance are the Conway Bridge, over the River Conway, an erection identical in principle with the Britannia Bridge, but on a smaller scale; the Brotherton Bridge over the River Aire; the tubular railway bridge across the Damietta branch of the Nile, which has this peculiarity, that the roadway is carried above instead of through the tubes; and the Victoria Bridge over the St. Lawrence, Canada. A girder railway bridge across the Firth of Tay at Dundee was opened in 1887, being the second built at the same place, after the first had given away in a great storm. It is 2 mi. 73 yds. long, has 85 spans. is 77 ft. high and carries two lines of rails. The bridge over the Firth of Forth, at Queensferry, in course of construction, has two chief spans of 1,710 ft., two others of 680 ft., fifteen of 168 ft., and seven small arches, and will give a clear headway for navigation purposes of 150 ft. above high-water of springtides. The great spans consist of a canti-lever at either end, 680 ft. long, and a central girder of 350 ft. Both the above bridges are built to carry the lines of the North British Railway. The Crumlin Railway viaduct. South Wales, having lattice-girders supported on open-work piers is more remarkable for height than length, being 200 ft. high.

Suspension bridges, being entirely independent of central supports, do not interfere with the river, and may be erected where it is impracticable to build bridges of any other kind. The entire weight of a suspension bridge rests upon the piers at either end from which it is points of support. Such bridges always swing a little, giving a vibratory movement which imparts a peculiar sensation to the passenger. The modes of constructing these bridges are various. The roadway is suspended either from chains or from wire-ropes, the ends of which require to be anchored, that is, attached to the solid rock or masses of masonry or iron. One of the earlier of the great suspension bridges is that constructed by Telford over the Menai Strait, near the Britannia Tubular Bridge, finished in 1825; the opening between the points of suspension is 580 ft. On the European continent, the Fribourg Suspension bridge in Switzerland, span 870 ft., erected

1834, is a celebrated work; as is that over the Danube connecting Buda with Pesth. In America the lower suspension bridge over the Niagara, 7 mi. below the falls, sup-ported by wire cables, is 822 ft. long; it has two floors or roadways connected together but 15 ft. apart, the lower serving for ordinary traffic, the upper carrying three lines of rails, 245 ft. above the river. Another bridge, close to the falls, has a span of 1,250 ft. The Cincinnati bridge over the Ohio has a span of 1,057 ft. A suspension bridge of great magnitude, connecting the city of New York with Brook-lyn, was opened in 1883. The central or main span is 1,595; ft. from tower to tower, and the land spans between the towers and the anchorages 930 ft. each; the approach on the New York side is 2,492 ft. long, and that on the Brooklyn side 1,901 ft., making the total length 5,989 ft. The height of the platform at the center is 135 ft. above high-water, and at the ends 119 ft. The roadway is 85 ft. broad, and is divided into five sections, the two outside for vehicles, the two inner for tram-cars, and the middle one, 12 ft. above the rest, for foot passengers.

Though the oldest bridges on record were built of wood, like the Sublician Bridge at Rome, or that thrown by Cæsar across the Rhine, it is only in certain places and for certain purposes that wood is much used at present. Perhaps the most celebrated of all wooden bridges was that which spanned the Rhine at Schaffhausen in Switzerland. This was 364 ft. in length and 18 ft. broad. It was designed and executed by Ulric Grubenman, a village carpenter, in 1758, and was destroyed by the French in 1799. In the U.S., where timber is still in common use, we have some fine ex-amples, the Trenton Bridge over the Delaware, erected in 1804; the bridge over the Susquehanna, etc. Some of the most notable developments in the art of bridge construction are to be found on this continent, where an enormous railway system traversing a country of great rivers and ravines, has given an exceptional stimulus to the art. The main characteristics of American bridges are simplicity and boldness of design, the reduction of the number of members to a minimum by the use of open trusses composed of simple systems rather than the plate, tubular, or closely latticed girders of European engineers, thus offering less resistance to wind pressure.

The largest swing bridge in the world is now in process of construction on the Chicago Drainage Canal. Over this bridge there will be eight railroad tracks. The bridge will be of steel construction, weighing 7.000,000 pounds, and capable of supporting a train-load of 8.800,-000 pounds. The total cost is estimated at \$700,000. This bridge will have a total length of 400 ft. 5 in., and width 125 ft. The height of the center columns will be 68 ft., and the headway under the trusses for trains 21 ft., headway under the bridge 18 ft., and depth of water in the channel 24 ft. Electric power will be used to turn the bridge. The turntable will have a diameter of 80 ft. and will be 10 ft. below the level of the bridge. This bridge will be used by the Northern Pacific, the Pan Handle, and Union Stock Yards Railroads.

Bridge port, a seaport of Connecticut, 58 mi. n.e. of New York, on an arm of Long Island Sound, with a large coasting trade, but chiefly supported by its manufactures, including the large sewing-machine factories of Wheeler, Wilson & Co., Elias Howe, etc. Pop. est. 1897, 50,000.

Bridgeton, Cumberland co., N. J., on the Cohansey Creek. Railroads: Vineland, West Jersey, and Bridgeton & Port Norris. It is the location of the West Jersey Academy, South Jersey Institute, and Ivy Hall, a school for girls. Industries: rolling mill, glass works. nail factory, woolen mills, leather factories, machinery works and carriage factory. Pop. est. 1897, 14,000.

**Bridgetown,** the capital of the island of Barbadoes, in the West Indies, extending along the shore of Carlisle Bay, on the s.w. coast of the island for nearly 2 mi. Its appearance is very pleasing, the houses being embosomed in trees, while hills of moderate height rise behind, studded with villas. Bridgetown is the residence of the governor general of the Windward Islands. Pop. 20,047.

Bridge' water (or Bridgwater), a municipal borough and port in the county of Somerset, England, on the Parret, which is navigable as far up as the town for small vessels. A considerable shipping trade is carried on, chiefly coastwise. Bricks are made here in great quantities, especially bath bricks. Up till 1870, when it was disfranchised for bribery. Bridgewater returned two members to Parliament. Pop. 12,429.

Bridgman, LAURA DEWEY (1829-1889), a remarkable blind and deaf mute. At the age of two a severe illness deprived her of sight. hearing, and speech, and to some extent also of smell and taste. She was placed in the Perkins institution for the blind, Boston, at the age of eight, and Dr. Howe undertook her education. The first step was made by giving her some familiar object, with its name in raised letters, and teaching her at the same time the qualities of that article and its relation to other things. She made rapid progress, and acquired a knowledge of geography. arithmetic, learned to do household work and also to sew, both by hand and on the machine. After receiving her education, Miss Bridgman taught in the Perkins institution. She was a member of the Baptist Church. She read whatever book she found in raised print, especially the Bible. She made much of her own clothing.

Bridle and Bit, that part of a horse's harness which is attached to the head and mouth, by means of which he is governed and restrained. The proper bitting of horses has been a matter of much study, and innumerable kinds of bits have been introduced for the purpose. The ordinary single riding-bridle has a snaffle-bit. There are several forms of the snaffle-bit. The common riding form is a

round, smooth bit, jointed in the middle, attached at either side to straight bars or cheeks, which prevent the bit being pulled through the horse's mouth, and with rings to which the reins and cheek-pieces of the headstall are fixed. The twisted snaffle has the mouthpiece twisted or fluted. The ring snaffle is

Bridle and Bit.

made without cheeks; and the rings for headstall and reins are not fixed, but work loose in holes at the ends of the mouthpiece. The double bridle is generally used in the hunting field and often for ordinary purposes. Among the Arabs and in South America and some parts of Mexico and Texas, a heavy, old-fashioned, and terribly cruel curb-bit is used. On the other hand, the stockmen of Australia employ the plain snaffle-bridle alone. It is interesting to know that in the representations of harnessed horses in the Assyrian sculptures the bridle generally shown is apparently almost identical with the modern snaffle. The figure represents a chariot horse with bridle, and a bronze bit from Nimrud.

**Briel** (brēl) (or Brielle, brē-el'), sometimes called the *Briel*, a fortified seaport of Holland, near the mouth of the Mass, province of South Holland. The taking of Briel in 1572 was the first success of the revolted Netherlanders in their struggle with Philip II of Spain. The famous Admiral Van Tromp was born here. Pop. 4,442.

**Brienne** (brē-ān), a small town of France, dep. Aube. In the military academy which formerly existed here Napoleon received his early military training. Brienne was also the scene of a bloody battle between Blücher and Napoleon (Feb. 29, 1814).

**Brig**, a sailing vessel with two masts rigged like the foremast and mizzen-mast of a fullrigged ship. See *Brigantine*.

Brig'antine, a sailing vessel with two masts, the foremast rigged like a brig's, the mainmast rigged like a schooner's. Called also hermophrodite brig.

Briggs, CHARLES AUGUSTUS, a Presbyterian theologian, b. in New York, Jan. 15, 1841. He studied at Union Theological Seminary, New York City, and at the University of Berlin, Germany. In 1874 he became professor of Hebrew and the cognate languages in Union Theological Seminary. He was made a member of the editorial staff of the Presbyterian Review in 1880. His works include Biblical Study, American Presbyterianism, Messianic Prophecy, etc. His advanced views in biblical criticism, with certain doctrinal views, subjected him to a trial for heresy 1892-93, which resulted in his condemnation and suspension by the Presbyterian General Assembly.

**Briggs**, HENRY (1556-1631), a celebrated English mathematician. He was the first Savilian professor of geometry at Oxford. In 1616 he visited Napier, the inventor of logarithms, and afterward published his work on logarithms, which suggested an important improvement upon Napier's system.

provement upon Napier's system. Bright, JOHN (1811-1889), English orator and He first became known as a leadstatesman. ing spirit in the Anti-corn-law League. In 1843 he was chosen M. P. for Durham, and distinguished himself as a strenuous advocate of free-trade and reform. In 1847 he sat for the first time for Manchester, but in 1857 his opposition to the war with China made him so unpopular in the constituency that he lost his seat by a large majority. He was, however, returned for Birmingham, and soon after made speeches against the policy of great military establishments and wars of annexation. During the American Civil War he was one of the few English statesmen who were outspokenly in favor of the Union cause. In 1865 he took a leading part in the movement for the extension of the franchise, and strongly advocated the necessity of reform in Ireland. In the Gladstone ministry formed in 1868, he was president of the board of trade and afterward chancellor of the duchy of Lancaster, and he held the latter office again under Mr. Glad-stone in 1880-1882. In 1886 he joined the Liberals who opposed Mr. Gladstone's schemes for Ireland, and contributed by his letters and in-

fluence to the overthrow of the Gladstone party. He was a member of the Society of Friends.

**Brighton** (brī'tun), a maritime town and watering-place in England, co. of Sussex,  $50\frac{1}{4}$ mi. from London. In front of the town is a massive sea wall, with a promenade and drive over 3 mi. in length, one of the finest in Europe.
Brighton has no manufactures, and is resorted to only as a watering-place. It was about the middle of last century that Dr. Russell, an eminent physician, drew attention to Brighton, which subsequently was patronized by George IV, then Prince of Wales. Pop. 142,121.

Bright's Disease, a name (derived from Dr. Richard Bright (1789-1856), an English physician, who first described the disorder) given to various forms of kidney disease, especially to that which is characterized by a granular condition of the cortical part of the kidneys and inflammation of the malpighian bodies. The urine during life contains albumen, and is of less specific gravity than natural. The disease is accompanied with uneasiness or pain in the loins, pale or cachectic countenance, disordered digestion, frequent urination, and dropsy. The blood contains urea, and is deficient in albu-men and corpuscles. Progressive blood poisoning induces other visceral diseases, and in the end gives rise to the cerebral disturbance which is the frequent cause of death.

**Brillat-Savarin** (brè-yä-så-và-ran) (1775– 1820), a French author, who, although he wrote works on political economy, archeeology, and duelling, is now known only by his famous book on gastronomy, the *Physiologie du Gout*, published in 1823.

Brim'stone, a name of sulphur. Sulphur, in order to purify it from foreign matters, is generally melted in a close vessel, allowed to settle, then poured into cylindrical molds, in which it becomes hard, and is known in commerce as *roll brimstone*.

**Brindaban** (brin-dä-ban'), a town of India, one of the holiest cities of the Hindus, with a large number of temples, shrines, and sacred sites. Pop. 21,467.

**Brindisi** (brên'di-sẽ, anc. Brundusium), a seaport and fortified town, province of Lecce, Southern Italy, on the Adriatic, 45 mi. e.n.e. of Taranto. In ancient times Brundusium was an important city, and with its excellent port became a considerable naval station of the Romans. Its importance as a seaport declined in the Middle Ages, and was subsequently completely lost, and its harbor blocked, until in 1870 the Peninsular and Oriental Steam Navigation Company put on a weekly line of steamers between Brindisi and Alexandria for the conveyance of mails and passengers between Europe and the East. From this cause Brindisi has suddenly risen into importance. Pop. 16,719.

**Brind'ley**, JAMES (1716-1772), an English engineer and mechanic. When the Duke of Bridgewater was occupied in planning a communication between his estate at Worsley and the towns of Manchester and Liverpool by water, Brindley undertook the work, and by means of aqueducts over valleys, rivers, etc., he completed the Bridgewater Canal between 1758 and 1761, so as to form a junction with the Mersey. The other great works of this kind undertaken by him were the Grand Trunk Canal uniting the Trent and Mersey, and a canal uniting that with the Severn.

Brignoli, PASQUALE (1824-1884), b. in Italy,

d. in New York City. He came to the U.S. in 1855, and for nearly thirty years his magnificent tenor voice was heard in opera and concert music in this country and in Europe.

Brinvilliers (bran-vēl-yā), MARIE MARQUE-RITE D' AUBRAY, MARCHONESS OF (1630-1676), a notorious French poisoner. She was married in 1651 to the Marquis of Brinvilliers. but after some seven or eight years of married life a young cavalry officer named Sainte-Croix inspired her with a violent passion, and being instructed by him in the art of preparing poisons, she poisoned in succession her father, her two brothers, and her sisters, chiefly, it is thought, in order to procure the means for living extravagantly with her paramour. The sudden death of Sainte-Croix led to the discovery of letters incriminating Madame de Brinvilliers. She fied to Liége, where she was captured, conveyed to Paris, and condemned to death.

Bris' bane, the capital of Queensland, about 25 miles by water from the mouth of the river Brisbane, which intersects the town. Brisbane was originally settled, in 1825, as a penal sta-tion by Sir Thomas Brisbane (whence the name of the town). In 1842 the district was opened to free settlers, and on the erection of Queensland into a separate colony in 1859, Brisbane become the capital. Since then it has made great progress, and now possesses many fine public buildings, such as the Houses of Legislature, erected at a cost of over \$500-000, the townhall and the Albert Hall, the viceregal lodge, the post and telegraph offices. etc. There are also botanical gardens, several public parks, etc. The climate is tropical, the annual rainfall about 55 inches. The town is the terminus of the western and southern railway system, and the port is the principal one in the colony. Pop. 50,000.

Bris bane, GENERAL SIR THOMAS MAC-DOUGALL (1773-1860), a Scotch soldier and astronomer. After serving in Flanders and the West Indies he commanded a brigade under the Duke of Wellington during the Peninsular war, and took part in the battles of Vittoria, Orthes, and Toulouse. In 1821 he was appointed governor of New South Wales. At the same time he devoted himself to astronomy, and from his observatory at Paramatta catalogued 7,385 stars, until then scarcely known. On his return to Scotland he continued his astronomical pursuits, until his death.

Bristies, the stiff, coarse, glossy hairs of the hog and the wild boar, especially of the hair growing on the back; extensively used by brushmakers, shoemakers, saddlers, etc., and chiefly imported from Russia and Germany. Russia supplies the finest qualities, which are worth about \$250 or \$300 per cwt.

Bris'tol, a cathedral city of England, situated partly in Gloucestershire, partly in Somersetshire, but forming a county in itself. The town is built partly on low grounds, partly on eminences, and has some fine suburban districts, such as Clifton, on the opposite side of the Avon, and connected with

Bristol by a suspension bridge 703 ft. long and 245 ft. above high-water mark. The most notable public buildings are the cathedral, founded in 1142; St. Mary Redcliff, said to have been founded in 1293, and perhaps the finest parish church in the kingdom. Bristol has glass works, potteries, soap works, tanneries, sugar refineries, and chemical works, shipbuilding and machinery yards. Coal is worked extensively within the limits of the borough. The export and import trade is large and varied. There is a harbor in the city itself, and the construction of new docks at Avonmouth and Portishead has given a fresh impetus to the port. The Saxons called it *Bricgstow*, "bridge-place." In 1373 it was constituted a county of itself by Edward III. It was made the seat of a bishopric by Henry VIII in 1542 (now united with Gloucester). In 1831 the reform agitation gave origin to riots that lasted for several days. The rioters destroyed a number of public and private buildings, and had to be dispersed by the military. Sebastian Cabot, Chatterton, and Southey were natives of Bristol. Pop. 221,-655

**Bristol**, Bristol co., R. I., 15 mi. s.e. of Providence, on Narragansett Bay. Railroad: Old Col. R. R. It is the seat of worsted mills, cotton mills, shipyards and a rubber goods factory whose product is valued at \$2,000,000 per annum. Pop. est. 1897, 5,600.

Bristol, Hartford co., Conn. Railroad: N. Y. & N. E. Industries: clock, stocking and water wheel manufactories, also several foundries and machine shops. Copper is found near there. Pop. est. 1897, 7,800. Bristol, Bucks co., Pa., on Delaware River,

Bristol, Bucks co., Pa., on Delaware River, 17 mi. e. of Philadelphia. Railroad: Pennsylvania. Industries: iron foundry, carpet, worsted yarn, hosiery, cassimere, and other factories, and planing mill. Surrounding country agricultural. It was first settled in 1681, laid out in 1695, incorporated a borough by letters patent from the crown in 1720. Pop. est. 1897, 7,000. Bristol Channel, an arm of the Atlantic,

Bristol Channel, an arm of the Atlantic, extending between the southern shores of Wales and the southwestern peninsula of England, and forming the continuation of the estuary of the Severn. It is remarkable for its high tides.

high tides. Britannia Tubular Bridge, an iron tubular bridge across Menai Strait, which separates Anglesea from Wales, about one mi. from the Menai Suspension Bridge. It has two principal spans of 460 ft. each over the water, and two smaller ones of 230 ft. each over the land; constructed 1846-50.

Britan' nicus, son of the Roman Emperor Claudius, by Messalina, b. A. D. 42, poisoned A. D. 56. He was passed over by his father for the son of his new wife Agrippina. This son became the Emperor Nero, whose fears that he might be displaced by the natural successor of the late emperor caused him to murder Britannicus.

British Association FOR THE ADVANCEMENT OF SCIENCE, a society first organized in 1831,

mainly through the exertions of Sir David Brewster, whose object is to assist the progress of discovery and to disseminate the latest results of scientific research, by bringing together men eminent in all the several departments of science. Its first meeting was held at York on Sept. 26, 1831, under the presidency of Lord Milton; and all the principal towns of the United Kingdom have on different occasions formed the place of rendezvous, a different locality being chosen every year. The seances extend generally over about a week. The society is divided into sections, which, after the president's address, meet separately during the seances for the reading of papers and conference. Soirees, conversaziones, lectures, and other general meetings are usually held each evening during the meeting of the association. As the funds which the society collects at each meeting are more than sufficient to cover its expenses, it is enabled to make money grants for the pursuit of particular scientific inquiries, which otherwise could not be conducted so efficiently, if at all. In 1884 the association held its meeting in Montreal, Canada, the only occasion on which it has met out of the United Kingdom. British Columbia, a British colony forming

with Vancouver Island a province of the Dominion of Canada. Area 341,305 sq. mi. (including Vancouver Island). Till 1858 it was part of the Hudson Bay Territory; in that year gold discoveries brought settlers, and it became a colony. Vancouver Island, 16,000 sq. mi., became a colony at the same time, but was afterward joined to British Columbia; the conjoined colony entered the Dominion in 1871. The coast line is much indented, and is flanked by numerous islands, the Queen Charlotte Islands being the chief after Vancouver. The interior is mountainous, being traversed by the Cascade Mountains near the coast, and by the Rocky Mountains farther west. There are numerous lakes, generally long and narrow, and lying in the deep ravines that form a feature of the surface and are traversed by numerous rivers. Of these the Fraser, with its tributary the Thomson, belongs entirely to the colony, as does also the Skeena; while the upper courses of the Peace River and of the Columbia also belong to it. All except the Peace find their way to the Pacific. Its mountain ranges (highest summits; Mount Hooker, 15,700 feet, and Mount Brown, 16,000 feet) afford magnificent timber (including the Douglas pine and many other trees); and between the ranges are wide grassy prairies. Part of the interior is so dry in summer as to render irrigation necessary, and the arable land is comparatively limited in area, but there is a vast extent of splendid pasture land. The climate is mild in the lower valleys, but severe in the higher levels; it is very healthy. The chief products of the colony are gold. coal, silver, iron, copper, galena, mercury, and other metals; timber, furs, and fish, the last, particularly salmon, being very abundant in the streams and on the coasts. Gold exists almost everywhere, but has been obtained

chiefly in the Cariboo district. The total yield since 1858 has been over \$50,000,000. The coal is found chiefly in Vancouver Island, and is mined at Nanaimo, where large quantities are now raised. Mining, cattle-rearing, agriculture, fruit-growing, salmon-canning, and lum-bering are the chief industries. Victoria, on bering are the chief industries. the s.e. coast of Vancouver Island, is the capi-tal and chief town of the colony. New Westminster, on the Fraser River, about 15 mi. from its mouth, is the most considerable place on the mainland; but the new town Van-couver, the terminus of the Canadian Pacific railway, at the mouth of the Fraser, will doubtless become a place of importance. Besides this railway there is one between Nan-aimo and Victoria. Steamers now run to aimo and Victoria. Steamers now run to China and Japan in connection with the Cana-dian Pacific Railway, also lines to Australia and India are open. Like the other provinces of the Dominion, British Columbia has a separate parliament and administration, with a lieutenant governor of its own. Schools are supported entirely by government. Pop. including about 25,000 Indians, in 1891, 92,767.

British Museum, the great national museum in London, owes its foundation to Sir Hans Sloane, who, in 1753, bequeathed his various collections, including 50,000 books and MSS., to the nation, on the condition of \$100,000-less by \$150,000 than the original cost-being paid to his heirs. Montague House, which was bought for the purpose for \$51,250, was ap-propriated for the museum, which was first opened on Jan. 15, 1759. The original to his heirs. edifice having become inadequate, a new build-ing in Great Russell Street was resolved upon in 1823, the architect being Sir R. Smirke, whose building was not completed till 1847. In 1857 a new library building was completed and opened at a cost of \$750,000. It contains a circular reading-room 140 ft. in diameter, with a dome 106 ft. in height. This room contains accommodation for 300 readers comfortably seated at separate desks, which are provided with all necessary conveniences. More recently, the accommodation having become again inadequate, it was resolved to separate the objects belonging to the natural history department from the rest, and to lodge them in a building by themselves. Accordingly a large natural history museum has been erected at South Kensington, and the specimens pertaining to natural history (including geology and mineralogy) have been transferred thither, but they still form part of the British Museum. Further additions to the Great Russell Street buildings were made in 1882. The British Museum is under the management of fortyeight trustees. It is open daily free of charge. Admission to the reading room as a regular reader is by ticket, procurable on application to the chief librarian, there being certain sim-ple conditions attached. The library, which is now one of the largest and most valuable in the world, has been enriched by numerous bequests and gifts, among others the library collected by George III during his long reign. copy of every book, pamphlet, newspaper, piece

of music, etc., published anywhere in British territory, must be conveyed free of charge to the British Museum. The museum contains eight principal departments; namely, the department of printed books, maps, charts. plans, etc., the department of manuscripts; the department of natural history; the department of oriental antiquities; the department of Greek and Roman antiquities; the department of Greish and medals; the department of British and mediæval antiquities and ethnography: and the department of prints and drawings.

Brit'tany or (Bretagne), an ancient duchy and province of France, corresponding nearly to the modern departments of Finisterre, Côtes du Nord, Morbihan, Ille et Vilaine, Loire Inférieure. It is supposed to have received its name from the Britons who were expelled from England and took refuge here in the fifth century. Along the coast and toward its seaward extremity, the country is remarkably rugged, but elsewhere there are many beautiful and fertile tracts. Fisheries employ many of the inhabitants. The people still retain their ancient language, which is closely allied to Welsh, and is exclusively used by the peasantry in the western part of the province.

Brix' ham, a seaport and sea-bathing resort. England, Devonshire, on the south of Torbay. Brixham was the place where William III landed, Nov. 4, 1688. Pop. 7,664.

Bri'za, a genus of grasses, commonly called quaking grass, maiden's hair, or lady's tresses. There are about thirty species, chiefly found in South America. Two are natives of Britain: these and other species are sometimes to be found in gardens as ornamental plants.

**Broach** (or Baroach) (bröch, ba-röch'), town in Guzerat (Gujerat), Hindustan, on the Nerbudda, one of the oldest seaports of Western India, with a considerable coasting trade. The town was taken by storm by the British in 1772, and, with the district, ceded to them by treaty with Scindiah in 1803. Pop. 37,281.

**Broad Arrow**, a government mark placed on British stores of every description (as well as on some other things), to distinguish them as public or crown property, and to obliterate or deface which is felony. Persons in possession of goods marked with the broad arrow forfeit the goods and are subject to a penalty. The origin of the mark is not clearly known.

**Broad' sword**, a sword with a broad blade, designed chiefly for cutting, formerly used by some regiments of cavalry and Highland infantry in the British service. The claymoror broadsword was the national weapon of the Highlanders.

**Brocade**', a stuff of silk, enriched with raised flowers, foliage, or other ornaments. The term is restricted to silks figured in the loom, distinguished from those which are embroidered after being woven. Brocade is in silk what damask is in linen or wool.

**Brock**, SIR ISAAC (1769-1812), British soldier. He became lieutenant in 1790, served in the West Indies until 1793, was with the expedition in Holland in 1799, and at the battle of Copenhagen in 1801. In 1802 he went to Canada, where he suppressed a troublesome conspiracy. In 1810 he commanded the troops in Upper Canada, and became lieutenant governor of that province. General Brock moved his command to Detroit in 1812, and on August 16 captured General Hull with his entire army. Meanwhile a U. S. force of 6,000 men was gathered on the frontier of Niagara. These were attacked by General Brock, who fell at the head of his troops.

**Brock'en**, the highest summit of the Harz Mountains (3,742 ft.), in Prussian Saxony. celebrated for the atmospheric conditions which produce the appearance of gigantic spectral figures in the clouds, being shadows of the spectators projected by the morning or evening sun.

**Brockton**, Plymouth co., Mass., 20 mi. s. of Boston. Railroad: Old Colony. Manufactures: sewing machines, needles, shoe machinery, and tools. Seat of extensive boot and shoe factories. There are large granite deposits in the vicinity. Pop. est. 1897, 27,300.

**Brockville**, in united counties of Leeds and Greenville, Province of Ontario, on St. Lawrence River, 125 mi. w. of Montreal. Railroads: Grand Trunk, Canadian Pacific, and the Brockville, Westport & Sault Ste. Marie. Industries: manufacture of stoves, hardware, boilers and agricultural implements, carriage works, glove and wringer factories, and boat building. Brockville was first settled in 1800. Pop. est. 1897, 0,000.

Broglie (brol-yē), a family of Italian origin distinguished in the annals of French wars and diplomacy. 1. FRANÇOIS MARIE, DUC DE, marshal of France (1071-1745). 2. VICTOR FRANÇOIS, DUC DE, eldest son of preceding, likewise marshal of France (1718-1804); served in Italy, Bohemia, Bavaria, and Flanders. Was minister of war for a short time in 1789, and took part in the invasion of Champagne, 1792. 3. CLAUDE VICTOR, PRINCE DE (1757-1794), the third son of Victor François. He entered at first into the views of the revolutionary party, and was appointed field marshal in the army of the Rhine, but upon his refusal to acknowledge the decree of August 10, suspending the royal authority, was deprived of his command and afterward summoned before the revolutionary tribunal, and led to the guillotine. 4. ACHILLE LEONCE VICTOR CHARLES, DUC DE, peer of France, son of Claude Victor (1785-1870). In 1816 he married a daughter of Madame de Staël and was made a member of the chamber of peers. After the revolution of 1830 the Duc de Broglie and Guizot were the chiefs of the party called Doctrinnaires. He was minister of public instruction for a short time in 1830, and minister of foreign affairs from October, 1832, to April, 1834. In 1849 he was a conservative member of the Legislative Assembly, and after the coup d'état he continued a bitter enemy of the imperial régime. His latter years were devoted to philosophical and literary pursuits, and in 1856 he was elected a member of the French Academy. 5. ALBERT, DUC DE, son of the preceding, statesman and author, b. 1821. His principal work.

The Church and the Roman Empire in the Fourth Century, has passed through many editions. He has been ambassador at London, minister of foreign affairs, and head of a short-lived royalist ministry in 1877.

Broke, PHILIP BOWES VERE (1776-1841), a British admiral; distinguished himself, particularly in 1813, as commander of the Shannon, in the memorable action which that vessel fought with the U. S. vessel Chesapeake, off the American coast, and in which the latter was captured.

**Broken-wind**, a disease in horses, often accompanied with an enlargement of the lungs and heart, which disables them for bearing fatigue. In this disease the expiration of the air from the lungs occupies double the time that the inspiration of it does; it requires also two efforts rapidly succeeding each other, attended by a slight spasmodic action, in order fully to accomplish it. It is caused by rupture of the air-cells, and there is no known cure for it.

Broker, an agent who is employed to conclude bargains or transact business for others in consideration of a charge or compensation, which is usually in proportion to the extent or value of the transaction completeb by him. and is called brokerage. In large mercantile communities the business of each broker is usually limited to a particular class of transactions, and thus there are brokers with several distinctive names, as bill brokers, who buy and sell bills of exchange for others; insurance brokers, who negotiate between underwriters and the owners of vessels and shippers of goods; ship brokers, who are the agents of owners of vessels in chartering them to merchants or procuring freights for them from one port to another; stock brokers, the agents of dealers in shares of joint-stock companies, government securities, and other monetary investments.

**Brom berg,** a town of Prussia, province of Posen. Among its industries are machinery, iron founding, tanning, paper, tobacco, chicory, pottery, distilling, and brewing. Pop. 34,064.

**Bro'mine**, a non-metallic element discovered in 1826. In its general chemical properties it much resembles chlorine and iodine, and is generally associated with them. It exists, but in very minute quantities, in sea-water, in the ashes of marine plants, in animals, and in some salt springs. It is usually extracted from bittern by the agency of chlorine. At common temperatures it is a very dark reddish liquid of a powerful and suffocating odor, and emitting red vapor. It has bleaching powers like chlorine, and is very poisonous. Its density is about four and a half times that of water. It combines with hydrogen to form hydrobromic acid gas. With oxygen and hydrogen it forms bromic acid. Bromide of potassium has sedative and other properties, and is used in medicine (scrofula, goiter, rheumatism, etc.); bromide of silter is used in photography.

**Bron' chi** ( $-k\bar{i}$ ), the two branches into which the trachea or windpipe divides in the chest, one going to the right lung, the other to the left, and ramifying into innumerable smaller tubes-the bronchial tubes.

Bronchitis (bron-kI'tis), an inflammation of the mucous membrane of the bronchial tubes, or the air-passages leading from the trachea to the lungs. It is of common occurrence, and may be either acute or chronic. Its symp-toms are those of a feverish cold, such as headache, lassitude, and an occasional cough, which are succeeded by a more frequent cough occurring in paroxysms, a spit of yellowish mucus, and a feeling of great oppression on the chest. Slight attacks of acute bronchitis are frequent and not very dangerous. They may be treated with mustard poultices or Acute bronchitis is often a fomentations. formidable malady, and requires prompt treatment. Its main symptoms are cough, shortness of breath, and spit. It is particularly apt to attack a person in winter; and in the end may cause death through the lungs be-coming unable for their work, and through accompanying complications.

**Bron'té**, a town of Sicily, 22 mi. n. n. w. of Catania, in a picturesque situation at the w. base of Mount Ætna. Nelson was created duke of Bronté by the Neapolitan government in 1799. Pop. 14,567.

Bron'te, CHARLOTTE (afterward MRS. NICH-OLLS) (1816-1855), English novelist. After an education received partly at home and partly at neighboring schools. Miss Bronté became a teacher, and then a governess in a family. In 1842 she went with her sister Emily to Brussels, with the view of acquiring a knowl-edge of the French and German languages, and she subsequently taught for a year in the school she had attended here. They resolved now to turn their attention to literary composition; and in 1846 a volume of poems by the three sisters was published, under the names of Currer, Ellis, and Acton Bell. It was issued at their own risk, and attracted little attention, so they quitted poetry for prose fiction, and produced each a novel. Charlotte (Currer Bell) entitled her production The Professor, but it was everywhere refused by the publishing trade, and was not given to the world till after her death. Emily (Ellis Bell) with her tale of Wuthering Heights, and Anne (Acton Bell) with Agnes Grey, were more successful. Charlotte's failure, however, did not discourage her, and she composed the novel of Jane Eyre, which was published in October, 1847. Its success was immediate and decided. Her second novel of Shirley appeared in 1849. Previous to this she had lost her two sisters, Emily dying on Dec. 19, 1848, and Anne on May 28, 1849. In the autumn of 1852 appeared Charlotte's third novel, Villette. Shortly after, she married her father's curate, the Rev. Arthur Bell Nicholls, but in nine months d. of consump-Her originally rejected tale of The Protion. fessor was published after her death, in 1857, and the same year a biography of her appeared from the pen of Mrs. Gaskell.

**Bronze**, an alloy formed wholly or chiefly of copper and tin, in variable proportions. It has been used from a very early period. Ar-

chæologists distinguish a bronze age in prehistoric times in Western Europe (intermediate between those of stone and iron), characterized by a general use of the alloy for cutting instruments and other objects. The "brass" of the Bible was probably of the nature of The addition of tin to copper gives bronze. rise to a product more fusible than copper, and thus better suited for casting. The allov The prois also harder and less malleable. portions in which copper and tin are combined to make bronze vary according to the object for which the alloy is designed. With about 7 parts copper to 1 part tin, bronze is very hard, brittle, and sonorous. Soft bronze, again, which bears drifting, rolling, and draw-ing is generally composed of 16 copper to 1 tin; while a flexible, tenacious alloy good for nails and bolts, is made of 20 copper to 1 tin. In preparing bronze for statues, bas-reliefs, etc., the qualities chiefly looked at are fusibility and hardness, also readiness to acquire a fine patina on exposure, though it appears this may be acquired by bronzes differing widely in composition. A common statue bronze is formed of copper 80, tin 20. Bell metal, for large bells, is generally made with about 3 parts copper to 1 part tin; for house bells, 4 copper to 1 tin. The bronze of bells (as of various other objects) sometimes contains a little zinc, lead, etc., in addition to the primary ingredients. The Chinese tam tams or gonge. are made of bronze forged by the hammer: they contain about 20 per cent. tin, the rest

copper only. The Japanese bronzes are remarkable for the amount of work put upon them. A workman will often spend years on a single piece. They contain a large proportion of lead, the average composition being copper 80 parts, lead 10, tin 4, zinc 2, and the remaining four parts consisting of iron, nickel, arsenic, silver, Bronze can be covered with a and gold. black, red, brown, or green patina, as desired. by suitable oxidation or sulphurization. Some important researches on bronze for field-guns have lately been made by Colonel Uchatius of Vienna; and the steel bronze he produces is equal to steel in hardness, homogeneousness, resistance, and other qualities; while it is less affected by atmospheric agency, and less costly. These new bronze guns have been found to bear several hundred discharges successively without the slightest apparent deformation or other injury. The alloy known as aluminium bronze is one endowed with great strength, malleability, and ductility. It is formed of 10 parts aluminium and 90 of copper. In the melting of ordinary bronze, reverberatory furnaces have long been used, as rapid fusion is desirable in order to prevent loss of tin, zinc, or lead by oxidation. Bell founders often use dome-topped furnaces, as their alloy does not require so intense a heat for fusion; but there is some waste of material with these. The copper is melted first, and covered with small charcoal or coke; and the tin is rapidly thrust down to the bottom of the melted mass.

In casting a bronze statue the work, though

generally supposed to be that of the artist, is in reality the work of a score or more of men. When the cast reaches the foundry it is carefully unpacked and laid upon the sand tables. The moist molding sand is then pounded into every line and crevice in the plaster mold. This sand, which is all imported, is so adhesive that it readily receives and retains all impressions. When any one part, for example the eyes, have been filled with the sand, the edges are smoothed off with a sharp knife and sprinkled with starch. Another section is then pounded in and trimmed as before and starched. When the molding is complete, liquid plaster of Paris is poured around it and allowed to harden, after which the whole mass is bound with iron bands and allowed to stand two days to dry. Then the bands are taken off and the layer of sand with its outside coat of plaster is separated from the cast, from which it has re-ceived an exact impression. The inside of the sand mold is then painted with plumbago. The core is made by hammering more of the black sand into the half mold and allowed to dry. When it is taken out it is a sand image of the original cast. Then it is cut down about a quarter of an inch all around according to the desired thickness for the bronze. The core is then painted with plumbago. After the molds and core have been completed they are put into an oven where they become exceed-ingly hard. The core is then fitted into the two halves of the mold leaving a space between them equal to the amount shaved off for the molten bronze. Air holes are made in the bottom of the mold to allow the gas to escape and a funnel is placed in the top. The whole mass is bound with wooden girders and iron bands. The molten bronze is brought to the mold in a crucible and poured into the mold. They must have enough bronze or the whole process is of no value, and the casting is ruined. When the molds are filled the bronze is allowed to cool, after which the outside plaster and the sand mold are removed, leaving the bronze figure. If the bronze were to be solid there would be no core. The bronze figure when it first appears is rough and has small seams where the pieces of the mold were put together. These are smoothed down with a file and the statue is burnished with wire

brushes and emery paper. Bronze Age, a term in prehistoric archæology, denoting the condition or stage of culture of a people using bronze as the material for cutting implements and weapons. As a stage of culture, it comes in between the use of stone and the use of iron for these purposes. It is not an absolute division of time, but a relative condition of culture, which in some areas may have been reached earlier, in others later, while in some it may have been prolonged, and in others brief, or even, as in the Polynesian area, it may have been non-existent in consequence of the people passing directly from the use of stone to that of iron. The implements and weapons of the Bronze Age include knives, saws, sickles, awls, gouges, hammers, anvils, axes, swords daggers, spears, arrows, shields. The composition of the bronze varied considerably, but may be stated in general as about 90 per cent. of copper to 10 per cent. of tin.

**Bronze-wing,** a name for certain species of Australian pigeons, distinguished by the bronze color of their plumage. The common bronze-winged ground-dove abounds in all the Australiau colonies, and is a plump bird, often weighing a pound, much esteemed for table.

**Brooch** (brôch), a kind of ornament worn on the dress, to which it is attached by a pin stuck through the fabric. They are usually of gold or silver, often worked in highly artistic patterns and set with precious stones. Brooches are of great antiquity, and were formerly worn by men as well as women, especially among the Celtic races. Among the Highlanders of Scotland there are preserved in several families ancient brooches of rich workmanship and highly ornamented. Some of them seem to have been used as a sort of amulet or talisman.

**Brooke,** SIR JAMES (1803-1808), celebrated as the Rajah of Sarawak. In 1838, having gone to Borneo, he assisted the sultan of Brunei (the nominal ruler of the island) in suppressing a revolt. For his services he was made rajah and governor of Sarawak, a district on the n.w. coast of the island, and being established in the government he endeavored to induce the Dyak natives to abandon their irregular and piratical mode of life and to turn themselves to agriculture and commerce; and his efforts to introduce civilization were crowned with wonderful success. He was made a K.C.B. in 1847, and was appointed governor of Labuan. His son now rules Sarawak.

**Brookline**, Norfolk co., Mass., on Charles River, 4 mi. w. of Boston. It was originally a part of Boston, but was set off and incorporated as an independent township in 1705. Railroad: Boston & Albany. Industry: electric company. Surrounding country agricultural. Pop. est. 1897, 17,000.

Brooklyn, a city and seaport, New York state, on the w. end of Long Island, separated from the city of New York by East River, a strait about three quarters of a mile broad, crossed by steam ferries, and by a suspension bridge having a total length of 5,989 ft., and a clear height above high water of 135 ft. Brooklyn is one of the finest cities in the U.S., with broad, straight streets, many of them planted with rows of trees. It has a river front of nearly 9 mi., and covers an area of 16,000 acres. It is popularly known as the "city of churches," having about 300 of all denomina-Among the public buildings are the tions. city hall, of white marble, the jail, the county courthouse, the academy of music, etc. The literary and charitable institutions are very numerous. The Atlantic Dock is one of the largest in the U. S., covering 40 acres. The U. S. navy yard, on Wallabout Bay, occupies 45 acres. Brooklyn is a favorite residence of the wealthy New Yorkers. It has a large trade. It was founded in 1625, and was the scene of

several memorable events of the Revolution. Pop. 806,343.

**Brooks,** PHILLIPS (1835-1893), American bishop. Graduated from Harvard, 1855, and studied theology in Alexandria, Va. From 1859-1860 he resided in Philadelphia and thereafter in Boston. Trinity church, Boston, is a memorial to his ministry. His Christmas carol, O Little Town of Bethlehem, is preserved. In 1885 he received the title D. D. from Oxford, England. He was consecrated bishop of Massachusetts 1891, and his last public appearance was at Newton. Of commanding appearance, rapid of speech, and clear of utterance, he held audiences spellbound. In 1892 he was elected bishop of Massachusetts Diocese. He d. Jan. 23, 1893.

**Brooks**, PRESTON S. (1819-1857), American politician. He became a member of Congress in 1853, and attained an unenviable notoriety in May, 1856, by making a ferocious assault upon Charles Sumner in the U. S. Senate chamber.

Broom, a peculiar name which includes several allied genera of plants distinguished by a leguminous fruit and papilionaceous flowers. The common broom of Europe is a bushy shrub with straight, angular branches of a dark-green color, deciduous leaves, and flow-ers of a deep golden yellow. Its twigs are often made into brooms, and are used for thatch for houses and cornstacks. They have also been used for tanning. The whole plant has a very bitter taste, and a decoction of it is diuretic, in strong doses emetic. White broom, or Portugal broom, has beautiful white flowers. Spanish broom, or Spart, is an ornamental flowering shrub growing in Africa, Spain, Italy, and the s. of France, and often cultivated in English gardens. It has upright, round branches, that flower at the top, and spearshaped leaves. Its fiber is made into various textile fabrics, and is also used in papermaking. Dyer's broom yields a yellow color used in dyeing. Butcher's broom is an evergreen shrub of the order Liliaceæ, and therefore entirely different from the brooms proper.

**Broom-corn, Broom-grass, a** plant of the order of grasses, with a jointed stem, rising to the height of 8 or 10 ft., extensively cultivated in the U. S., where the branched panicles are made into carpet-brooms and clothes-brushes. The seed is used for feeding poultry, cattle, etc.

**Broth,** the liquor in which some kind of flesh is boiled and macerated, often with certain vegetables, to give it a better relish. Beeftea is a kind of broth. Scotch broth is a kind of soup in which pot barley is an ingredient.

**Brough**, JOHN (1811-1865), born at Marietta, O. When a boy he was apprenticed to a printer and later studied at the Ohio University. He became editor of political journals giving considerable attention to oratory, and held several public offices. He was admitted to the bar in 1846. In 1846 he became governor of Ohio, receiving the vote of all parties who were in favor of prosecuting the war. His opponent was C. L. Vallandigham, who was running on an anti-war platform. Brough's majority was over 100,000 and has ever since been referred to by politicians as the "Old John Brough majority."

**Brougham** (brom or bro'em), a close fourwheeled carriage, with a single inside seat for two persons, glazed in front and with a raised driver's seat, named after and apparently invented by Lord Brougham.

**Brougham** (bröm or brö'ém). HENRY, Baron Brougham and Vaux (1778–1868), an English statesman and jurist. Along with Jeffrey, Horner, and Sydney Smith he bore a chief part in starting the *Edinburgh Review* in 1802. He entered Parliament, agitated for reforms, and his fearless and successful defense of Queen Caroline in 1820 and 1821 placed him on the pinnacle of popular favor. In the ministry of Earl Grey he accepted the post of lord chancellor, and was raised to the peerage (Nov. 22, 1830) with the title of Baron Brougham and Vaux. In this post he distinguished himself as a law reformer, and aided greatly in the passing of the Reform Bill of 1832. In

Branch of Common Broom. a .- Flowering Branch.

1834 the Whig ministry were dismissed, and this proved the end of his official life, though for years he continued an active member of the House of Lords. In legal procedure he was the means of introducing various reforms.

Broussais (brö-sä), FRANÇOIS JOSEPH VICTOR (1772-1838), French physician. He is regarded as the founder of what was called the physiological system of medicine. According to his theory irritability was the fundamental property of all living animal tissues, and every

#### Brouwer

malady proceeded from an undue increase or

diminution of that property. Brouwer (brou'ver) (or Brauwer), ADRIAN (1608-1640). He was a pupil of Franz Hals, and was patronized by Rubens; but was of very dissipated habits. His works are chiefly tavern scenes and other delineations of low life, and rank among the best of their kind.

Brown, a color which may be regarded as a mixture of red and black, or of red, black, and yellow. There are various brown pigments, mostly of mineral origin, as bistre, umber, cappagh brown, etc.

**Brown**, CHARLES BROCKDEN (1771-1810), an eminent novelist. He was destined for the law, but the term intended for preparatory legal study was principally occupied with literary pursuits. His novel Wieland, or the Transformation, was published in 1798: Ormond, or the Secret Witness, in 1799; and Arthur Mervyn in 1800. In the last-named work the ravages of the yellow fever, which the author had witnessed in New York and Philadelphia, are painted with terrific truth. He was originator of the Monthly Magazine and American Review. He also founded in 1805 the Literary Magazine and American Register, which he edited for five years. Among his other works are Clara Howard and Jane Talbot.

Brown, GEORGE (1818-1880), a Canadian statesman. He was educated in Scotland, came to New York in 1838, and published there the British Chronicle. In 1843 he went to Canada, and the following year issued the first number of the Toronto Globe. He sat in the Dominion Parliament 1851-67. In 1873 he entered the Senate. He was shot by a discharged employé, and died from the effects of his wound two months later.

Brown, HENRY KIRKE (1814-1886), American sculptor. At an early age he made an excellent portrait of an old man. He studied painting with Chester Harding of Boston, and anatomy in Cincinnati, where he modeled his first bust. In 1840 he went to Troy and Albany, executing many portrait busts of prominent persons. He was in Italy 1842-1846. He returned to New York and opened a studio, where the first bronze-casting was done in this city. In 1850 he removed to Brooklyn, and was engaged with the statue of De Witt Clin-ton for Greenwood cemetery for two years, the first bronze statute cast in America. In 1857 he was invited by South Carolina to make the pediment for the statehouse in Columbia. It represented a colossal figure of South Carolina, with Justice and Liberty at either side, and industries represented by negro slaves at work in the cotton and rice plantations. This work was destroyed by Sherman's soldiers in 1865. Mr. Brown's principal statues are: Abraham Lincoln in Prospect Park, Brooklyn (1866); Gen. Nathanael Greene for the state of Rhode Island, presented to the National Gallery in the capitol, Washington (1867); Abra-hum Lincoln, Union Square, New York; Eques-trian Status of General Scott, Scott Circle, Washington (1872); Gen. George Clinton, presented by the state of New York to the U.S.

government (1873); Gen. Philip Kearney, in Newark, N. J.; Richard Stockton, for New Jersey (1874); an Equestrian Statue of Gen. Nathanael Greens, for the U.S. government (1875-76).

Brown, JOHN (1800-1859), an American abolitionist, celebrated as the originator of the Harper's Ferry insurrection, was b. in Tor-rington, Conn., May 9. Originally intended for the church, he was compelled to give up study on account of inflammation in the eyes. He then took up the business of a tanner. which he carried on for twenty years. Not being very successful in trade he started business as a wool dealer in Ohio in 1840. Failing in this he removed to Essex co., N. Y. in 1849, and began to reclaim a large tract of land which had been granted to him. After two years he returned to Ohio and resumed his business as a wool dealer. In 1855, with his four sons, he migrated to Kansas and at once took a prominent position as an anti-slavery man. He became renowned in the fierce border warfare which was carried on for some years in Kansas and Missouri, and gained particular celebrity by his victory at Osawat-About this time he seems to have omie. formed the idea of effecting slave liberation by arming the slaves and inciting them to rise in revolt against their oppressors. As the first step in this scheme, he designed to seize the arsenal of Harper's Ferry, where an immense stock of arms was kept. On the night of Oct. 10, 1859, he, with a handful of well-armed and resolute companions, overpowered the small guard and gained possession of the arsenal. During the next morning he made prisoners of some of the chief men of the town, but there was no rising of slaves as had been expected. The townsmen, too, recovered from their astonishment at the audacity of the act, and a bold attack was made on the arsenal. Fresh assailants poured in from the country round, and on the morning of the 18th the arsenal was recaptured, and Brown, severely wounded. was taken prisoner. On October 27, he was tried at Charlestown for treason and murder, and was found guilty. The sentence passed upon him, death by hanging, was carried into execution December 2. He was immortalized by the Union soldiers in the war song, John Brown's body lies a-moldering in the grave.

Brown, JOHN (1735-1788), author of the Brunonian system in medicine. He maintained that the majority of diseases were proofs of weakness and not of excessive strength or excitement, and therefore contended that indiscriminate lowering of the system, as by bleeding, was erroneous, and that supporting treatment was required. His system gave rise to much opposition, but his opinions materially influenced the practise of his professional successors.

Brown, JOSEPH EMERSON. b. 1821. He was elected to the Georgia state senate in 1849, became judge in 1855, and was governor 1857-1865. At the outbreak of the Civil War, Governor Brown, who was an active secessionist, seized the U. S. forts and the arsenal at Augusta, Ga. After the war he advised his state to accept the terms of reconstruction offered, and for a time he acted with the Republican party. He was defeated for U. S. senator in 1868, and was appointed chief justice of the state supreme court in the same year. In 1872 he again joined the Democratic party during the Greeley campaign; in 1880 was elected U. S. senator for the unexpired term of General Gordon, and was re-elected in 1884.

**Brown**, ROBERT (1773-1858), a noted English botanist. In 1800 he was appointed naturalist to Flinders's surveying expedition to Australia. He returned with nearly 4,000 species of plants, and was shortly after appointed librarian to the Linnæan Society. He was the first English writer on botany who adopted the natural system of classification, which has since entirely superseded that of Linnæus. As a naturalist Brown occupied the very highest rank among men of science. A collection of his miscellaneous writings has been published by the Ray Society.

Browne, CHARLES FARRAR, see Artemus Ward.

Browne (1815-1882), HABLOT KNIGHT, an English designer of humorous and satirical subjects, and an etcher of considerable skill, better known by the pseudonym of "Phiz," born at Kennington, Surrey. In 1835 he succeeded Seymour as the illustrator of Dickens's *Pickwick*, and was afterward engaged to illustrate Nicholas Nickleby, Dombey and Son, Martin Chuezlevit, Darid Copperfield, and other works of that author. He also illustrated the novels of Lever, Ainsworth, etc., besides sending many comic sketches to the illustrated serials of the times.

Browne, SIR THOMAS (1605-1682), an English physician and writer. In 1642 was published his *Religio Medici* (A Physician's Religion), which excited the attention of the learned, not only in England but throughout Europe, gave rise to doubts of the author's orthodoxy, and was translated into various languages. In 1646 appeared his *Treatise on Vulgar Er*rors. In 1658 his *Hydriotaphia* (or *Treatise* on Urn-Burial) appeared conjointly with his Garden of Cyrus. He was a believer in alchemy, astrology, and witchcraft.

**Browne**, WILLIAM (1591-1645), an English poet. In his twenty-third year he published his Britannia's Pastorals, which met with great approbation; and in the following year appeared his Shepherd's Pipe. In 1616 he published the second part of his Britannia's Pastorals, which met with equal success with the former.

**Brownie**, in Scotland an imaginary spirit formerly believed to haunt houses, particularly farmhouses. Instead of doing any injury he was believed to be very useful to the family, particularly to the servants if they treated him well, for whom he was wont to do many pieces of drudgery while they slept. The brownie bears a close resemblance to the Robin Goodfellow of England, and the Kobold of Germany.

Browning, ELIZABETH BARRETT (1809–1861),

## Browning

English poetess. Her father, Edward Moulton, took the name of Barrett, on succeeding to some property. She grew up at Hope End, near Ledbury, Herefordshire, where her father possessed a large estate. Her bodily frame was from the first extremely delicate, and she had been injured by a fall from her pony when a girl, but her mind was sound and vigorous, and disciplined by a course of severe and exalted study. She early began to commit her thoughts to writing, and in 1826 a volume, entitled An Essay on Mind, with Other Poems, appeared of her authorship. A money catastrophe compelled her father to settle in London, and her continued delicacy received a severe shock by the accidental drowning of her brother, causing her to pass years in the confinement of a sickroom. Her health was at length partially restored, and in 1846 she was married to Mr. Robert Browning, soon after which they set-tled in Italy, and continued to reside for the most part in the city of Florence. Her Prome-theus Bound (from the Greek of Æschylus) and Miscellancous Poems appeared in 1833; the Seraphim and Other Poems in 1838. In 1856 a collected edition of Mrs. Browning's works appeared, including several new poems, and among others Lady Geraldine's Courtship. Casa Guidi Windows, a poem on the struggles of the Italians for liberty in 1848-40, appeared in 1851. The longest and most finished of all her works, Aurora Leigh, a narrative and didactic poem in nine books, was published in 1857. Poems before Congress, appeared in 1860, and two posthumous volumes, Last Poems, 1862, and The Greek Christian Poets and the English Poets (prose essays and translations), 1863, were edited by her husband.

Browning, ROBERT (1812-1889), an English poet. In 1846 he married Elizabeth Barrett, and resided chiefly in Italy, making occasional visits to England. His first poem, Pauline, was published in 1833; followed by Paracelsus in 1835; Stafford, a Tragedy (1837), produced at Covent Garden, Macready and Helen Faucit playing the chief parts. Sordello appeared in 1840, followed by the series called Bells and Pomegranates, including the three plays Pippa Passes, King Victor and King Charles, and Colombe's Birthday; four tragedies: The Return of the Druses, A Blot on the Scutcheon, Luria, and The Soul's Tragedy; and a number of Dramatic Lyrics, among them the well-known Pied Piper of Hamelin, and How they Brought the Good News from Ghent to Air (1841-46). Between 1846 and 1868 appeared Men and Women, Christmas Ere and Easter Day; Dramatis Persona, and some shorter poems. The Ring and the Book (1869). his longest poem, was followed by Balustion's Adventure; and Prince Hohenstiel-Schwangau (1871); Fifine at the Fair (1872); Red Cotton Nightcap Country (1873); Aristophanes's Apology; Inn Album (1873); Pacchiarotto (1876); La Sai-saiz (1878); Dramatic Idylls (1879-80); Jocoseria (1883); Ferishtah's Fancies (1884); and Parley-ings with Certain People of Importance in Their Day (1887). Browning received the degree of D.C.L. from Oxford in 1882. A Browning Society for the study of his works was formed

in 1881, under whose auspices several of his dramas have been performed. His poems are often difficult to understand from the quick transitions of thought, and they are not infrequently rugged and harsh in expression, yet they are among the chief poetic utterances of the century.

**Brownlow**, WILLIAM G. (1805–1877), a Southern Unionist, born in Virginia. He became a Methodist preacher, and afterward edited various newspapers in Tennessee. He became governor of that state in 1864, served two terms, and was in 1869 elected to the U. S. Senate. "Parson Brownlow," as he was called, edited the Knoxville Whig until it was suppressed by the Confederacy, and was always loyal to the Union cause.

Brown-Sequard, EDOUARD (1818-1894), an American physician. His father was an American sea captain, his mother a Frenchwoman. He was a professor in the medical department of the Harvard University, 1864-68, and was connected with the Virginia Medical College. In 1869 he was appointed professor of pathology in the School of Medi-cine at Paris, in 1873 established a medical journal in New York, and in 1878 became professor of medicine in the College of France. He wrote many scientific papers, and in 1889 made public the results of some experiments which he had made on human subjects with subcutaneous injections of an infusion pre-pared from the testes of animals. The effect pared from the testes of animals. of this treatment was claimed to be powerfully tonic and stimulant, but it proved to be of no practical value.

Brownson, ORESTES AUGUSTUS (1803-1876), American clergyman. He joined the Presbyterian Church in 1822, but changed his views and became a Universalist in 1825. He conducted the Gospel Advocate, the organ of the latter church, and was afterward editor of the Philanthropist. In 1828, he tried to form in New York a workingman's party. He was drawn to the Unitarians by Doctor Channing, and in 1832 became pastor of a congregation of this denomination. In 1838 he established the Boston Quarterly Review, of which he was the proprietor, and almost sole writer. This was afterward merged into the Democratic Review of New York. In 1844 he became a Roman Catholic, and afterward remained a layman in that faith. Subsequently he founded Bronca-son's Quarterly Review. This was the first American periodical printed in England, where it had a circulation among Roman Catholics.

**Brown Paper**, a coarse kind of wrapping paper made from unbleached materials.

**Brownsville**, Cameron co., Tex., on the Rio Grande River, and Rio Grande Railroad. It is the center of a stock-raising district and has a trade with Mexico. Pop. est. 1897, 6,200.

trade with Mexico. Pop. est. 1897, 6,200. Brown University, Providence, R. I. was founded in 1764, the original name being Rhode Island College. It is one of the best equipped universities in the U. S. It has an annual income of nearly \$200,000, about 900 students, 78 professors and instructors, 16 buildings, and a library of 80,000 volumes. It is co-educational, and Baptist in denomination.

Bruce, BLANCHE K., born a slave in Virginia, 1841; came north during the Civil War, and studied at Oberlin College. Ohio. In 1875, he became U. S. senator from Mississippi, and on May 19, 1881, was appointed register of the treasury by President Garfield.

Bruce, a family name distinguished in the history of Scolland. The family of Bruce was of Norman descent, its founder having obtained from William the Conqueror large grants of land in Northumberland. After being frequently involved in border warfare with the Scots, the house of Bruce received, about 1130, from David I a grant of the lands of Annandale, thus obtaining a footing in the south of Scotland.

Bruce, EDWARD, a brother of Robert I, who, after distinguishing himself in the war of independence, crossed in 1315 to Ireland to aid the native septs against the English. After many successes he was crowned king of Ireland at Carrickfergus, but fell in battle near Dundalk in 1318.

Bruce, ROBERT (1274-1329), the greatest of the kings of Scotland. In 1296, as Earl of Carrick, he swore fealty to Edward I, and in 1297 fought on the English side against Wallace. He then joined the Scottish army, but in the same year returned to his allegiance to Edward until 1298, when he again joined the national party, and became in 1299 one of the four regents of the kingdom. In the three final campaigns, however, he resumed fidelity to Edward, and resided for some time at his court; but, learning that the king meditated putting him to death on information given by the traitor Comyn, he fled in February, 1306, to Scotland, stabbed Comyn in a quarrel at Dunfries, assembled his vassals at Lochmaben Castle, and claimed the crown, which he received at Scone, March 27. Being twice defeated, he dismissed his troops, retired to Rathlin Island, and was supposed to be dead, when, in the spring of 1307, he landed on the Carrick coast, defeated the Earl of Pembroke at London Hill, and in two years had wrested nearly the whole country from the English. He then in successive years advanced into England, laying waste the country; and on June 24, 1314, defeated at Bannockburn the English forces advancing under Edward II to the relief of the garrison at Stirling. In 1316 he went to Ireland to the aid of his brother Edward, and on his return in 1318, in retaliation for inroads made during his absence, he took Berwick and harried Northumberland and Yorkshire. Hostilities continued until the defeat of Edward near Byland Abbey in 1323, and though in that year a truce was concluded for thirteen years it was speedily broken. Not until March 4, 1328, was the treaty concluded by which the independence of Scotland was fully recognized. Bruce did not long survive the completion of his work, dying at Cardross Castle on June 7, 1329. He was twice marrled: first, to a daughter of the Earl of Mar, Isabella, by whom he had a daughter, Marjory, mother

of Robert II; and then to a daughter of Aymer de Burgh, Earl of Ulster, Elizabeth, by whom he had a son, David, who succeeded him.

Brueys-d' Aigailiers (bru-å-då-gål-yå), FRANÇOIS-PAUL (1753-1798), a French admiral, became captain in 1792, and vice admiral in 1798. He successfully conveyed Bonaparte and his army to Egypt in 1798, but was killed in the subsequent naval battle in the Bay of Aboukir shortly before his ship, the Orient, blew up.

Bruges (brüzh) an old walled city of Bel-gium, capital of West Flanders, 57 mi. n.w. Brussels, on the railway to Ostend. It is an important canal center, and has over fifty bridges, all opening in the middle for the passage of vessels. The principal canals are those to Sluis, Ghent, and Ostend, on all of which large vessels can come up to Bruges. In the thirteenth and fourteenth centuries it was one of the chief commercial places in Europe, and an important member of the Hanseatic League. Toward the end of the fifteenth century it began to decline, but still carries on a considerable trade with the n. of Europe, and is by its canals an entrepôt of Belgian commerce. Among its more noteworthy buildings are the Halles, a fine old building, with a tower 354 ft. high, in which is a fine set of chimes; the Hotel de Ville, the Bourse, and the Palace of Justice; the church of Nôtre Dame, with its elevated spire and splendid tombs of Charles the Bold and Mary of Burgundy, etc. The town possesses interesting works of art by Jan Van Eyck, Memling, the Van Oosts, etc. Textile goods, lace, etc., are manufactured. Pop. 46,274.

**Brumaire** (brü-mär), the second month in the calendar adopted by the first French Republic, beginning on October 23, and ending November 21.

**Brummell**, GEORGE BRYAN (Beau Brummell) (1778-1840), son of a clerk in the Treasury, b. in London in 1778. He was educated at Eton and at Oxford, and at the age of sixteen made the acquaintance of the Prince of Wales, afterward George IV, who made him a cornet in his own regiment of the Tenth Hussars, and secured his rapid promotion. The death of his father in 1794 brought him a fortune of \$150,000, which he expended in a course of sumptuous living, extending over twenty-one years, during which his *dicta* on matters of etiquette and dress were received in the *beau* monde as indisputable. His creditors at length became clamorous, and in 1816 he took refuge in Calais, where he resided for many years. partly supported by the remains of his own fortune, and partly by remittances from friends in England. Subsequently (1830) he was appointed consul at Caen, but on the abolition of the post was reduced to absolute poverty, and died in a lunatic asylum at Caen.

Brun anburgh, the scene of a British battle in which Athelstan and the Anglo-Saxons defeated a force of Scots, Danes, etc., in 937; locality very doubtful.

Brune (brön), GUILLAUME MARIE ANNE (1763-1815), marshal of France, son of a lawyer

at Brive-la-Gaillarde. In 1793 he joined the army, and afterward distinguished himself at Arcola and Verona as general of brigade in the Italian army. In 1799 he compelled the British and Russians to evacuate the north of Holland. In 1800 he pacified La Vendée, and, replacing Masséna as commander of the Italian army, led his troops over the Mincio, conquered the Austrians, passed the Adige, took possession of Vicenza and Roveredo, and hastened the conclusion of peace. In 1802-4 he was ambassador at Constantinople, and the latter year was made a marshal. Losing the favor of Napoleon, he remained without employment for some years, but on the return of Napoleon from Elba he received an important command in the south of France, which he was soon after compelled to surrender at the second restoration. He then set out for Paris, but was attacked and brutally killed by the populace at Avignon

**Brunchilda**, a Visigothic princess, married to Siegebert I, king of Austrasia, in 568. To avenge her sister (assassinated at the instigation of Fredegonde) she involved her husband in a war with his brother Chilperic, in the course of which Siegebert was murdered, A. D. 575, and she herself taken prisoner. She induced Meroveus, one of Chilperic's sons, to marry her, effected her escape, recovered her authority and maintained it till 613, when she was captured by Fredegonde's son, Clothaire II of Soissons, who had her torn to pieces by wild horses as the murderess of ten kings and royal princes.

**Brunei** (brö'nt) (Bruni), an independent Malayan sultanate on the northwest coast of Borneo, between Sarawak and British North Borneo, exporting sago, gutta-percha, rubber, etc.; pop. 125,000. Its capital, also called Brunei, is situated on the river of same name, about 14 mi. from its mouth, the houses being mostly raised above the water on posts. It has a considerable trade, its pop. being 30,000 to 55,000.

**Brunel'**, ISAMBARD KINGDOM (1806-1859), English engineer, son of Mark Isambard Brunel. He was educated at the Henri IV College, Paris; and commenced practical engineering under his father, acting at twenty as resident engineer at the Thames Tunnel. Among his best-known works were the Great Western, Great Britain, and Great Eastern steamships; the entire works on the Great Western Railway, to which he was appointed engineer in 1833, the Hungerford Suspension Bridge. docks at Plymouth, Milford Haven, etc.

**Brunel'**, MARK ISAMBARD (1769-1849), a distinguished engineer. He was educated in Rouen, his mechanical genius early displaying itself. In 1786 he entered the French naval service, and in 1793 only escaped proscription by a hasty flight to America. He was afterward employed as engineer and architect in the city of New York, erecting forts for its defense, and establishing an arsenal and foundry. In 1799 he proceeded to England and settled at Plymouth, rapidly winning reputation by the invention of an important machine

for making the block-pulleys for the rigging of ships. Among his other inventions were a machine for making seamless shoes, machines for making nails and wooden boxes, for ruling paper and twisting cotton into hanks, and a machine for producing locomotion by means of carbonic acid gas; but his greatest engineering triumph was the Thames Tunnel, commenced March, 1825, and opened in 1843. Brunelleschi (brö-nel-es'kē), FILIPPO (1377-

When at Rome with 1446), Italian architect. Donatello he conceived the idea of bringing architecture back to Græco-Roman principles as opposed to the dominant Gothic. In this he was successful, his work opening the way for Alberti, Bramante, Vignola, and Palladio. His great achievement was the dome of the cathedral of Santa Maria at Florence, the possibility of which was denied by other archi-tects. It has remained unsurpassed, the dome of St. Peter's, though it excels in height, being inferior to it in massiveness of effect. Other important works by him were the Pitti Palace at Florence, the churches of San Lorenzo and Spirito Santo, and the Capella dei Pazza.

Bruni. See Brunei.

**Brunings** (brö'ningz), CHRISTIAN (1736–1805), a great hydraulic architect of Holland; appointed general inspector of rivers by the States of Holland in 1769.

**Brünn** (brun), an Austrian city, capital of Moravia, on the railway from Vienna to Prague, nearly encircled by the rivers Schwarzawa and Zwittawa. It contains a cathedral and other handsome churches; a landhaus, where the provincial assembly meets, and several palaces; and has extensive manufactures of woolens, which have procured for it the name of the Austrian Leeds. It is the center of Moravian commerce, a great part of which is carried on by fairs. Near it is the fortress of Spielberg, in which Trenck and Silvio Pellico were confined. Pop. 95,342.

**Bruno,** The Great (925-965). Archbishop of Cologne and Duke of Lorraine, third son of Henry the Fowler, and brother of the Emperor Otho I. He was employed in various important negotiations, and was a great patron of learning. Commentaries on the Pentateuch, and some biographies of saints, are ascribed to him.

**Bruns' wick**, a duchy and sovereign state in the n.w. of Germany, area 1,425 sq. mi. It is divided into several detached portions, surrounded by the Prussian provinces of Hanover, Saxony, and Westphalia. A good portion of it is hilly or undulating, and it partly belongs to the Harz mountain system. Mining is carried on chieffy in the Harz, and the minerals include iron, lead, copper, brown coal, etc. About half the surface is arable, and the chief cultivated products are grain, flax, hops, tobacco, potatoes, and fruit. Brewing, distilling, the manufacture of linens, woolens, and leather, the preparation of paper, soap, tobacco, beet-sugar, with agriculture and mining, afford the principal employment of the people. As a state of the German Empire it sends two members to the Bundesrath and, three deputies to the Reichstag. In its internal government it is a constitutional monarchy. On the death of the Duke of Brunswick without issue in 1884 the Duke of Cumberland claimed the succession. Bismarck, however, interfered, and the Brunswick diet decided Albrecht of Prussia being elected to the post. Pop. 403,773. Brunswick, the capital, is situated on the Oker, and on the railway from Hanover to Berlin. The older streets are narrow, tortuous, and antiquated. The principal buildings of note are the ducal palace. the cathedral of St. Blaise (1173), St. Catherine's church (dating from 1172), and St. Magnus's (1031), the Gewandhaus, and the fine old Gothic Council House. The educational institutions include the polytechnic school, a gymnasium. etc., and there are a city museum, a ducal mu-seum, and a public library. The principal manufactures are wool, linen, jute, machinery, sewing machines, etc. Pop. 101,047.

**Brunswick**, Glynn co., Ga., on Oglethorpe Bay, 90 mi. s. of Savannah. Surrounding country agricultural. Railroads: Southern Railroad, and B. & W. part of the Plant System. Industries: two barrel factories, two iron foundries, and oyster-canning factory. The town was laid out in 1837, and became a city in 1856. Pop. est. 1897, 12,000.

Branswick, Cumberland co., Me., on the Androscoggin River. Railroad: Maine Central. It is the seat of Bowdoin College. Principal industries: paper, cotton, and lumber manufactories. Pop. est. 1897. 6.500.

cipal industries: paper, cotton, and lumber manufactories. Pop. est. 1897, 6,500. Brunswick, Family of, a distinguished family founded by Albert Azo II, Marquis of Reggio and Modena, a descendant, by the female line, of Charlemagne. In 1047 he married Cunigunda, heiress of the Counts of Altorf, thus uniting the two houses of Este and Guelph. From his son, Guelph. who was created Duke of Bavaria in 1071, and married Judith of Flanders, a descendant of Alfred of England, descended Henry the Proud. who succeeded in 1125, and by marriage acquired Brunswick and Saxony. Otho, the great grandson of Henry by a younger branch of his family, was the first who bore the title of Duke of Brunswick (1235). By the two sons of Ernst of Zell, who became duke in 1532, the family was divided into the two branches of Brunswick-Wolfenbüttel (II) and Brunswick-Hanover, from the latter of which comes the present royal family of Britain. The former was the German family in possession of the duchy of Brunswick until the death of the last duke in 1884. George Louis, son of Ernst Augustus and Sophia, granddaughter of James I of England, succeeded his father as elector of Hanover in 1698, and was called to the throne of Great Britain in 1714 as George I.
