**Brunswick Black**, a varnish composed chiefly of lamp-black and turpentine, and applied to cast-iron goods. Asphalt and oil of turpentine are also ingredients in some kinds of it.

Brusa (Broussa) (brö'så) (or Bursa), a Turkish city in Asia Minor: s. of the Sea of Mar-

25

mora, about 20 mi. distant from its port, Mudania, with a pop. of 72,560 Turks, Greeks, Armenians, and Jews, engaged in commerce, and the manufacture of satins, silk stuffs, carpets, gauze, etc. The town is situated in a fertile plain, which is enclosed by the ridges of Olympus, and abounds in hot springs. Brusa represents the ancient Prusa, long capital of Bithynia, and one of the most flourishing towns in the Greek empire of Constantinople. It was the residence of the Turkish sovereigns from 1329 until the transference of the seat of empire to Adrianople in 1365.

**Brush**, a well-known implement used for various purposes. There are two chief varieties, those with stiff hair or fibers, and those with flexible. The former are made of hog's bristles, whalebone fibers, vegetable fibers of various kinds (brush-grass, palms, etc.), and sometimes wire is made to serve the same purpose. The latter are made of hog's bristles, or of the hair of the camel, badger, squirrel, sable, goat, etc., and are chiefly used for painting, the smallest kinds being called *pencils*.

Brush, CHARLES FRANCIS, b. 1849: an American inventor in Ohio; graduated at the University of Michigan in 1869. He became an analytical chemist, and turned his attention to electric lighting. He invented a dynamo and an electric lamp, which were successfully introduced in 1876, and he has more than fifty patents relating to these inventions.

Brus'sels, the capital of Belgium, and of the province of Brabant. The city consists of a northwestern or lower portion and a south-eastern or upper portion. The older part is surrounded with fine boulevards on the site of its fortifications, and in many places presents a congeries of twisted streets. The upper town, which is partly inside the boulevards and partly outside, is the finest part of the city, and contains the king's palace, the palace of the chambers, the palace of justice (a magnificent new building of colossal proportions in the classical style, ranking among the finest in Europe), the palace of the fine arts, the public library and museum, etc.; and has also a fine park of 17 acres, around which most of the principal buildings are situated. The lower town retains much of its ancient appearance. The hôtel de ville (1401-55) is an imposing Gothic structure, with a spire 364 ft. in height, the square in front of it being perhaps the most pictorial of all the public places of Brussels. The cathedral of Saint Gudule (dating in part from the thirteenth century) is the finest of many fine churches, richly adorned with sculptures and paintings. The whole town is rich in monuments and works of art. The institutions comprise a university, an academy of science and the fine arts and polytechnic school; one of the finest observatories in Europe; a conservatorium of music; a public library, containing 400,000 volumes and 30,000 MSS.; a picture gallery, with the finest specimens of Flemish art; and many learned societies and educational organizations. The manufactures and trade are greatly promoted by canal communications with Charleroi, Mechlin, Antwerp, and the ocean, and by the network of Belgian railways. The industries are varied and important. Lace was an ancient manufacture, and is still of great importance; the manufacture of cotton and woolen fabrics, paper, carriages, and many minor manufac-tures are carried on. There are breweries, dis-tilleries, sugar refineries, foundries, etc. The language spoken by the upper classes is French, and Flemish is that of the lower; but German, Dutch, and English are also a good deal spoken. During the Middle Ages Brussels did not attain great importance. It was walled by Bald-ric of Louvain in 1044; was more completely fortified in 1380; and was twice burned and once ravaged by the plague during the fifteenth century. It was bombarded and burned by the French in 1695; and was again taken by the French in 1794, and retained till 1814, when it became the chief town of the department of the Dyle. From 1815 to 1830 it was one of the capitals of the Kingdom of the Netherlands, and in 1830 was the chief center of the revolt which separated Belgium from Holland. Pop. 176,138.

**Brussels Sprouts**, one of the cultivated varieties of cabbage having an elongated stem 4 or 5 ft. high, with small clustering green heads like miniature cabbages. They are cultivated in great quantities near Brussels.

**Brutus** (or Brute), the first king of Britain: a purely mythical personage, said to have been the son of Sylvius, and grandson of Ascanius, the son of Æneas. He landed in Devonshire, destroyed the giants then inhabiting Albion, and called the island from his own name. At his death the island was divided among his sons: Locrine, Cumber, and Albanact.

**Brutus**, DECIMUS JUNIUS, served under Julius Cæsar in Gaul, and was afterward commander of his fleet, but, like his relative, Marcus Junius Brutus, joined in the assassination of Cæsar. He was afterward for a short time successful in opposing Antony, but was deserted by his soldiers in Gaul and betrayed into the hands of his opponent, who put him to death in B. c. 43.

Brutus, LUCIUS JUNIUS, ancient Roman hero, son of Marcus Junius by the daughter of the elder Tarquin. He saved his life from the persecutions of Tarquin the Proud by feigning himself insane, whence his name Brutus (stupid). On the suicide of Lucretia, however, he threw off the mask, and headed the revolt against the Tarquins. Having secured their banishment, he proposed to abolish the regal dignity and introduce a free government, with the result that he was elected to the consulship, in which capacity he condemned his own sons to death for conspiring to restore the monarchy. He fell in battle B. c. 509.

**Brutus**, MARCUS JUNIUS (B. c. 85-42), a distinguished Roman; was at first an enemy of Pompey, but joined him on the outbreak of civil war until the battle of Pharsalia. He then surrendered to Cæsar, who made him in the following year governor of Cisalpine Gaul, and afterward of Macedonia. He soon, how-

ever, joined the conspiracy against Cæsar, and by his influence insured its success. After the assassination he took refuge in the East, made himself master of Greece and Macedonia, and with a powerful army joined Cassius in the subjugation of the Lycians and Rhodians. In the meantime the triumvirs, Octavianus, Antony, and Lepidus, had been successful at Rome. and were prepared to encounter the army of the conspirators, which, crossing the Hellespont, assembled at Philippi in Macedonia. Cassius appears to have been beaten at once by Antony: and Brutus, though temporarily successful against Octavianus, was totally defeated twenty days later. He escaped with a few friends: but, seeing that his cause was hopelessly ruined, fell upon the sword held for him by his confidant Strato, and died.

Bryan, WILLIAM JENNINGS, was b. in Salem, Ill., March 19, 1860. He graduated from Illinois College, Jacksonville, Ill., in 1881, and immediately entered the Union College of Law at Chicago. In 1883 he began the practise of his profession in Jacksonville, Ill. A year later he married Mary Baird. In 1887 he removed to Lincoln, Neb., and has been actively constate ever since, being elected to the 52d and 53d Congresses. In 1896 he was nominated by the Democratic National Convention for president of the United States, but at election was defeated by William Mc Kinley, Republican. The main issue of the campaign was the money question, Bryan and his constituents advocating the free coinage of silver at the ratio of 16 to 1. The Republican platform rather favored the gold standard. Bryan has written a book, "The First Battle," which contains a history of the campaign together with a number of his own speeches on the silver question. He was the first presidential nominee to take the stump in his own behalf. Bryan has three children, two girls and a boy. He is now on the lyceum platform.

Bryant, WILLIAM CULLEN (1794-1878), a famous American poet and journalist, b. at Cummington, Mass. His father, Peter Bryant, physician, encouraged his literary tastes. He contributed his first poem to a country newspaper when but ten years old. He published in Boston (1807) The Embargo. A second edi-tion, including the Spanish Revolution, appeared in 1809. Bryant entered Williams College (1810), but left to study law at Worthington. He removed to Bridgewater (1814) to continue his studies, and was admitted to the bar (1815) at Plymouth. At Great Barrington he became distinguished as an orator. Married Miss Frances Fairchild (1821). Thanatopsis. published in the North American Review (1817), won him fame, as did his Essay on American Poetry. He gave up law and removed to New York, 1825. He became editor of the New York Review, and in 1826 assistant editor of the Evening Post; later (1829) he became editor-in-chief. He entered warmly into the antislavery struggle, and helped to form the Republican party (1856). To the Post Bryant gave a dignified

and high moral tone. A complete collection of Bryant's poems was reprinted in London with a laudatory preface by Irving. His prose is marked by clearness, vigor, and purity of diction, while his poetry is both philosophical and religious. The Fountain, and Other Poems (1842), The White-footed Deer, and Other Poems (1844), and many original and collected works, show his power as a writer. A festival was given in his honor at the Century Club (1864), and in 1876 he was presented with a silver vase, a token of the esteem of contemporaneous literary admirers. He died June 12, 1878, from the effect of a fall. Bryant's Library of Poetry and Song, and his Illustrated History of the United States, are well-known publications.

Bubas' tis, an ancient Egyptian town, so named from the goddess Bast, supposed to answer to the Greek Artěmis, or Diana. The cat was sacred to her, and the Bubasteia or festivals of the goddess were the largest and most important of the Egyptian festivals.

Buccaneers', a name derived from Carib boucan, a place for smoking meat, first given to European settlers in Hayti, or Hispaniola, whose business was to hunt wild cattle and swine and smoke their flesh. In an extended sense it was applied to English and French adventurers, mostly seafaring people, who, combining for mutual defense against the arrogant pretensions of the Spaniards to the dominion of the whole of America, frequented the West Indies in the seventeenth century, acquired predatory and lawless habits, and be-came ultimately, in many cases, little better than pirates. The earliest association of these adventurers began about 1625 but they afterward became much more formidable, and continued to be a terror until the opening of the eighteenth century, inflicting heavy losses upon the shipping trade of Spain, and even atwere Montbars (II exterminador), Peter the Great of Dieppe. L. Olonnas, de Busco, Van Horn, and the Welshman Henry Morgan, who, in 1670, marched across the isthmus, plundered Panama, and after being knighted by Charles II, became deputy governor of Jamaica. The last great exploit of the buccaneers was the capture of Carthagena in 1697, after which they are lost sight of in the annals of vulgar piracy.

**Bučcinator** (buk-si-nā'ter), the trumpeter's muscle, a flat, thin muscle forming the wall of the cheek, assisting in mastication and regulating the expulsion of the air in whistling or playing a wind-instrument.

**Bucen' taur**, a mythical monster, half man and half ox. The splendid galley in which the doge of Venice annually wedded the Adriatic bore this name.

**Buceph' alus** ("Ox-head"), the horse of Alexander the Great. On its death from a wound Alexander built over its grave, near the Hydaspes. a city called Bucepala.

**Bucer** (bu 'tser), MARTIN (1491-1551), a sixteenth century reformer, whose real name was Kuhhorn (cow-horn), of which *Bucer* is meant

# Buch

to be the Greek equivalent. In 1521 he left the Dominican order and became preacher at the court of the Elector Frederick, and afterward in Strasburg, where he was professor in the university for twenty years. In 1548 Edward VI invited him to Cambridge, where he held the office of professor of theology, and died in 1551. In 1557 Queen Mary caused his bones to be burned. Cardinal Contarini called him the most learned divine among the heretics.

Buch (buh), LEOFOLD VON (1774-1853), a German geologist. He made extensive geological excursions on the continent of Europe, and also visited the Canary Islands, the Hebrides, and the coasts of Scotland and Ireland. He was the author of various important works; and compiled a magnificent geological map of Germany.

Buchan (buk'an or bu'han), WILLIAM (1729-1895), a Scotch medical writer, studied at Edinburg, and commenced practise there, where also he published in 1769 his work entitled *Domestic Medicine; or the Family Physician*—the first work of the kind published in Britain. Before his death, nineteen large editions had been sold. It was translated into French, and became even more popular on the Continent and in America than at home.

Buchanan, JAMES (1791-1868), fifteenth president of the U.S., b. in Pennsylvania; son of an Irishman who had quitted Europe in 1783. James Buchanan was educated at Dickinson College, Carlisle; was admitted to the bar in 1812; was elected to the legislature of Pennsylvania in 1814; in 1820 was elected to Congress, of which he continued a member till 1831. After having been sent to Russia to conclude a commercial treaty he was in 1834 elected to the Senate, and under the presidency of Polk (1845-49) was appointed secretary of state. During the presidency of General Taylor he retired from public life, but in 1853 General Pierce, who was then president, named him ambassador of the U. S. at London. He returned to America in 1856 as Democratic candidate for the presidency, and was elected by a large majority over Fremont, the Republican candidate, and inaugurated in March, 1857. By his pro-slavery views Buchanan succeeded in delaying the storm which burst out on the election of his successor Lincoln. He lived in retirement after the close of his administration (1861), of which he published an account two years before his death.

Buchanan, ROBERT WILLIAM, b. 1841, English poet and author, was educated at the University of Glasgow. He was for many years a writer for the *Contemporary Review*, has published several novels and some good poetry, and wrote the plays of *Alone in London* and *Sophia*.

**Buck-bean**, Bog-bean, or Marsh-trefoil, a beautiful plant of the order of Gentianaceæ, common in spongy, boggy soils, and found in Britain, throughout Europe, in Siberia, and in North America. It is from 6 to 12 in. in height, and flowers in Britain about the latter end of June, the flower stalk terminating

#### Buckingham

in a thyrse of white flowers, while the inner surface of the corolla has a coating of dense fleshy hairs. The whole plant, the root espe-

Buck-bean a.-fruit; b.-flower.

cially, has an intensely bitter taste, and formerly ranked highly as a tonic.

Buck, ALFRED E., b. at Foxcroft, Me., 1832, graduated at Waterville College, now Colby University, 1859, after which he taught school for two years. When the war broke out he applied for enlistment but was refused. Later he raised a company at his own expense and was made captain. In 1863 he organized the Ninty-first Regiment of colored infantry and became its lieutenant-colonel. The following year he was made lieutenant colonel of the Fifty-first colored infantry, which position he held until he was mustered out in 1866. He then settled in Alabama where he held several political offices, being elected to Congress in 1869. He then moved to Atlanta, Ga., and was a member of the Georgia delegation to the Republican National conventions of 1880, 1884, In 1882 he was chairman of the Georand 1888. gia State Central Committee and became U.S. He was appointed in 1897 minister marshal. to Japan by President McKinley.

Buck, DUDLEY (1839-1897), American musical composer, b. at Hartford, Conn. He studied in Leipsic, Dresden, and Paris, settled in Chicago for several years, then became organist of Boston Music Hall, and afterward of Trinity Church, Boston. He wrote a cantata, which was performed under the direction of Theodore Thomas at the inauguration of the Centennial exhibition of 1876, and was the author of some popular operettas and several compositions for the organ.

Buckeye, an American name for certain species of horse-chestnuts.

Buck' ingham (or Bucks), an inland county, England: area about 730 sq. mi. The breeding and fattening of cattle and pigs are largely carried on, also the breeding of horses, and much butter is made. The manufactures are unimportant, among them being straw-plaiting, thread lace, and the making of wooden articles, such as beechen chairs, turnery, etc. Pop. 185.190. BUCKINGHAM, the co. town, is pleasantly situated on a peninsula formed by the Ouse. Malting and tanning are carried on, and some lace is made. Pop. 3,364.

Buck' ingham, GEORGE VILLIERS, Duke of

l

# **Buckingham Palace**

(1592-1628), favorite of James I and Charles I of England. At eighteen he was sent to France where he resided three years, and on his return made so great an impression on James I that in two years he was made a knight, a gentleman of the bed-chamber, baron, viscount, Marquis of Buckingham, lord highadmiral, etc., and at last dispenser of all the honors and offices of the three kingdoms. In 1623 when the Earl of Bristol was negotiating a marriage for Prince Charles with the Infanta of Spain, Buckingham went with the prince incognito to Madrid to carry on the suit in person in the hope of securing the Palitinate as a dowry. The result, however, was the breaking off of the marriage, and the declaration of war with Spain. During his absence Buckingham was created duke. After the death of James in 1625 he was sent to France as proxy for Charles I to marry the Princess Henrietta Maria. In 1626 after the failure of the Cadiz expedition, he was impeached, but saved by the favor of the king. Despite the difficulty in obtaining supplies Buckingham took upon himself the conduct of a war with France, but his expedition in aid of the Rochellese proved an entire failure. In the meantime the spirit of revolt was becoming more formidable; the Petition of Right was carried despite the duke's exertions, and he was again protected from impeachment only by the king's prorogation of Parliament. He then. went to Portsmouth to lead another expedition to Rochelle, but was stabbed by John Felton. an ex-lieutenant who had been disappointed of promotion.

Buckingham Palace, a royal palace in London, facing St. James's Park, built in the reign of George IV, and forming one of the residences of Queen Victoria.

Buck land, FRANCIS TREVELVAN (1826-1880). English naturalist. From 1848 to 1851 he was a student, and from 1852 to 1853 house surgeon at St. George's Hospital. He became assistant surgeon in the Second Life Guards in 1854. On the establishment of the *Field* newspaper in 1856, he joined the staff, writing for it until 1865. In 1866 he commenced a weekly journal of his own, Land and Water, and in 1867 was appointed an inspector of salmon fisheries. His best known books are his *Curiosities of* Natural History (4 vols. 1857-72), the Logbook of a Fisherman and Zoologist (1875), and the Natural History of Fishes (1881).

Buckle, GEORGE EARLE, b. 1854, British journalist: won the Newdigate prize at Oxford, 1875, and graduated in 1876, and M. A. in 1879. He was a fellow of All Souls' College, 1877-85, and in 1884 became editor of the London Times.

Buckle, HENRY THOMAS (1822-62), English historical writer. At the age of eighteen he devoted himself entirely to study. His chief work, a philosophic *History of Civilization*, of which only two volumes were completed, was characterized by much novel and suggestive thought, and by the bold co-ordination of a vast store of materials drawn from the most varied sources. Three volumes of his miscellaneous and posthumous works were edited by Helen Taylor in 1872. He d. while traveling. at Damascus.

Buckner, SIMON BOLIVAR, an American soldier, b. 1823, in Hart co., Ky. He was educated at West Point, and served with distinction in the Mexican War. He joined the Confederacy in August, 1861, and surrendered Fort Donelson, Feb. 16, 1862. He afterward commanded a division at Chattanooga, and an army corps at Chickamauga. On May 26, 1865, he surrendered the last army corps of the Confederates to General Canby, of the Federal army. In 1896 he was a candidate for the vicepresidency on the Democratic sound-money ticket with Senator Palmer of Illinois.

Buck' thorn, the name of an extensive genus of trees and shrubs, order Rhamnaceæ. Several species belong to North America. The common buckthorn, a British and North American shrub, grows to 7 or 8 ft., has strong

Alder Buckthorn.

spines on its branches, elliptical and serrated leaves, male and female flowers on different plants, a greenish-yellow calyx, no corolla, and a round, black berry. It flowers in May. The berries are purgative, but harsh in action. The bark yields a yellow dye, the berries sap green. Dyer's buckthorn yields French or yellow berries.

Buck' wheat (or Brank), a plant of the order Polygoneæ, with branched herbaceous stem, somewhat arrow-shaped leaves, and purplishwhite flowers growing to the height of about 30 in. and bearing a small triangular grain, of a brownish black without and white within. The shape of its seeds gives it its German name buchneeizen, "beech-wheat" whence the English name. The plant was first brought to Europe from Asia by the Crusaders, and hence in France is often called Saracen corn.

It grows on the poorest soils. It is cultivated in China and other eastern countries as a bread-corn. In Europe buckwheat has been principally cultivated as food for oxen, swine and poultry; but in Germany it serves as an ingredient in pottage, puddings, and other food, and in America buckwheat cakes are esteemed a great delicacy.

**Bucyrus,** Crawford co., O., on Sandusky river, 63 mi. n. from Columbus. Railroads: P., Ft. W. & St. L. division of Pa. Ry., T. & O. C., C. S. & H. Industries: brick and tile factory, three flouring mills, three iron foundries, one woolen mill, furniture factory, plow factory, and others. Surrounding country agricultural. Bucyrus became a city in.1885. Colonel Crawford fought his last battle with the Indians in this county. Pop. est. 1897, 7,500.

Bud, the name of bodies of various form and structure, which develop upon vegetables, and contain the rudiments of future organs, as stems, branches, leaves, and organs of fructification. Upon exogenous plants they are in their commencement cellular prolongations from the medullary rays, which force their way through the bark. In general, a single bud is developed each year in the axil of each leaf, and there is one terminating the branch called a terminal bud. The life of the plant during winter is stored up in the bud as in an embryo, and it is by its vital action that on the return of spring the flow of sap from the roots is stimulated to renewed activity. Buds are distinguished into leaf-buds and flower-The latter are produced in the axil of buds. leaves called floral leaves or bracts. The terminal bud of a branch is usually a flower-bud, and as cultivation is capable of producing flower-buds in place of leaf-buds, the one is probably a modification of the other.

Budapest (-pesht'), the official name of the united towns of Pest and Buda (or Ofen), the one on the right, the other on the left. of the Danube, forming the capital of Hungariy, the seat of the imperial diet of the Hungarian ministry and of the supreme court of justice. Buda, which is the smaller of the two, and lies on the west bank of the river, consists of the fortified Upper Town on a hill; the Lower Town (or Wasserstadt) at the foot of the hill, and several other districts. Among the chief buildings are the royal castle and several

# Buddhism

palaces, the arsenal, town hall, government offices, etc., and the finest Jewish synagogue The mineral baths of Buda in the empire. have long been famous, the Bruckbad and Kaiserbad having both been used by the Ro-mans. Pest, or the portion of Budapest on the left or east bank of the river, is formed by the inner town of Old Pest on the Danube, about which has grown a semicircle of districts-Leopoldstadt, Theresienstadt, Elizabethstadt, etc. In commerce and industry Budapest ranks next to Vienna in the empire. Its chief manufactures are machinery. gold, silver, copper, and iron wares, chemicals, silk, leather, tobbaco, etc. A large trade is done in grain, wine, wool, cattle, etc. Budapest is strongly Magyar, and as a factor in the national life may almost be regarded as equivalent to the rest of Hungary. It was not until 1799 that the population of Pest began to outdistance that of Buda; but from that date its growth was very rapid and out of all proportion to the increase of Buda. In 1709 the joint population of the two towns was little more than 50,000; in 1886 it was 411,917.

Buddha (bud'ha; "the Wise" or "the Enlightened"), the sacred name of the founder of Buddhism, an Indian sage who appears to have lived in the fifth century B. C. His personal name was Siddhartha, and his family name Gautama; and he is often called also Sakya-muni (from Sakya, the name of his tribe, and muni, a Sanskrit word meaning a sage). His father was king of Kapilavastu, a few days' journey north of Benares. Siddhartha, filled with a deep compassion for the human race, left his father's court, and lived for years in solitude till he had penetrated the mysteries of life, and become the Buddha. He then began to teach his new faith, in opposition to the prevailing Brahmanism, commencing at Benares. Among his earliest converts were the monarchs of Magadha and Kosala, in whose kingdoms he chiefly passed the latter portion of his life, respected, honored, and protected. See Buddhism.

Buddhism, the religious system founded by Buddha, one of the most prominent doctrines of which is that Nirvana, or an absolute release from existence, is the chief good. According to it pain is inseparable from existence, and consequently pain can cease only through Nirvana; and in order to attain Nirvana our desires and passions must be suppressed, the most extreme self-renunciation practised, and we must, as far as possible, forget our own personality. In order to attain Nirvâna eight conditions must be kept or practised. The first is in Buddhistic lanpractised. guage right view; the second is right judgment; the third is right language; the fourth is right purpose; the fifth is right profession; the sixth is right application; the seventh is right memory; the eighth is right meditation. The five fundamental precepts of the Buddhist moral code are: not to kill, not to steal, not to commit adultery, not to lie, and not to give way to drunkenness. To these there are added five others of less importance, and binding more

particularly on the religious class, such as to abstain from repasts taken out of season, from theatrical representations, etc. There are six fundamental virtues to be practised by all men alike; viz., charity, purity, patience, courage, contemplation, and knowledge. These are the virtues that are said to "conduct a man-to the other shore." The devotee who strictly practises them has not yet attained Nirvana, but is on the road to it. The Buddhist virtue of charity is universal in its application, extending to all creatures, and demanding sometimes the greatest self-denial and sacrifice. There is a legend that the Buddha in one of his stages of existence (for he had passed through innumerable transmigrations before becoming "the enlightened") gave himself up to be devoured by a famishing lioness which was un-able to suckle her young ones. There are other virtues, less important, indeed, than the six cardinal ones, but still binding on believers. Thus not only is lying forbidden, but evil-speaking, coarseness of language, and even vain and frivolous talk, must be avoided. Buddhist metaphysics are comprised in three theories-the theory of transmigration (borrowed from Brahmanism), the theory of the mutual connection of causes, and the theory of Nirvâna. The first requires no explanation. According to the second, life is the result of twelve conditions, which are by turns causes and effects. Thus there would be no death were it not for birth; it is therefore the effect of which birth is the cause. Again, there would be no birth were there not a continuation of existence. Existence has for its cause our attachment to things, which again has its origin in desire; and so on through sensation, contact, the organs of sensation and the heart, name and form, ideas, etc., up to This ignorance, however, is not ignorance. ordinary ignorance, but the fundamental error which causes us to attribute permanence and reality to things. This, then, is the primary origin of existence and all its attendant evils. Nirvâna, or extinction, is eternal salvation from the evils of existence, and the end which every Buddhist is supposed to seek. Sakya-muni did not leave his doctrines in writing; he declared them orally, and they were carefully treasured up by his disciples, and written down after his death. The determination of the canon of the Buddhist scriptures as we now possess them was the work of three successive councils, and was finished two centuries at least before Christ. From Buddhism involving a protest against caste distinctions it was eagerly adopted by the Dasyus or non-Aryan inhabitants of Hindustan. It was pure, moral, and humane in its origin, but it came subsequently to be mixed up with idolatrous worship of its founder and other deities. Although now long banished from Hindustan by the persecutions of the Brahmans, Buddhism prevails in Ceylon, Burmah, Siam, Anam, Thibet, Mongolia, China, Java, and Japan, and its adherents are said to comprise about a third of the human race.

Budding, the art of multiplying plants by

causing the leaf-bud of one species or variety to grow upon the branch of another. The operation consists in shaving off a leaf-bud, with a portion of the wood beneath it, which portion is afterward removed by a sudden jerk of the operator's finger and thumb, aided by the budding-knife. An incision in the bark of the stock is then made in the form of a T; the two side lips are pushed aside, the bud is thrust between the bark and the wood, the upper end of its bark is cut to a level with the cross arm of the T, and the whole is bound up with worsted or other soft fastening, the point of the bud being left exposed. In performing the operation, a knife with a thin flat handle and a blade with a peculiar edge is required. The bud must be fully formed; the bark of the stock must separate readily from the wood below it; and young branches should always be chosen, as having beneath the bark the largest quantity of cambium, or viscid matter, out of

a.-the bud cut out; b.-the stock; c.-the bud inserted.

which tissue is formed. The maturer shoots of the year in which the operation is performed are the best. The autumn is the best time for budding, though it may also be practised in the spring.

Bude Light, an exceedingly brilliant light, invented by Mr. Gurney of Bude, Cornwall, England, and produced by directing a current of oxygen into the interior of the flame of an argand-lamp or gas-burner.

**Buell**, DON CARLOS (1818-), American sol-dier, b. at Marietta, O. He graduated at the U. S. military academy in 1841, became first lieutenant, third infantry, 1846, and won the brevet of captain at Monterey, and that of major at Contreras and Churubusco, where he was wounded. From 1849-61 he was at the headquarters of various departments. On May 11, 1861, he was made a lieutenant colonel and appointed brigadier general of volunteers May 17, 1861. After organizing troops in Washington he was assigned to a division in the army of the Potomac, which became noted for its discipline. He succeeded Gen. W. T. Sherman in the department of the Cumberland. On March 21, 1862, he was made major general of volunteers. By the aid of his division, which arrived at Shiloh, April 6, the Confederates, under General Beauregard, were driven to Corinth. On June 12, 1862, he assumed command of the district of Ohio. On September 30, by order from Washington, General Buell gave up his command to Gen. G. H. Thomas, but he was restored on the same day. A courtmartial was held and Buell was acquitted. Andrew Johnson, then military governor of Tennessee, protested against his ever holding duty in that state, and he was transferred to the department of the Gulf. He declined this command, and resigned. He was mustered out of the volunteer service May 23, 1864. He subsequently held the post of pension agent at Louisville, Ky.

Buenos Ayres (bu-en'ôs ī'rās), a city of South America, capital of the Argentine Republic. It was founded in 1535 by Don Pedro de Mendoza, and is built with great regularity, the streets uniformly crossing each other at right angles. It contains the palace of the president, the house of representatives, a townhall, a number of hospitals and asylums, a cathedral, several monasteries, nunneries, and Catholic and Protestant churches, and several theaters, a university, and a customhouse. The university, founded in 1821, is attended by about 800 students. There are also a medical school, normal and other schools, besides liter-ary and scientific societies. There is no harbor, and large vessels can only come within 8 or 9 miles of the town, but extensive harbor works have been begun. The nearest good harbor is at La Plata, a new town 30 miles lower down the estuary, and now (since 1884) the capital of the province. Buenos Ayres is one of the leading commercial centers of South America, its exports and imports together annually amounting to over \$60,000,000. Chief exports are ox and horse hides, sheep and other skins, wool, tallow, horns, etc. There are 6 railways running from the city, and 100 miles of tramway in the city and suburbs. About one-fourth of the inhabitants are whites; the rest are Indians, negroes, and mixed breeds. Pop. 581,276. The province of Buenos Avres has an area of about 63,000 sq. mi., and presents nearly throughout level or slightly undulating plains (pampas), which afford pasture to vast numbers of cattle and wild horses. These constitute the chief wealth of the inhabitants. Pop. 1,411,160.

**Buf falo**, an ungulate or hoofed ruminant mammal, family Bovidæ, or oxen, the bestknown species of which is the common or Indian buffalo. larger than the ox and with

The Oape Buffalo.

stouter limbs, originally from India, but now found in most of the warmer countries of the Eastern Continent. A full grown male is a bold and powerful animal, quite a match for the tiger. The buffalo is less docile than the common ox, and is fond of marshy places and rivers. It is, however, used in tillage, draught, and carriage in India, Italy, etc. The female gives much more milk than the cow, and from the milk the ghee, or clarified butter, of India is made. The hide is exceedingly tough, and a valuable leather is prepared from it, but the flesh is not very highly esteemed. Another Indian species is the arnee, the largest of the ox family. The Cape Buffalo is distinguished by the size of its horns, which are united at their bases, forming a great bony mass on the front of the head. It attains a greater size than an ordinary ox. The name is also applied to wild oxen in general, and particularly to

the bison of North America. See Bison. Buf'falo, a city of New York, at the e. extremity of Lake Erie, the mouth of the Buffalo River, and the head of the Niagara River. It has a water front of 21 mi. on the lake and of the same extent on the Niagara River, which is here crossed by an iron bridge. The position of Buffalo on the great water and railway channels of communication between the West and the East makes it the center of a vast trade in grain, live stock, and other commodities. The harbor is capacious, and is protected by extensive breakwaters. The Eric Canal, which connects with the Hudson, has its western terminus here. The whole site is a plain with a gentle descent toward the lake, well covered with houses, except where open spaces or squares have been left for ornament and ventilation. There is a splendid public park. The principal buildings are the city and county hall, the customhouse and postoffice. the arsenal, and many of the churches; other buildings and institutions of note are: a young men's literary association with a library of above 40,000 volumes, an orphan asylum, a general hospital, and a fine cemetery covering about 76 acres. Manufactures are numerous and varied, consisting of machinery and iron goods, agricultural implements, leather, etc. Pop. 255.664.

**Buffalo-berry**, a shrub of the oleaster family, a native of the U. S. and Canada, with lanceolate silvery leaves and close clusters of bright red acid berries about the size of currants, which are made into preserves and used in various ways.

Buffalo-grass, a strong-growing North American grass, so called from once forming a large part of the food of the buffalo. It is very nutritious. The blades of this grass are about six inches long. In the springtime it grew very luxuriantly, and when burned by the summer sun became crisp, curly, and light brown in color. It grew best in the buffalo wallows—round depressions about a foot deep which marked the sleeping place of the bison.

Buff Leather, a sort of leather prepared from the skin of the buffalo and other kinds of oxen, dressed with oil, like chamois. It is used for

making bandoliers, belts, pouches, gloves, and other articles.

**Buffon** (bu-fön), GEORGE LOUIS LECLERC, Count de (1707-1788), celebrated French naturalist, b. at Montbard, in Burgundy. In 1739 he was appointed superintendent of the Royal Garden at Paris (now the Jardin des Plantes), and devoted himself to the great work on *Natural History*, which occupied the most of his life.

**Bug**, otherwise known as the house-bug or bed-bug. The common bug is about  $\frac{1}{16}$ inch long, wingless, of a roundish depressed body, dirty, rust color, and emits an offensive smell when touched. The female lays her eggs in summer in the crevices of bedsteads, furniture, and walls of rooms. Its larvæ are small, white, and semi-transparent. They attain full size in eleven weeks. The mouth of the bug has a three-jointed proboscis, which forms sheath for a sucker. It is fond of human blood, but eats various other substances. The name was formerly applied loosely to insects of various kinds, and in the U. S. it is generally used where *beetle* would be used in England.

Bugeaud (bu-zho), THOMAS ROBERT, Duke d'Isly (1784-1849), a marshal of France. He entered the army in 1804 as a simple grenadier, but rose to be colonel before the fall of Napoleon. After the revolution of 1830 he obtained a seat in the Chamber of Deputies. He was afterward sent to Algeria, where he gained many advantages over the Arabs. On the revolution of 1848 he adhered to Louis Philippe to the last. Under the presidency of Louis Napoleon he was appointed commanderin-chief of the army of the Alps.

Bugenhagen (bö'gen-hi-gen), JOHANN (1485-1558), German reformer, friend and helper of Luther in preparing his translation of the Bible. He effected the union of the Protestant free cities with the Saxons, and introduced into Brunswick, Hamburg, Lübeck, Pomerania, Denmark, and many other places, the Lutheran service and church discipline. He translated the Bible into Low German, wrote an Exposition of the Book of Psalms and a History of Pomerania.

**Buggy**, a name given to several species of carriages or gigs; in England, a light one-horse two-wheeled vehicle without a hood; in the U. S., a light one-horse four-wheeled vehicle, with or without a hood or top; in India, a gig with a large hood to screen those who travel in it from the sun's rays.

**Buhl-work** (böl'-), a description of inlaid work, said to have been invented by Boule, a French cabinetmaker, in the reign of Louis XIV. It consisted at first of unburnished gold, brass, enamel, or mother-of-pearl worked into complicated and ornamental patterns, and inserted in a ground of dark-colored metal, wood, or tortoise shell; but at a later period the use of wood of a different color was introduced by Reisner, and to his process the modern practise of buhl-work is chiefly confined.

**Buhrstone** (bör'-) (Burrstone), a name given to certain siliceous or siliceo-calcareous stones, whose dressed surfaces present a burr or keencutting texture, whence they are much used for millstones. The most esteemed varieties are obtained from the upper fresh-water beds of the Paris basin, and from the Eocene strata of South America.

Building Lease, a lease of land for a long term of years, usually 90 years, at a rent called a ground rent, the lessee covenanting to erect certain edifices thereon, and to maintain the same during the term. At the expiration of the lease the houses built become the absolute property of the landlord.

Building Societies, joint-stock benefit societies for the purpose of raising by periodical subscriptions a fund to assist members in obtaining small portions of landed property and houses, which are mortgaged to the society till the amount of the shares drawn on shall be fully repaid with interest. These societies may be divided into two sections: the Pro-The prietary and the Mutual Societies. former class takes money on deposit, paying a somewhat higher rate of interest than can generally be had on money available at call. and gives loans for building purposes, or the like, repayable by installments. The profit of the company lies in the difference between the rate charged to borrowers and the rate paid to depositors. The mutual societies are of two chief kinds, either limited to a certain term of years and confined to a certain number of members, or permanent and not confined to any definite number of members, but ready to receive new members as long as the society exists and to issue at stated intervals new series of stock. A favorite form of terminating a society allots its capital among the members, according to the number of shares they hold, by ballot. The subscriptions are paid weekly or monthly, and on securing a loan the member repays this sum very much as he would pay his rent, over a term of years. When his payments and accrued profits amount to the face value of the stock, he surrenders his stock and the house or land becomes his own. Terminable societies are giving place to the permanent kind. These, by the constant admission of new members, have a constant supply of funds at their disposal, and are thus able to supply the demands of all the borrowers; while the security offered to investors induces many people to enter the society merely with the view of having a convenient means of depositing their savings, and not with the intention of acquiring any real prop-erty for themselves. The states usually have strict laws governing such institutions, and examiners to see that they are enforced.

Bukarest', the capital of Roumania, situated on the Dimbovitza about 33 mi. n. of the Danube, in a fertile plain. It is in general poorly built, among the chief buildings being the Royal Palace, the National Theater, the university buildings, the National Bank, the Mint, and the Archiepiscopal church. There are handsome public gardens. Manufactures are varied but unimportant; the trade is considerable, the chief articles being grain, wool, honey, wax, wine, hides. The mercantile portion of the community is mostly foreign, and the whole population presents a curious blending of nationalities. Bukarest became the capital of Wallachia in 1665, in 1802 that of the united principalities of Wallachia and Moldavia. A treaty was concluded here in 1812 between Turkey and Russia by which the former ceded Bessarabia and part of Moldavia. Pop. about 220,000.

**Bukowina** (bö koo-vē'nà), an Austrian duchy forming the southeastern corner of Galicia. Area 4,035 sq. mi., pop. 571,671. It is traversed by ramifications of the Carpathians, and much of the surface is occupied with swamps and forests. Chief town, Czernowitz.

**Bualacan'**, a town, Philippines, island of Luzon, about 22 mi. n.w. of Manilla; chief industries: sugar-boiling and the manufacture of silken mats. Pop. about 10,000.

Bulb, a modified leaf-bud, formed on a plant upon or beneath the surface of the ground, emitting roots from its base, and producing a stem from its center. It is formed of imbricated scales or of concentric coats or layers. It encloses the rudiments of the future plant and a store of food to nourish it. Examples of bulbs are the onion, lily, hyacinth, etc.

**Bulbul** (bul'bul), the Persian name of the nightingale, or a species of nightingale, rendered familiar in English poetry by Moore,

a.-Truncated bulb of onion; b.-onion leaf dissected off; c.-bulb of llly.

Byron, and others. The same name is also given in Southern and Southwestern Asia to sundry other birds.

Buiga' ria, a principality tributary to Turkey, constituted by the first article of the Treaty of Berlin, July 13, 1878, and placed under the suzerainty of the sultan. It is bounded n. by Roumania and the Dobrudsha, e. by the Black Sea, s. by the Balkan Mountains, which separate it from Eastern Roumelia, and w. by Servia. The principal towns are Widdin, Sofia, Plevna, Sistova, Tirnova, Rustchuk, Shumla, Varna, and Silistria. The country almost wholly belongs to the n. slope of the Balkans, and is intersected by streams flowing from that range to the Danube. It possesses much good agricultural land and a good climate; but cul-

### **Bulkheads**

tivation is backward, though the rearing of cattle and horses is successfully carried on. Agricultural produce is exported, manufactured goods imported. Education is backward, but improving; four years' school attendance is obligatory in principle. The prevalent religion is that of the Greek Church. The revenue and expenditure are each about \$5,945,000. Military service is obligatory; the war strength of the army is about 100,000. In accordance with the terms of the treaty of Berlin a constitution was drawn up for the new principality by an assembly of Bulgarian notables at Tirnova, in 1879. By this constitution the legislative authority is vested in a single chamber, called the Sobranje, or National Assembly, the members of which are partly elected by universal manhood suffrage, partly nominated by the prince. On April 29, 1879, Prince Alexander of Battenberg, cousin of the grand duke of Hesse, was elected prince by unanimous vote of the constituent assembly. In 1885 a national rising took place in Eastern Roumelia, the Turkish governor was expelled, and union with Bulgaria proclaimed. In consequence Servia demanded an addition to her own territory, and began a war against Bulgaria (November, 1885), in which she was severely de-feated. By the treaty following, the prince of Bulgaria was appointed governor general of Eastern Roumelia for a term of five years, to be renominated at the end of that time by sanction of the great powers. These events greatly irritated Russia, whose agents managed to seduce certain regiments of Bulgarians; and in August, 1886, the prince was seized and carried off, while a proclamation was issued to the effect that he had abdicated. When he was set free on Austrian territory he discovered that the people were still with him, and determined to return. Seeing, however, that his presence would cause an immediate interference on the part of Russia, he formally abdicated and left the country (Sept. 7, 1886). In 1887 Prince Ferdinand of Saxe-Coburg accepted an invitation to occupy the throne; but his position is insecure, as the great powers have not sanc-tioned the step taken by him. The area of Bulgaria proper is about 24,400 sq. mi.; pop. 3,154,375. Eastern Roumelia has an **area of** 13.-500 sq. mi.; a pop. of over 975,000.

Bulgarians, a race of Finnish origin, whose original seat was the banks of the Volga, and who subdued the old Mæsian population and established a kingdom in the present Bulgaria in the seventh century. They soon became blended with the conquered Slavs, whose language they adopted. In the fourteenth century the country was conquered by the Turks, and has until lately remained part of the Ottoman Empire. (See Bulgaria.) The Bulgarian lan-Empire. (See Bulgaria.) guage is divided into two dialects, the old and the new; the former is the richest and best of the Slavonic tongues, and although extinct as a living tongue is still used as the sacred language of the Greek Church. The Bulgarians are now spread over many parts of the Balkan Peninsula.

Bulkheads, partitions built between the

several portions of the interior of a ship, either to separate it into rooms, or as a safeguard in case of wreck.

Buil, a letter, edict, or rescript of the pope, published or transmitted to the churches over which he is head, containing some decree, order, or decision, and in many cases having a leaden seal attached, impressed on one side with the heads of St. Peter and St. Paul, on the other with the name of the pope. The document is in Latin and on parchment.

Buil, JOHN, the English nation personified, hence any typical Englishman; first used in Arbuthnot's satire, *The History of John Bull*, designed to ridicule the Duke of Marlborough, and in which the French are personified as *Lewis Baboon*, the Dutch as *Nicholus Frog*, etc.

Buil, OLE BORNEMANN (1810-1880), famous violinist, b. at Bergen, in Norway. He secured great triumphs both throughout Europe and in America by his wonderful playing. He lost all his money in a scheme to found a colony of his countrymen in Pennsylvania, and had to take again to his violin to repair his broken fortunes. He afterward settled down at Cambridge, Mass., and had also a summer residence in Norway, where he died.

Buildog, a variety of the common dog, remarkable for its short, broad muzzle, and

the projection of its lower jaw, which causes the lower front teeth to pro-trude beyond the upper. The head is massive and broad; the lips are thick and pendulous; the ears pendent at the extremity; the neck robust and short: the body long and stout; and the legs short and thick. The bulldog is a slow-motioned ferocious animal, better

suited for savage combat than for any purpose requiring activity and intelligence. For this

Bulldog.

reason it is often employed as a watchdog. It was formerly used—as its name implies for the barbarous sport of bull-baiting. The *bull terrier* was originally from a cross between the bulldog and the terrier. It is smaller than the bulldog, lively, docile, and very courageous.

**Bullet** (bul'et) a projectile intended to be discharged from firearms or other missile weapons; more especially, one for a rifle, musket, fowling piece, pistol, or similar firearm. Bullets used to be solid spherical masses, but of late many changes have been made on their shape and structure. Bullets used for rifles of recent construction are elongated and generally rounded, conical, or ogival at the apex, somewhat like half an egg drawn out, often with a hollow at the base, into which a plug of wood or clay is inserted. When the rifle is fired the plug is driven forward, forcing the base of the bullet outward till the lead catches the grooves of the barrel.

**Bulletin** (bul'e-tin), an anthenticated official report concerning some public event, such as military operations, the health of a distinguished personage, issued for the information of the public. The name is also given to some periodical publications recording the proceedings of learned societies.

**Bullet tree** (or bully tree), a forest tree of Guiana and neighboring regions, yielding an excellent gum (the concreted milky juice) known as *balata*, having properties giving it in some respects an intermediate position between gutta-percha and india rubber, and making it for certain industrial purposes more useful than either. In the U.S. it is used as a chewing material. The timber of the tree also is valuable.

**Builfights** are among the favorite diversions of the Spaniards. They are usually held in an amphitheater having circular seats rising one above another, and are attended by vast crowds who eagerly pay for admission. The combatants, who make bullfighting their profession, march into the arena in procession. They are of various kinds-the picadores, combatants on horseback, in the old Spanish knightly garb; the chulos, or banderilleros, combatants on foot, in gay dresses, with colored cloaks or banners; and lastly, the metador (the killer). As soon as the signal is given the bull is let into the arena. The picadores, who have stationed themselves near him, commence the attack with their lances, and the bull is thus goaded to fury. Sometimes a horse is wounded or killed (only old worthless animals are thus employed), and the rider is obliged to run for his life. The *chulos* assist the horsemen by drawing the attention of the bull with their cloaks; and in case of danger they save themselves by leaping over the wooden fence which surrounds the arena. The banderilleros then come into play. They try to fasten on the bull their banderillos—barbed darts ornamented with colored paper, and often having squibs or crackers attached. If they succeed, the souibs are discharged, and the bull races madly about the arena. The metador, or espada, now comes

# Bullfinch

in gravely with a naked sword, and a red flag to decoy the bull with, and aims a fatal blow at the animal. The slaughtered bull is dragged away, and another is let out from the stall. Several bulls are so disposed of in a single day.

Builfinch, an insessorial bird, of the finch family, with short, thick, rounded bill, beak and crown of the head black, body bluish-gray above and bright tile-red below. It occurs in Britain, in the middle and south of Europe, and in Asia, and when tamed may be taught to sing musical airs.

Builfrog, a species of frog found in most parts of the U. S. and Canada, but chiefly abundant in the Southern states. It is of a large size, 5 to 7 in. long. The color is olive green or reddish brown, with large brown or black spots, and with a yellow line along the back. The under surface is yellowish. It receives its name from the remarkable loudness of its voice, heard as a hollow bass in the frog concerts which take place in the evening and all night long in marshy places. Its voice can be distinctly heard at a distance of forty or fifty yards. It sits for hours during the day, basking in the sun, near the margin of a stream, into which it plunges with a great leap on the least appearance of danger. It does not confine itself to insects and worms like smaller frogs, but eats fish and other frogs, and is said to be partial to young ducks, and to swallow them entire. Its flesh is tender, white, and affords excellent eating, the hind legs, however, being the only part used. These parts make excellent bait for the larger catfish.

**Builhead**, the popular name of certain fishes. One of these, a British fish, is about 4 in. long, with head very large and broader

#### Bullhead.

than the body. It is often called also *Miller's*thumb. The armed bullhead is found in the Baltic and northern seas; the six-horned bullhead is a North American species. In America this name is given to a species called also *Cat*fish and *Horned pout*.

**Bull'ion** is uncoined gold or silver, in bars, plate, or other masses, but the term is frequently employed to signify the precious metals coined and uncoined.

**Bull Run**, a stream in the n.e. of Virginia, flowing into the Occoquan river, 14 mi. from the Potomac; the scene of two great battles during the American Civil War in which the Federals were defeated. The first battle was fought July 21, 1861; and the second on Aug. 30, 1863.

### Buncombe

Buils and Bears, in stock exchange slang, manipulators of stocks; the former operating in order to effect a rise in price, the latter doing all they can to bring prices of stock down.

**Buil's-eye:** 1, a round piece of thick glass, convex on one side, inserted into the decks, ports, scuttle-hatches, or skylight covers of a vessel for the purpose of admitting light. 2, A small lantern with a lens in one side of it to concentrate the light in any desired direction. 3, In *rifle shooting*, the center of a target, of a different color from the rest of it and usually round.

**Bull trout**, a large species of fish of the salmon family, thicker and clumsier in form than the salmon, but so like it as sometimes to be

Bull Trout

mistaken for it by fishers. It attains a weight of 15 to 20 lbs., and lives chiefly in the sea, ascending rivers to spawn. Its scales are smaller than those of the salmon, and its color less bright.

Bülow (bū'lõ), FRIEDRICH WILHELM VON, (1755-1816), Prussian general. He was actively engaged against the French at the earliest periods of the revolutionary war; and his services in 1813 and 1814, especially at Grosbeeren and Dennewitz, were rewarded with a Grand Knightship of the Iron Cross and the title Count Bülow von Dennewitz. As commander of the fourth division of the allied army he contributed to the victorious close of the battle of Waterloo.

Bülow (bü'lö), HANS GUIDO VON (1830-). pianist and composer, born at Dresden; was intended for a lawyer, but adopted music as a profession. He studied the piano under Liszt. and made his first public appearance in 1852. In 1855 he became leading professor in the Conservatory at Berlin; in 1858 was appointed court pianist: and in 1867 he became musical director to the king of Bavaria. His compositions include overture and music to Julius Casar, The Minstrel's Curse, Nirucana; songs, choruses, and pianoforte pieces. He is considered one of the first of pianists and orchestral conductors.

**Buloz** (bü-loz), FRANÇOIS (1803-1877), born near Geneva, Switzerland; founder and editor of the *Revue des Deux Mondes*, the celebrated French fortnightly literary magazine.

**Buirush** (bul'-), the popular name for large, rush-like plants growing in marshes; not very definitely applied.

Buncombe (bunkum), a county in North Carolina. Area 450 sq. mi; pop. 21,910. The

# Bundesrath

term bunkum, meaning talking for talking's sake, bombastic speech-making, is said to have originated with a congressional member for this county, who declared that he was only talking for *Buncombe*, when attempts were made to cut his oratory short.

Bundesrath (bun' des-rät), the German federal council which represents the individual states of the empire, as the Reichstay represents the German nation. It consists of sixtytwo delegates, and its functions are mainly those of a confirming body, although it has the privilege of rejecting measures passed by the Reichstag.

Bungalow, in India, a house or residence, generally of a single floor. Native bungalows are constructed of wood, bamboos, etc., but those erected by Europeans are generally built of sun-dried bricks, and thatched or tiled, and are of all styles and sizes, but invariably surrounded by a veranda.

Bun'ion, an enlargement and inflammation of the joint of the great toe arising from irritation of the small membranous sac.

Bunsen. ROBERT WILHELM EBERARD (1811-), eminent German chemist. He studied at Göttingen University, and at Paris, Berlin, and Vienna; was appointed professor at the Polytechnic Institute of Cassel, 1836; at the University of Marburg in 1838, at Breslau in 1851, and finally professor of experimental chemistry at Heidelberg in 1852. Among his many discoveries and inventions are the production of magnesium in quantities, magnesium light, spectrum analysis, and the electric pile, and the burner which bears his name.

Bunsen's Battery, a form of galvanic battery, the cells of which consist of cleft cylinders of zinc immersed in dilute sulphuric acid, and rectangular prisms of carbon in nitric acid, with an intervening porous cell of unglazed earthenware.

Bunsen's Burner, a form of gas burner espe-

cially adapted for heating, consisting of a tube, in which. by means of holes in the side, the gas becomes mixed with air before consumption. so that it gives a non-illumin at ing smokeless flame.

Bunt (some-

Bunsen's Burner.

times called Smut Ball, Pepper Brand, and Brand Bladders). a fungoid disease incidental to cultivated corn, consisting of a black powdery matter, having a disagreeable odor, occupying the interior of the grain of wheat. This powdery matter con-sists of minute balls filled with sporules, and is caused by the attack of a kind of mold.

Bunt'ing, the popular name of a number of insessorial birds, family Emberizidæ, chiefly included in the genus Emberiza; such as the

### Bunyan

English or common bunting; the rice-bunting; the Lapland, gnow. black-headed, yellow, cirl. and ortolan buntings. The yellow-bunting or yellow-hammer is one of the most common

Reed Bunting.

British birds. The common or corn-bunting is also common in cultivated districts. The snow-bunting is one of the few birds which cheer the solitudes of the polar regions.

Bunker Hill, Charlestown, Mass. One of the most important battles of the Revolution was fought here June 17, 1775. The British army, 10,000 under Generals Gage, Howe, Clinton, and Burgoyne, occupied Boston. The American army, 15,000 strong, enlisted for three months, was commanded by General Ward with headquarters at Cambridge. Learning that the British intended occupying Bunker Hill and the neighboring heights, the Americans stole a march on them and silently, dur-ing the night, fortified Breed's Hill. The British discovering the redoubt at daybreak, opened fire from their ships of war and floating batteries in Charlestown harbor. They landed a force at Morton's Point and advanced upon the position of the Americans, who withheld their fire until they could see the "whites of their enemies' eyes." The British were repulsed with great loss. A second at-tack, during which Charlestown was burned, was no more successful. The British rallied for a third attack, and the Americans, after resisting with stones and the butts of their rifies, having exhausted their ammunition and being destitute of bayonets, drew off with inconsiderable loss. General Warren was among the 115 killed. The Americans lost 305 wounded, and 30 taken prisoners. The loss of the British was about 1,054. June 17, 1825. the fiftieth anniversary of the battle, the corner stone of the Bunker Hill Monument was laid by Lafayette. This monument is a beautiful granite shaft 220 ft. in height. It was completed in 1843.

Bun'yan, JOHN (1628-1688), author of the Pilgrim's Progress, was the son of a tinker and was b. at the village of Elstow, near Bedford. He followed his father's employment, but during the civil war he served as a soldier. Re-

#### Buonarotti

turning to Elstow, after much mental conflict his mind became impressed with a deep sense of the truth and importance of religion. He joined a society of Anabaptists at Bedford, and at length undertook the office of a public teacher among them. Acting in defiance of the severe laws against dissenters, Bunyan was detained in prison for 12 years (1660-72), but was at last liberated, and became pastor of the community with which he had previously been connected. During his imprisonment he wrote Profitable Meditations, The Holy City, etc., and also the curious piece of autobiography entitled Grace Abounding to the Chief of Sinners. In 1675 he was sent to prison for six months under the Conventicle Act. To this confinement he owes his chief literary fame, for in the solitude of his cell he produced the first part of that admired religious allegory, the Pilgrim's Progress. His Holy War, his other religious parables, and his devotional tracts, which are numerous, are also remarkable, and many of them valuable. On obtaining his liberty Bunyan resumed his functions as a minister at Bedford, and became extremely popular. He died when on a visit to London.

Buonarotti (bu-o-nå-rot'tē), sec Michael Angelo (1475-1563).

Bur'bage, RICHARD (1567-1619), famous actor and contemporary of Shakespeare. He was a member of the same company as Shakespeare, Fletcher, Hemming, Condell, and others, and filled all of the greatest parts of the contemporary stage in turn. He was the original Hamlet, Lear, Othello, and Richard III, and played the leading parts in the plays of Beaumont and Fletcher, Ben Jonson, Webster, Marston, etc.

**Bur' bot** (or burbolt), a fish of the cod family, shaped somewhat like an eel, but shorter,

with a flat head. It has two small barbs on the nose and another on the chin. It is called also, *eel-pout* or *coney-fish*, and is said to arrive at its greatest perfection in the Lake of Geneva. It is delicate food. The spotted burbot is found in the American northern lakes and rivers.

**Burckhardt** (burk hart), JOHANN LUDWIG, (1784-1817), a noted traveler. He came to England in 1806, and undertook a journey of exploration to the interior of Africa for the African Association. He started in 1809, assuming an Oriental name and costume: spent some time in Syria, thence visited Egypt and Nubia; spent several months at Mecca, and visited Medina; and after a short stay in Egypt died at Cairo while preparing for his African journey.

Bur'dekin, a river of the n.e. of Queensland. Australia, with a course of about 350

# Burdette

mi. With its affluents it waters a large extent of country, but it is useless for navigation.

Bur'dett, SIR FRANCIS (1770-1844), English politician. In 1796 he entered Parliament as member for Boroughbridge. He afterward sat for Middlesex and in 1807-37 for Westminster. In 1810 he was convicted of breach of privilege, and after a struggle between the police and the populace, in which some lives were lost, he was imprisoned in the Tower. In 1819 he was again imprisoned and fined \$10,000 for a libel. In his later years he became a Tory, and represented North Wilts.

Burdett-Coutts (köts), ANGELA GEORGINA, daughter of the above. b. 1814, has become deservedly popular for the liberal use she has made of the immense wealth she inherited from her grandfather (Thomas Coutts) in public and private charities. In 1871 she received a peerage from government, and in 1881 married a Mr. Ashmead Bartlett who assumed the name of Burdett-Coutts.

**Bur' dock**, the popular name of a coarselooking weed with globose flower-heads, the scales of the involucre each furnished with a

# Greater Burdock.

a.—Section of flower-head showing hooked bracts. hook. In Britain burdocks are regarded as troublesome weeds, but in some countries the roots, young shoots, and young leaves are used in soups, and the plant is cultivated with this view in Japan. It is common in the U.S.

**Bureau** ( $b\bar{u}r\delta'$ ), a writing table; also the chamber of an officer of government and the body of subordinate officers who labor under the direction of a chief. Bureau system, or bureaucracy, is a term often applied to those governments in which the business of administration is carried on in departments, each under the control of a chief; or more broadly, the system of centralizing the administration of a country through regularly graded series of government officials.

Burdette, ROBERT J., b. in Greensboro, Pa., 1844. He attended public school at Pe-

### Burgkmair

oria, Ill., and in 1862 joined the Forty-seventh Illinois volunteers, and served through the war. He wrote for several papers after the war and finally became associate editor of the Burlington *Hawkeye*, of Iowa. He became known as a humorist through this paper. He began to lecture in 1877. He was licensed to preach by the Baptists, and frequently filled pulpits.

**Burgkmair** (burk'mir), a family of German artists in the fifteenth and sixteenth centuries, the best known of whom is Hans (1472-1559). Several of his paintings are to be seen at Augsburg, Munich, Nürnberg, etc., but these have contributed far less to his fame than his woodcuts, which are not inferior to those of his friend Albert Dürer. The most celebrated is the series of 135 cuts representing the Triumph of the Emperor Maximilian.

**Bürglen** (bür'-glen), a village in the canton of Uri, Switzerland, celebrated as the birthplace of William Tell.

Burgos (bür'-gos), a city of Northern Spain, once the capital of the kingdom of Old Castile, and now the chief town of the province of Burgos. It stands on the declivity of a hill on the right bank of the Arlanzon, and has dark, narrow streets full of ancient architecture, but there are also fine promenades in the modern style. The cathedral, commenced in 1221, is one of the finest examples of Gothic architecture in Spain. It contains the tombs of the famous Cid, and of Don Fernando, both natives of Burgos, and celebrated throughout Spain for their heroic achievements in the wars with the Moors. Before the removal of the court to Madrid, in the sixteenth century, Burgos was in a very flourishing condition, and contained thrice its present population. It has some manufactures in woolens and linens. Pop. 29,683. The province has an area of 5,650. sq. mi., largely hilly or mountainous, but with good agricultural and pastoral land. Pop. 348, 152.

**Burgoyne** (bur-goin'), JOHN (1722-1792), an English general officer and dramatist. After serving in various parts of the world, he was in 1777 appointed commander of an army against the American patriots and took Ticonderoga, but had at last to surrender with his whole army at Saratoga. He was illy received on his return to England, and deprived of his command of the Seventy-sixth Light Dragoons and the governorship of Fort William. but Fox and Sheridan took his part and received his parliamentary support. Latterly he occupied himself mainly with the writing of comedies, including *The Maid of the Oaks, Bon Ton*, and *The Heirese*, a play that still Holds the stage.

**Burgoyne**, Sir JOHN FOX (1782-1871), son of the above, an eminent officer of engineers. He served in Malta, Sicily, Egypt, and with Sir John Moore and Wellington in the Peninsula from 1809 to 1814, and was present at all the sieges, generally as first or second in command of the engineers. In 1851 he was made a lieutenant general, and was chief of the engineering department of Sebastopol till recalled in 1855. In the following year he was created a baronet, and in 1868 a field marshal.

# **Burgundy Wines**

**Burgundy**, a region of Western Europe, so named from the Burgundians, a Teutonic, or Germanic, people originally from the country between the Oder and the Vistula. They migrated first to the region of the Upper Rhine, and in the beginning of the fifth century passed into Gaul and obtained possession of the southeastern part of this country, where they founded a kingdom having its seat of government sometimes at Lyons, and sometimes at Geneva. They were at last wholly subdued by the Franks. In 879 Boson, count of Autun, succeeded in establishing the royal dignity again in part of this kingdom. He styled himself King of Provence, and had his residence at Arles. His son Louis added the country beyond the Jura, and thus established Cis-Juran Burgundy. A second kingdom arose when Rudolph of Strettlingen formed Upper or Trans-Juran Burgundy out of part of Switzerland and Savoy. Both these Burgundian kingdoms were united, and finally, on the ex-tinction of Rudolph's line, were incorporated But a third state, the historwith Germany. ical Duchy of Burgundy, consisting principally of the French province of Bourgogne, or Burgundy, had been formed as a great feudal and almost independent province of France in the ninth century. This first ducal line died out with a Duke Philip, and the duchy, reverting to the crown, was, in 1363, granted by King John of France to his son Philip the Bold, who thus became the founder of a new line of dukes of Burgundy. A marriage with Margaret, daughter of Louis III, count of Flanders, brought him Flanders, Mechlin, Antwerp, and Franche-Comté. He was succeeded by his son Duke John the Fearless, whose son and successor, Philip the Good, so greatly extended his dominions, that on his death in 1467 his son Charles, surnamed the Bold, though possessing only the title of duke, was in reality one of the richest and most powerful sovereigns of Europe. Charles left a daughter, Mary of Burgundy, the sole heiress of his states, who by her marriage to Maximilian of Austria transferred a large part of her dominions to that prince, while Louis XI of France acquired Burgundy proper as a male flef of France. Burgundy then formed a province, and is now represented by the four departments of Yonne, Côte-d'Or, Saône-et-Loire, and Ain. It is watered by a number of navigable rivers, and is one of the most productive provinces in France, especially of wines

**Burgundy Pitch**, a resin got from the Norway spruce and several other pines. It is used in medicine as a stimulating plaster. It takes\_ its name from Burgundy in France, where it was first prepared.

Burgundy Wines are produced in the former province of Burgundy, especially in the department of Côte-d'Or, and in richness of flavor and all the more delicate qualities of the juice of the grape they are inferior to none in the world. Among the red wines of Burgundy the finest are the Chamberlin, the Clos Vougeot, Romanée-Conty, etc.

Burial (be'ri-al), the mode of disposing of the dead, a practise which varies among different people. Among savage races, and even among some cultured peoples of the East, exposure to wild animals or birds of prey is not uncommon. The careful embalmment of their dead by the ancient Egyptians may be regarded as a special form of burial. But by far the most common forms of disposing of the dead have been burning and interring. Among the Greeks and Romans both forms were practised, though among the latter burning became common only in the later times of the republic. In this form of burial the corpse, after being borne in procession through the streets, was placed upon a pyre built of wood, and profusely sprinkled with oils and perfumes. Fire was set to the wood, and after the process of cremation was complete the bones and ashes were carefully gathered together by the rela-tives and placed in an urn. With the introduction of the Christian religion, consecrated places were appropriated for the purpose of general burial, and the Roman custom of providing the sepulcher with a stone and inscription was continued by the Christians. The practise of cremation now declined and finally disappeared, but has recently been revived.

**Bu** rlats, a nomadic Tartar people allied to the Kalmucks, inhabiting the southern part of the government of Irkutsk and Transbaikalia. Their number is about 200,000. They live in huts called *yurts*, which in summer are covered with leather, in winter with felt. They support themselves by their flocks, by hunting, and the mechanical arts, particularly the forging of iron.

Buridan (bu-rē-dün), JEAN, a French scholastic philosopher of the fourteenth century. He was a disciple of Occam at Paris, and has attained a kind of fame from an illustration he is said to have used in favor of his theory of determinism (that is, the doctrine that every act of volition is determined by some motive external to the will itself), and which still goes under the name of "Buridan's ass." He is said to have supposed the case of a hungry ass placed at an equal distance from two equally attractive bundles of hay, and to have asserted that in the supposed case the ass must inevitably have perished from hunger, there being nothing to determine him to prefer the one bundle to the other. The nature of the illustration, however, makes it more likely that it was invented by Buridan's opponents to ridicule his views than by himself.

Bu'rin (or graver), an instrument of tempered steel, used for engraving on copper, steel, etc. It is of a prismatic form, having one end attached to a short wooden handle, and the other ground off obliquely, so as to produce a sharp, triangular point. In working the burin is held in the palm of the hand, and pushed forward so as to cut a portion of the metal.

Burke, EDMUND (1730-1797), a noted British writer, orator, and statesman. He applied himself more to literature than to law, and in 1756 published his *Exactly on the Sublime and the* 

Beautiful, which attracted considerable attention, and procured him the friendship of some of the most notable men of the time. The political career for which he had been arduously preparing himself all along at length opened up to him. The great question of the right of taxing the American colonies was then occupying Parliament, and the Rockingham ministry having taken, mainly through Burke's advice, a middle and undecided course, was soon dissolved (1766). From 1770 to 1782 Lord North was in power, and Burke held no office. In 1774-80 he was member for Bristol. In several magnificent speeches he criticised the ministerial measures with regard to the colonies, and advocated a policy of justice and conciliation. In 1782, when the Rockingham party returned to power, Burke obtained the lucrative post of paymaster general of the forces, and shortly after introduced his famous bill for economical reform, which passed after considerable modifications had been made on On the fall of the Duke of Portland's it. coalition ministry, 1783, of which Burke had also been part, Pitt again succeeded to power, and it was during this administration that the impeachment of Hastings, in which Burke was the prime mover, took place. The lucidity, eloquence, and mastery of detail which Burke showed on this occasion have never been surpassed. The chief feature in the latter part of Burke's life was his resolute struggle against the ideas and doctrines of the French Revolution. His attitude on this question separated him from his old friend Fox, and the Liberals who followed Fox. His famous Reflections on the Revolution in France, a pamphlet which appeared in 1790, had an unprecedented sale, and gave enormous impetus to the reaction which had commenced in England. From this time most of his writings are powerful pleadings on the same side. In 1794 he withdrew from Parliament.

Burke, ROBERT O'HARA (1821–1861), an Australian explorer. After serving in the Austrian army he went to Australia, and after seven years' service as inspector of police was appointed commander of an expedition to cross the continent of Australia from south to north. He and his associate Willis reached the tidal waters of the Flinders River, but both perished of starvation on the return journey.

Burking, a species of murder by suffocation. which derives its name from William Burke. a native of Ireland, who, in 1828-29, was detected, tried, and executed at Edinburgh, for the murder of numerous individuals. The the murder of numerous individuals. vigilance with which the burying grounds throughout the country were watched rendered a supply of subjects for anatomical schools almost altogether impracticable, and the demand for dead bodies consequently became great. This led the above mentioned individual, in conjunction with another wretch named Hare, to decoy into their lodging house and murder by strangulation many obscure wayfarers, whose bodies they sold to a school of anatomy at prices averaging from \$40 to \$70.

### Burlesque

**Burlesque** (bur-lesk') signifies a low form of the comic, arising generally from a ludicrous mixture of things high and low. High thoughts, for instance, are clothed in low expressions, noble subjects described in a familiar manner, or *tice tersd*. The true comic shows us an instructive, if laughable, side of things; the burlesque travesties and caricatures them in order to excite laughter or ridicule.

Burlingame, ANSON (1820-1870), American statesman, b. in N. Y. He graduated in law at Harvard in 1846, became a state senator in Massachusetts in 1853, entered Congress in 1854, and sat until March, 1861. He was challenged in 1856 by Preston S. Brooks, whose brutal assault upon Charles Sumner he had denounced in fitting terms. The duel was never fought. He was then sent as U. S. minister to China, and when he was recalled, in 1867, the Chinese government engaged his services as their diplomatic representative in Europe and the U. S. He negotiated, in 1868, the treaty known by his name, by which China subscribed to the principles of international law.

Burlington, Chittenden co., Vt., on Lake Champlain, about 250 mi. n. of New York. Railroads: Central Vermont; Rutland, and Lake Champlain Transportation Co. Industries: cotton mills, woolen mill, two iron foundries, two flouring mills, and a number of other factories. Surrounding country agricultural. The town was first settled about 1780. Pop. est. 1897, 18,600.

Burlington, Des Moines co., Ia., on Mississippi River, 206 mi. s. w. of Chicago. Railroads: C. B. & Q.; St. L. K. & N. W.; C. B. & K. C.; B. C. R. & N.; T. P. & W.; B. & N. W., and many other branches of the Burlington route. Industries: iron works, two flouring mills, two iron foundries, school furniture and desk factories, wheel factory, and three for the manufacture of agricultural implements. Surrounding country agricultural. Burlington contains a 90-acre public park; and the largest auditorium in the state, seating capacity 7,000. The city was first settled in 1833. Pop. est. 1897, 27,000.

**Burlington,** Burlington co., N. J., on Delaware River, 19 mi. e. of Philadelphia. Railroad: Pennsylvania. Industries: pipe and foundry co., flour mill, iron foundry, several shoe factories and a large carriage factory. Surrounding country agricultural. Burlington is the birthplace of James Fenimore Cooper. The town was first settled by Quakers in 1677, and became a city in 1784. Pop. est. 1897, 7,900.

Bur'mah, a country of Southern Asia, area about 290,000 sq. mi. It is traversed by great mountain ranges branching off from those of Northern India and running parallel to each other southward to the sea. Between these ranges and in the plains or valleys here situated, the four great rivers of Burmah—the Irrawaddy, its tributary the Kyendwen, the Sittang, and the Salwen—flow in a southerly direction to the sea, watering the rich alluvial

### Burmah

tracts of Lower Burmah, and having at their mouths all the great seaports of the country-Rangoon, Bassein, Moulmein, Akyab, etc. The Irawaddy is of great value as a highway of communication and traffic, being navigable beyond Bhamo, near the Chinese frontier, or over 800 mi. Though its resources are almost entirely undeveloped, the country, as a whole, is productive, especially in the lower portions. Here grow rice, sugar-cane, tobacco, cotton, indigo, etc. Cotton is grown almost every-where; tea is cultivated in many of the more elevated parts. The forests produce timber of many sorts, including teak, which grows most luxuriantly, and is largely exported. Ironwood is another valuable timber; and among forest products are also the bamboo, cutch. stick-lac, and rubber. Burmah has great mineral wealth-gold, silver, precious stones, iron, marble, lead, tin, coal, petroleum, etc.; but these resources have not yet been much de-veloped. The chief precious stone is the ruby, and the mines of this gem belong to the crown. Sapphire, amber, and jade are also obtained. Among wild animals are the elephant, rhinoceros, tiger, leopard, deer of various kinds, and the wild hog. Among domestic animals are the ox, buffalo, horse, and ele-phant. The rivers abound with fish. The most common fruits are the guava, custardapple, tamarind, pine, orange, banana, jack, and mango. The yam and sweet potato are cultivated, and in some parts the common potato. The climate of course varies according to elevation and other circumstances, but as a whole is warm, though not unhealthy, except in low jungly districts. The rainfall among the mountains reaches as high as 190 in. per annum.

The population may be stated at about 8,000,000 or 9,000,000, made up of a great variety of races besides the Burmese proper, as Talaings, Shans, Karens, etc. The Burmese proper are of a brown color, with lank, black hair (seldom any on the face), and have active, vigorous, well-proportioned frames. They are a cheerful, lively people, fond of amusement, averse to continuous exertion, free from prejudice of caste or creed, temperate and hardy. The predominant religion is Buddhism. The Burmese are skillful weavers, smiths, sculptors, workers in gold and silver. joiners, etc. The ordinary buildings are of a very slight construction, chiefly of timber or bamboo raised on posts; but the religious edifices are in many cases imposing, though the material is but brick. Carving and gilding are features of their architecture. The Burmese language is monosyllabic, like Chinese, and is written with an alphabet the characters of which (derived from India) are more or less circular.

Burmah is now divided into Lower Burmah and Upper Burmah, the former till 1886 being called British Burmah, while the latter till that date was an independent kingdom or empire. Lower Burmah was acquired from Independent Burmah in 1826 and 1852 as the result of two wars terminating in favor of

26

١

Britain. It comprises the divisions of Aracan, Pegu, Irrawaddy, and Tenasserim. Area,87,473 sq. mi.; pop. (1891) 2,946,933. Under British rule it has prospered greatly, the population and trade having increased immensely, there being regularly a large surplus revenue. Roads, canals, and railways have been constructed and other public works carried out, as also public buildings erected. The chief city and port is Rangoon, which is now connected by railway with Mandalay in Upper Burmah.

Under its native kings the form of government in Upper Burmah was an absolute monarchy, the seat of government being latterly at Mandalay. The king was assisted in governing by a council of state known as the Hlootdaw, to which belonged the functions of a house of legislature, a cabinet, and a supreme court. The king had power to punish at his pleasure any one, even the great officers of state. The revenue was derived from taxes levied in a very irregular and capricious manner, and official corruption was rampant. The criminal laws were barbarously severe. Capital punishment was commonly inflicted by decapitation, but crucifixion and disembowelling were also practised. After the loss of the maritime provinces the influence of Independent Burmah greatly declined, as did also its Asiatic and foreign trade.

The Burmese Empire is of little note in ancient or general history. Since the sixteenth century the Burmese proper have mostly been the predominant race, and ruled the Peguans, Karens, etc., throughout the country. The capital has at different times been at Ava, The Pegu, Prome, or elsewhere. In the latter half of the eighteenth century the Burmese emperors began a series of wars of conquest with China, Siam, Assam, through which they greatly en-larged the empire. This brought them into contact with the British, and in 1824 war was declared against them on account of their encroachments on British territory and their seizure of British subjects. The war terminated in the cession of the provinces of Aracan and Tenasserim to the British. Peace continued for some years, but latterly various acts of hostility were committed by the Burmese, and in 1852 the maltreatment of British subjects occasioned a second war, at the end of which the British possessions were extended to include the whole of Pegu. The third and last war occurred in 1885 in consequence of the arrogance and arbitrary conduct of King Theebaw. The result was that Upper Burmah was annexed to the British empire by procla-mation of the Viceroy of India, Jan. 1, 1886. The area thus annexed was about 200,000 sq. mi., of which half belonged to the kingdom proper, half to the semi-independent Shan states. The country is yet far from tranquil, bands of *dacoits*, or robbers, causing much trouble. There are about 20,000 military stationed in it.

**Bur' naby**, FREDERICK GUSTAVUS (1842-1885), English soldier and traveler. He was educated at Harrow, and entered the Royal Horse Guards in his eighteenth year. In 1875 he made his famous ride to Khiva — a journey that presented great difficulties. In 1876 he rode through Asiatic Turkey and Persia. Of both these journeys he published narratives. In 1885, while serving as lieutenant colonel of the Royal Horse Guards in the Egyptian campaign, he was slain at the battle of Abu-Klea.

paign, he was slain at the battle of Abu-Klea. Burnand, FRANCIS COWLEY (1837-), English humorist; educated at Eton and Trinity College, Cambridge, and admitted to the bar in 1862. In 1880 he became editor of the London Punch, to which he had contributed for several years. He wrote many burlesques, of which *Irion* and *Black-Eyed Susan* were very successful.

**Burne-Jones**, EDWARD (1833-), an English painter. He early adopted the profession of artist, and came under the influence of D. G. Rossetti. He has painted in water-color as well as oil, and his works are remarkable for richness of coloring as well as for their poetical, ideal, and mediæval characteristics.

Bur'net, the popular name of two genera of plants, natural order Rosaceæ: 1, Common or lesser burnet, a perennial plant of North

1-Common Burnet. 2-Great Burnet. a-A floret, b-Flower-head.

America and Europe, which grows to the height of about 2 ft., with smooth, alternate, imparipinnate leaves, and flowers arranged in rounded heads of a purplish color. 2, Greater burnet, also a perennial plant with imparipinnate leaves; flowers red, arranged on oval spikes at the extremity of long peduncles. Both kinds make very wholesome food for cattle. There is also a Canadian species.

Bur' net, GILBERT (1643-1715), a noted British historian. Having studied at Aberdeen, he traveled into Holland in 1664. He was ordained in 1665, was for some years minister of Saltoun parish, and became professor of divinity at Glasgow in 1669. He was long in great favor at court, but the court favor did not continue, for Burnet, dreading the machinations of the Catholic party, joined the opposition, and wrote his *History of the Reformation in England*. Eventually he was invited to The Hague by the Prince and Princess of Orange, and had a great share in the councils relative to Britain. He accompanied the Prince of Orange to England as chaplain, and was rewarded for his services with the bishopric of Salisbury. As a prelate, Bishop Burnet distinguished himself by fervor, assiduity, and charity.

Burnett's Disinfecting Liquid, an antiseptic liquid and deodorizer prepared from chloride of zinc. It is useful in deodorizing sewerage, bilge water in ships, etc., and is found of service in the dissecting room.

Burnett, FRANCES ELIZA HODGSON, an American novelist, b. 1849, in Manchester, England. She came to this country in 1865, and in 1873 married Dr. S. M. Burnett. Her best known works are Surly Tim's Trouble (1872), That Lass o' Lowrie's (1876), Haworth's (1878), A Fair Barbarian (1881), Through One Administration (1882), and Little Lord Fauntleroy, the last named having been successfully dramatized. Burnham, SHELBOURNE W., b. 1840, an

Burnham, SHELBOURNE W., b. 1840, an American astronomer. He was for many years shorthand reporter in the courts of Chicago, and devoted all his leisure to astronomical studies. Mr. Burnham was connected with the Dearborn observatory, and made a special study of double stars, of which he recorded more than any other man. When the Lick observatory in California was erected he was asked to take charge of it. He was a member of the Royal Astronomical Society, and wrote many papers of great value. He is now a professor of astronomy at the University of Chicago, and is continuing his researches at the new Yerkes observatory.

Burning glass, a lens which, by bringing the sun's rays rapidly to a focus, produces a heat strong enough to kindle combustible matter. The lenses commonly used are convex on both sides, and having a small focal distance. That such a glass may produce its greatest effect it is necessary that the rays of the sun should fall upon it in a perpendicular direction. The effect may be greatly augmented by the use of a second lens, of a smaller focal distance, placed between the first and its focus. Some immense burning glasses have been made, producing surprising effects. Concave burning mirrors produce the same kind of results, and have almost four times more power than burning glasses of equal extent and curvature. The concavity must present a surface of high reflecting power (polished silver or other metal, or silvered glass), and must be either spherical or parabolic. Plane mirrors may also be employed like concave ones, if several of them are combined in a proper manner. The ancients were acquainted with such mirrors, and Archimedes is said to have set the Roman fleet on fire at the siege of Syracuse (B. c. 212) by some such means. In 1747

Buffon by a combination of mirrors burned wood at the distance of 200 ft. and melted tin at the distance of 150, etc.

**Burnisher**, a blunt, smooth tool, used for smoothing and polishing a rough surface by rubbing. Agates, tempered steel, and dogs' teeth are used for burnishing.

**Burn' ley**, a city of England, in Lancashire, about 22 mi. n. of Manchester. The staple manufacture is cotton goods, and there are large cotton mills and several extensive foundries and machine shops, with collieries and other works, in the vicinity. Pop. 87,058.

**Burnoose** (ber-nös') a large kind of mantle, in use among the Bedouin Arabs and the Berbers of Northern Africa, commonly made of white wool, but sometimes also of red, blue, green, or some other color, and having a hood which may be drawn over the head in case of rain.

Burns, ROBERT (1759-1796), the great lyric poet of Scotland, was b. near Ayr, his father being a gardener, and latterly a small farmer. He was instructed in the ordinary branches of an English education by a teacher engaged by his father and a few neighbors; to these he afterward added French and a little mathematics. But most of his education was got from the general reading of books, to which he gave himself with passion. In this manner he learned what the best English poets might teach him, and cultivated the instincts for poetry which had been implanted in his nature. At an early age he had to assist in the labors of the farm; and when only fifteen years old he had almost to do the work of a man. In 1781 he went to learn the business of flaxdresser at Irvine, but the premises were de-stroyed by fire, and he was thus led to give up the scheme. His father dying in 1784, he took a small farm (Mossgiel) in conjunction with his younger brother Gilbert. He now began to produce poetical pieces which attracted the notice of his neighbors and gained him considerable reputation. His first lines had been written some time previously, having been inspired by love, a passion to which he was peculiarly susceptible. His love affair with Jean Armour of Mossgiel decided him to emigrate to Jamaica, and engage himself as assistant overseer on a plantation there. To obtain the funds necessary for the voyage he was in-duced to publish, by subscription, a volume of his poetical effusions. It was printed at Kilmarnock in 1786, and Burns, having thus obtained the assistance he expected, was about to set sail from his native land, when he was drawn to Edinburgh by a letter from Doctor Blacklock to an Ayrshire friend of his and the poet, recommending that he should take advantage of the general admiration his poems had excited, and publish a new edition of them. This advice was eagerly adopted, and the result exceeded his most sanguine expectations. After remaining more than a year in the Scottish metropolis, admired, flattered, and caressed by persons of eminence for their rank, fortune, or talents, he retired to the country with the sum of some \$2,500, which he had

### Burns and Scalds

realized by the second publication of his poems. A part of this sum he advanced to his brother, and with the remainder took a considerable farm (Ellisland) near Dumfries, to which he subsequently added the office of exciseman. He now married, or rather formally completed his marriage with Jean Armour. But the farming at Ellisland was not a success, and in about three years Burns removed to Dumfries and relied on his employment as an exciseman He continued to exercise his pen, alone. particularly in the composition of a number of beautiful songs adapted to old Scottish But his residence in Dumfries, and tunes. the society of the idle and the dissipated who gathered around him there, attracted by the brilliant wit that gave its charm to their convivialities, had an evil effect on Burns, whom disappointment and misfortunes were now making somewhat reckless. In the winter of 1795 his constitution, broken by cares, irregularities, and passions, fell into premature decline; and a rheumatic fever terminated his life and sufferings at the early age of thirtyseven. He left a wife and four children, for whose support his friends and admirers raised a subscription, and with the same object an edition of his works, in four volumes, 8vo., was published in 1800 by Doctor Currie of Liver-pool. His character, though marred by imprudence, was never contaminated by duplicity or meanness. He was an honest, proud, warmhearted man, combining sound understanding with high passions and a vigorous and excursive imagination. He was alive to every species of emotion: and he is one of the few poets who have at once excelled in humor, in tenderness, and in sublimity.

Burns and Scalds are injuries produced by the application of excessive heat to the human body. They are generally dangerous in proportion to the extent of surface they cover, and a wide-spread scald may cause serious consequences on account of the nervous shock. Congestion of the brain, pneumonia, inflam-mation of the bowels, or lockjaw may result from an extensive burn. Hence the treatment requires to be both local and constitutional. If there is shivering or exhaustion hot brandy and water may be given with good effect, and if there is much pain, a sedative solution of opium. The local treatment consists in dredging the burn with fine wheat flour, and then wrapping it up in cotton-wool. An application of equal quantities of olive oil and lime water, called carron-oil, is much recommended by some, the part being afterward covered by cotton-wool. The main thing is to keep the air from the injured part, and therefore, when a blister forms, although it may be pricked, the loose skin should not be removed.

Burnside, AMBROSE EVERETT (1824-1881), an American soldier. His ancestors were Scotch, and emigrated to South Carolina in 1746. Ambrose, the fourth of nine sons, was born in a log cabin. At the age of seventeen he was indentured to a merchant tailor, and, after learning his trade, began business in Liberty,

### Burnt-umber

Ind. He entered the U. S. military academy, was graduated in 1847, and went to Mexico as Second Lieutenant of Third Artillery. In 1852 he resigned his commission. At the beginning of the Civil War he took command of a regiment from Rhode Island. He commanded a brigade at Bull Run, and when General Hunter was wounded assumed command. On Aug. 6, 1861, he was made brigadier general of volunteers. On October 23 he was ordered to Annapolis, Md., to organize a "coast division." intended to operate along the lower Potomac and the Chesapeake Bay, but the plan was changed, and it was sent to Pamlico Sound by way of Hatteras Inlet, and on Feb. 5. 1862, the fleet captured the Confederate garrison of 2,500 men on Roanoke Island. Burnside relinquished the department of North Carolina, and was transferred to the Army of the Potomac. He was twice offered the chief command and declined. He was sent with command of the first and ninth corps to meet General Lee at Sharpsburg, and encountered the Confederate force at South Mountain. His force, the ninth corps, held, with great loss of life, the stone bridge at Antietam, which was the important post of that battle. General Mc-Clellan was relieved in November and Burn-side took the command. He was superseded by Major-General Hooker, and transferred to the department of the Ohio. In August, 1863, he crossed the Cumberland Mountains to Knoxville, where he lay fortified for a siege. General Sherman relieved him, and he devoted himself to reorganizing the ninth corps. He resumed command in April, 1864, at Annapolis, with nearly 20,000 men, and was again attached to the Army of the Potomac under General Grant. He led his force at the Wilderness, Cold Harbor, and Petersburg, and suffered severe defeats. General Meade brought charges of disobedience against General Burnside and ordered a court-martial, which found him "answerable for the want of success." He resigned from the army on April 15, 1865. and became identified with railroad management. He was elected governor of Rhode Island in 1866, 1867, and 1868, but declined re-election. He went to Europe during the Franco-Prussian War, and was called upon to act as envoy between the two forces endeav-oring to negotiate peace. Returning to this country he was elected to the U. S. Senate from Rhode Island in 1875 and re-elected in 1880.

**Burnt-offering**, something offered and burnt on an altar as an atonement for sin; a sacrifice. The burnt-offerings of the Jews were either some clean animal, as an ox, a sheep, a pigeon; or some species of vegetable substance, as bread, flour, ears of wheat or barley.

**Burnt-sienna**, an ochreous earth known as sienna-earth submitted to the action of fire, by which it is converted into a fine orangebrown pigment, used both in oil and watercolor painting.

Burnt-umber, a pigment of reddish-brown color obtained by burning umber, a soft earthy mixture of the peroxides of iron and

manganese, deriving its name from Umbria in Italy.

Burr, AARON (1750-1836), an American statesman, b. at Newark, New Jersey, graduated at Princeton. where his father and grandfather (Jonathan Edwards) had been president of the college, and in 1775 joined the patriot army, in which he gained a high reputation, and in 1777 the rank of lieutenant colonel. Retiring in 1779, he was in 1782 called to the bar, where he soon became a leader. He was attorney general in 1788-90, U.S. senator in 1791-96, and vice-president of the U.S. in 1800-4. His defeat in a contest for the governorship of New York led him to force a duel (July 11, 1804) on the most active of his opponents, Alexander Hamilton, who had been his personal rival for many years, and who now fell mortally wounded at the first fire. Burr fied to South Carolina, and though indicted for murder, returned after the excitement had subsided, and completed his term as vice-president. He now prepared to raise a force to conquer Texas, and establish there a republic, which might detach the Western states from the Union. This enterprise was proclaimed by the president, and Burr tried for treason (1807). Acquitted, but bankrupt in reputation, he spent some wretched years in Europe, and in 1812 returned to his law practise in New York. Here, shunned by society, the unhappy man, who had long survived all the members of his own family, died on Staten Island, in a home for which he was indebted to the charity of an old friend. Burr was a man of the world, of polished man-ners and fascinating address. He early adopted pronouncedly infidel views.

Burrard Inlet, an inlet of British Columbia, forming a fine harbor, and having Vancouver, the terminus of the Canadian Pacific railway, on its northern shore.

**Burrillville**, Providence co., R. I., has numerous manufactories and a national bank. Pop. 5,492.

**Bur ritt**, ELIHU (1810–1879), the "learned blacksmith," was b. at New Britain, Conn. He was apprenticed to a blacksmith, but began to read English literature, and acquired proficiency in the ancient and most modern languages of Europe. He afterward came into public notice as a lecturer on behalf of temperance, the abolition of slavery and war, etc., and founded papers, missions, and organizations to further these ends. In 1848 the first International Peace Congress was held under his guidance at Brussels. In 1865 he was consular agent at Birmingham. In 1868 he returned to live on his farm in America. His best known writings are Sparks from the Antil, Thoughts and Things at Home and Abroad; Chips from Many Blocks.

**Burroughs**, JOHN, b. 1837. An American author, wrote extensively on natural history. His charming essays on the beauties of nature were extremely popular in America and Europe.

**Burrowing-owl**, an American owl, which dwells in holes in the ground either made by itself or by some other animal, as the prairie dog or marmot. It feeds on insects and seeks its food by day.

Burrows, JULIUS CZEAR, American statesman, b. in Erie co., Pa., 1837. He served in the Union army 1862-1864, and after the war became prosecuting attorney of Kalamazoo co., Mich. In 1875-76 he served in Congress as a Republican, and again from 1870-1881. In 1884 he was again elected from the fourth Michigan district, and re-elected in 1886 and 1888. He is now in the U. S. Senate from the state of Michigan.

Bur'sary, an endowment in one of the Scotch universities, intended for the support of the student during his ordinary course, and before he has taken a degree in the faculty in which he holds the bursary. This circumstance, according to the usage prevailing in Scotland, distinguishes bursaries from scholarships and fellowships, both of which are bestowed after the student has taken a degree. Each of the four universities of Scotland has a greater or smaller number of bursaries. Of late years most bursaries are awarded after competitive examination, and only a few are now given by the patrons for special reasons.

Burs'lem, a town of England, in Staffordshire, in the center of "The Potteries." Here is the Wedgwood Memorial Institute, comprising a free library, a museum, and a school of art, erected in honor of Josiah Wedgwood, who was b. at Burslem in 1730. Burslem has extensive manufactures of china and earthenware, in which trade and coal-mining the inhabitants are chiefly employed. Pop. 30,862.

Burton, JOHN HILL (1809-1881), historian of. Scotland. He early contributed to the Westminster Review, as afterward to the Edinburgh and North British, to Blackwood's Magazine, and to the Scotsman. His first book was the Life and Correspondence of David Hume, followed by Lives of Lord Lowert and Duncan Forbes of Culloden, and other works. His chief work was his History of Scotland from the Earliest Times to 1746, others equally well known were The Scot Abroad, and the Book-hunter.

**Bur'ton**, ROBERT (1576-1640). a British author. His vast out-of-the-way learning is curiously displayed in his book *The Anatomy of Melancholy*, which he published in 1621.

of Metancholy, which he published in 1021. **Burton**, WM. E. (1804-1800), an American actor. He began his theatrical career in England, and in 1834 came to the U. S. and appeared in standard comedies in Philadelphia and New York. In 1848 he became manager of the theater in Chambers street. Burton's Falstaff, his Amiuadab Sleek and his Toodles, dwell in the memory of veterau play-goers to this day.

Burton, RICHARD FRANCIS (1821-1890), a famous English traveler. He acquired a familiarity with nearly all the Oriental languages, and disguised as a pilgrim (Hadji) visited Mecca and Medina in 1853. He served with credit in the Crimea, and from 1856 to 1859 was engaged in Central African explorations. Subsequently he was English consul at Damascus and Trieste. He wrote over thirty volumes of travels, and in 1885-1888 published a literal translation of the *Arabian Nights*, of which only a limited number of copies were issued.

Burton-on-Trent, a town of England, in Staffordshire, on the n. bank of the Trent, in a low, level situation. Malting and iron-founding are carried on to a considerable extent, but it is chiefly celebrated for its excellent ale, for which there are numerous breweries, employing upward of 5,000 men and boys, the largest establishments being those of Messrs. Bass & Co. and Messrs. Allsopp. Pop. 46,047.

Bury (be'ri), a town of England, in Lancashire, 8 mi. n.n.w. of Manchester, well situated on a rising ground between the Irwell and the Roche. The staple manufacture is that of cotton, and there are also large woolen factories, bleaching and printing works, dye works, foundries. etc. Sir Robert Peel was b. near Bury in 1788, and a bronze statue of him adorns the town. Pop. 57,206.

**Burying-beetle**, the name of a genus of insects belonging to the order of beetles, and the tribe of the carrion beetles. They have a very keen scent, which guides them to the dead bodies of rats, mice. etc., which form their

Burying-beetle.

food. Several beetles will unite to cover such animals, burying them sometimes more than 6 in. in the earth. They deposit their eggs on the carrion, and in less than a fortnight the larvæ issue. The species are common everywhere.

Bury St. Edmond's (or St. Edmondsbury), a town in Suffolk, England, 26 mi. from Ipswich. Agricultural implements are manufactured, and there is a large trade in agricultural produce. It is an ancient place, and derived its name from St. Edmund, a king of the East Angles, slain by the heathen Danes and buried here. It contains the remains of an abbey, once the most wealthy and magnificent in Britain. Pop. 16,630.

**Busa'co**, a mountain ridge in the province of Beira, Portugal. It was here that Wellington repulsed Massena (Sept. 27, 1810) and continued his retreat to the lines of Torres Vedras.

**Bush-buck**, a name given to several species of antelopes, especially to an antelope of South Africa, 4 ft. long, and  $2\frac{1}{2}$  ft high, with triangular sub-spiral horns. The male is dark sepia brown, and the female reddish brown above; both are white below. The *while-backed bushbuck* is a white-backed antelope of Sierra Leone, with black, shining, pointed, and nearly straight horns, short, slender limbs, sleek, glossy, deep brown hair.

**Bushire** (bü'shēr) (properly *Abu Shehr*, the father of cities), the principal seaport of Persia, on the Persian Gulf, 1184 miles w.s.w. Shiraz. It carries on a considerable traffic with India and Britain, importing rice, indigo, sugar, cotton goods, etc., and exporting shawls, dates, tobacco, carpets, wool, drugs, etc. Pop. 25,000.

Bushmen (or Bosjesmen), a race of people who dwell in the western part of South Africa, in the immense plains bordering on the north side of the Cape of Good Hope. They are the most degraded of the races which inhabit this part of the country. They do not form societies, but unite only for defense or pillage. They have no huts, and do not cultivate the land, but support themselves by hunting. Their language is exceedingly poor, consisting only of a certain clicking with the tongue and harsh gurgling tones, for which we have no letters.

Bush rangers, the name for desperadoes or escaped convicts in Australia who, taking to the bush, supported themselves by levying contributions on the property of all and sundry within their reach. Considerable gangs of these lawless characters have sometimes collected, a body of fifty holding part of New South Wales in terror about 1830. A gang of four fell victims to justice in 1880, after having robbed a bank and committed other outrages. At the present day, owing to better police arrangements, increased population, and the introduction of railroads and telegraphs, bushrangers are practically extinct. Business Colleges, the name for the higher-

Business Colleges, the name for the higherclass institutions specially intended to give a practical training in all subjects belonging to commerce.

**Busi ris,** a town of ancient Egypt, in the Delta, the chief place where the rites of Isis were celebrated. The name is also given as that of a mythical Egyptian king.

**Bus' kin**, a kind of high shoe worn upon the stage by the ancient actors of tragedy, in order to give them a more heroic appearance; often used figuratively for tragedy, like "sock" for comedy.

Bussu-paim, a tree found in the swamps of the Amazon, whose stem is only 10 to 15 ft. high, but whose leaves are often 30 ft. long by 4 to 5 ft. in breadth. These are used by the Indians for thatch, the spathes are used as bags, or when cut longitudinally and stretched out they form a coarse but strong kind, of cloth.

Bust, in sculpture, the representation of that portion of the human figure which comprises the head and the upper part of the body. During the literary period of Greece the portrait busts of the learned formed an important branch of art, and in this way we come to possess faithful likenesses of Socrates,

#### Bustard

Plato, Demosthenes, etc., in which the artists show great power of expressing the character of those represented. The number of busts belonging to the time of the Roman Empire is very considerable, but those of the Roman poets and men of letters have not been preserved in nearly so large numbers as those of the Greeks. The first bust that can be depended upon as giving a correct likeness is that of Scipio Africanus the elder.

**Bus'tard**, a bird belonging to the order of runners, but approaching the waders. The great bustard is the largest European bird, the male often weighing 30 lbs., with a breadth of wing of 6 or 7 ft. The bustard is now rare

#### Great Bustard.

in Britain, but abounds in the south and east of Europe and the steppes of Tartary, feeding on green corn and other vegetables, and on earthworms. Its flesh is esteemed. All the species run fast, and take flight with difficulty.

**Bute** (būt), an island of Scotland. Pop. 11,-735; belonging principally to the Marquis of Bute. It is about 15 mi. long, and the average breadth is  $3\frac{1}{2}$  mi. In Kames Hill it rises to the height of 875 ft.; it has several pretty lakes, the principal of which is Loch Fad,  $2\frac{1}{4}$  mi. long. The herring fishery is a source of considerable profit. The only town is Rothesay.

siderable profit. The only town is Rothesay. Butler, Butler co., P.a., on Connoquenesug Creek. Railroads: P. R. R.; B. & O.; P. B. & L. E. Industries: plate glass works, two flouring mills, two iron foundries, woolen mill, and thirteen other factories. Surrounding country agricultural; coal, oil, and gas in vicinity. The town was first settled in 1803. Pop. est. 1897, 12,000.

Butler, BENJAMIN F. (1818–1896). American lawyer, general, and politician. He practised law in Lowell, Mass., and became prominent in his profession. Previous to the Civil War he was twice a candidate for the governorship of Massachusetts. He was appointed brigadier general of the state militia at the outbreak of the Civil War, and marched to Annapolis, Md.,

with the eighth Massachusetts regiment, to command the district of Annapolis, including Baltimore. He was appointed major general of volunteers in May, 1861, and given com-mand of the department of Eastern Virginia. General Butler captured Fort Clark and Fort Hatteras in August, 1861. The following March he led an expedition to the Gulf of Mexico. Butler commanded at New Orleans after it was captured by Farragut, from May to December. He armed the free colored men. Jefferson Davis, 1862, issued a proclamation declaring him to be an outlaw. In 1863 he was placed in command of Virginia and North Carolina with the Army of the James. He formed a plan to capture Richmond by operations from the south side of the James, intending to co-operate with the Army of the Potomac from the north. He was checked by General Beauregard. Later he was sent to Fort Fisher, N. C. He was removed from command by General Grant, and returned to Massachusetts. In 1866 he was elected to Congress as a Republican, and served until 1879, with the exception of the year 1875-76. He took an active interest in the impeachment of President Johnson. In 1871 he was the unsuccessful Republican nominee for governor of Massachusetts. In 1878 and 1879 he was again defeated for the same office on the ticket of the Greenback party. In 1882 he was elected by the Democrats. In 1884 he ran as the Greenback-Labor candidate for president, but did not get any votes in the electorial college.

Butler, ELIZABETH S., b. 1844, in Switzerland. She achieved fame by her pictures, *Missing, The Roll-Call, Balaklava*, and *Inker*mann, shown at the Royal Academy 1873. In 1877 she married Major General Butler, of the British army.

**Butler**, JAMES (1610-1688), duke of Ormonde, an eminent statesman in the reigns of Charles I and II.

Butler, JOSEPH (1692-1752), an English prelate and celebrated writer on ethics and theology. His great work is the Analogy of Religion. Natural and Rerealed, to the Constitution and Course of Nature, which acquired for him a great reputation.

Butler, WILLIAM ALLEN, b. in Albany, N. Y., 1825; American author; son of B. F. Butler, who was attorney general in Jackson's cabinet. Mr. Butler wrote, in 1857, a society satire in verse—Nothing to Wear—and has been a liberal contributor to the magazines.

Butler, WILLIAM FRANCIS, b. 1838; British soldier; entered the British army in 1858, and served in the Red River and Ashantee expeditions. He also held high command in the Soudan, and is a major general and commander of the Bath. He is the author of *The Great Lone Land* and *The Wild North Land*, which were published in 1872 and 1873 respectively.

**Butt**, ISAAC (1813-1879), Irish statesman. He was professor of political economy in the University of Dublin, 1836-41, and sat in Parliament as a Liberal-Conservative, 1852-65.

He was a prominent member of the Irish bar, and defended Smith O'Brien in 1848. In 1871 he was elected as a Home Ruler. He later lost his influence.

Butte City, Silver Bow co., Mont., 65 mi. s. w. of Helena. Railroads: Montana Central; Union Pacific; Northern Pacific, and Montana Union. In the vicinity are rich gold, silver and copper mines and smelting works. Pop. est. 1897, 10,723.

Butter, a fatty substance extracted from the ilk of mammalia. The amount of butter milk of mammalia. from the milk of well-fed cows is about four Butter is best made from the cream per cent. of the milk, but in large factories the whole of the milk is usually churned. Milk is very sensitive to environment and the flavor of the butter depends largely on the treatment of the milk. Butter is extracted by agitation which ruptures the minute fat globules and causes them to collect in masses. Butter for market is packed in tin or wooden tubs, or earthen jars, or is fashioned into rolls or pats. The rich yellow natural color of butter depends largely upon the richness of the pasture. Butter is artificially colored by arnetto. Skill is required in salting butter. One half ounce of common salt to two pounds of butter is the rule, but one ounce to a pound of butter is sometimes used. Butter in chemistry is applied to substances of a buttery consistency. Butter is a name applied to certain metallic substances which have an oily appearance, as butter of antimony.

**Butterbur**, a composite plant, with large rhubarb-like leaves and purplish flowers, growing by the side of streams: allied to coltated

ing by the side of streams; allied to coltsfoot. Buttercup, the popular name of two or three species of the Ranunculus. They are common plants with brilliant yellow flowers.

Butterfly, the common name of all diurnal lepidopterous insects, corresponding to the original Linnæan genus Papilio. The family of the butterflies or diurnal Lepidoptera (so called to distinguish them from nocturnal or crepuscular Lepidoptera, such as moths) is a very extensive one and naturalists differ much as to the manner of subdividing it. One of the most remarkable and interesting circumstances connected with these beautiful insects is their series of transformations before reaching a perfect state. The female butterfly lays a great quantity of eggs, which produce larvæ, commonly called caterpillars. After a short life these assume a new form, and become chrysalids or pupæ. These chrysalids are attached to other bodies in various ways, and are of various forms; they often have brilliant golden or argentine spots. Within its covering the insect develops, to emerge as the active and brilliant butterfly. These insects in their perfect form suck the nectar of plants, but take little food, and are all believed to be short-lived; their work in the perfect state being almost confined to the propagation of the species. Butterflies vary greatly in size and coloring, but most of them are very beautiful. The largest are found in tropical countries, where some measure nearly a foot

across the wings. They may generally be distinguished from moths by having their wings erect when sitting, the moths having theirs horizontal. Some of them have great powers of flight. Among the most remarkable butterflies are those that present an extraordinary likeness to other objects—leaves, green or withered, flowers, bark, etc., a feature that serves greatly to protect them from enemies.

serves greatly to protect them from enemies. Butterfly-weed, the pleurisy root of America, where it has a considerable reputation as an article of the materia medica. It is an expectorant, a mild cathartic, and a diaphoretic, and is employed in incipient pulmonary affections, rheumatism, and dysentery.

But terine (-ēn), an artificial butter, prepared from beef suet, milk, butter, and vegetable oil, and now largely made in Britain, the U.S., Holland, etc. By the use of coloring matters it can be made to resemble butter of any given brand; but although quite wholesome when well made, it has not the delicate flavor and aroma of the highest-class butters. To prevent fraudulent sales Congress has passed a law requiring under penalty that every package containing artificial butter shall be duly marked, and that retail dealers shall not sell except from the original package.

The process of manufacturing butterine is very interesting. One of the principal in-gredients of butter is olein. This is obtained from the caul-fat. As soon as the fat comes in from the slaughter house it is dumped into a vat of water, where all the blood and dirt is washed out. It is then poured into a row of iron kettles provided with steam jackets for heating purposes. The temperature is raised to 155° and the oil slowly tried out. When the fat has been sufficiently heated it is drained off into large cool kettles, where all the dirt and refuse settles to the bottom. The clear oil is then drawn out into tin-lined trucks and taken to a big room, where it is allowed to cool and granulate for a few days at a temperature of about 85<sup>o</sup>. It is then sent to the press room. Here is a small rectangular box open at the top and fastened to the table. A piece of stout white duck is spread over this and enough of the oil is dipped up to fill the box. The top of the duck is folded over the soft mass, and the whole is put into the presser. This machine consists of 60 pieces of sheet iron loosely fastened at the end to shafts. Between each pair of these plates 80 of the little duck packages of tallow are placed, and when the whole machine is full, pressure is applied by means of a screw at the top. The oil is gradually squeezed out through the duck and drops down into a trough. About 29 lbs. of this oleomargarine oil is obtained from 50 lbs. of fat. The product left in the duck is known as stearine, of pure white and almost tasteless substance, which is used in making certain brands of lard. The oil as it runs from the press is ready for use in making butterine and goes directly to the factory. Butterine is usually made in a three-story building and the process begins on the top floor. Here the oil is pumped into several large steam-jack-

eted kettles and stirred by means of dashes, the temperature is raised to 185° to melt the oil thoroughly. It is then conveyed into large tin-lined vats, where it is stored and chilled. It is then passed through a bath of brine where it is washed and deodorized. It then has a distinctly buttery taste. It is packed in tin-lined trays and packed in a cool store room until it is needed for use. Pure leaf lard which has gone through the process of deodorizing in brine is also brought into the store room and is one of the principal con-stituents of butterine. The oil and the lard are then shoveled in equal quantities into a large chute which leads to the creamery below. The chute leads to a large vat or churn heated to 180°. Here the mixture is rapidly stirred with wooden paddles until the lumps all disappear. Then a quantity of genuine butter and buttermilk, usually about 20 per cent. of the whole, is put in together with a little butter-color and the stirring is continued. When the oleomargarine comes from the churn it looks very much like butter. It is dumped on a circular table, and the buttermilk is squeezed out by means of a butter worker operated by machinery, and the salt is worked in. The butterine is then taken to a storage room for a day. It is then reworked and is ready to be put up in packages. The boxes in which the butterine is packed are marked and stamped. It has been shown by chemical analysis that butterine is almost identical with butter, and that one is digested as easily as the other.

Buttermilk, the milk from which butter has been extracted, forming a nutritious and agreeable cooling beverage with an acidulous taste.

Butternut, the fruit of the white walnut. an American tree, so called from the oil it contains. The tree bears a resemblance in its general appearance to the black walnut, but the wood is not so dark in color.

Buttertree, a name of several trees yielding oily or fatty substances resembling butter.

Common Butterwort. a .-- a flower,

grounds in Europe, Canada, etc. The leaves are covered with-soft, pellucid, glandular hairs, which secrete a glutinous liquor that catches small insects. The edges of the leaf roll over on the insect and retain it, and the insect thus retained serves as food for the plant. In the north of Sweden the leaves are employed to curdle milk.

Butterworth, BENJAMIN, b. 1837, American statesman; educated at

### Buttons

Ohio University, admitted to the bar in 1861, and practised law in Cincinnati. In 1870 he became U. S. district attorney, and in 1873-74 state senator. He was elected to Congress in 1878 and 1880, became commissioner of patents in September, 1883, and in 1884, 1880, and 1888 was re-elected to Congress from the first (Cincinnati) district of Ohio. Mr. Butterworth is a Republican, and introduced the compulsory army retirement act. He was appointed commissioner of pensions by President McKinley in 1897.

Buttons are of almost all forms and materials-wood, horn, bone, ivory, steel, copper, silver, brass, etc., which are either left naked

a.-Filigree silver button of Norway; b.-Filigree silver button of Ireland; c.-Japanese button.

or covered with silk or some other material. The material of buttons has varied much with times and fashions. In the last century gilt, brass, or copper buttons were almost universal. Birmingham was the great seat of manufacture, as it yet is of metallic and other buttons. The introduction of cloth-covered buttons early in this century made a great revolution in the trade, and led to great varie-ties in the style of making up. The metal buttons now used are commonly made of brass or a mixture of tin and brass. They are usually made from sheets of metal by punching and stamping. Such buttons are generally used for trousers. A substance now very commonly used for buttons is vegetable ivory (seeds of the ivory-nut palm), which may be colored according to taste. Mother-of-pearl buttons are another common kind. Of late years the making of porcelain buttons has developed into a re-markable industry. These buttons are both strong and cheap. Besides these kinds there are also glass buttons, made by softening the plass by heat and pressing it into a mold; but-tons of vulcanite, marble, and many other materials; but these are fancy articles in the trade. Buttons made of vegetable ivory are in very common use. The material is obtained from a palm tree that grows in South America. When young the seed of this palm contains a milky substance which becomes very hard and white, resembling ivory. The seeds are from
## Buttresses

an inch to three inches in size and almost round. First they are steamed to render their cutting easier. after which they are sawed into slices of proper thickness. The button is cut out with a peculiar saw, and each button is turned separately in a small lathe. The thread holes are then drilled and the buttons polished and finished. Buttons which have emblems and special designs are made by stamping machines. The desired figure which the face of the button is to assume is cut in the upper die, the reverse being made in relief on the underside. Materials used in making buttons include gold, silver, glass, porcelain, horn, bone, india rubber, mother-of-pearl, and various woods. In preparing the sheet-iron for metal and metal-covered buttons the iron is first scaled by putting it in acid. It is then punched out with the dies. The neck is japanned after being cut, and before the canvas cloth for sewing on is placed in place. The hollow between the top and the shell is then filled with brown paper called button-board. A clothfaced button is made by gluing a piece of cloth cut the exact size into the top of a piece of rubber, or vegetable, or ivory body. This leaves a hard material to protect the edges of the button from wearing. The thread holes are drilled through a knob turned or molded on the back of the body. The edges of cloth-covered buttons are protected by working a corded edge around the upper side.

But' tresses, in architecture, especially Gothic, projections on the outside of the walls of an edifice, extending from the bottom to the top, or nearly, and intended to give additional support to the walls and prevent them from spreading under the weight of the roof. Flying buttresses, of a somewhat arched form, often spring from the top of the ordinary buttresses, leaning inward so as to abut against and support a higher portion of the building, such as the wall of a clear-story, thus receiving part of the pressure from the weight of the roof of the central pile.

Buty $\hat{\mathbf{r}}$  ic Acid, an acid obtained from butter; it also occurs in perspiration, cod-liver oil, etc. Butyric acid is a colorless liquid, having a smell like that of rancid butter; its taste is acrid and biting, with a sweetish after-taste.

Butyr'ic Ether, a substance obtained from butyric acid with the flavor of pineapples, used in flavoring confectionery, as an ingredient in perfumes, etc.

**Buxton**, a small town in the county of Derby, England, situated in a valley celebrated for its mineral waters. The surrounding scenery is fine, and there is a vast stalactite cavern called Poole's Hole in the neighborhood. Pop. 7,424.

**Buz'zard**, the name of raptorial birds which form one of the subfamilies of the diurnal birds of prey; characteristics, a moderate-sized beak, hooked from the base, long wings, long tarsi, and short weak toes. The common buzzard is distributed over the whole of Europe as well as the north of Africa and America. Its food is very miscellaneous, and consists of moles, mice, frogs, toads, worms, insects, etc. It is sluggish in its habits. Its

length is from 20 to 22 in. The roughlegged buzzard, so called from having its legs feathered to the toes, is also a native of Britain. Its habits resemblethose of the common buzzard. The red-tailed hawk of the U.S. is a It buzzard. is also called hen hawk, from its raids on the poultry yard. The genus Pernis,

Byron

Common Buzzard.

to which the honey buzzard belongs, has the beak rather weaker than *Buteo* but does not differ much from that genus. The honey buzzard is so called because feeding specially on bees and wasps.

**By-law** (bye-law), a law made by an incorporated or other body for the regulation of its own affairs, or the affairs entrusted to its care. Town councils, railway companies, etc., enact by-laws which are binding upon all coming within the sphere of the operations of such bodies. By-laws must of course be within the meaning of the charter of incorporation and in accordance with the law of the land.

By'ron, George Gordon Noel, Lord Br-RON (1788-1824), a great English poet. Till the age of seven he was entirely under the care of his mother, and to her injudicious indulgence the waywardness that marked his after career has been partly attributed. On reaching his seventh year he was sent to the grammar school at Aberdeen, and four years after, in 1798, the death of his grand-uncle gave him the titles and estates of the family. Mother and son then removed to Newstead Abbey, the family seat, near Nottingham. Soon after Byron was sent to Harrow, where he distinguished himself by his love of manly sports and his undaunted spirit. While yet at school he fell deeply in love with Miss Chaworth, a distant cousin of his own. But the lady slighted the homage of the Harrow schoolboy, her junior by two years, and married another and more mature suitor. In The Dream Byron alludes finely to their parting interview. In 1805 he was entered at Trinity College, Cambridge. Two years after, in 1807, appeared his first poctic volume, Hours of Idleness, which, though indeed containing nothing of much merit, was castigated with severity by Brougham in the Edinburgh Review. This caustic critic roused the slumbering energy in Byron, and drew from him his first really notable effort, the cele-brated satire, English Bards and Scotch Reviewers. In 1809, in company with a friend, he visited

the southern provinces of Spain, and voyaged along the shores of the Mediterranean. The fruit of these travels was the fine poem of Childe Harold's Pilgrimage, the first two cantos of which were published on his return in 1812. The poem was an immense success, and Byron "awoke one morning and found himself fa-His acquaintance was now much mous." courted, and his first entry on the stage of public life may be dated from this era. During the next two years (1813-14) The Giaour, The Bride of Abydos, The Corsair, Lara, and The Siege of Corinth showed the brilliant work of which the new poet was capable. Byron married Anna Isabella, only daughter of Sir Ralph Milbanke; but the marriage turned out unfortunate, and in about a year Lady Byron having gone on a visit to her parents, refused to return, and a formal separation took place. This rupture produced a considerable sensation, and the real cause of it has never been satisfactorily explained. It gave rise to much popular indignation against Byron, who left England, with an expressed resolution never to return. He visited France, the field of Waterloo and Brussels, the Rhine, Switzerland, and the north of Italy, and for some time took up his abode at Venice, and latterly at Rome, where he completed his third canto of Childe Harold. Not long after appeared The Prisoner of Chillon, The Dream, and Other Poems; and in 1817 Manfred, a tragedy, and The Lament of Tasso. From Italy he made occasional excursions to the islands of Greece, and at length visited Athens, where he sketched many of the scenes of the fourth and last canto of Childe Harold. In 1819 was published the romantic tale of Mazeppa, and the same year was marked by the commencement of Don Juan. In 1820 appeared Marino Faliero, Doge of Venice, a tragedy; the drama of Sardanapalus; the Two Foscari, a tragedy; and Cain. a mystery. After leaving Venice Byron resided for some time at Ravenna, then at Pisa, and lastly at Genoa. At Ravenna he became intimate with the Countess Guiccioli, and when he removed to Pisa, in 1822, she followed him. There he continued to occupy himself with literature and poetry, sustained for a time by the companionship of Shelley, one of the few men whom he entirely respected and with whom he was quite confidential. Besides his contributions to the Liberal, a periodical established at this time in conjunction with Leigh Hunt and Shelley, he completed the later cantos of Don Juan, with Werner, a tragedy, and The De-formed Transformed, a fragment. These are the last of Byron's poetical efforts. In 1823, troubled perhaps by the consciousness that his life had too long been unworthy of him, he conceived the idea of throwing himself into the struggle for the independence of Greece. In January, 1824, he arrived at Missolonghi, was received with the greatest enthusiasm, and immediately took into his pay a body of 500 Sulicities. The disorderly temper of these troops, and the difficulties of his situation, together with the malarious air of Missolonghi, began to affect his health. On April 9, 1824,

while riding out in the rain, he caught a fever, which ten days later ended fatally. Thus, in his thirty-seventh year, d. prematurely a man whose natural force and genius were perhaps superior to those of any Englishman of his time, and, largely undisciplined as they were, and wasted by an irregular life, they acquired for him a name second, in the opinion of continental Europe at least, to that of no other Englishman of his time. The body of Byron was brought to England and interred near Newstead Abbey.

Byron, HENRY JAMES (1834-1884), English dramatist and actor. He wrote an immense number of pieces, including a great many farces, burlesques, and extravaganzas, besides comedies or domestic dramas, such as Cyril's Success; Dearer than Life; Blow for Blow; Uncle Dick's Darling; The Prompter's Box; Partners for Life; and Our Boys, which had an extraordinary success.

Byzan'tine Art, a style which arose in Southeastern Europe after Constantine the Great had made Byzantium the capital of the Roman Empire (330 A. D.), and ornamented that city, which was called after him, with all the treasures of Grecian art. See Byzantine One of the chief influences in By-Empire. zantine art was Christianity, and to a certain extent Byzantine art may be recognized as the endeavor to give expression to the new elements which Christianity had brought into the life of men. The tendency toward Oriental luxuriance and splendor of ornament now quite supplanted the simplicity of ancient taste. Richness of material and decoration was the aim of the artist rather than purity of conception. Yet the classical ideals of art, and in particular the traditions of technical processes and methods carried to Byzantium by the artists of the Western Empire, held their ground long enough, and produced work pure and powerful enough, to kindle the new artistic life which began in Italy with Cimabue and Giotto.

With regard to sculpture the statues no longer displayed the freedom and dignity of ancient art. The true proportion of parts, the correctness of the outlines, and in general the severe beauty of the naked figure, or of simple drapery in Greek art, were neglected for extravagant costume and ornamentation and petty details. Yet in the best period of Byzantine art, from the sixth to the eleventh century, there is considerable spiritual dignity in the general conception of the figures. But sculpture was of second-rate importance at Byzantium, the taste of those times inclining more to mosaic work with the costliness and brilliant colors of its stones. The first germ of a Christian style of art was developed in the Byzantine *pictures*. The artists, who appear to have seldom employed the living model, and had nothing real and material before them, but were obliged to find, in their own imaginations, conceptions of the external appearance of sacred persons, such as the mother of Christ or the apostles, could give but feeble renderings of their ideas. As they cared but

### **Byzantine** Empire

little for a faithful imitation of nature, but were satisfied with repeating what was once acknowledged as successful, it is not strange that certain forms, approved by the taste of the time, should be made, by convention, and without regard to truth and beauty, general models of the human figure, and be transmitted as such to succeeding times. In this way the artists in the later periods did not even aim at accuracy of representation, but were contented with stiff general outlines, lavishing their labor on ornamental parts.

Byzantine architecture may be said to have

dome. The last is the most conspicuous and characteristic object in Byzantine buildings, and the free and full employment of it was arrived at when by the use of pendentives the architects were enabled to place it on a square apartment instead of a circular or polygonal. In this style of building incrustation, the incrustation of brick with more precious materials, was largely in use. It depended much on color and surface ornament for its effect. and with this intent mosaics wrought on grounds of gold or of positive color are pro-fusely introduced, while colored marbles and stones of various kinds are greatly made use of. The capitals are of peculiar and original design, the most characteristic being square and tapering downward, and they are very varied in their decorations. Byzantine architecture may be divided into an older and a newer style. The most distinctive feature of the latter is that the dome is raised on a perpendicular circular or polygonal piece of masonry (technically the *drum*) containing windows for lighting the interior, while in the older style the light was admitted by openings in the dome itself. The Cathedral of Athens is an example of the new Byzantine style. The Byzantine style had a great influence on the architecture of Western Europe, especially in Italy, where St. Mark's in Venice is a magnificent example, as also in Sicily. It had also material influence in Southern France and Western Germany.

particular the

Byzantine Empire, also called the Eastern

#### **Byzantine Empire**

Empire, but properly so designated only after the re-establishment of the Western, or Holy Roman Empire, in the year 800. Other names by which it is known are Greek Empire, and Lower Empire. The existence of the Byzantine Empire as a separate dynasty lasted nearly 1,000 years, from the death of Theodosius the Great, 305 A. D., to the fall of Constantinople, 1453. The origin of the empire dates back to 330 A. D., when Constantine the Great removed the capital of the Roman Empire from Rome to the then unimportant town of Byzantium, on the Bosporus. This act was due partly to the fact that Constantine's conversion to Christianity had made the atmosphere of pagan Rome less congenial than that of the East, where the new religion had made great progress; partly to the fact that the center of population, wealth, and culture had moved eastward, owing to the Roman conquests on the one hand and the barbarian inroads on the other. The colony grew rapidly, and in honor of its founder the name of the imperial city was changed to Constantinople. For sixty-five years this city remained the capital of the Roman Empire, although from 364 to 378 the brothers Valentinian and Valens were joint rulers, the former having his court at Milan, the latter at Constantinople. Theodosius the Great (379-395) before his death. divided his dominions between his two sons, Honorius and Arcadius, and the latter became the first of the Byzantine emperors. The dividing line on the west ran southward from Pesth. and followed the Danube eastward to its mouth. The empire also included Asia Minor. the province of Oriens, or Syria, on the eastern shore of the Mediterranean, and Egypt, besides numerous islands, and for a time the southern part of Italy and a portion of Sicily. Its territory was gradually diminished by Asiatic invasion and conquest, until just before its final fall it embraced scarcely more than the capital city and its suburbs. Until the fall of Rome (476) the Byzantine emperors were busied in suppressing the uprisings of their Gothic allies and defending their dominions from invading hordes of Goths, Huns, and Vandals. Frequently they purchased safety by diverting the attention of the barbarians to the provinces of the Western Empire.

During the reign of Theodosius II (408-450) the regency was secured (415) by his sister, the Princess Pulcheria, and retained even after he reached his majority. Under the title of Augusta she gave the empire an able administration, carrying on a successful war against the Persians, and recovering for Valentinian III the Western Empire, in return for which service the Byzantine territory received cessions to the westward. The ravages of Attila and the Huns in Thrace and Macedonia were averted only by the payment of annual trib-ute. On the death of Theodosius (450) Pulcheria was called to the throne, the first woman to enjoy this dignity. She wedded Marcian, whose successful reign continued four years after the death of his remarkable wife (450-457). Leo I, a hitherto almost unknown Thracian, succeeded, the coronation being for the first time performed by the Christian clergy. He assisted in the defense of Rome against the Vandals, and became very popular in the West. His successor, Zeno the Isaurian (474-491), was driven from his capital by Basilicus, but regained the throne. His empire was threatened by Theodoric and the Goths, but the peril was averted by large presents, and the invaders were induced to march westward to Italy. During Zeno's reign occurred the disastrous fire at Constantinople, by which the library. with more than 100,000 manuscripts of classical literature, was destroyed. Anastasius (401-518) built the famous "long walls" across the peninsula, to protect Constantinople from the inroads of the Bulgarians.

Justin I (518-27) was succeeded by his nephew, the famous Justinian I (527-65), under whom the Byzantine Empire enjoyed the most glorious period of its existence, known in history as the "Era of Justinian." His conquests were due to his renowned General Belisarius, one of the great commanders of the world's history, whose services were most shamefully rewarded by his ungrateful emperor. The empire of the Vandals, in Northern Africa, was completely destroyed (533), and an immense province restored to the Christians. The Persians were defeated at the Euphrates. Sardinia, Corsica, and the Balearic Isles were added. Under Narses, a general only less famous than Belisarius, Italy was wrested from the Ostrogoths (555) and again became a part of the empire, being governed by a Greek exarch, whose residence was Ravenna. Justinian's reign is marked by the construction of fortifications, public works, and splendid buildings, among them the great church of St. Sophia. A most important incident of his reign was the introduction of silk manufacture from Asia, ever since a most valuable industry of Southern Europe. The chief monument for posterity of Justinian's reign is the Corpus Juris Cirilis, the "Body of the Roman Law," famous in all time as the Code of Justinian. It includes all the law knowledge of ancient Rome. His unfortunate successor, Justinus II (565-578) was harassed on one frontier by the Persians, on the other by the terrible Avars. Most of Italy was lost to the Lombards. In this reign an alliance was made with the Turks beyond the Caspian against the Persians. The reign of Heraclius (610-641) presents a series of overwhelming reverses retrieved by glorious vic-tories. The Persians, under Chosroes II, took Syria, Palestine, and Asia Minor, and the invading hordes advanced to a point within sight of Constantinople. Shrewdly gaining time by a humiliating treaty. Heraclius col-lected his forces and inflicted a defeat upon the Persians at Issus. The war with the Persians continued four or five years, until finally ended by the terrible battle of Nineveh, 627.

The Moslem hordes of Arabs under Mohammed and his successors appeared next. Between 635 and 641 Syria, Judea, and all the African possessions were lost. What remained, however, was more closely united than before. and from this time the empire became distinctly Greek in character. The dynasty of Heraclius ended with Justinian II, assassinated 711. The seventh and eighth centuries witnessed a peculiar internal religious controversy, which greatly weakened the defense of the Byzantines against their foreign foes. This was the war of the Iconoclasts, most violent under Leo III, the Isaurian (718-741), himself an ardent Iconoclast. The "Image Breakers," as they were called, violently opposed the presence of images in the churches, and the result was the separation of the Greek Church in the latter half of the ninth century from the mother church, henceforth known as the Roman Catholic Church. The formal separation, however, did not occur until the excommunication of the Greek Church, 1054. Leo's position on this question ended the Byzantine rule in Italy (728). Leo's successor, Constantine V (741-55), was also a zealous Iconoclast, and closed many monasteries and convents. Image-worship was restored for a brief period by the Empress Irene, who had obtained the throne by blinding her own son, Constantine VI, for whom she was guardian (707). She was ambitious to marry Charlemagne and thus reunite the Eastern and Western Empires, but her plan was not supported. During the reign of Leo V (813-20) the Bulgarians overran Thrace and laid siege to Constantinople, but were finally repulsed. The Saracens cap-tured Crete and Sicily (824-27). Under Michael III (842-67), who reigned first under the guardianship of his mother, Theodora, the images were finally restored in the Greek Church (842). But other differences had arisen which led to the separation noted above. The Russians now first appear as enemies of the Empire. The Macedonian dynasty (867-1057) was founded by Basil I, during whose reign pire. the Saracens conquered Sicily and ravaged the Peloponnesus. His son, Leo II, the Philosopher (886-911), called in the Turks to aid against the Saracens, and thus the former paved the way for future conquests. In the middle of the tenth century, during the reign of Constantine VII (911-59) Russian and Hungarian princes were baptized at Constanti-nople, married Christian wives, and carried the gospel to their peoples. Under Basil II (976-1025) the Bulgarian kingdom was overthrown, and that country became a Greek province (1018), remaining so until 1186. About the middle of the eleventh century the Seljuk Turks became threatening, and in Italy the Byzantine possessions were nearly all seized by the Normans. Isaac, the first of the Comneni, reigned 1057-50. Under his successors the inroads of the Seljuks became more frequent. and by 1078 they had conquered nearly all of Asia Minor.

The steady advance of the Mohammedan power alarmed all Christian Europe, and during the reign of Alexis Comnenus (1081-1118), began the wonderful movement of allied Christendom known as the Crusades. As the hosts

#### **Byzantine Empire**

marched toward Asia Minor via Constantinople the movement could not but have an important influence on the fortunes of the Byzantine Empire. Alexis wanted help against the Turks, but the vast numbers that came alarmed him, and their depredations within his territory led to serious conflicts, and finally under later emperors to open hostility. With the second Crusade Alexis made a treaty, he agreeing to furnish troops, they to hold any conquests as fiefs of the empire, but neither party kept faith. During this period the Normans, under Robert Guiscard and his son Bohemond, attacked the western frontier, but finally made peace. Manuel Comnenus (1143-80) was victorious over the sultan of Iconium and Raymond of Toulouse, the Christian prince of Antioch. The son of Isaac II (1185-95), who had been dethroned by Alexis III (1195-1203), asked aid of the Crusaders, who captured Constantinople (1203) and restored Isaac. He and his son were put to death the next year, and in April, 1204, the city was again taken by the Crusaders, who established the Latin Empire of Roumania (1204-61), with Count Baldwin of Flanders as first emperor. The empire was cut up into various kingdoms, duchies, and flefs, divided among the French and Venetians. Boniface of Montferrat received the kingdom of Thessalonica, including Macedonia and part of Greece, Venice, the lands along the Adriatic and the Ægean, also Crete and Eubœa. Athens and Bœotia were made a duchy. In Asia Minor the Greek Empire survived, and the capital was located at Nicæa, with Theodore Lascaris as emperor. With the aid of the Bulgarians the Greeks defeated Baldwin (1206). The latter's successor, Henry, was successful against the allies, and made peace with the Byzantines. Jean de Brienne (1228-37), titular king of Jerusalem, ruled as regent for Baldwin II, and saved Constantinople from an attack of the allied Bulgarians and Greeks. Finally in 1261 the emperor of Nicea, Michael Palæologus, with the aid of the Genoese navy (Genoa being the hated rival of Venice), captured Con-stantinople. The Latin Empire now vanished, but many of the principalities remained.

Michael (1261-82), founded the dynasty of the Palcologi, which lasted until 1453. He made fruitless efforts to reunite the Greek and the Latin churches. His son, Andronicus II (1282-1328), hired Catalan troops to aid in repelling the Turks, but in the following reign they took Nicæa and Nicomedia (1339). In 1361 the Sultan Amurath took Adrianople, and afterward conquered Macedonia and part of

#### Byzantium

Albania, whereupon the emperor John (1341-91) acknowledged himself his vassal and agreed to pay tribute. Bajazet, the successor of Am-urath, took Philadelphia in Asia Minor and later besieged Constantinople. In 1400 he was again before the city, when the invasion of the Turkish Empire by the Tatar hordes under Tamerlane called him back to Asia. During this time and the internal quarrels among the Turks after the death of Bajazet, the emperor Manuel (1391-1425) regained some of the lost ground, but in 1422 Amurath II appeared before Constantinople; Turkish quarrels, how-ever, once more saved the city. In this siege cannon were for the first time used in Eastern wars. Manuel's successor, John VI (1425-48), tried to effect a reconciliation of the churches, hoping for a crusade in his behalf. At the Council of Florence a reunion was actually proclaimed, but it was never effected and was without political results. By 1444 Amurath had taken all but the city and suburbs of Constantinople, and these he generously allowed the emperor to enjoy during the remainder of his life. On John's death, his brother Constantine XIII (1448-53) appealed to the West for aid, but with insignificant result. The Turks attacked Constantinople April 6, 1453, with an army of 400,000 men under Sultan Mohammed II. The brave garrison of 8,000 held out until May 29, when the city was finally taken; Constantine, the last of the Byzantine emperors, falling in the thick of the fight. The surviving inhabitants were sold into slavery, Christianity was exterminated, and on the dome of St. Sophia's the cross was replaced by the Moslem crescent. The various principalities and islands were conquered by 1461, and the last vestige of the Byzantine Empire had disappeared. But it had not existed in vain; for all through the Dark Ages, when the Roman civilization of Western Europe had succumbed to the barbarians, the precious legacy of the ancients was guarded and preserved for the modern world. And furthermore, the Byzantine Empire stood as a bulwark against the barbaric hordes of Asia until the growing nations gathered strength to with-stand their onsets. When we realize that without it, all that was best in the world's past would have been lost, all that is best in modern civilization retarded for hundreds of years, then only is the true significance of the Byzantine

Empire understood. W.A. HERVEY. Byzantium, the original name of the city of Constantinople. See Constantinople.

#### Caaing Whale

C, the third letter in the English alphabet and the second of the consonants. In English it serves to represent two perfectly distinct sounds, namely, the guttural sound pertaining to k and the hard or thin sound of s, the former being that which historically belongs to it; while it also forms with h the digraph ch. The former sound it has before the vowels a, o, and u, the latter before e, i, and y. The digraph chhas three different sounds, as in *church*, *chaise*, and *chord*. To these the Scotch adds a fourth, heard in the word *loch*.

C, in music, 1, after the clef, the mark of common time, in which each measure is a semibreve or four minims, corresponding to  $\xi$  or  $\xi$ ; and when a bar is perpendicularly drawn through it *alla brere* time or a quicker movement is indicated. 2. The name of the first or keynote of the modern normal scale answering to the *do* of the Italians and the *ut* of the French.

**Caaing Whale** (kä'ing) (Scotch name, meaning "driving whale," whale that may be driven), the round-headed porpoise, a cetaceous animal of the dolphin family, characterized by a rounded muzzle and a convex head, attaining a size of 16 to 24 ft. It frequents the shores of

#### Caaing Whale.

Orkney, Shetland, the Faroe Islands, and Iceland, appearing in herds of from 200 to 1,000, and numbers are often caught. They live on cod, ling, and other large fish, and also on molluscs, especially the cuttle fishes.

**Caballero** (kå bå-lyer'ō), FERNAN (1797-1877), pseudonym of Cecilia Böhl von Faber, the chief modern Spanish novelist. Her first novel, *La Gaviota*, appeared in 1849, and was followed by *Elia*, *Clemencia*, *La Familia de Alvareda*, etc., as well as by many shorter stories. The chief charm of her writings lies in her descriptions of life and nature in Andalusia.

**Cabatuan'**, a town on the island of Panay, one of the Philippines. It was founded in 1732, and has considerable trade. Pop. 23,000.

#### Cabinet

**Cabaze'ra**, a town in the island of Luzon. Philippines. It is the capital of the province of Cayagan and has some trade in tobacco. Pop. 30,016.

Cabbage, the popular name of various species of cruciferous plants of the genus Brassica, and especially applied to the plain-leaved, hearting, garden varieties cultivated for food. The wild cabbage is a native of the coasts of Britain, but is much more common on other European shores. The kinds most cultivated are the common cabbage, the savoy, the broc-coli, and the cauliflower. The common cabbage forms its leaves into heads or bolls, the inner leaves being blanched. Its varieties are the white, the red or purple, the tree or cow cabbage for cattle (branching and growing when in flower to the height of 10 ft.), and the very delicate Portugal cabbage. The garden sorts form valuable culinary vegetables, and are used at table in various ways. In Germany pickled cabbage forms a sort of national dish, known as sauerkraut. The cow cabbage, which grows in New Jersey, attains gigantic proportions for a vegetable, and the stalks, which frequently grow to heights of 12 ft. and 16 ft., are used as rails for fences, and as rafters for the thatched roofs of farm buildings; while shorter ones are made into umbrella handles and walking sticks, which are much in request as curiosities among tourists. This sort of cabbage was introduced by Mr. Fullard, and was asserted by that gentleman's cowherd to be so prolific that five plants of it per day are, with proper management, sufficient for 10 oxen or 100 sheep. The largest cabbage farm in the world is to be found at Chicago, U. S., in a district known as the cabbage prairie; its area is 190 acres, upon which are raised 1,114,000 cabbages annually.

**Cabbage Paim**, a name given to various species of palm trees from the circumstance that the terminal bud, which is of great size, is edible and resembles cabbage. As the Arēca oleracēa, a native of the West India, the simple unbranched stem of which grows to a height of 150 or even 200 ft. The unopened bud of young leaves is much prized as a vegetable, but the removal of it completely destroys the tree, as it is unable to produce lateral buds.

**Cabbage Rose,** a species of rose of many varieties, supposed to have been cultivated from ancient times, and eminently fitted for the manufacture of rose water and attar from its fragrance. It has a larger, rounded, and compact flower. Called also *Provence Rose.* 

**Cab** inet, the collective body of ministers who direct the government of a country. In the U. S. the cabinet consists of the secretary of state, the secretary of the treasury, the secretary of war, the secretary of the navy, the secretary of the interior, the attorney general.

the postmaster general, and the secretary of agriculture. These are the heads of their respective departments, and in their collective capacity act as advisory board to the president. They are appointed to office by the president, but their appointments must be confirmed by the senate, and they generally hold office until their successors are appointed and confirmed. Contrary to the English system, the U. S. cabinet ministers must not have seats in Congress; there is no premier, and the president, not the ministers, is responsible for the acts of the government. The salary of members of cabinet is \$8,000 a year.

The word cabinet is used for analogous institutions in other countries. In England. though the executive government is vested nominally in the crown, it resides practically in a committee of ministers called the *cabinet*. Every cabinet includes the first lord of the treasury, who is usually (not always) the prime minister or chief of the ministry, and therefore of the cabinet; the lord chancellor, the lord president of the council, the chancellor of the exchequer, the first lord of the admiralty, and the five secretaries of state. Although the cabinet is regarded as an essential part of the institutions of Great Britain, it has never been recognized by act of Parliament. It began to take its present form in the reign of William III.

Cable, a large strong rope or chain, such as is used to retain a vessel at anchor. It is made usually of hemp or iron, but may be made of other materials. A hemp cable is composed of three strands, each strand of three ropes, and each rope of three twists. A ship's cable is usually 120 fathoms or 720 ft. in length; hence the expression a cable's length. Chain cables have now almost superseded rope cables. Although deficient in elasticity, heavier, and more difficult of management, yet their immunity from chafing and rotting, their greater compactness for stowage, and the fact that from their greater weight the strain is exerted on the cable rather than on the ship, more than counterbalance these drawbacks. Compared with the strength of hempen cable, 1 in. diameter chain cable is equivalent to 101 in. circumference hemp, 11 in. to 131 in., 11 in. to 16 in., 12 in. to 18 in., and 2 in. to 24 in.

**Cable,** THE ATLANTIC, for submarine communication of messages between America and England. While the biography of Cyrus W. Field graphically portrays the trials, failures, and ultimate triumph of submarine telegraphy, some practical details and particulars are necessary in regard to this greatest of modern achievements.

Professor Morse of New York was the first to experiment with a cable from Castle Garden to Governor's Island, in 1842. Then, in 1854, Cyrus W. Field took up the project and organized a company, capitalized at \$1,750,000. The first attempt to lay the cable, Aug. 7, 1857, resulted in a failure and the loss of 280 ml. of cable. In 1858, on a second attempt, 144 mi. of cable were lost, and on August 6 in that year the first completed cable flashed from Valentia to Newfoundland the inspiring message, "Europe and America are united by telegraph; glory to God in the highest: on earth, peace and goodwill toward men." The triumph was brief. One hundred twenty-nine messages were sent from England and 271 from America when the cable refused to work. For six years ridicule alternated with failure. Then the giant steamer, the Great Eastern, was employed, and. after some failures, in 1866 succeeded in laying a new cable, and recovering and placing in operation a cable which had broken the previous year. To-day eleven transatlantic cables are in operation. The commercial cables of the world number 310, with an aggregate mileage of 139.754. The governmental cables of the various powers number 994, with a mileage of 18,132. The cables are insulated by gutta-percha wrappings and reinforced by surrounding wires. In the Mediterranean they are constantly suffering from the attacks of the ship worm (which see), and on the Atlantic plateau are subject to some disturbance from fouling by the anchors of the fishing fleets.

A submarine telegraph cable is composed of one or more copper wires embedded in a compound of gutta-percha and resinous substances, encircled by layers of gutta-percha or india-rubber, hemp or jute padding, and coils of iron wire. In the process of manufacture the cable is tested at every step by expert elec-In the very center of the cable are copper wires. This strand of wires tricians. seven fine copper wires. is first drawn over an adhesive black mixture and then through a machine which coats it with gutta-percha which acts as insulating material. Four coats of gutta-percha are put on the copper center, and the core is then coiled in an iron tank, covered with water and tested to find whether it is electrically sound. It is then wrapped with tarred jute. Another machine covers the jute with steel or iron wires, twisting them around the jute to envelop the core. Over this a canvas which has been soaked in asphaltum is wrapped, and again the cable is put to a test. It is coiled in tanks and covered with water, where it remains while very delicate electrical tests are made. It is then ready to be put on board the ship which is to lay it in the ocean. In the hold of the ship are large steel tanks around which the cable is coiled. The cable is hauled into the ship over the drum of a large hoisting machine. It glides over steel rollers in the bottom of a trough which lies on the deck, and dives down in the hold of the vessel. The cable is then ready to be laid in the ocean. Over the bow of the ship hangs a deeply grooved iron pulley called the bow-sheave. Back of the bow-sheave is a dynamometer which indicates the strain upon the cable. In the stern of the vessel is the paying-out gear. The submarine cable after first being passed several times around the drum of the payingout gear is attached to a hemp cable. The picking-up gear draws in the hemp cable over the bow, and thus pulls the cable ashore. As the cable slips over the stern, sailors fasten air balloons to it at intervals of 50 to 60 ft. These

27

Cable

balloons serve to keep the cable from being dragged to the bottom or chafed by rocks. When the end of the cable has been made fast on shore, the cable steamer heads for the ocean, leaving a wake of submarine cable as it moves along.

**Cable**, GEORGE WASHINGTON, a popular American author, was b. in New Orleans in 1844. He volunteered into the Confederate service. He saw some hard service, and in one action was severely wounded. After the war he was laid up with malarial fever caught at survey work on the Atchafalaya River. During his two years' illness he began to write for the New Orleans papers, and his success ere long was such as to encourage him to de-vote himself to the literary craft. His sketches of Creole life revealed to the world an interesting phase of American social life hitherto unknown. His keen observation and dextrous literary use of the Creole dialect at once found him a public on both sides of the Atlantic. Among his books are Old Creele Days (1879), The Grandissimes (1880), Madame Delphine (1881), Dr. Serier (1883), The Creoles of Louisiana (1884), The Silent South (1885), Bonarenture (1888), Strange True Stories of Louisiana (1880), and The Negro Question (1890). Cable has lectured with success on his chosen subject, and has had the happiness to see important reforms in contract convict labor in the Southern states brought about mainly through his own pen.

**Cab** ot, SEBASTIAN (1474-1557), a noted navigator. He was the son of John Cabot, a Venetian pilot, who resided at Bristol, and was highly esteemed for his skill in navigation. In 1497, in company with his father and two brothers, he discovered the mainland of North America, having visited Nova Scotia and Newfoundland. In 1517 he made an attempt to discover the northwest passage, visiting Hudson's Bay. In 1520, when in the Spanish service, he visited Brazil and the river Plata. In 1548 he again settled in England, and received a pension from Edward VI. He was the first who noticed the variations of the compass; and he published a large map of the world.

**Cabral'**, PEDRO ALVAREZ (1460-1526), the discoverer (or second discoverer) of Brazil, a Portuguese. In 1500 he received command of a fleet bound for the East Indies, and sailed from Lisbon, but having taken a course too far to the west he was carried by the South American current to the coast of Brazil, of which he took possession in name of Portugal. Continuing his voyage, he visited Mozambique, and at last reached India, where he made important commercial treaties with native princes, and then returned to Europe.

**Cabul** (Cabool, Kabul) (kä-bul'), capital of Afghanistan, 165 mi. from Peshawur, 600 from Herat, and 290 from Candahar. It stands on the Cabul River, at an elevation of 6,400 ft. above sea level. The citadel, Bala-Hissar, contains the palace and other public buildings, the fort, etc. Cabul carries on a considerable trade with Hindustan through the Khyber Pass. It was taken by the British in 1839 and in 1842, and on the occasion of a subsequent war with the British in 1879 Cabul was twice taken by their troops. Pop. 75,000. The Cabul River rises in Afghanistan at the height of about 8,400 ft., flows eastward, passes through the Khyber Pass into India, and falls into the Indus at Attock. Length 300 mi.

**Caca'o** (or Co'coa), the chocolate tree and also the powder and beverage made with it obtained from the fruit of this tree. The tree is 16 to 18 ft. high, a native of tropical America, and much cultivated in the tropics of both hemispheres, especially in the West India Islands, Central and South America. Its fruit is contained in pointed, oval, ribbed pods 6 to 10 in. long, each enclosing 50 to 100 seeds in a white, sweetish pulp. These are very nutritive, containing 50 per cent. of fat. are of an agreeable flavor, and used, both in their fresh state and when dried, as an article

a.-branch with leaves; b.-fruit (partly in section).

of diet. Cocoa and chocolate are made from them, the former being a powder obtained by grinding the seeds, and often mixed with other substances when prepared for sale, the latter being this powder mixed with sugar and various flavoring matters and formed into solid cakes. The seeds when roasted and divested of their husks and crushed are known as cocoa niks. The seeds yield also an oil called butter of cacao, used in pomatum and for making candles, soap, etc. The term cocoa is a corruption of cacao, but is more commonly used in commerce; cocoa-nuts, however, are obtained from an entirely different tree.

**Cachar'**, an East Indian district in Assam; area 3,750 sq mi.; pop. 313,858, entirely engaged either in rice cultivation or on the tea plantations.

**Cacique** (ka-sēk), in some parts of America the title of the native chiefs at the time of the conquest by the Spaniards.

**Cactus**, a Linnæan genus of plants, now used as a name for any of the Cactaceæ, a nat-

#### Cadomosto

ural order of dicotyledons, otherwise called the Indian fig order. The species are succulent shrubs, with minute scale-like leaves (except in the genus *Pereskia*, tree cactus, with large leaves), and with clusters and spines on the stems. They have fleshy stems, with sweetish watery or milky juice, and they assume many peculiar forms. The juice in some species affords a refreshing beverage where water is not

#### Cacti.

a.-Cereus giganteus; b.-Opuntia coccinellifera; c.-Mammiliaria pectinata; d.-Phyllocactus anguliger.

to be got. All the plants of this order, except a single species, are natives of America. They are generally found in very dry localities. Several have been introduced into the Old World, and in many places they have become naturalized. The fruits of some species are edible, as the prickly pear, and the Indian fig, cultivated throughout the Mediterranean region. The flowers are usually large and beautifully colored, and many members of the order are cultivated in hot-houses.

**Cadomosto**, ALOIS DA (1432-1464), an early navigator. He explored the west coast of Africa as far south as the Gambia. His Book of the First Voyage over the Ocean to the Land of Negroes in Lower Ethiopia was published in 1507.

**Cadas' tral Survey**, a detailed survey of the lands of a country, their extent, divisions, and subdivisions, nature of culture, etc., in most countries executed by the government as the basis of an assessment for fiscal purposes.

**Caddis Fly**, an insect, called also the May fly, the larva or grub of which (caddis or case worm) forms for itself a case of small stones, grass roots, shells, etc., lives under water till ready to emerge from the pupa state, and is used as bait by anglers. This grub is very rapacious, and devours large quantities of fishspawn.

**Cade**, JOHN (better known as Jack Cade), a popular agitator in England of the fifteenth century, was the leader of an insurrection which broke out in 1450. Yeomen and tradesmen formed the bulk of the insurgents. The rebellion was *political*, not *social*, like that headed by Wai Tyler. C. defeated a detachment of troops sent against him, and even ruled London for two days, causing one of the king's favorites, Lord Say, to be beheaded. A promise of pardon caused his followers to disperse. C. then fled, but was followed and killed.

**Ca' dence**, the concluding notes of a musical composition or of any well-defined section of it. A cadence is *perfect*, *full*, or *authentic* when the last chord is the tonic preceded by the dominant; it is *imperfect* when the chord of the tonic precedes that of the dominant; it is *plagal* when the closing tonic chord is preceded by that of the subdominant; and it is *interrupted*, *false*, or *deceptire* when the bass rises a second, instead of falling a fifth. Cadence, or *cudenza*, is the name also given to a running passage which a performer may introduce at the close of a movement.

**Cader Idris**, a mountain mass about 10 mi. long in Merionethshire, Wales. The highest peak is 2,914 ft. above the level of the sea.

**Cadet** (Fr., through some low Lat. diminutive form, from Lat. caput, "head") is a term applied in a general sense to the younger son of a noble house as distinguished from the elder; and in France, any officer junior to another is a cadet in respect to him. The term is generally applied to a youth studying for the army at one of the military colleges or for the navy. In the U. S., pupils at the West Point Military Academy and at the Naval Academy at Annapolis are termed cadets.

Of British military cadets, those destined for the Royal Artillery or Royal Engineers study at the Royal Military Academy, Woolwich, and those for other branches of the service at the Royal Military College, Sandhurst.

**Cadiz** (kä-deth'), a seaport of Spain. It is well built, well paved, and very clean, and is strongly fortified. The chief buildings are the great hospital, the customhouse, the old and new cathedrals, the theaters, the bull ring, capable of accommodating 12,000 spectators, and the lighthouse of St. Sebastian. The bay of Cadiz is a large basin enclosed by the mainland on one side, and the projecting tongue of land on the other, with good anchorage, and protected by the neighboring hills. It has four forts, two of which form the defense of the grand arsenal, La Carraca (4 mi. from Cadiz), at which are large basins and docks. Cadiz has long been the principal Spanish naval station. Its trade is large, its exports being especially wine and fruit. Cadiz was founded by the Phonicians about B. C. 1100, and was

## Cadmium

one of the chief seats of their commerce in the west of Europe. Pop. 62,531. The province of Cadiz is the most southerly in Spain; area 2,809 sq. mi.; pop. 429,872.

**Cad' mium**, a scarce metal which resembles tin in color and luster, but is a little harder. It is very ductile and malleable, and fuses a little below ared heat. In its chemical character it resembles zinc. It occurs in the form of carbonate, as an ingredient in various kinds of calamine, or carbonate of zinc. It is also found in the form of a sulphide, as the rare mineral greenockite. It forms at least two oxides, one chloride, and one sulphide.

**Cadmus,** in Greek legend, the son of Agenor, and grandson of Poseidon (Neptune). He was said to have come from Phœnicia to Greece about 1550 B. c., and to have built the city of Cadmea, or Thebes, in Bœotia. Herodotus and other writers ascribe the introduction of the Phœnician alphabet into Greece to Cadmus. The solar mythists identify him with the sun-god.

**Cadore** ( $k\dot{a}$ -d $\delta$ ' $r\ddot{a}$ ), a small town of Italy, the native place of Titian, the famous artist, who was b. here in 1477.

**Cadu ceus**, Mercury's rod; a winged rod entwisted by two serpents, borne by Mercury as an ensign of quality and office. In modern times it is used as a symbol of commerce, Mercury being the god of commerce. The rod represents power; the serpents, wisdom; and the two wings, diligence and activity.

**Cædmon** (kad'mon), the first Anglo-Saxon of note who wrote in his own language, flourished about the end of the seventh century. He was originally a tenant, or perhaps only a cowherd, on the abbey lands at Whitby, but afterward was received into the monastery. His chief work (if it can all be attributed to him) consists of paraphrases of portions of the Scriptures, in Anglo-Saxon verse, the first part of which bears striking resemblances to Milton's narrative in *Paradise Lost*.

**Caen** (kän), a town of France, in Normandy, chief place in dep. Calvados. It is the center of a rich agricultural district, and carries on extensive manufactures. One of the finest churches is that of St. Pierre, built in 1308. Two other remarkable churches are St. Etienne or church of the Abbaye-aux-Hommes, built by William the Conqueror who was buried in it, and La Ste. Trinité or church of the Abbaye-aux-Dames, founded by the Conqueror's wife. Other buildings are the castle and the hôtel de ville. There is a public library of 60,-000 volumes, and a botanic garden. Lace is largely made here. Valuable building stone is quarried. Pop. 45,201.

**Caen Stone**, a cream-colored building stone of excellent quality, got near Caen in Normandy. Winchester and Canterbury cathedrals, Henry VII's chapel at Westminster, and many other English churches are built of it.

**Cæsalpiniæ**, a subdivision of the natural order of plants Leguminosæ, containing several genera. The typical genus is Cæsalpinia, to which belong the Brazil wood, Japanwood, Nicaragua wood, etc. The Cæsalpinieæ in-

# clude also among their number, senna, the carob, tamarind, aloes wood, logwood, etc.

Cee'sar, a title, originally a surname of the Julian family at Rome, which, after being dignified in the person of the dictator Caius Jt lius Cæsar, was adopted by the successive Roman emperors, and latterly came to be applied to the heir-presumptive to the throne. The title was perpetuated in the *kaiser* of the Holy Roman Empire, and in the *czar* of the Russian emperors.

Cæsar, CAIUS JULIUS (B.C. 100-44), a famous Roman general, statesman, and historian, son of a Roman prætor of the same name. He married Cossutia, a rich lady of good family. from whom he was divorced to marry Cornelia, daughter of Cinna. Refusing to divorce her at the command of Sulla, he was proscribed and compelled to flee from Rome. After the death of Sulla, he returned and again took part in public affairs. He es-poused the cause of the people, and won for himself the highest civil and military honors. The rise of Cæsar was contemporaneous with that of Cicero (67-63). Cæsar's patrician birth, his relationship to Marius and Cinna, combined with his personal talents, won for him the leadership of the popular party. His attempt to procure the Roman franchise for the Latins beyond the Po, secured him the sympathies of the Italians. He was elected Curule

Ædile (66), and increased his popularity by lavish public expenditures and splendid public games. In 63 he tried to gain a commaud abroad, hoping thus to make his own position secure before the return of Pompey. The real object of the agra-

rian law proposed by Rullus (63) was the creation of a commission that would make Cæsar and Crassus nearly, if not quite, equal in power to Pompey himself. Cicero's influence defeated this measure.

Catiline's outbreak (63) brought discredit on all members of the popular party. Cæsar not excepted. The wave of popular indignation which checked Cæsar's career, brought to the front Cicero, whose influence with the "true Roman people" was paramount. The people, fearing the influence of Cæsar, elected Cicero to the consulship (63) over the heads of the Cæsarian nominees. To gain the assistance of his colossal wealth, Cæsar made a coalition with Crassus, who, being inferior in intellect. became a tool to work his superior's will in the accomplishment of his ambition to become master of the Roman world. On Pompey's return to Rome, Cæsar's versatility, aided by the opposition of Pompey's enemies, and the latter's wish to have his arrangements in Asia ratified, and land granted to his troops, won him for an ally. Pompey joined Crassus in supporting Cæsar for the consulship. Just

prior to taking up the duties of his office, Cæsar formed with Pompey and Crassus the so-called "First Triumvirate." Thus was destroyed Cicero's hope of enlisting Pompey as champion of constitutional government. As consul, Cæsar won the favor of the populace by the agrarian law providing for the distribution of land among the poor. He relieved the knights of one third their tax pledges, and gave Pompey his request.

He himself secured military command in the West, where he hoped to make himself a position similar to the one held by Pompey in the East. Having received from the people Cisalpine Gaul with the command of three legions of soldiers, to which the senate added Transalpine Gaul and another legion, he was fairly, launched upon the military career destined to make him master of the Roman world. For nine years he was in Gaul. The final subjugation of Gaul was accomplished in nine campaigns (58-50). Cæsar, in his first campaign (58), defeated the Helvetii, sending the survivors home to cultivate their land, while he overthrew Ariovistus, a German prince. His sec-ond campaign (57) was against the Belgæ in which he defeated four allied tribes united for the defense of Gaul. After wintering at Luca and spending large sums in hospitality, he took the warpath against the Venetii, defeating them totally (56) in his third campaign. His fourth campaign was against two German tribes invading Gaul, whom he defeated and followed across the Rhine. The same year (55) he invaded Britain, and won from the senate a second thanksgiving lasting 20 days. His second invasion of Britain (54) resulted in the subjugation of the Britons. The subjugation was nominal only, as he left no troops to hold the land. Consequently the Britons retained their independence 100 years longer.

His sixth campaign (53) was against revolting Gallic tribes, who were soon reduced to obedience. Cæsar's most brilliant victory (52) was over Vercingetorix, who led a revolt of nearly all the Gallic nations. In the eighth and ninth campaigns (51-50) he accomplished the final subjugation of all Gaul. After the return of Cicero from exile, he became alarmed for the fate of his agrarian law because of the hostility of the senate. A stronger alliance of the three "citizen rulers" was formed at Luca (56) when Cæsar was wintering there. Pompey and Crassus became joint consuls (55), and the control of the Roman world was divided among them. During 54 anarchy was rampant at Rome and Pompey remained at home. After Crassus was slain (53) Pompey was forced into a hostile attitude toward Cæsar. In 52 Pompey being sole consul, and having had his military command prolonged and fresh troops added to his army joined the senatorial party against Cæsar.

Cæsar wished to stand for the consulship (48) without giving up his command. This did not suit his enemies. The discussion continued through 51 and 50. Cæsar's last compromise was rejected Jan. 1, 49. Being ordered to disband his army he answered by promptly crossing the Rubicon. Pompey with the senate and nobles fied to Greece. In three months Cæsar was master of all Italy. He enjoyed his victory but a short time before he hastened to Spain to overthrow Pompey's legates there. On his return from this expedition he was appointed dictator, holding the office but eleven days. In January (48) he followed Pompey into Greece, and defeated him on the plains of Pharsalia, Aug. 9, 48. When the news of this victory reached Rome, Cæsar was appointed dictator for one year, consul for five, and tribune for life.

Before Cæsar again returned to Rome he brought to a successful issue (47) the Alexandrine War undertaken to satisfy the claims of Cleopatra against her brother Ptolemy. Returning through Pontus Cæsar defeated Pharnaces and informed the senate of his victory in the laconic dispatch, "veni, vidi, vici" (I came, saw, conquered). He defeated Scipio at Thespius (46). Cato killed himself at Utica rather than to fall into the hands of this universal conqueror. Now undisputed master of the Roman world, Cæsar showed his greatness by his magnanimity. The dictatorship was bestowed upon him for ten years by a grateful people, and his victories were celebrated by magnificent triumphs. He caused the calendar, which had falled into confusion, to be corrected (46).

After his return from defeating the two sons of Pompey in Spain (45), fresh honors were conferred upon him. He was made Imperator for life, and his portrait was stamped upon the coins of the realm. He proposed many public improvements, such as a digest of the Roman laws, the founding of public libraries, draining the Pontine marshes, enlarging the harbor at Ostia, digging a canal across the isthmus of Corinth, etc. After the crown had been offered Cæsar at Lupercalia, the aristocracy, all of whom had received favors at his hands, con-spired against his life. The twenty-three wounds from which he died, March 15, 44, tell the story of envious swords in the hands of treacherous friends. Thus died a great general. statesman, and orator. The only extant liter-ary monument of this great man's genius is the incomparable account given in his Commentaries of the Gallic and Civil Wars.

**Cæsare'a**, the ancient name of many cities, such as: 1, Cæsarea Philippi in Palestine, north of the Sea of Galilee, rebuilt by Philip, tetrarch of Galilee, son of Herod the Great. 2, Cæsarea, on the shores of the Mediterranean, about 55 mi. n.w. from Jerusalem, enlarged and beautified by Herod the Great, and named in honor of Cæsar Augustus: the place where St. Paul was imprisoned two years (Acts 23-25). 3, The capital of Cappadocia in Asia Minor.

**Cæsa' rean Operation**, a surgical operation, which consists in delivering a child by means of an incision made through the walls of the abdomen and womb; necessary when the obstacles to delivery are so great as to leave no other alternative. It is said to be so named because Julius Cæsar was brought into the world in this way. **Cæsa**' rion, son of Julius Cæsar and Cleopatra, put to death by order of Augustus.

**Cæsium**, a rare metal, first discovered by Bunsen and Kirchoff by spectrum analysis in 1860. It is soft, and of a silver-white color. It is always found in connection with rubidium. It belongs to the same group of elements with lithium, sodium, potassium, and rubidium, viz., the group of the alkali metals.

**Caff'eine** (or the'Ine), the active principle of tea and coffee, a slightly bitter, highly azotized substance, crystallizing in slender, silklike needles, found in coffee beans, tea leaves, Paraguay tea, guarana, etc. Coffee contains from 0.8 to 3.6, and tea from 2 to 4 per cent. Doses of 2 to 10 grains induce violent nervous and vascular excitement.

**Caffre Corn**, a variety of millet. The seed was first brought from the Caffraria country in Africa. It is grown extensively and successfully in the Western states subject to drought.

**Cagliari** (kål'yå-rö), the capital of the island of Sardinia. It is the residence of the viceroy and of an archbishop, and the seat of a university. It has some manufactures, and is the chief emporium of all the Sardinian trade. Pop. 39,312.

Cagliostro (kål-yos' tro), Count Alessandro (real name Giuseppe (Joseph) Balsamo) (1743-1795), a celebrated charlatan. He entered the order of the Brothers of Mercy, where he acquired a knowledge of the elements of chemistry and physic. He committed so many crimes in Palermo that he was obliged to ab-scond. He subsequently formed a connec-He committed so many tion with Lorenza Feliciani, whose beauty, ability, and want of principle made her a valuable accomplice in his frauds. With her he traveled through many countries, pretending to supernatural powers, and wringing considerable sums from those who became his In Paris he was implicated in the dupes. affair of the diamond necklace, which caused so great a scandal in the reign of Louis XVI, and was imprisoned in the Bastile, but escaped. In 1789 he revisited Rome, but being discovered, and committed to the Castle of St. Angelo, he was condemned by the pope to imprisonment for life as a freemason, archheretic, and a foe to religion. He died in prison.

**Cag** ots (kä'gôz'), properly applied to an extinct race of deformed dwarfs among the peasants of the Pyrenees. They were shunned and set apart by their fellow Christians. The priest handed them the wafer at the end of a stick. Only the most repulsive labor was assigned to them by the town authorities, but they were allowed to be carpenters and ropemakers. The Spanish Cagots of Navarre are said to be tall, strong, well-built in person, and of regular features.

**Cahors** (kä-ör), a town in Southern France. Under the Romans it was adorned with a temple, theatre, baths, an immense aqueduct, and forum, remains of which are still to be seen. Among the principal edifices are the cathedral, and an episcopal palace, now converted into the prefecture. It was the birthplace of Gambetta. Pop. 15,369. **Cal'aphas**, a Jew, was the high priest at the time when the crucifixion took place. He was deposed A. D. 35, and Jonathan, the son of Annas, appointed in his stead.

**Caicos** (Cayos, or the Keys) (kľköz, kľóz) (Spanish *Cayo*, a rock or islet), one of the island groups comprehended under the general name of the Bahamas, consisting of six islands besides some uninhabited rocks. The largest, called the Great Key, is about 30 mi. long. The inhabitants are few in number, and mostly engaged in fishing and the preparation of salt. In 1873 the Turks Islands and the Caicos were united into a commissionership under the governor of Jamaica. Area 169 sq. mi.; Pop. 4,774.

**Cain**, the eldest son of Adam and Eve; the first murderer, who slew his brother Abel. For the Biblical history of Cain and his descendants see Gen. 4-7.

**Cainozo'ic,** a geological term applied to the latest of the three divisions into which strata have been arranged, with reference to the age of the fossils they include. The *Cainozoic* system embraces the tertiary and post-tertiary systems, exhibiting recent forms of life, in contradistinction to the *Mesozoic*, exhibiting intermediate, and the *Paleozoic*, ancient and extinct forms. It corresponds nearly with what has been called the Age of Mammals.

**Caique** (ká-ök), a small skiff or rowing boat; especially a light skiff used in the Bosporus, where it almost monopolizes the boat traffic. It may have from one to ten or twelve rowers. The name is also given to a Levantine vessel of a larger size.

**Ca-ira** (sä-ē-rå), "It [the Revolution] shall go on," the burden or refrain of a French revolutionary song of 1790. The air was a favorite one with Marie Antoinette.

**Cairn** (kūrn), a heap of stones; especially one of those large heaps of stones common in Great Britain, particularly in Scotland and Wales, and generally of a conical form. They are of various sizes, and were probably constructed for different objects. Some are evidently sepulchral, containing urns, stone chests, bones, etc. Some were erected to commemorate some great event, others appear to have been intended for religious rites, while the modern cairn is generally set up as a landmark especially in Arctic regions for the guidance of subsequent explorers.

**Cairnes,** JOHN ELLIOT (1823-1875), economist, was b. in county Louth, Ireland. His father was a brewer, and as the son showed no aptitude for such learning as his teachers offered him, he was placed in the brewery. After a time, however, young Cairnes began to entertain a liking for intellectual pursuits, and, much against his father's will, went to Trinity College. Dublin, where he graduated in 1848. In 1856 he was appointed Whatley professor of political economy at Dublin, the first fruits of this office being his *Character and Logical Method of Political Economy* (1857). In 1859 he was elected to the chair of political economy and jurisprudence in Queen's College, Galway. He published in 1862 his book on the *Slare*  Power, which made a profound impression. In 1866 he was called to the chair of Political Economy in University College, London. He published his Essays on Political Economy, Theoretical and Applied in 1873, and in 1874 Some Leading Principles of Political Economy Newly Expounded.

Cairo (ki'ro) (Arab, Kahira, the Victorious), the capital of Modern Egypt. The city is partly surrounded by a fortified wall, and is intersected by 7 or 8 great streets, from which run a labyrinth of narrow, crooked streets and lanes. There are several large squares or places, the principal being the Ezbekiyeh. To the s.e. of the town is the citadel, on the last spur of the Mokattam Hills, overlooking the city. It contains the fine mosque of Mohammed Ali, a well 270 ft. deep called Joseph's Well, cut in the rock, the palace of the viceroy, etc. There are upward of 400 mosques. The finest is that of Sultan Hassan. There are also some 40 Christian churches, Jewish synagogues, etc. The tombs in the burying grounds outside the city also deserve mention, especially those known as the tombs of the Caliphs. The trade of Cairo is large, and the bazaars and markets are numerous. Of these the Khan el Kahalili, in the n.e. of the town, consists of a series of covered streets and courts, in which all kinds of Eastern merchandise are displayed in open stalls. Cairo has railway communication with Alexandria, Suez, and Siout. It was founded by the Fatimate Caliphs in A.D. 969, and its fortress was built by Saladin in 1176. It was taken from the Mamluke princes by the Turkish Sultan Selim in 1517. It was taken by the French in 1798, and in 1801 by the British, who restored it to the porte. After the battle of Tel-el-Kebîr in 1882, it again came into the possession of the British, and has become the center of English influence in Egypt. The terrible massacre of the Mamlukes took place in Cairo March 1, 1811. The tombs of the Mamluke rulers of Egypt, about 1 mi. from the city, are singularly beautiful, being built of white marble, richly carved and colored, and supporting gilded domes. Pop. 372,241.

**Cairo** (kā'ro), Alexander co., Ill., at Junction of Ohio and Mississippi rivers, 150 mi. s.e. of St. Louis. Rallroads: C. C. C. & St. L.: Mobile & Ohio; Illinois Central; St. L. I. M. & S.; and St. Louis Southwestern. Industries: mill and lumber, sewing machine works, milling, two iron foundries, and a dozen large wood-working factories. Surrounding country agricultural. The town was first settled in 1854 and became a city in 1857. Pop. est. 1897, 15,000.

**Cais** son. In civil engineering (a) a vessel in the form of a boat used as a floodgate in docks. (b) An apparatus on which vessels may be raised and floated; especially a kind of floating dock, which may be sunk and floated under a vessel's keel, used for docking vessels while at their moorings, without removing stores or masts. (c) A watertight box or casing used in founding and building structures in water too deep for the coffer dam, such as

piers of bridges, quays, etc. (d) The term is used also to describe an artillery ammunition wagon.

**Caithness**, a county of Scotland. The coast is rocky, and remarkable for bays and promontories, including among the latter, Dunnet Head, Duncansby Head, and Noss Head. Fishing, together with the rearing of sheep and cattle, forms the principal employment of the inhabitants. Flagstones (Caithness flags) for pavement are extensively quarried. The towns are Wick, the county town, and Thurso. Pop. 37, 137.

Pop. 37,137. **Caj eput Oil**, the volatile oil obtained from the leaves of the cajeput tree, a native of the Indian Archipelago and some parts of Australia, or from others of the same genus. It is used in medicine as a carminative, stimulant, sudorific, and antispasmodic: also externally in chronic rheumatism, and has been used as a cure for cholera.

**Calaba Oil**, an excellent illuminating oil obtwined from *calaba nuts*, the seeds of a tree that flourishes in Brazil and the West Indies.

**Calabar'**, a maritime district of West Africa on the Bight of Biafra, intersected by two rivers, called respectively Oll and New Calabar, under British protection: A large portion of the population is employed in the palm-oil trade. The district is now part of the Niger Coast Protectorate.

**Calabar Bean**, the seed of a leguminous African plant, nearly allied to the kidney bean. It is a powerful narcotic poison, operating also

Calabar Bean. a.-flowering branch; b.-seed pod; c.-seeds.

as a purgative and emetic, and in virtue of these last qualities is the famous "ordeal bean" of Africa, administered to persons suspected of witchcraft. If it causes purging it indicates crime: if vomiting, innocence. It induces fainting fits and asphyxia, and weakens or paralyzes the action of the heart. It is employed in medicine, chiefly (externally) as an agent for producing contraction of the pupil of the eye in certain cases; sometimes also

#### Calabash

(internally) in neuralgia, tetanus, and rheumatism.

**Cal'abash**, a vessel made of a dried gourd shell or of a calabash shell, used in some parts of America and Africa. They are so closegrained and hard that when they contain any liquid they may be put several times on the fire as kettles.

**Calabash Tree**, the popular name of certain American trees or shrubs given to them because of their large gourd-like fruits, the hard shells of which are made into numerous domestic utensils, as basins, cups, spoons, bottles, etc. The name is also given to the baobab of Africa.

**Cala bria**, a name applied to the s.w. peninsula in which Italy terminates. Area 5,810 sq. mi.: pop. 1,327,618. It is divided into three provinces—Cosenza, Reggio, and Catanzaro. The central region is occupied by the great Apennine ridge, to which whole colonies with their cattle migrate in the summer. Wheat, rice, saffron, anise, licorice, madder, flax, hemp, olives, almonds, and cotton are raised in abundance. The sugar cane also comes to perfection here. Sheep, horned cattle, and horses are numerous. Silkworms are extensively raised. The minerals include alabaster, marble, gypsum, alum, chalk, rock salt, lapis lazuli, etc. The fisheries are valuable.

**Calais** (kā-lā), a fortified seaport town of France, dep. Pas-de-Calais, on the strait of, and 25 mi. s. e. of Dover, and distant 184 mi. by rail from Paris. The Old Town or Calais proper-has a citadel, and was till recently surrounded by fortifications; but the modern suburb of St. Pierre les Calais having been amalgamated with Calais proper, both are now surrounded with forts and other works, to which morasses lend additional strength. Calais has considerable exports of grain, wine, and spirits, eggs, fruit, and vegetables; but the town derives its principal importance from its being the chief landing place for English trav-elers to the Continent. It has important manufactures of cotton and silk bobbinet lace. In 1347 Calais was taken by Edward III of England, after a siege of eleven months. In 1558 it was retaken by the duke of Guise, being the last relic of the French dominions of the Plantagenets, which at one time comprehended the half of France. Pop. 56,876.

**Calais**, a town of Maine, on the river St. Croix, a center of the lumber trade. Pop. 7,290.

**Calaman' der Wood**, a beautiful species of wood, the product of a tree, native of Ceylon. It resembles rosewood, but is so hard that it is worked with great difficulty. It takes a very high polish and is wrought into chairs and tables, and yields veneers of almost unequaled beauty.

**Cal amary**, the general name for the squid or cuttlefishes. The body is oblong, soft, fleshy, tapering, and flanked behind by two triangular fins, and contains a pen-shaped gladius or internal horny, flexible shell. They have the power of discharging, when alarmed or pursued, a black fluid from an ink bag.

## Calamy

The species are found in all seas, and furnish food to dolphins, whales, etc. Some species can dash out of the water and propel themselves through the air for 80 or 100 yards.

Cuttlefish.

**Calamianes** (-ä'nez), a cluster of islands in the Indian Sea, among the Philippines, forming a Spanish province.

**Cal'amint, a** plant, some species of which are known respectively by the names of mountain balm, catmint, basil balm, and wild basil. The first, also termed common calamint, has aromatic leaves, employed to make herb tea.

**Cal'amus**, a genus of palms, the stems of the different species of which are the rattan canes of commerce. The genus holds a middle station between the grasses and palms,

A, Acorus Calamus, showing rhizome; B. flower head: c.-separate floret; d.-floral dlagram, showing essentially lillaceous type; c.-verticul section of ovary; f.-single ovule.

with the habit of the former and the inflorescence of the latter. The species are principally found in the hotter parts of the East Indies.

**Cal'amy**, EDMUND (1600-1666), a Presbyterian divine. of England, He engaged warmly in the religious disputes of the day.

and was one of the writers of the famous treatise against Episcopacy, entitled Smeetymnuus, a title furnished from the initial letters of the authors' names. A relative of his, Edmund Calamy (1671-1732), has a place in literature as the biographer of Nonconformity. He published an abridgment of Baxter's History of His Life and Times, with a continuation; the Life of Increase Mather, etc.

**Calatra' va**, anciently a famous fortress of Spain, on the Guadiana, not far from Ciudad-Real. It gave its name to a Spanish order of chivalry founded by Sancho III in connection with the defense of the place against the Moors, 1158. For a long period the war with the Moors was carried on mainly by the knights of Calatrava, who acquired great riches. In 1808 their possessions were confiscated, and the order became a simple order of merit.

**Calca' reous,** a term applied to substances partaking of the nature of lime, or containing quantities of lime. Thus we speak of calcareous waters, calcareous rocks, calcareous soils.—*Calcareous apar*, crystallized carbonate of lime. It is found crystallized in more than 700 different forms, all having for their primitive form an obtose rhomboid.—*Calcareous tufa*, an alluvial deposit of carbonate of lime, formed generally by springs, which, issuing through limestone strata, hold in solution a portion of calcareous earth; this they deposit on coming in contact with air and light. Calc-sinter is a

**Calceolaria** (a slipper, from the shape of the inflated corolla resembling a shoe or slipper), slipperwort, a genus of ornamental herbaceous or shrubby plants. All the species are South American; extensively cultivated in gardens. Most of them have yellow flowers, some have puce-colored ones, and some occur with the two colors intermixed, while some are white. The greater number in cultivation are hybrids and not true species.

**Calcination,** the operation of roasting a substance or subjecting it to heat, generally with the purpose of driving off some volatile ingredient, and so rendering the substance suitable for further operations. The term was formerly also applied to the operation of converting a metal into an oxide or metallic calx; now called oxidation.

**Cal'cite**, a term applied to various minerals all of which are modifications of the rhombohedral form of carbonate of calcium. It includes limestone, all the white and most of the colored marbles, chalk, Iceland spar, etc.

**Cal'cium**, the metallic base of lime; in the metallic state, one of the rarest of substances; combined, one of the most abundant and most widely distributed. As phosphate, it forms the main part of the mineral matter of the boues of animals; as carbonate, chalk, limestone, or marble, it forms mountain ranges; as sulphate or gypsum, large deposits in various geological formations; it is a constituent of many minerals, as fluor spar, Iceland spar, etc., and is found in all soils, in the ash of plants, dissolved in sea water, and in springs, both common and mineral. It was first obtained in the metallic

state by Sir H. Davy in 1808. When quite pure, it is a pale-yellow metal, with a high luster. It is about one and a half times as heavy as water, ductile, malleable, and very oxidizable. Its salts are for the most part insoluble or sparingly soluble in water, but dissolve in dilute acids.

**Calc-sinter**, a carbonate of lime, the substance which forms the stalactites and stalagmites that beautify many caves.

**Calculating Machines**, machines or contrivances by which the results of arithmetical operations may be obtained mechanically. Various machines of this kind have been produced. The more complicated ones invented for more difficult operations by Babbage were never completed. Machines called comptometers and adders are in general use in America, and perform arithmetical operations with exactitude. The well-known "cash register" is a similar machine.

Cal'culus, the Infinitesimal, or Transcendental Analysis, a branch of mathematical science. The lower or common analysis contains the rules necessary to calculate quantities of any definite magnitude whatever. But quantities are sometimes considered as varying in magnitude, or as having arrived at a given state of magnitude by successive variations. This gives rise to the higher analysis, which is of the greatest use in the physico-mathemat-ical sciences. Two objects are here proposed: First, to descend from quantities to their ele-ments. The method of effecting this is called the differential calculus. Second, to ascend from the elements of quantities to the quantities themselves. This method is called the integral calculus. Both of these methods are included under the general name infinitesimal or transcendental analysis. Those quantities which retain the same value are called constant; those whose values are varying are called rariable. When variable quantities are so connected that the value of one of them is determined by the value ascribed to the others, that variable quantity is said to be a function of the others. A quantity is infinitely great or infinitely small, with regard to another, when it is not possible to assign any quantity sufficiently large or sufficiently small to express the ratio of the two. When we consider a variable quantity as increasing by infinitely small degrees, if we wish to know the value of those increments, the most natural mode is to determine the value of this quantity for any given period, as a second of time, and the value of the same for the period immediately following. This difference is called the differential of the quantity. The integral calculus, as has been already stated, is the reverse of the differential calculus. There is no variable quantity expressed algebraically, of which we cannot find the differential; but there are differential quantities which we cannot integrate: some because they could not have resulted from differentiation; others because means have not yet been discovered of integrating them. Newton was the first discoverer of the principles of the infinitesimal calculus, having pointed them out in a treatise

#### Calculus

written before 1669, but not published till manyyears after. Leibnitz, meanwhile, made the same discovery, and published it before Newton, with a much better notation, which is now universally adopted.

**Calculus,** in pathology, a general term for the various inorganic concretions which are sometimes formed in the body. Such are *biliary calculi* or gall-stones, formed in the gall bladder; *urinary calculi*, formed by a morbid

Alternating Calculus. a.-uric acid nucleus; b.-oxalate of lime; c.-phosphates of lime, and of magnesia and ammonia.

deposition from the urine in the kidney or bladder; and various others known as salizary, arthritic, pancreatic, lachrymal, etc. Urinary and biliary calculi are the most common. The former, when the particles are comparatively small in size, are known as grazel, when larger as stone. Either cause painful and dangerous symptoms. Stone in the bladder is often operated on by means of lithotomy or lithotrity.

Calcutta, capital of British India and of Bengal; situated on the Hooghly (Húgli), a branch of the Ganges. The river opposite the to three quarters of a mile. The city extends along the bank for about 41 mi., and with a breadth of about 11 mi., the entire site of Calcutta proper being about 8 sq. mi. Adjacent to the city itself, however, are extensive suburbs, which include the large town of Howrah, on the opposite side of the Hooghly, connected with Calcutta by a pontoon bridge. The houses of the south or British quarter of Calcutta are of brick, elegantly built, and many of them like palaces, in striking contrast with the northern quarter, occupied by the natives, which has narrow, crooked, and ill-built streets. The city is encompassed by a spacious way called the Circular Road. On the west side is an extensive quay about 2 mi. long, called the Strand. Outside the city, between the river and the fashionable quarter, lies Fort William, a magnificent octagonal work, which cost altogether \$10,000,000, mounts over 600 guns, contains 80,000 stand of arms, and will hold 15,000 men. The plain between Fort William and the city forms a favorite prome-At the north side, called the Esplanade. nade, stands the government house, or palace of the governor general, built by the Marquis

#### Caldecott

Wellesley, at an expense of \$5,000,000. Other edifices worthy of notice are the townhall, supreme court, government treasury, writers' buildings, Metcalfe Hall, mint, theater, medical college, general post office, general hospital, the new cathedral, the old cathedral. tolerably good supply of filtered water from the Hooghly is furnished to the inhabitants, and a complete system of drainage has been constructed. Calcutta has an extensive system of internal navigation through the numerous arms and tributaries of the Ganges, and it almost monopolizes the external commerce of Bengal. There is a railway from Calcutta to Delhi, with branches to Ranigunge, Agra, etc., and through Allahabad to Bombay. Another line extends to Dacca. There is telegraphic communication with all parts of India. and with Europe. The principal exports are opium, cotton, rice, wheat, jute, gunny bags, tea, indigo, seeds, raw silk, etc. Of the imports the most important in respect of value are cotton goods. Salt is a considerable import. The maritime trade is of the annual value of fully \$350,000,000; the inland trade is as large or larger. In 1686 a factory of the East India Company was established here, and in 1700 three adjoining villages were presented to the company by the emperor of Delhi. The settlement was then fortified, and called Fort William, in honor of the then king of England, but subsequently it received its present name, which had been that of one of the villages. C. was made the capital of a presidency in 1707, but it first figures in history in connection with the events of 1756. In that year it was attacked suddenly by Surajah Dowlah, and after a stout siege was shamefully deserted by the officers on duty. In two days more disturb-ances within the town itself led to its surrender. Then followed the fearful tragedy of the Black Hole, when 146 English captives were forced into a room only 20 ft. square, to pass one of the hottest nights of an Indian summer. On the following morning it was found that there barely survived twenty-three of the number. Eight months later Clive and Admiral Watson rescued C., which soon afterward entered on its modern career of prosperity. At the end of the seventeenth century Calcutta was only a cluster of three mud villages. It now contains, with its suburbs, a population of 850,000.

**Calda'ra**, POLIDORO (1495-1543) (called also *Caracaggio*), an Italian painter. In his youth he carried bricks for the masons in the Vatican, and envying the artists at work there devoted himself to painting under the guidance of Maturino. He was afterward employed by Raphael on the friezes of the Vatican. The oil painting of *Christ on the way to Calvary* is his most noteworthy picture.

**Calde' cott**, RANDOLPH (1846-1886), a noted artist. He entered a bank, but gave up banking for art. His first success was the publication, in 1875, of his illustrations of a volume of selections from Washington Irving's Sketchbook, under the title of Old Christmas. It was followed by his illustrations of Bracebridge

Hall, of Mrs. Carr's North Italian Folk, Blackburn's Breton Folk, of Æsop's Fables with Modern Instances. His most popular work, however, was the series of colored, children's books commenced by him in 1878, and including John Gilpin, the Elegy on the Death of a Mad Dog, and the Great Panjandrum. He died at St. Augustine, Florida.

**Calderon' de la Bacra**, DON PEDRO (1600-1681), the great Spanish dramatist, educated in the Jesuits' College, Madrid, and at Salamanca. Before his fourteenth year he had written his third play. Calderon has left 95 autos sacramentales, 200 loas (preludes), and 100 saynetes (farces). He wrote his last play in the eightieth year of his age.

**Caledonia** (Caledonians), the names by which the northern portion of Scotland and its inhabitants first became known to the Romans, when in the year 80 Agricola occupied the country up to the line of the Firths of Clyde and Forth. He defeated the Caledonians in 83, and again at Mons Grampius in 84, a battle of which a detailed description is given by Tacitus. In the early part of the third century they maintained a brave resistance to Severus, but the name then lost its historic importance. Caledonia is now used as a poetical name of Scotland.

**Caledonian Canal**, a water way passing through Glenmore or the Great Glen of Scotland, and allowing vessels of 500 or 600 tons to sail from the Moray Firth to Loch Eil and the sea on the west. The route passes through Lochs Ness, Oich, and Lochy, the whole distance from sea to sea being about 60 mi., of which only 22 consist of canal proper. The scenery is of the finest in Scotland, this route being extremely popular with tourists.

Cal'endar (L. calendarium, from calenda, the first day of the month), a record or marking out of time as systematically divided into years, months, weeks, and days. The periodical occurrence of certain natural phenomena gave rise to the first division of time, the division into weeks being the only purely arbi-trary partition. The year of the ancient Egyptians was based on the changes of the seasons alone, without reference to the lunar month, and contained 365 days divided into twelve months of thirty days each with five supplementary days at the end of the year. The Jewish year consisted of lunar months of which they reckoned twelve in the year, intercalating a thirteenth when necessary to maintain the correspondence of the particular months with the regular recurrence of the seasons. The Greeks in the carliest period also reckoned by lunar and intercalary months, but after one or two changes adopted the plan of Meton and Euctemon, who took account of the fact that in a period of nineteen years, the new moons return upon the same days of the year as before. This period of nine-teen years was found, however, to be about six hours too long, and subsequent calculators still failed to make the beginning of the seasons return on the same fixed day of the year. Each month was divided into three decades.

The Romans at first divided the year into ten months, but they early adopted the Greek method of lunar and intercalary months, making the lunar year consist of 354, and afterward of 355 days, leaving ten or eleven days and a fraction to be supplied by the inter-calary division. This arrangement continued till the time of Cæsar. The first day of the month was called the *calends*. In March, May, July, and October the 15th, in other months the 13th, was called the *ides*. The ninth day before the ides (reckoning inclusive) was called the nones, being therefore either the 7th or the 5th of the month. From the inaccuracy of the Roman method of reckoning the calendar came to represent the vernal equinox nearly two months after the event, and at the request of Julius Cæsar, the Greek astronomer Sosigenes, with the assistance of Marcus Fabius, contrived the so-called Julian calendar. The chief improvement consisted in restoring the equinox to its proper place by inserting two months between November and December, so that the year 707 (B. c. 46), called the year of confusion, contained fourteen months. In the number of days the Greek computation was adopted, which made it 3651. To dispose of the quarter of a day it was determined to intercalate a day every fourth year between the 23d and 24th of February. This calendar continued in use among the Romans until the fall of the empire, and throughout Christendom till 1582.

By this time, owing to the cumulative error of eleven minutes, the vernal equinox really took place ten days earlier than its date in the calendar, and accordingly Pope Gregory XIII issued a brief abolishing the Julian calendar in all Catholic countries, and introducing in its stead the one now in use, the Gregorian or reformed calendar. In this way began the new style, as opposed to the other or old style. Ten days were to be dropped; every hundredth year, which by the old style was to have been a leap year, was now to be a common year, the fourth excepted; and the length of the solar year was taken to be 365 days, five hours, forty-nine minutes, and twelve seconds, the difference between which and subsequent observations is immaterial. The new calendar was adopted in Spain, Portugal, and France in 1582; in Catholic Switzerland, Germany, and the Netherlands in 1583; in Poland in 1586; in Hungary in 1587; in Protestant Germany, Holland, and Denmark in 1700; in Switzerland in 1701; in England in 1752; and in Sweden 1753. In the English calendar of 1752, also, January 1 was now adopted as the beginning of the legal year, and it was customary for some time to give two dates for the period intervening between January 1 and March 25, that of the old and that of the new year, as January 175%. Russia alone retains the old style, which now differs twelve days from the new.

In France, during the Revolution, a new calendar was introduced by a decree of the National Convention, Nov. 24, 1793. The time from which the new reckoning was to commence was the autumnal equinox of 1792,

' which fell upon the 22d of September, when the first decree of the new republic had been promulgated. The year was made to consist of twelve months of three decades each, and, to complete the full number, five fete days, or sansculatides (in leap years six) were added to the end of the year. The seasons and months were as follows: Autumn, September 22 to December 22,— Vendémiaire, vintage month; Brumaire, foggy month; Frimaire, sleet month. Winter, December 22 to March 22,- Nivõse, snowy month; Pluvidse, rainy month; Ventdse, windy month. Spring, March 22 to June 22,-Germinal, bud month; Floréal, flower month; Prairial, meadow month. Summer, June 22 to September 22,- Messidor, harvest month; Thermidor, hot month; Fructidor, fruit month. The common Christian or Gregorian calendar was re-established in France on January 1, 1806, by Napoleon. For the Mohammedan calendar, see Hegira.

**Cal'ender**, a machine consisting of two or more cylinders (calenders) revolving so nearly in contact with each other that cloth or paper passed between them is smoothed and glazed by their pressure, or some other kind of finish is imparted to the surface. **Cal'ends.** See Calendar. The Greek calends,

**Cal'ends.** See Calendar. The Greek calends, a time that never occurred; an ancient Roman phrase which originated in the fact that the Greeks had nothing corresponding to the Roman calends.

**Cal'gary**, a rising town on the Canadian Pacific Railway, near the eastern base of the Rocky Mountains, in the district of Alberta, the center of an important cattle and horseranching district. Pop. 1,600.

**Calhoun** (kal-hön'), JOHN CALDWELL, an American statesman (1782–1850). He was admitted to the bar of South Carolina in 1807, and in 1811 was sent to Congress, where he distinguished himself by his eloquent advocacy of the war with England. In 1817 he was made secretary of war under President Monroe; in 1824 he was elected vice-president of the U. S.; in 1832, a senator; in 1844, secretary of state, and in 1845, again a senator. He continued till his death an advocate of extreme state rights, and of the policy of slave-holding states. In 1829 he carried the famous South Carolina "nullification resolution," and was the father of the doctrines which caused the South to secede in 1861.

**Cali** (kä'lē), a town of South America, Colombia, state of Cauca, with a good trade. Pop. 12,743.

**Cal** ico (from *Calicut* in India), a general term for any plain white cotton cloth; in America usually applied to printed cottons.

**Calico Printing** is the art of applying colors to cloth after it has come from the hand of the weaver in such a manner as to form patterns and figures. This art, originally brought from India, is sometimes practised on linen, woolen, and silk, but most frequently upon that species of cotton cloth called calico. The process was first introduced into Britain in 1738, and was originally accomplished by means of handblocks made of wood, on which patterns or parts of patterns for each different color were These blocks were of various dimensions, cut. according to the nature of the work, and where several colors were employed in one pattern, a block for each color was necessary. As an improvement in the method of printing from wooden blocks especially where delicacy of outline is required, engraved copper plates were introduced about 1760; but the greatest improvement was effected by the introduction of cylinder printing about 1785, which has almost superseded the other methods, except for particular styles. The machinery now generally used consists of various modifications of the cylinder printing machine, in which a number of separate engraved cylinders are mounted, corresponding to the number of colors to be printed. Formerly the cloth had to pass once through the machine for every color; but now, by an arrangement of machinery equally ingenious and effective, any number of cylinders are fitted on one machine, which act on the cloth one after the other, and by this means the pattern is finished with a corresponding number of colors in the same time that was formerly employed to give one. A great variety of methods are employed in calico print-ing, but they all fall under the general heads of dye colors, and steam colors. Under the first. head are included all the styles in which the pattern is printed on the cloth by a mordanta substance which may have little or no color itself, but has an affinity for the fiber on the one hand, and for the coloring matter on the other-the dye or coloring matter being subsequently fixed by dyeing on such parts of the cloth as have been impregnated with the mordant, and thus bringing out the pattern. In steam color printing, the coloring material is applied to the cloth direct from the printing cylinder, and subsequently fixed by steaming. In steam colors there is no limit to the number and variety of shades which may be produced, each color box on the cylinder printing machine containing the whole ingredients essential to the production and fixation of a separate and distinct shade of color. This process is superseding most of the other styles, the brilliant coal tar colors so extensively used being almost entirely fixed by steaming. The bodies used for fixing are tin mordants, tannic acid, etc., which are mixed with the dye colors and printed together. The effects of calico printing are varied by numerous other operations, such as the discharge style, in which the cloth is first dyed all over, then printed in a certain pattern with discharge chemicals, which either produce a pattern of some other color, or one purely white, as in the Turkey-red ban-danna handkerchiefs. The resist style, in some respects, is the reverse of the discharge style; the process being to print a pattern in certain chemicals, which will enable those parts to resist the action of the dye subsequently applied to all other parts of the cloth After the prints have undergone the printing process they are submitted to a series of finishing operations, the object of which is to give to the fabrics a pleasing appearance to the eye.

**Cal'icut**, a seaport of India, presidency of Madras, on the Malabar coast, which was ceded to the British in 1702. It was the first port in India visited by Europeans, the Portuguese adventurer, Pedro da Covilham having landed here about 1486, and Vasco da Gama in 1408. It has considerable trade, and manufactures cotton cloth, to which it has given the name *calico*. Pop. 66,078.

California has a coast line of 900 mi. on the Pacific Ocean, extends from the latitude of Boston to that of Charleston. On the n. is Oregon, on the e. are Nevada and Arizona Ter-ritory, and on the s. is Lower California. The lower two thirds of the state has a southeasterly trend, the easterly boundary being as nearly as possible parallel with the coast line. The extreme length is 775 mi., the maximum width 235 mi., and the minimum width 148 mi. The total area is 158,360 sq. mi., and the land area 155.980 sq. mi., making the state second only to Texas in size. The central portion is embraced between the parallels 35° and 40°, and has on its e. side the Sierra Nevada, and on its w. the Coast Ranges. Between these two mountain chains lies the Great Central Valley of the Sacramento and San Joaquin, renowned for its beauty and fertility. It is this valley, which is about 450 mi. in length by about 40 in breadth, to which the state now owes its principal wealth, and which has made it famous for its wheat, its wool, its fruits (including subtropical fruits in the s.), and the produce of its vineyards. N. of the parallel of 40°, where the Coast Ranges and the Sierra unite, the country is extremely rough and thinly inhabited. That portion of the state which lies to the s. and e. of the southern junction of the Coast Ranges and the Sierra is also thinly inhabited, with the exception of a narrow strip along the coast. The principal river is the Sacramento, which flows s. for upward of 300 mi., receiving numerous affluents from the Sierra Nevada, and falls into the bay of Suisun. The San Joaquin rises in the Sierra Nevada, flows n. for about 250 mi., and joins the Sacramento about 15 mi. above Suisun Bay. It receives the waters of lake Tulé or Tulares, and has numerous tributaries. The Bay of San Francisco, forming the most capacious harbor on the Pacific coast, is about 60 mi. in length, 14 broad, and with a coast line of 275 mi. It is connected with the ocean by a strait two mi. wide, and from five to seven long, called the Golden Gate.

The peaks of the Sierra Nevada — Mount Shasta, Lassen's Butte, Spanish Peak, Pyramid Peak, Mounts Dana, Lyell, Brewer, Tyndall, Whitney, and others — reach from 10,000 to nearly 15,000 ft. above the sea (Mount Whitney is 14,886). The volcanic character of the state is manifested by the mountain formations; and earthquakes are frequent. California is celebrated for its many wonderful natural objects and remarkable scenery. Noteworthy are the Yosemite Valley and the "big tree groves," containing groups of giant redwood trees — Sequoia gigantea — some of which reach the height of nearly 400 ft.

In the Colorado desert are depressions several hundred feet below the level of the sea. Saline marshes and alkaline tracts are features of the desert. Hot and cold mineral springs abound in the state, and cover a wide range of medicinal virtues: these are confined to no particular district, but are most numerous in the counties of Lake, Napa, and Sonoma. The Geysers, in Sonoma county, yield great volumes of steam and boiling mineral waters of various kinds, and as a natural wonder are second only to the Geysers of the Yellowstone. Several lakes of great beauty exist in the Sierra, the largest being Lake Tahoe, twenty miles long and 6,200 ft. above the level of the sea. (It has been proposed to tap this enormous reservoir to secure water for irrigation and for domestic consumption.) Another large and beautiful lake, called Clear Lake, lies in the coast range n. of San Francisco.

Climate.-Within the borders of California may be found great varieties of climate. Below and near the line of the Sierras the peculiarities of climate are small rainfall, rainless summers, and almost constant winds off the Pacific, and the absence of extremes of temperature. The wind of summer comes generally from the north and northwest. This wind has a steady effect west on the coast ranges, and is deflected in the valleys of the Sacramento and the San Joaquin southward and its temperature is much raised, so that in the interior valleys the summer is warm. In the Sacramento valley the average sum-mer temperature is 80° and in the San Joaquin valley 83.8°. At San Francisco it is 58°; at Los Angeles, 73.2°; at San Diego on the ex-treme southern coast, 60.7°. There are no rains in the summer but the winds carry much moisture and the late nocturnal temperature of summer contains this moisture in the form of heavy dews. The prevailing winds of winter come from the south and southwest and these make the winter warm. On the coast the difference between summer and winter temperature is very small. For instance at San Francisco, the difference is less than eight degrees. Winter winds bring the rains which fall from November to April. The rainfall in the northern part of the state is much greater than that of the southern.

Vegetation.-In the coast range valleys there is almost always a sufficient rainfall to ripen the crops, but in the interior basin and in the south it is uncertain and generally inadequate. Irrigation is used to a large extent to water the land and the arid lands have been made serv-The fruit-growing industries have iceable. developed so rapidly that other industries have passed into the background. As soon as the gold fever subsided the agricultural possibili-ties of the state came into view. At first the agricultural pursuits were confined to live stock which found pasture in the plains in winter and in the mountains in summer. On the coast the early settlers planted grapes and grew small cereals; then the cultivation of grain was begun and flouring mills established. Wheat is the principal grain and the acreage

has constantly increased in the last twenty years. The great bulk of the grain is raised in the Sacramento and San Joaquin valleys. The vine and fruit yield is large, and, owing to the freedom from rain, the fruit can be dried in the open air. Trees and vines come into bearing at an early age. Certain wines can be produced which are unique to Cal-The principal fruits and nuts are ifornia. grapes, oranges, lemons, olives, figs, prunes, peaches, pears, apricots, nectarines, cherries, apples, plums, and English walnuts, and such small fruit as blackberries, strawberries, raspberries, currants, and gooseberries. The growing of vegetables is a large industry; vegetables raised are beans, potatoes, onions, and hops. Wide varieties of soil and climatic conditions give rise to a diversified range of vegetation. In the valleys may be found occasional groves of white oak and live oak, and on the plains in the early spring are many wild flowers. The coast ranges are generally covered with various members of the pine family. The sugar pine in the north is usually of great size, and with the redwood is of great commercial importance. There are various species of cedars and cypresses. The most striking species of trees are Sequoia Gigantea (the big tree of California), and the Sequoia Semperoireus (redwood); some of the larger ones have a height of 350 ft. and a diameter of 20 to 40 ft. California laurel is a useful tree largely employed in the interior finish of houses. There are many varieties of lilies, including the tiger lily. Other varieties of flowers are wild rose, yellow pansy, sage, larkspur, bluebell, tulip, dandelion, etc. Mustard is very common on the plains and often grows to a height of 7 ft.

Railroads and other transportation facilities. The railroads entering the southern part of the state are Southern Pacific and A. T. & S. F.; in the central part is the Central Pacific Railway. The Southern Pacific Company controls and operates 6,000 miles of railroad. three main arms of which are: 1, from San Francisco to New Orleans; 2, from San Francisco to Ogden, where connection is made with the Union Pacific; 3, from San Francisco to Portland, Ore. It also controls numerous branches, especially in California, running from main lines to fer-tile sections. There are also many roads within the state. Other transportation facilities consist of a large fleet of sailing vessels and several lines of steamers which sail at regular intervals. The Occidental Steamship Co., sending steamers to Japan and China; the Oceanic Steamship Co., to the Hawaiian Islands, New Zealand, and Australia; and the Pacific Mail Steamship Co. The coast lines include the Pacific Coast Steamship Co., sending vessels to Alaska and intermediate points of the north, and to Mexico; the U. P. Ry. division, and the Oregon Development Co.

Minerals.—Since 1848 when gold was first discovered in California, mining has been the most important industry in the state. Both gold and silver have been mined in great quantities. Until 1878 gold mining was carried on in a reckless manner and prospectors wan-

dered from one end of the state to the other: but in the year mentioned matters took a more rational turn and mining was put upon sound business principles. Silver has been mined with varied success, and much capital has been spent in trying to develop the silver lodes which have from time to time been discovered. The best paying silver mines are those in the Inyo range. Quicksilver has been extensively mined in California, and also copper ores ap-pear in many localities. Zinc and lead occur in a great number of the quartz veins of the gold-bearing valleys. Iron ores are also found in some localities. The only coal mines of any consequence in California are found in Monte Diablo, a few miles from the entrance of San Joaquin River into Suisun Bay. Borax and sulphur have been mined in several localities. Marble is quarried in places on the Sierra Nevada for architectural purposes. There is also some granite.

Manufactures.—The forests afford a great amount of lumber and the manufacture and shipment of lumber constitutes an important industrial feature. Other manufactures are the distillation of brandy, sugar refining, drying and preserving of fruits, shipbuilding and the packing of meats.

Education. — California has an extensive and thorough system of public instruction which extends into the remotest districts. The system consists of a state board of education, superintendent of public instruction, county board of education, county superintendent, city board, and district trustees. There is a state university at Berkeley, state normal schools at San Jose, Los Angeles and Chico. Besides the public schools there are many private institutions of a high order. The Leland Stanford, Jr., University has an annual income of \$250,000, about 1,100 students, 85 instructors and 30,000 books. The estate on which the university is situated covers 7,500 acres. The Lick Observatory, which is an adjunct of the state university, is constructed and equipped on Mt. Hamilton.

History.-Spaniards came to California as early as 1534 and it is believed that Cortez surveyed the Gulf of California in 1536. Sir Francis Drake visited the coast in 1578. The early missions were under Franciscan control. California became independent of Spain in 1822, and until after the war of 1847 the region was chiefly important for its export of hides and skins. California was part of the territory ceded to the U.S. by Mexico after the Mexican War. Gold was discovered in 1848 and there was an enormous rush of gold seekers. California was admitted to the Union in 1850. At first it was peopled by lawless spirits and crimes of violence were frequent and apt to go unpunished. Recourse was had to the inevi-table "lynch" law and in 1851 the citizens of the chief towns established a vigilance committee. Gradually a better regulated order of things was established and the development of the country has since been steady and rapid. The principal cities are San Francisco, Los Angeles, San Diego, Oakland, Alameda, Berkeley. Bakersfield, Fresno City, Napa City, Nevada City, Sacramento, capital of the state, Stockton, Santa Cruz, San Jose, Palo Alto, Monterey, Santa Rosa, and Marysville. Pop. in 1890 was 1,380,500.

Governors.—1840, Peter H. Burnett; 1851, John McDougal; 1852, John Bigler; 1856, J. Neely Johnson; 1858, John B. Weller; 1860, Milton S. Latham; 1860, John G. Downey; 1862, Leland Stanford; 1863, Frederick F. Low; 1867, Henry H. Haight; 1871, Newton Booth; 1875, Romualdo Pacheco: 1875, William Irwin; 1880, George C. Perkins; 1883, George Stoneman; 1887, Washington Bartlett; 1887, R. W. Waterman; 1891, H. H. Markham; 1895, J. H. Budd. **California**, GULF of, a gulf on the w. coast of North America, in Mexico Lying between

**California**, GULF OF, a gulf on the w. coast of North America, in Mexico, lying between the peninsula of Lower California and the mainland. It is about 700 mi. long, and through most of its length, is less than 100 mi. wide. It has long had a pearl fishery.

**California**, LowER, a territory of Mexico, comprising a peninsula jutting into the Pacific Ocean, and separated from the mainland throughout its entire length by the Gulf of California. Area 58,328 sq. mi. It is largely mountainous and arid, but is said to possess valuable agricultural and mineral resources. The chief towns are Loretto, and La Paz, the capital. Pop. 35,720, of whom perhaps half are Indians.

Calig'ula, CAIUS CÆSAR AUGUSTUS GERMANI-CUS (A. D. 12-41), Roman emperor, son of Ger-manicus and Agrippina. He received from the soldiers the surname of Caligula, on account of his wearing the caligæ, a kind of boots in use among them. He succeeded Tiberius, A. D. 37, and made himself very popular by his mildness and ostentatious generosity; but at the end of eight months he was seized with a disorder caused by his irregular mode of living, which appears to have permanently deranged his intellect. After his recovery, he suddenly showed himself the most cruel and unnatural of tyrants - a monster of debauchery and prodigality, a perpetrator of the great-est crimes and follies. The most exquisite tortures inflicted on the innocent served him for enjoyments. In the madness of his arrogance he even considered himself a god, and caused sacrifices to be offered to himself. One of his greatest follies was the building of a bridge between Baiæ and Puteoli (Puzzuoli), in order that he might be able to boast of marching over the sea on dry land. He projected expeditions to Gaul, Germany, and Britain, and on reaching the sea, bade his soldiers gather shells for spoils, and led them back to Rome. At last a band of conspirators put Rome. At last a band of conspirators put an end to his career in the 29th year of his age.

**Cal'iper Compasses**, compasses made either with arched legs to measure the diameters of cylinders or globular bodies, or with straight legs and retracted points to measure the interior diameter or bore of anything.

**Cal' iph** (Calif, or Khalif—vicegerent), is the name assumed by the successors of Mohammed in the government of the faithful and in the high-priesthood. Caliphate is therefore the name given to the empire of these princes which the Arabs founded in Asia, and enlarged, within a few centuries, to a dominion exceeding even the Roman Empire in extent. The appellation of caliph has long ago been swallowed up in *shah*, *sultan*, *emir*, and other titles peculiar to the East.

**Calisa' ya Bark**, a variety of Peruvian or cinchona bark.

**Calisthen' ics** (Gr. kalli-, beautiful, and sthenos, strength), the art or practise of exercising the body for the purpose of giving strength to the muscles and grace to the carriage. The term is usually applied to the physical exercises of females, as gymnastics is to those of males.

Calix'tus, the name of three popes. CALIX-TUS I was a Roman bishop from 217 to 224, when he suffered martyrdom. CALIXTUS II was elected in 1119, in the monastery of Clugny, successor of the expelled pope, Gelasius II, who had been driven from Italy by the Emperor Henry V, and had died in this monastery. He excommunicated the Emperor Henry V on account of a dispute respecting the right of investiture; as also the anti-pope Gregory VIII, whom he drove from Rome. He availed himself of the troubles of the emperor to force him, in 1122, to agree to the Concordat of Worms. He d. in 1124. CALIXTUS III, chosen in 1168 in Rome, as anti-pope to Paschal III, and confirmed by the Emperor Frederick I, in 1178, was obliged to submit to Pope Alexander III. As he was not counted among the legal popes, a subsequent pope, Alfonso Borgia, made pope in 1455, was called Calixtus III. He d. in 1458.

**Calixtus,** GEORG (1586-1656), an able and enlightened German theologian of the Lutheran Church in the seventeenth century. He wrote against the celibacy of the clergy, and proposed a reunion of Catholics and Protestants upon the basis of the Apostles' creed.

**Calla**, a genus of plants, nat. order Orontiaceæ. The known species are few and of widely different habitats, occurring in the north of America and Europe. It has a creeping root stock extremely acrid in taste, but which, when deprived

of its causticity by maceration and boiling, is made by the Lapps into bread. The beautiful Ethiopian lily was for merly included in this genus and is still sometimes called *Calla* 

Callao (kålyä'ö), a seaport town of Peru, the port of Lima, from which it is 6 mi.

#### Callimachus

distant, and with which it is connected by a railway; pop. 36,805. The roadstead is one of the best in the Pacific, and there is a dock, with an area of nearly 52 acres, constructed at a cost of \$8,500,000, besides a floating iron dock. Callao is the emporium of the whole of the trade of Peru, importing manufactured goods, and exporting guano, copper ore, cubic niter, wool, bark, etc. In 1746 the old town was destroyed by an earthquake, with much

Callim'achus. 1, A Greek poet and gram-marian, b. at Cyrene, in Libya, of a noble family: flourished about 250 B. C. He taught at Alexandria, and was appointed by Ptolemy Philadelphus librarian of the Alexandrine Museum. He wrote an epic poem called Galatea, several prose works, and tragedies, elegies, comedies, etc., but only some seventy-two epigrams and six hymns remain. 2, A Greek architect and artist, flourished about 400 B. c., the reputed originator of the Corinthian column.

Calli'nus, of Ephesus, the earliest Greek elegiac poet, flourished about 730 B. C. Only a few fragments of his elegies are extant.

Calliope (kal-i'o-pe) one of the Muses. She presided over eloquence and heroic poetry, and is said to have been the mother of Orpheus by Apollo.

**Callis'thenes** (-ēz) (B. c. 360-328) a Greek philosopher and historian, a native of Olynthus, was appointed to attend Alexander in his expedition against Persia. He was put to death on a pretended charge of treason. He wrote a history of the Actions of Alexander and other historical works.

Calms, REGIONS OF, tracts in the Atlantic and Pacific oceans, on the confines of the trade winds, where calms of long duration prevail.

Cal'omel, mercurous chloride; a preparation of mercury much used in medicine, and also found native as horn quicksilver. It is prepared by grinding in a mortar sulphate of mercury with as much mercury as it already contains, and heating the compound which is formed with common salt in a retort until the mercury sublimes. The calomel is thus produced as a white powder. It is used in a variety of ailments, as a purgative, a vermifuge, etc.

Calorim'eter, an apparatus for measuring absolute quantities of heat or the specific or latent heat of bodies, as an instrument for measuring the heat given out by a body in cooling from the quantity of ice it melts or from the rise of temperature it produces in water around it.

Cal otype, the name given to the process, invented by Talbot about 1840, of producing photographs by the action of light upon paper impregnated with nitrate of silver.

Calpur' nia, the fourth wife of Julius Cæsar, married to him 59 B. C. She was a daughter of L. Calpernius Piso, who was consul in 58 B. C.

Caltagirone (-jē-ro'nā), a town of Sicily, 34 mi. s. w. of Catania; the see of a bishop. It is noted for the manufacture of terra cotta figures and pottery. Pop. 28,119.

Caltanisset'ta, a town, Sicily, capital of the province of same name, on the right bank of the Salso, 62 mi. s. e. of Palermo. In the vicinity are springs of petroleum and of hydrogen gas, a mud volcano, and important sui-phur mines. Pop. 31,762. The province has an area of 1,445 sq. mi., with a population of 265, 930.

Caltha, the genus of plants to which the marsh marigold belongs.

Cal' trop, a military instrument with four iron points disposed in such a manner that three of them being on the ground the other

points upward; formerly scattered

on the ground to impede the progress of an enemy's cavalry. Also the common name of the star thistle, found in waste places in the south of England. The heads Caltrop. are covered with long yellow spines.

Calum'ba (or Colombo), a plant, indigenous to the forests of Mozambique. The large roots are much used as a bitter tonic in cases of indigestion. American or false calumba is the bitter root of a gentianaceous herb found in North America.

Cal'umet, a kind of pipe used by the American Indians for smoking tobacco. Its bowl is usually of soft red soapstone, and the tube a long reed, ornamented with feathers. The Calumet was used as a symbol or instrument of peace and war. To accept the calumet is to agree to the terms of peace, and to refuse it is to reject them. The calumet of peace is used to seal or ratify contracts and alliances, to receive strangers kindly, and to travel with safety. The calumet of war, differently made. is used to proclaim war.

Calvados (kål-vå-dos), a French dep., part of the old province of Normandy. Area 2,145 sq. mi. It is named from a dangerous ridge of rocks which extends along the coast for 10 or 12 mi. The dep. is undulating and picturesque. and possesses rich pastures. Pop. 428,945. Chief town, Caen.

**Cal vary**, applied to the place outside Jeru-salem where Christ was crucified, usually identified with a small eminence on the north side of the city. The term is also applied in Catholic countries to a kind of chapel, sometimes erected on a hill near a city and sometimes on the exterior of a church, as a place of devotion, in memory of the place where our Saviour suffered; as also to a rocky mound or hill on which three crosses are erected, an adjunct to religious houses.

Calvé, EMMA, celebrated operatic vocalist, b. in France in 1866. She made her début in Faust, in 1882, at Brussels. A few years later she made a tour of Italy. She scored a grand success at Covent Garden in 1893 where she appeared at the command of the queen. She made American tours in 1894, 1896, and 1897.

Cal'vert, GEORGE, the first Baron Baltimore. See Lord Baltimore.

Calvin, JOHN (1509-1564), reformer and Protestant theological writer, b. at Noyon. in Picardy. He went to Paris and entered

regular study. He soon became dissatisfied with the teaching of the Roman Catholic Church; in consequence he gave up his curé, and took to the study of the law in Orleans. In 1532 he returned to Paris a decided convert to the reformed faith, and was soon compelled to fly, when, after various wanderings, he found a protector in Margaret of Navarre. In 1534 he returned to Paris, but retired to Basel in the autumn of the same year. At Basel he completed and published his great work, The Institutes of the Christian Religion. In 1538 he was expelled from Geneva, but in 1541 his friends succeeded in effecting his recall, when he laid before the council the draft of his ordinances respecting church discipline, which were immediately accepted and published. Michael Servetus, passing through Geneva in 1553, was arrested, and through Calvin's instrumentality, was burned alive because he had attacked the mystery of the Trinity in a book which was neither written nor printed at Geneva. He was consulted upon points of law as well as of theology. Besides this, he found time to maintain a correspondence through all Europe. Up to 1561 the Lutherans and the Calvinists were as one, but in that year the latter expressly rejected the tenth article of the Confession of Augsburg, besides some others, and hence arose the name of Calvinists.

**Calvinism**, the theological tenets or doctrines of John Calvin, including a belief in predestination, election, total depravity, original sin, effectual calling, and the final perseverance of the saints.

**Caix** (L., lime or chalk), a term formerly applied to the *residuum* of a metal or mineral which has been subjected to violent heat, burning, or calcination.

**Calycan'thus,** a genus of hardy American shrubs, of which one species, Florida allspice. has yellow flowers, and is sweet-scented.

**Cal'ydon**, an ancient city of Northern Greece, in Ætolia, celebrated in Greek mythology on account of the ravages of a terrible boar. All the princes of the age assembled at the famous Hunt of the Calydonian Boar, which was finally despatched by Meleager.

**Calyp'so,** in Greek mythology, a nymph who inhabited the island Ogygia, on the shores of which Ulysses was shipwrecked. She promised him immortality if he would consent to marry her, but after a seven years' stay she was ordered by Hermes to permit his departure.

**Calyp' tra**, the hood of the theca or capsule of mosses. The same name is given to any hood-like body connected with the organs of fructification in flowering plants.

**Calyptræ'idæ**, a family of gasteropodous molluscs, known as bonnet or chambered limpets. The typical genus *Calyptræa* includes the cupand-saucer limpet.

**Ca**'lyx, in botany, the name given to the exterior covering of a flower, that is, the floral envelope consisting of a circle or whorl of leaves external to the corolla, which it incloses and supports. The parts or leaves which belong to it are called *\*epals*; they may be united

by their margins, or distinct, and are usually of a green color and of less delicate texture than the corolla. In many flowers, however, (especially monocotyledons), there is little or no difference in character between calyx and corolla, in which case the whole gets the name of *perianth*. When the calyx leaves are distinct the calyx is called *polysepalous*; when united, gamosepalous or monosepalous.

**Cam**, in machinery, a simple contrivance for converting a uniform rotary motion into a varied rectilinear motion, usually a projecting part of a wheel or other revolving piece so placed as to give an alternating or varying motion to another piece that comes in contact with it and is free to move only in a certain direction.

**Camaieu** (ka-mā'ū), monochrome painting or painting with a single color, varied only by gradations of the single color, by light and shade, etc. Drawings in Indian ink, sepia, etc., are classed as works *en camaieu*.

Cambacérès (kän-bå-sā-rå), JEAN JAQUES RÉGIS DE, Duke of Parma (1753-1824), a famous French statesman. He was trained a lawyer, and was appointed to various judicial offices. He declared Louis guilty, but disputed the right of the Convention to judge him, and voted for his provisory arrest, and in case of a hostile invasion, death. When Bonaparte was first consul, Cambacérès was chosen second. After the establishment of the empire, Cambacérès was chosen arch-chancellor, grand officer of the Legion of Honor, and ultimately duke of Parma. He was banished on the second restoration of Louis XVIII, but was subsequently permitted to return.

**Cam'bay**, a feudatory state in India, Bombay presidency. Area 350 sq. mi.; pop. 80, 722. Also chief town of above state, situated at the head of the Gulf of Cambay, formerly a flourishing port, but now decayed. Pop. 31,390. The gulf separates the peninsula of Kathiawar from the northern coast of Bombay, having a length of about 80 mi., and an average breadth of 25 mi.

**Cambo' dia** (or Cambo' ja), a country in the Indo-Chinese peninsula. The greater part of it is low and flat with numerous streams, the chief being the Mekong. The soil is very fertile, producing large quantities of rice, and the vegetation generally is marked by tropical luxuriance. Cattle are exceedingly numerous; among wild animals are the elephant and tiger. Gold and precious stones are found. In early times Cambodia was a powerful state exacting tribute even from Siam, but it gradually fell into decay, and in the last and early in the present century lost a large part of its dominions to Siam. Magnificent ruins, bridges, etc., attest the former prosperity of the country. Since 1863 it has been a protectorate of France, and since 1884 practically a French colony, though nominally ruled by a king of its own. The chief town is Pnom-Penh on an arm of the Mekong; the port is Kampot, on the Gulf of Siam. Area 38,560 sq. mi; pop. 1,700,000, partly Cambodians proper, partly Siamese, Annamese, etc. •**)**g

## Cambral

**Cambrai** (kim-brā), a fortified French city, on the Scheldt, in the dep. Du Nord, 104 mi. n.e. of Paris; long celebrated for its manufactures of fine liness and lawns, whence similar fabrics are called *cambrics*. It is the seat of an archbishop, and has a cathedral, an archiepiscopal palace, townhouse, etc. Pop. 24,122. *The League of Cambrai*, a league formed in 1508 between Louis XII of France, the German Emperor Maximilian, and Ferdinand of Spain, for the purpose of humbling the republic of Venice, and which was joined in 1509 by Pope Julius II.

**Cambrian Rocks**, in geology, an extensive series of gritstones, sandstones, conglomerates, slates, and shales, lying under the Lower Silurian beds, and above the Archæan, and divided into the Upper and Lower Cambrian. Many fossils occur in the series, including sponges, starfishes, trilobites, brachiopods, lamellibranchs, pteorpods, gasteropods, cephalopods, etc. They may be regarded as the bottom rocks of the Silurian system, and are well developed in North Wales (hence the name), but can be recognized in many other regions.

regions. **Cam'bric**, originally the name of a fine kind of linen which was manufactured principally at Cambrai, in French Flanders, whence the name. It is now applied to a cotton fabric, which is very extensively manufactured in imitation of the true fabric, and which is in reality a kind of muslin.

Cam'bridge (kām'brij), an inland county of England. Area 859 sq. mi. Pop. 196, 269. The soil is diversified and generally fertile; a large part belongs to the fen country. By drainage much of the fen land (including the Bedford Level) has been converted into arable land and pastures, and about nine tenths of the county is under cultivation. The county town is Cam-bridge; other towns are Ely, Wisbech, Newmarket, and March. Cambridge, the county town, is situated on the river Cam, 50 mi. n. of London. It is an ancient place, and was a Roman station (Granta). It occupies a perfect level encompassed by the colleges, and their beautiful grounds and gardens, on both sides of the Cam. Several of the streets are narrow and winding, but some are spacious and airy, and much improvement has taken place of late years. The town is supported mainly by the presence of the university; but has some

manufactures. Pop. 44,330. **Cambridge**, GEORGE WILLIAM, DUKE OF, b. in Hanover, March 26, 1819. He is the grandson of Adolphus Frederick, first duke of Cambridge, is grandson of George III, and first cousin of Queen Victoria. From 1856 to 1896 he was commander-in-chief of the British forces, and in 1861 was made a field marshal.

**Cambridge**, UNIVERSITY OF, one of the two great English universities, as old at least as the thirteenth century, situated in the above town. The following list contains the names of the colleges or distinct corporate bodies comprised in the university, with the time when each was founded: St. Peter's College, or Peter House (1257); Clare College, formerly

# Cambyses

Clare Hall (1326); Pembroke College (1347): Gonville and Caius College (1348); Trinity Hall (1350); Corpus Christi College (1352); King's College (1441); Queen's College (1448); St. Catherine's College, or Catherine Hall (1473); Jesus College (1496); Christ's College (1505); St. John's College (1511); Magdalene College (1519); Trinity College (1546); Emmanuel College (1584): Sidney Sussex College (1598); Downing College (1860); Cavendish College (1873); Selwin College (1882); Ayerst Hall (or Hostel) 1884.

Each of these colleges is a separate corporation which is governed by laws and usages of its own, although subject to the paramount The university is laws of the university. composed of a chancellor, vice chancellor, the masters or heads of colleges, fellows of colleges, and students, and is incorporated as a society for the study of all the liberal arts and sciences. The senate, which is composed of all who have taken the degree of Doctor or Master, is the great legislative assembly of the university. The chief executive power is vested in the chancellor, the high-steward. and the vice chancellor, who is the head of some college. Two proctors superintend the discipline of all pupils. Women who have fulfilled the conditions of residence and standing may be admitted to the examinations. Those who pass are placed in the published lists, and receive certificates; but no degrees conferred upon them. Two colleges (Girton and Newnham) have been established for women; but they are no part of the university, though many of the university lectures are open to stu-dents of these colleges. The annual income of the university was recently about \$150,000, arising from various sources, including the produce of fees at matriculation, for degrees, etc. The number of undergraduate students is about 3,000. There are over forty professors in the various departments. A botanic garden, an anatomical school, an observatory, and a valuable library, containing more than 300,000 printed volumes, besides many manuscripts, are attached to the university. The new museums and laboratories for the study of science are among the most complete in the country. The university sends two members to the House of Commons. The right of election is vested in the members of the senate.

**Cambridge**, Middlesex co., Mass., on Charles River, 3 mi. from Boston, with which it is connected by street railway. Railroad, Fitchburg. Industries: musical instruments, glassware, furniture, soap and candles, printing and publishing, etc. Cambridge is the seat of Harvard University, one of the foremost educational institutions in the country, founded in 1638. Pop. est. 1897, 80,000.

**Cambyses**, 1, a Persian of noble blood, to whom King Astyages gave his daughter Mandane in marriage. Astyages was dethroned by Cyrus, the offspring of this union. 2, The son of Cyrus the Great, and grandson of the preceding, became, after the death of his father, king of the Persians and Medes, B.C. 520. In the fifth year of his reign he invaded

## Camden

Egypt, conquering the whole kingdom within six months. But his expeditions against the Ammonites and Ethiopians having failed, his violent and vindictive nature broke out in cruel treatment of his subjects, his brother Smerdis and his own wife being among his victims. He died in 521 B.C.

Camden, WILLIAM (1551-1623), a noted British antiquary and historian. Appointed second master of Westminster School, he devoted all his leisure to the study of British antiquities, and began to collect matter for his great work, the Britannia, which gives a topographical and historical account of the British Isles from the earliest ages. He d. at Chiselhurst, in Kent, in the house which was afterward that of Napoleon Ill.

Camden, Camden co., N. J., on Delaware River opposite Philadelphia. It is a prominent railroad center, being the terminus for five Manufacturing and commercial inroads. terests are very extensive. Among the principal industries are large iron foundries, steel pen works, woolen and cotton mills, nickel refinery, fertilizers, chemicals, dyes, paints, oil-cloths, shawls, machinery, etc. It also has several large shipyards, and is a port of entry.

Camel, a genus of ruminant quadrupeds, characterized by the absence of horns; the possession of incisive, canine, and molar teeth; a fissure in the upper lip; a long and arched neck; one or two humps or protuberances on the back; a broad, elastic foot, ending in two small hoofs, which does not sink readily in the sand of the desert. The native country of the

Camel.

camel is said to extend from Morocco to China. within a zone of 900 or 1,000 mi. in breadth. The common camel, having two humps, is only found in the northern part of this region, and exclusively from the ancient Bactria, now Turkestan, to China. The dromedary, or single hump camel, or Arabian camel, is found throughout the entire length of this zone, on its southern side, as far as Africa and India. The Bactrian species is the larger, more robust, and more fitted for carrying heavy burdens. The dromedary has been called the

# **Camel's** Thorn

race horse of its species. To people residing in the vicinity of the great deserts, the camel is an invaluable mode of conveyance. It will travel three days under a load, and five days under a rider, without drinking. The stronger varieties carry from 700 to 1,000 lbs. burden. The camel's power of enduring thirst is partly

due to the peculiar structure of its stomach, to which are attached little pouches or water cells, capable of straining off and storing up water for future use, when journeying across the desert. It can live on little food, and of the coarsest kind, Part of the inside of Stomachleaves of trees,

nettles, shrubs,

paunch of Camel, showing the water cells.

twigs, etc. In this it is helped by the fact that its humps are mere accumulations of fat (the backbone of the animal being quite straight), and form a store upon which the system can draw when the outside supply is defective. Hence the camel driver who is about to start on a journey takes care to see that the humps of his animal present a full and healthy appearance. Camels which carry heavy burdens will do about 25 mi. a day, those which are used for speed alone, from 60 to 90 mi. a day. The camel is rather passive than docile, showing less intelligent co-operation with its master than the horse or ele-It lives from 40 to 50 years. Its flesh is es-teemed by the Arab, and its milk is his common food. The hair of the camel serves in the East for making cloth for tents, carpets, and wearing apparel. It is imported into European countries for the manufacture of fine pencils for painting, and for other purposes. The South American members of the family constitute the genus to which the llama and alpaca belong: they have no humps.

Camellia (ka-mel'ya), a genus of plants, of the tea order, with showy flowers and elegant dark green, shining, laurel like leaves, nearly allied to the plants which yield tea, and named from George Joseph Kamel, a Moravian Jesuit. The C. japonica, in Japan and China, is a lofty tree of beautiful proportions. It is the origin of many double varieties of our gardens. Besides this species, the C. sasangua, with small, white, scentless flowers, and the C. reticulatta (net-veined), with its large, peony-like flowers. are cultivated in America.

Camel' opard, a name given to the giraffe, originally from the notion that it was a kind of hybrid between a camel and leopard. It constitutes the only species of its genus and family. See Giraffe.

Camel's Thorn, a name of several plants. They are half shrubby plants growing in the deserts of Egypt and the East, and derive their name from the fact that they afford a

#### Cameo

food relished by camels. Some of the species yield a manna-like exudation from the leaves and branches.

**Cam'eo**, a general name for all gems cut in relief, in contradistinction to those hollowed out, or *intaglios*. More particularly, a cameo is a gem composed of several different colored layers having a subject in relief cut upon one or more of the upper layers, an under layer of a different color forming the ground. For this purpose the ancients used the onyx, sardonyx, agate, etc. The shells of various molluses are now much used for making cameos; and they are also imitated on glass.

Camellia Japonica.

Cam'era Lucida (L., "clear chamber"), an optical instrument employed to facilitate the sketching of objects from nature by producing a reflected picture of them upon paper. Wollaston's apparatus is one of the commonest. The essential part is a totally reflecting prism with four angles, one of which is 90°, the opposite one  $135^{\circ}$ , and the other two each  $67^{\circ} 30^{\circ}$ . One of the two faces which contain the right angle is turned toward the object to be sketched. Rays falling in a straight line on this face are totally reflected from the face to the next face whence they are again totally reflected to the fourth face, from which they emerge in a straight line. An eye placed so as to receive the emergent rays, will see an image of the object, and by placing the sketching paper below in this place, the image may be traced with a pencil. As the paper, for convenience of drawing, must be at a distance of about a foot, a concave lens, with a focal length of something less than a foot, is placed close in front of the prism in drawing distant objects. By raising or lowering the prism in its stand, the image of the object to be sketched may be made to coincide with the plane of the paper. The prism is mounted in such a way that it can be rotated either about a horizontal or a vertical axis: and its top is usually covered with a movable plate of blackened metal, hav-

#### Cameron

ing a semicircular notch at one edge, for the observer to look through. This form of camera has undergone various modifications. It is very convenient on account of its portability.

very convenient on account of its portability. Cam'era Obscu'ra, (L., "dark chamber") an optical instrument employed for exhibiting the images of objects in their forms and colors, so that they may be traced and a picture drawn, or may be represented by photography. A simple camera obscura is presented by a darkened chamber into which no light is permitted to enter excepting by a small hole in the window-shutter. A picture of the objects opposite the hole will then be seen on the wall, or on a white screen placed opposite the opening. The rays of light passing through a convex lens, being reflected from the mirror. (which is at a slope of  $45^{\circ}$ ) to the glass plate. where they form an image that may be traced. Another arrangement is a kind of tent surrounded by opaque curtains, and having at its top a revolving lantern, containing a lens with its axis horizontal, and a mirror placed behind it at a slope of 45°. to reflect the transmitted light downward on the paper. It is still better to combine lens and mirror in one by using a glass of peculiar shape, in which rays from external objects are first refracted at a convex surface, then totally reflected at the back of the lens, which is plane, and finally emerge through the bottom of the lens, which is concave, but with a larger radius of curvature than the first surface. The camera obscura employed by photographers is commonly a box. one half of which slides into the other, with a tube in front containing an object glass at its extremity. At the back of the box is a slide of round glass, on which the image of the object or objects to be depicted is thrown, in set-ting the instrument. The focusing is performed in the first place by sliding the one half of the box into the other, and by means of a pinion attached to the tube in front which moves the lens. When the image has thus been rendered as sharp as possible, the groundglass slide is removed, and a sensitized plate substituted, which not only receives, but retains the image.

**Cameron**, ANGUS, American statesman, b. 1826; removed to La Crosse, Wis., in 1857, and served several terms in the state legislature. From 1875 to 1885 he was U. S. senator from Wisconsin.

**Cameron**, JAMES DONALD, b. 1833. American statesman, son of Simon Cameron; became connected with railroads and iron manufacturing. From 1876 to 1877, he was secretary of war under President Grant, and was then chosen U. S. senator. He was re-elected in 1874 and 1875.

**Cameron**, RICHARD, a Scottish Covenanter. b. at Falkland in Fife. Becoming an enthusiastic votary of the pure Presbyterian system. on June 20, 1680, at the head of a small band of followers, he entered Sanquhar, and formally renounced allegiance to the king (Charles II) on account of his misgovernment. The little band kept in arms for a month in the mountainous country between Nithsdale and

Ayrshire, but were at length surprised by a much superior force at Aird's Moss, and after a stubborn fight overcome. Cameron was among the slain. See *Cameronians*.

**Cameron,** SIMON (1799-1889), American statesman, b. in Lancaster co., Pa. He edited a newspaper in Harrisburg in 1822. He was elected to the U. S. Senate in 1845, and supported the Mexican War. In 1856 was again elected senator. He was a formidable candidate in the Chicago Convention of 1860, but was defeated by Lincoln, who on becoming president appointed Cameron secretary of war. He resigned in 1862, and was sent as minister to Russia. In 1866 he again became U. S. senator, and held that office until 1877, when he was succeeded by his son.

when he was succeeded by his son. **Cameron**, VERNEY LOVETT, African traveler, b. 1844. He entered the British navy in 1857, and in 1872 was chosen to conduct an expedition for the relief of Dr. Livingstone. He was only in time to meet the remains of Livingstone at Unyanyembe, but continued his journey west to Benguela, and was thus the first to cross Central Africa. In 1878 he made a journey through Asia Minor and Persia. He published accounts of both journeys in his Across Africa and Our Future Highway to India.

**Cameroons,** 1, a district on the w. coast of Africa, on the Bight of Biafra, belonging to Germany, and one of the suitable districts for colonization in this region. 2, a river in the Cameroons territory. There are several large and thriving towns (including King Bell's town) on the river, through which an extensive trade is carried on in ivory and palm oil. 3, a mountain range in the territory, the highest peak of which has been estimated at over 13,000 ft.

**Camil'ius,** MARCUS FURIUS, a Roman patrician, famous as the deliverer of the city of Rome from the Gauls. In B.C. 396 he was made dictator during the Veientine War, and captured the town of Veii by mining, after it had defied the Roman power for ten years. In B.C. 394 Camillus besieged the Falerii, and by an act of generosity induced them to surrender. Camillus was appointed dictator a second time, and was successful in repelling the invaders. After having been four times appointed dictator, a new invasion of the Gauls called Camillus, now eighty years old, again to the front, and for the fifth and last time, being appointed dictator, he defeated and dispersed the barbarians. He d. in B.C. 365.

**Cam'oens**, LUIS DE (1524-1579). the most celebrated poet of the Portuguese. He became a soldier, and served in the fleet which the Portuguese sent against Morocco. He landed at Goa, India, but, being unfavorably impressed with the life led by the ruling Portuguese there, wrote a satire which caused his banishment to Macao (1556). Here he wrote the earlier cantos of his great poem, the *Lusiads*. Returning to Goa in 1561, he was shipwrecked and lost all his property except his precious manuscript. After much misfortune Camoens in 1570 arrived once more in his

native land, poor and without influence, as he had left it. The *Lusiads* was now printed at Lisbon (1572). The *Lusiads* is an epic poem in ten cantos. Its subject is the voyage of Vasco da Gama to the East Indies; but many other events in the history of Portugal are also introduced.

Camomile. See Chamomile.

**Camor'ra**, a well organized secret society. once spread throughout all parts of the kingdom of Naples. At one time the Camorristi were all-powerful, levying a kind of blackmail on all markets, fairs, and public gatherings, claiming the right to settle disputes, hiring themselves out for any criminal service, from the passing of contraband goods to assassination. It had central stations in all the large provincial towns, and a regular staff of recruiting officers. Though properly a secret society, it did not find it necessary under the régime of the Bourbons to conceal its operations; but under the present government of united Italy. the society, if it has not quite ceased to exist, has lost almost all its power, except in the wilder parts of Southern Italy. See Mafia and Vendetta.

**Campagna** (kåm-pån-yå) a town of s Italy, province of Salerno, surrounded by high mountains. It is the seat of a bishopric, and contains a superb cathedral. Pop. 9,028. **Campagna di Roma** (kåm-pån'yå), the coast region of Middle Italy, in which Rome

is situated, from 30 to 40 mi. wide and 100 long, and forming the undulating mostly uncultivated plain which extends from near Civita Vecchia, or Viterbo to Terracina, and includes the Pontine Marshes. The district is volcanic, and its lakes, Regillus, Albano, Nemi, etc., are evidently craters of extinct The soil is very fertile in the volcanoes. lower parts, though its cultivation is much neglected, owing to the malaria which makes residence there during midsummer very dangerous: and during the months of July, August, and September its inhabitants, chiefly herdsmen and peasants, seek refuge in Rome or the neighboring towns. In ancient times the Campagna, though never a salubrious district, was well cultivated and populated, the villas of the Roman aristocracy being numerous here.

**Campa' nia**, the ancient name of a province of Italy, in the former kingdom of Naples, which, on account of its beauty and fertility, was a favorite resort of wealthy Romans, who built there magnificent country houses. It comprises the modern provinces of Caserta, Naples, and parts of Salerno and Avellino. Cumæ (the oldest Greek settlement in Italy). Puteoli, Naples, Herculaneum, Pompeii, Baiæ, Stabiæ, Salernum, and Capua (its ancient capital) were the principal cities of Campania. Even now Campania is the most beautiful and fruitful part of Italy.

**Campanile** (kam-pa-nē'lā), a bell tower detached from the church to which it belongs, common in the church architecture of Italy. Among the most remarkable examples are the beautiful campanile of the cathedral at Flor-

.

#### Campanula

ence, designed by Giotto. and the famous leaning tower of Pisa.

**Campan' ula,** the bell-flower genus. a large genus of plants which gives its name to the order Campanula-ceæ. The species are herbaceous plants, with bellshaped flowers usu-ally of a blue or white color. It includes several American species, which are known to all lovers of wild flowers. The harebell or rock-bell flower, found in all the states on damp rocks and rocky streams, is an exceedingly delicate plant.

lant. Canterbury Bell. Campbell, SIR COLIN. See Clyde, Lord.

**Campbell**, SIR ALEXANDER, b. 1822, a Canadian statesman, went to Canada when a boy, and in 1843 was called to the bar of Upper Canada. In 1856 he was made queen's counsel. He sat in the Legislative Council of Canada before the union. In 1867 he was made postmaster general and afterward minister of the interior. In 1878 he was postmaster general and minister of the militia in the Liberal-Conservative administration. He entered the senate and became leader of the government party in that body; in 1881 was made minister of justice, and in 1885 postmaster general. In 1887 he was elected lieutenant governor of Ontario.

**Campbell,** ALEXANDER (1788-1806). American theologian. His father Thomas, a clergyman, came to this country in 1807. He spent a year in the University of Glasgow, and in 1809 came to America, and for a short time was pastor of a Presbyterian church. He became dissatisfied with that sect. His father sympathized with him, and in 1810 they formed a sect of their own, which they called the "Disciples of Christ." better known as "Campbellites." In 1840-41 he founded Bethany College, of which he was the first president, holding this office until his death.

ing this office until his death. **Campbell**, BARTLEY (1843-1888), American dramatist. He began his life as a newspaper reporter in Pittsburg, and founded the *Erening* Mail of that city in 1868. In 1871 he began writing for the stage, and produced Through Fire, and the following year Peril. Among his later plays were The Big Bonanza. My Partner, The Galley Slare, My Geraldine, and Siberia. Campbell died insane.

**Campbell**, JOHN (Lord Campbell) (1779-1861). lord chancellor of England. He is known as the author of a considerable work, *Lives of the Chancellors*, which with its supplementary vols., *Lives of the Chief Justices*, enjoyed great popularity.

#### Camphor.

**Campbell**, JOHN ARCHIBALD (1811-1889), American public man. He graduated at the University of Georgia in 1826, practised law in Alabama, and was a member of the legislature of that state. President Pierce made him an associate justice of the U.S. Supreme Court in 1853. He resigned in 1861 to become assistant secretary of war of the Confederacy.

Campbell, THOMAS (1777-1844), a noted English poet. After leaving Glasgow University he resided for a short time in Edinburgh, and all at once attained the zenith of his fame by publishing, in 1799, his Pleasures of Hope. In 1803, after spending some time in Germany, Campbell published an edition of the Pleasures of Hope with the addition of the lyrics Hohenlinden, Ye Mariners of England, and the Exile of Erin. In 1809 he published Gertrude of Wyoming, Lord Ullim's Daughter, and the Battle of the Baltic. He became editor in 1820 of the New Monthly Magazine. He took an active part in the foundation of London University. and in 1827 was elected rector of Glasgow University. He died at Boulogne, and was interred in the Poets' Corner, Westminster Abbey.

**Campeachy** (or Campeche), a seaport of Mexico, in the state and on the bay of the same name, on the w. coast of the peninsula of Yucatan, a mart for logwood and wax. Cigars are manufactured, and ships are built, though the harbor can only admit small vessels. Pop. 15, 196. The state Campeachy has an area of 25, 832 sq. mi., a pop. of 90,413.

**Camphene** (kam' fēn), the generic name for the volatile oils or hydrocarbons, isomeric or polymeric with oil or turpentine, as oil of bergamot, cloves, copaiba, hops, juniper, orange, pepper, etc. They are liquid at ordinary temperatures, and are distinguished from each other by their odors.

**Camphine** (kam'fēn), the commercial term for purified oil of turpentine, obtained by distilling the oil over quicklime to free it from resin. It is used in lamps, and gives a very brilliant light; but to prevent smoking, the lamp must have a very strong draught. With oxygen it forms camphor.

**Cam'phor**, a whitish, translucent substance, of a granular or foliated fracture, and somewhat unctuous to the touch, which is mostly extracted from two or three kinds of trees of the laurel tribe. It has a bitterish, aromatic taste and a strong characteristic smell. In chemical character it belongs to the vegetable oils. The common camphor of the shops is obtained from the camphor laurel, a native of China and Japan, now naturalized in many other countries. The camphor is chiefly prepared in the island of Formosa, though also exported from Japan, and to a small extent from China. The wood is cut into chips and distilled with water, the vapor of camphor rising with the steam being collected in the head of the still. After collection camphor oil drains off. In the refining process the grains of impure camphor are detached, and being introduced, along with a small proportion of quicklime, into a large globular glass vessel in quantities of about ten pounds, are reheated,

when first the water rises in steam, and is allowed to escape at a small aperture; and thereafter, this aperture being closed, the camphor sublimes and resolidifies in the interior upper part of the flask as a semi-transparent cake, leaving all the impurities behind. The flakes are then cooled and broken by throwing cold water on them, and the camphor taken out and sent into market. It is a white, tough solid, slightly lighter than water. It is very sparingly soluble in water, but freely soluble in alcohol, ether, acetic acid, and the essential oils. It fuses at 347°, and boils at 399°, but volatilizes somewhat rapidly at ordinary temperatures. When set fire to, it burns with a white, smoky flame. Thrown upon water, it floats, and may be set fire to. It has a peculiar hot, aromatic taste, and an agreeable characteristic odor. Bornco camphor is the product of a tree 100 to 130 ft. high, found in Borneo and Sumatra. Borneo camphor is not procured by distillation, but is found in masses, secreted naturally in cavities in the trunk and greater branches. Numerous other vegetables, such as thyme, rosemary, sage, etc., are found to yield camphor by dis-tillation. In medicine camphor is used both as an external and internal stimulant. In small doses it acts as an anodyne and antispasmodic; in large doses it acts as a poison. Its effluvia being very noxious to insects, it is much used to protect specimens in natural history. It readily dissolves in alcohol, oils, etc., and in this way is much used as a liniment. It evaporates or volatilizes at ordinary temperatures. A third kind of camphor, blumea camphor, is prepared in China from a tall, composite plant.

**Campi**, a family of Italian artists who founded what is known in painting as the school of Cremona. Of the four of this name, Giulio, Antonio, Vincenzo, and Bernardino, the first and the last are the best known. Giulio (1502-72), the eldest and the teacher of the others, was a pupil of Giulio Romano, and acquired from the study of Titian and Pordenone a skill in coloring which gave the school its high place. Bernardino(1525-90) was the greatest of the school. He took Romano. Titian, Correggio in succession as his models, but without losing his own individuality as an artist.

**Campobas' so,** a town of Italy, province of Campobasso, on a hill slope, 52 mi. n.e. Naples: has manufactures of cutlery, and a good trade. Pop. 14.818. The province (formerly Molise) has an area of 1,771 sq. mi.; pop. 385,140.

**Campobel** 10, an island 8 mi. long, belonging to New Brunswick, Canada, in the Bay of Fundy, with a lighthouse on its northern extremity.

**Campo Formio**, a town in Italy, 66 mi. n.e. of Venice, famous for the treaty of peace between Austria and France which was signed in its neighborhood on Oct. 17, 1797. Its chief provisions were that Austria should cede the Belgian provinces and Lombardy to France, receiving in compensation the Venetian states.

**Campo-Santo** (lit. "Holy Field"), the name given to a burying ground in Italy, best known

as the appellation of the more remarkable, such as are surrounded with arcades and richly adorned. The most famous Campo-Santo is that of Pisa, which dates from the twelfth century, and has on its walls frescoes of the fourteenth century of great interest in the history of art. Among more modern Italian cemeteries, that of Genoa is distinguished for its magnificence.

**Campus Martius** (called also *Campus*, merely), was a large place in the suburbs of ancient Rome, consisting of the level ground between the Quirinal. Capitoline, and Pincian hills, and the River Tiber, set apart for military exercises, and sacred to the god Mars. In the later period of the republic it was a suburban pleasure ground for the Romans, and was laid out with gardens, shady walks, baths, etc. Large part of the modern city stands on it.

**Camuccini** (kå-mut-chē' nē), VINCENZO (1775-1814), a distinguished Italian historical painter. He followed the pseudo-classical style, and his pictures are of large size. Among his best known works are Death of Casar, Death of Virginia, The Incredulity of Thomas, Horatius Cocles, Death of Mary Magdalene.

**Camwood**, a red dye-wood imported from tropical West Africa, and obtained from a leguminous tree. This wood is of a very fine color, and is used in turnery for making knife handles and other similar articles. The dye obtained from it is brilliant, but not permanent. It is called sometimes *Barwood*, though this name belongs to another tree.

**Cana**, a village of Palestine in Galilee, the scene of Christ's first miracle; probably represented by Kana el Jelil, a modern village 9 mi. n. of Nazareth.

Canaan (kā'nan). See Pulestine.

**Canaanites**, the general name for the heathen peoples (Jebusites, Hittites, Amorites, etc.) whom the Israelites found dwelling in Canaan (Palestine) west of the Jordan, and whom latterly they utterly subdued, though the subjugation was not quite complete till Solomon's time. They are believed to have been, in part, at least, of kindred race to the Israelites; and some authorities find traces of their descendants among the present inhabitants of Palestine.

Canada, DOMINION OF, an extensive series of British territories in North America, the greatest of Britain's colonial possessions, comprising the provinces of Ontario (formerly Upper Canada), Quebec (formerly Lower Canada), Nova Scotia, New Brunswick, British Columbia, Prince Edward Island, and Manitoba, along with the vast regions in the north and northwest known as the Northwest Territories, and another vast region north of Quebec known as the Northeast Territory. The Dominion thus embraces the whole of British North America, with the exception of Newfoundland and part of Labrador (which belongs to Newfoundland), and its area is not much less than that of Europe. The following shows the population of the provinces of the Dominion (some of which have recently had their boundaries altered), according to the census of 1891. British Columbia, 92,766; Manitoba, 154,442; New Brunswick, 321,294; Nova Scotia, 450,523; Ontario, 2,112,909; Prince Edward Island, 109,088; Quebec, 1,488,-586; Saskatchewan, Alberta, and Assiniboia, 61,487. Unorganized, 32,168. Total, 4,823,-344.

Nova Scotia, New Brunswick, and Prince Edward Island are called the "Maritime Provinces," though British Columbia, being on the Pacific, is also a maritime province. In the Northwest Territories four districts have been marked out: Assiniboia, area 95,000 sq. mi.; Saskatchewan, 114,000 sq. mi.; Alberta, 100,000 sq. mi.; Athabasca, 122,000 sq. mi. There is also the district of Kewatin, subordinate to Manitoba. The boundaries of the dominion are: the Atlantic on the east, the U. S. on the south, the Pacific and Alaska on the west, and the Arctic Ocean on the north.

Coasts.-On the east the coast line is very irregular, being marked by deep indentations and fringed by islands. The province of Nova Scotia forms an odd peninsula projection with the Bay of Fundy between it and the mainland, while north of it is the Gulf of St. Lawrence, shut in from the Atlantic by Cape Breton Island and Newfoundland. In the gulf are the Island of Anticosti and Prince Edward Island. The chief features of the north coast are the Archipelago of the Arctic islands and the great opening of Hudson's Bay, connected with the Atlantic by Hudson's Strait, and having as its southern continuation James Bay. On the west coast are Vancouver Island, the Queen Charlotte Islands, and many others. The southern boundary is most remarkable for The passing through the system of great lakes-Superior, Huron, Erie, and Ontario, between the last two of which are the Falls of Niagara,

partly belonging to Canada, partly to the U.S. To the Atlantic the drainage of these lakes is carried by the St. Lawrence with which river, and the great gulf into which it expands, are connected the provinces of Ontario, Quebec, New Brunswick, Nova Scotia, and Prince Edward Island, together containing by far the greater portion of the population of the dominion.

Surface.—Canada may be divided roughly into three great regions: a region of woodlands and hills or undulating ground in the e., a region of prairies in the middle, and a mountainous forest region in the w. The chief mountain ranges of the e. are n. and s. of the St. Lawrence, and run nearly parallel to that river. On the s. are the Shickshock Mountains and the Notre Dame range, the former rising to the height of 4,000 ft. On the n. is the Laurentian range (perhaps attaining 4,000 ft.), running in a westerly direction from the Labrador coast to the Ottawa River, and forming the watershed between the rivers which flow into the St. Lawrence and those which flow into Hudson's Bay. The prairie region and great wheat-producing tract extends n.w. of Lake Superior to the Rocky Mountains. This is a great region of plains, with low hills in some places: it is well wooded in many parts, else where bare or with a mixture of woodland and prairie. On the Pacific slope we have a distinctly mountainous region, including the Rockies, some peaks of which (Mt. Hooker, Mt. Brown) attain a height of about 16,000 ft., as also the Gold and the Cascade ranges.

Lakes and Rivers. - The vast lake and river systems which Canada possesses of its own, or shares with the U.S. give it a unique char-acter. Everywhere in the interior are rivers and lakes. To Hudson's Bay flow the Albany, Nelson, Churchill, and many other streams; to the Arctic Ocean, the Mackenzie, Coppermine, and Back or Great Fish River; to the Pacific, the Fraser, Skeena, Stickeen, etc. The basin of the St Lawrence, with the connected lakes Superior, Huron, Michigan, Erie, and Ontario. affords a continuous water way from the At-lantic to the interior of the continent. To this system belong the Ottawa, Gatineau, Richelieu, St. Maurice, Saguenay, and other rivers. In the prairie region and the northwest are similar great lake and river systems, formed by the Saskatchewan, Nelson, Churchell, Athabasca, and Mackenzie rivers, and the great lakes Winnipeg, Athabasca, Great Slave, and Great Bear. The Saskatchewan, lying in the heart of the rich, wheat growing district, must in time prove a far more important water way than at present. The Mackenzie and its connected lakes and rivers form the most remarkable feature of the far northwest. This river, including its tributary, the Peace, has a length of perhaps 2,500 mi., and drains an area of 550,000 sq. mi., or almost double that of the St. Lawrence basin. Between the Mackenzie system and Hudson's Bay is a great region called from its desolate character the Barren Grounds.

Geology and Minerals.-As regards the geological features of Canada, great part of the Dominion north of the St. Lawrence and west of Hudson's Bay is covered with archæan rocks belonging to the Laurentian system, and consisting largely of granite and gneiss, with quartz rock, schist, limestone, etc. South of the St. Lawrence, in New Brunswick and Nova Scotia, is a considerable development of Carboniferous strata. Between the archæan rocks and the Rocky Mountains is a great area of secondary (Mesozoic) strata. In the Rocky Mountain region the archæan, palæozoic. mesozoic, and tertiary systems are represented. Canada has great mineral wealth. Iron of the best quality has been found in great abundance in Quebec, Ontario, and British Columbia. The district round Lake Superior and the upper part of Lake Huron abounds in copper, and has much silver as well; and Nova Scotia, Assiniboia, Alberta, and British Columbia are rich in coal. In Nova Scotia there are a number of coal mines worked; gold is also ob-tained in some quantity, as well as iron. Coal is worked in the northwest, and more extensively in British Columbia; but the most valuable mineral of the latter is gold, of which more than \$50,000,000 has been obtained since 1858. British Columbia is also rich in iron. The chief oil district is the peninsula in the

## Canada

province of Ontario formed by Lakes Erie and Huron and the river St. Clair. Other useful mineral products are salt, gypsum, phosphate of lime, slate, asbestos, plumbago, antimony, and building stone.

Animals.-The chief wild animals (some of them represented by several species) are the deer, buffalo, musk-ox, bear, wolf, fox, otter, beaver, squirrel, raccoon, muskrat, marten, etc. The largest of the deer kind is the moose, or elk. The reindeer occurs in the north. The grizzly bear is met with in the Rocky Mountains, and the polar bear in the extreme north and northeast. Fur-bearing animals are so numerous as to have been a source of revenue to a large trading company like the Hudson's Bay company for over two centuries. There are birds in great variety, Canada having more than 700 of these altogether. They include the wild swan, wild turkey, geese and ducks of various kinds, partridges, quail, prairie-fowl, pigeon, woodcock, snipe, plover, etc ; besides eagles, hawks, owls, and many smaller birds, among which are two species of hum-ming-bird. Except at certain seasons game of all kinds may be shot at will. The rattlesnake and other snakes occur, but are less common than in the U. S. The seas, lakes, and rivers, especially the Gulf of St. Lawrence and the neighboring waters, abound in almost all kinds of fish, and the fisheries are extremely valuable, employing over 250,000 people, The chief sea fish caught are cod, herring, mackerel, halibut, haddock, hake, shad, salmon, etc. The rivers and lakes abound with salmon, whitefish, bass, trout. sturgeon, maskinonge, pike, pickerel, etc. The seal and whale fisheries are also valuable. Lobsters and oysters are abundant and excellent.

Vegetation. - The forests are of great extent, and the timber trade is a great source of wealth. In the forests grow more than sixty kinds of trees. Among the most valuable are the white and red pine, white and black spruce, maple, ash, beech, oak, walnut, but-ternut, chestnut, basswood, birch, cedar, etc. The forests of British Columbia produce the largest timber, the Douglas pine being the chief tree. The balsam poplar grows to an immense size on the Athabasca, Peace, and Mackenzie Rivers, and even at the mouth of the last, within the Arctic Circle, trees of some size are found. The sugar maple, a forest tree attaining the height of 120 ft. flourishes in the greater part of the St. Lawrence valley up to lat. 49°, and is much valued for the sugar that is obtained from it. There are a great many varieties of wild fruits, as the wild plum, wild cherry, raspberry, service-berry, cranberry, gooseberry, strawberry, black and red currant, wild vine, blueberry, buffalo berry, etc., and numerous wild flowers and flowering shrubs. Of the wild fruits, the raspberry, the cranberry, and the blueberry are alone important economically.

Climate. — The climate differs very much in different places. British Columbia on the Pacific coast, and Nova Scotia and the other Alantic regions are very dissimilar to the prairie region of the center. In Ontario and the region of the Upper St. Lawrence it may be described as temperate. Generally the climate of the Dominions shows considerable extremes of heat and cold, but, except in some of the coast regions, the exceeding dryness of the Canadian atmospheres makes both extremes of temperature pleasant and healthy. Apart from the portions of the Dominion that fall within the Arctic Circle, Labrador, and all the country e. of Hudson's Bay have the most severe climate. The Pacific coast region has a decidedly moist climate. The peninsula lying between Lakes Ontario, Erie, and Huron has the finest climate, allowing of fruits. shrubs, and flowers to be grown that cannot stand the winter elsewhere. The Mackenzie River district - especially in the region of the Peace River, where the temperature throughout the year is remarkably genial-possesses a climate much less severe than one might expect, and would allow of agriculture almost to the Arctic Ocean.

Agriculture.-Both by soil and climate Canada is specially adapted for agriculture. Within the last few years its agricultural importance has greatly increased, and when the great prairies are brought under cultivation Canada will be one of the chief agricultural countries in the world. In general, sowing is later than in the northern parts of Britain, but the harvest is gathered earlier, a large part of it usually before the end of July, so rapid is the growth during the hot Canadian summer. The chief crops are wheat, barley, oats, rye, maize, buckwheat, potatoes, turnips, mangle-wurzel. etc., and cattle, horses, and sheep are exported. The province of Ontario has an agricultural college and model farm at Guelph, and there are also model farms in Quebec. Fruit growing in now an important industry in certain localities, and large quantities of apples are exported, as well as canned and dried fruits. Peaches are grown to most advantage in the Niagara district of Ontario, where peach orchards many acres in extent are to be seen. The vine is cultivated too, and good wine is made. Pears, plums, and many kinds of berry

fruits, etc., are produced in great perfection. Commerce.—The trade of the Dominion is chiefly with the U. S. and Great Britain. About four fifths of the whole exports are sent to these two countries, while nearly nine tenths of the imports come from them. Besides timber, animals and their produce, and agricul-tural products, the chief articles of export are fish, coal and other minerals, leather, and The imports chiefly consist wooden goods. of manufactured goods, coal, iron, tea, coffee, sugar, cotton, etc. A uniform decimal system of coinage was established throughout the Dominion in 1871. The unit of account is the dollar of 100 cents, the value of which is declared to be on the basis of 486 cents and two thirds of a cent to the pound of British sterling money. The average rate of exchange makes the dollar equal to about 4s. The money used consists of bank bills, and gold, silver, and bronze coins, besides government notes of

#### Canada

small denominations up to 4 dollars, the bank bills being not of lower denominations than 5 dollars. There is a uniform system of weights and measures, the Canadian standards being the same as the British imperial standards. The British hundredweight of 112 pounds and ton of 2,240 pounds are, however, superseded by the U. S. weights of 100 pounds and 2,000 pounds respectively.

pounds respectively. Railways.—Of the railways the greatest is the Canadian Pacific Railway, running from Montreal across the whole continent to Vancouver on the Pacific coast in British Columbia; length about 2,900 mi. exclusive of branches. The Grand Trunk Railway connects the maritime provinces and the northeastern parts of the U.S., with the western railways. Another important railway is the Intercolonial Railway from Halifax in Nova Scotia to Quebec. Altogether the Dominion has now 14,633 mi. of railway. A railway has been begun to connect Winnipeg and Regina with Port Nelson on Hudson's Bay. This route will only be available for perhaps half of the year on account of ice in Hudson Strait and Bay.

Canals. - Some of the canals are stupendous The most important, from a achievements. commercial point of view, are the St. Law-The rence Canals and the Welland Canal. former series of canals, with an aggregate length of about 70 mi., avoids the rapids on the St. Lawrence between Montreal and Kingston on Lake Ontario, and thus affords to vessels the means of ascending to that lake (in descending vessels of 700 tons can shoot the rapids with safety); and the latter, with a length of 27 mi., avoids the Niagara falls and rapids, and enables vessels to ascend from Lake Ontario to Lake Erie. Both the Wel-land Canal and the St Lawrence series have been enlarged and deepened so as to accommodate the increased traffic expected as a result of the settlement of the northwestern provinces, and the construction of the Canadian Pacific Railway. The Rideau Canal connects Lake Ontario at Kingston with the Ottawa near the city of that name.

Constitution, Etc.-By the Act of Confederation of 1867 the constitution of the Dominion was required to be similar in principle to that of the United Kingdom. There is a central federal government and separate provincial governments and legislatures. The central executive government is vested in the sovereign of Great Britain and Ireland, and is carried on by a governor general appointed by the crown, and a privy council. The governor general has a salary of \$50,000 per annum. He is assisted by a privy council consisting of the prime minister and twelve other ministers or heads of de-partments. The legislative authority rests with a Parliament consisting of two houses, the Senate and the House of Commons. The The Senate consists of seventy-eight members, who are nominated by the governor general. Each senator must be a born or naturalized subject, thirty years of age, and possessed of real or personal property to the value of at least \$4,000

in the province for which he is appointed. The House of Commons is elected by the people for five years, there being one member for about every 20,000 of the population. There is a uniform franchise, a vote being given to every male of twenty-one years of age, pos-Each sessed of a small property qualification. of the provinces has a separate parliament and administration, independent in its own sphere, at the head being a neurenance of the pointed by the central government. Ontario, Manitoba, and British Columbia have only one the other provinces have two. The at the head being a lieutenant governor apadministration of justice is based on the English model, except in Quebec province, where the old French law prevails. The only court that has jurisdiction throughout the Dominion (except the Exchequer and the Maritime Court) is the Supreme Court, the ultimate court of appeal in civil and criminal cases. In certain cases an appeal may be had to Her Majesty's Privy Council. The capital of the Dominion is Ottawa, but the largest cities are Montreal. Toronto, and Quebec. Canada has both a large volunteer force and a militia. The former comprises many well equipped organizations in infantry, cavalry, and artillery.

Religion and Education.—There is no state church in the Dominion. The prevailing religion in Quebec is that of the Roman Catholic church. In Ontario Methodists predominate, then Presbyterians, the English Church, and the Roman Catholics. Of the total population in 1891, 1,791,892 were Roman Catholics, 742,-981 Methodists, 676,165 Presbyterians, 574,818 Anglicans. Education is well attended to, being everywhere more or less under the supervision of government, and excellent free schools being provided. In Ontario, Quebec, and Manitoba separate public schools are provided for Roman Catholics; in the other provinces the schools are unsectarian. All the colonies except British Columbia have universities or colleges.

People.-The total population, 1891, was 4,-820,411. Ontario is settled principally by emigrants from Great Britain and their descendants, with considerable numbers of Germans and Americans. In the province of Quebec the people are mostly French in origin, speech, and customs, being mainly descendants of the French colonists who inhabited the region before it became British. There are, besides, the Indian tribes and the Eskimo, the latter in the extreme north. The Indians are estimated to number about 130,000. They are divided into various tribes as well as larger stocks or races, such as the Tinneh or Athabascan Indians, the Thlinkets, and Hydahs of British Columbia and the west coast, the Algonquins, Hurons, Iroquois, etc., of the St. Lawrence region. In the old provinces separate land allotments have been granted to the Indian population. The majority of the Indians, however, live beyond the influences of this kind of civilization, and wander over the northwest, supporting themselves by fishing and hunting, carrying their furs to the forts or trading stations of the Hudson Bay Company.

History .- English ships were the first to reach the shores of what is now Canada. In 1497 John Cabot, sailing from Bristol, landed on the coast of Labrador, and planted the English flag there. But it was the French navigator Jacques Cartier who first really opened up Canada for European settlers. Some years later vigorous attempts at coloni-zation were made. The Sieur de Roberval was appointed Viceroy of New France, as the newly-discovered territory had been called, and under his leadership and that of Cartier two hundred colonists were landed, who, after struggling for two winters, had eventually to return. Martin Frobisher in 1576, and Sir Humphrey Gilbert in 1583, explored and took formal possession of Newfoundland and the adjacent coasts. In 1603 Samuel Champlain, a French naval officer, sailed up the St. Lawrence to where the city of Montreal now stands. At length, in 1608, a French Colony under the leadership of Champlain and Des Monts settled at Quebec. Two years later another En-glish navigator, Henry Hudson, explored the river and the bay which bear his name. In 1627, the fur trade having made considerable development under the guidance of Champlain, Cardinal Richelieu organized the company for the further colonization of New France. At Champlain's death in 1635 it numbered but 250 Europeans, and in 1663 was still under 2,000. The most formidable foes of the colonists were the Iroquois Indians. In 1663, Colbert being at the head of affairs in France, fresh supplies of emigrants and a strong body of troops were sent out to Canada. Under the governorship of Count de Fontenac the ex-ploration of Jesuit missionaries, and of the adventurers Joliet and La Salle, opened up the region of the Mississippi and the "Great West;" but the French generally preferred an adventurous life to the solid pursuits of agriculture.

The French did not altogether neglect industrial development; they laid the foundation of shipbuilding at Quebec, encouraged the fur trade and other industries; but in general their colonists lacked the qualifications for agricultural and other settled pursuits. The British colonists, on the other hand, stuck to agriculture, and reclaimed every year great tracts of forest land. As a natural consequence their population rapidly increased, and when the final struggle began, the British colonies in America numbered 3,000,000 of prosperous inhabitants against some 60.000 French colonists hampered by feudal tenures, commercial monopolies, and a corrupt set of officials. A little later occurred the incident of the expulsion of the Acadian peasants (immortalized in Longfellow's Erangeline), of whom about 7,000 still remained in Nova Scotia, mostly on the shores of the Bay of Fundy.

Canada was formally annexed to the British Empire, and in 1774 an act passed in the British Parliament (the Quebec act) extended the bounds of the province from Labrador to the Mississippi and from the Ohio to the watershed of Hudson's Bay. In 1775 the war of the American Revolution broke out, and Canada became the scene of a brief struggle between the royalists and the revolted colonists of New England. Thousands of American royalists sought new homes in Canada, and a large number settled on the St. John River, and had that district erected into the separate province of New Brunswick. More than 10,000 settled in Ontario, where they received liberal grants of land. In 1791 Canada was divided into two provinces-Upper Canada or Ontario, and Lower Canada or Quebec-the latter still retaining its seigneurial tenure and French law in civil cases. In Upper Canada British law and freehold tenure were introduced. From 1812 to 1815, war having broken out between Great Britain and America, Canada was again the theater of a bloody strife, among the chief incidents of which were Brock's victory over the Americans on the heights of Queenstown, and the battles of Chippewa, Lundy's Lane, Mora-vian's Town, etc. In 1837-38 the discontent of the people of Lower Canada with their system of irresponsible government took the form of a rebellion, which was repressed after a brief but sharp struggle. The year 1839 was distinguished by the celebrated "Boundary Dispute" between New Brunswick and the U.S. After threatening preparations on both sides the quarrel was settled in 1842 by the Ashburton Treaty, which fixed the forty-fifth parallel as the boundary line westward from the disputed territory to the St. Lawrence, and the forty-ninth parallel, from the Lake of the Woods to the Pacific, the central line of the Great Lakes and their connecting rivers completing the boundary. The result of the rebellion of 1837-38 and Lord Durham's report, was the reunion in 1841 of Upper and Lower Canada as one province with equal representation in the common legislature, and the practical concession on the part of the mother country of responsible government. Kingston was selected as the new seat of government, and three years afterward Montreal. In 1848 the Parliament House at Montreal having been burned in a riot, the seat of government was removed to Toronto and Quebec alternately every four years. In 1854 the Reciprocity Treaty with America was concluded, according to which there was to be free exchange of the products of sea and land, with navigation of the St. Lawrence, the St. John, and the canals, and the use of the inshore fisheries in the British waters to the Americans and of Lake Michigan to the Canadians. In 1858 Ottawa was finally selected as the capital of Canada, the choice having been referred to the queen. In 1866 the Reciprocity Treaty with the U.S. having expired, the government of that country practically refused to renew it except on the most disadvantageous terms for Canada. About the same time a Fenian expedition against Canada, originating in the U.S. began to be heard of. The filibusters crossed the frontier, were routed by the Canadian militia, and dispersed by American troops.

In 1867, March 28, the British North America act for confederation of the colonies passed

the imperial Parliament. It united Upper Canada or Ontario, Lower Canada or Quebec, New Brunswick, and Nova Scotia, into one territory, to be named the Dominion of Canada. Newfoundland declared against joining the confederation, but with that exception all the British territory north of the U.S. was gradually included within the Dominion-the Hudson Bay Company territory by purchase in 1868, British Columbia in 1871, Prince Edward Island in 1873. In 1870 an insurrection of the Red River settlers, who were under apprehensions as to how their titles to their lands might be affected by the cession of the Hudson Bay Company's rights, took place under the leadership of Louis Riel. To reassure the settlers, a part of the newly-purchased territory was erected into an independent province under the name of Manitoba, the unorganized territory beyond receiving the name of the Northwestern Territory. In 1871 the Washington Treaty arranged that the fisheries of both Canada and the U.S. should be open to each country for the next twelve years. Canada receiving a compensation, afterward fixed at five and a half million dollars, for the superior value of its fisheries. On Nov. 7, 1885, the Canadian Pacific Railway was completed, being opened for through traffic the following year. Since 1883, when the Washington Treaty expired, disputes between the American and Canadian fishermen have again been frequent, and several American fishing vessels have been seized on the British North American coasts, and others prevented from buying bait. For the adjustment of the differences connected with the fisheries, a joint British and American commission was instituted in 1887.

**Canada Balsam**, a fluid oleo-resin obtained from the balsam fir, common in Canada and the U. S., and also from Fraser's balsam fir and the hemlock spruce. It is used in medicine, and in making varnishes, etc.

**Canada Goose,** an American wild goose 30 to 35 in. long, brownish above, lighter below, head, neck, bill, and feet black, a white patch on the cheek; breeds in the north of the continent, and migrates southward when the frost becomes severe.

**Canada Hemp**, a perennial herb of the dogbane family, native of North America. It has a strong fiber used by the Indians for twine, nets, woven fabrics, etc.

**Canada Rice**, a floating grass growing in lakes and sluggish streams in Canada and the northern U. S., yielding a grain that forms part of the food of the Indians, and is eaten by whites also.

Canadian Pacific Ry. See Pacific Railways.

**Canadian River**, a river of New Mexico, Texas, and Indian Territory, a tributary of the Arkansas; length 900 mi. In 1897 a terrible cloudburst on its banks drowned many residents in the Indian Territory.

**Canal**, an artificial water-course for the transportation of goods or passengers by boats or ships, or for purposes of drainage or irrigation. The canals most familiar to ordinary

readers are for navigation. These consist usually of a number of different sections, each on one level throughout its course, but differing in relative height from the others. From one section to another boats are transferred by means of locks, or it may be by inclines or lifts. The lock is a water-tight enclosure with gates at either end, constructed between two succes-When a vessel is desive sections of a canal. scending, water is let into the lock till it is on a level with the higher water, and thus permits the vessel to enter; the upper gates are then closed, and by the lower gates being gradually opened, the water in the lock falls to the level of the lower water, and the vessel passes out. In ascending the operation is reversed. The incline conveys the vessel from one reach to another, generally on a specially constructed carriage running on rails, by means of drums and cables. The lift consists of two counterbalancing troughs, one going up as the other descends, carrying the vessel from the higher to the lower level, or vice versa. Works of great magnitude in the way of cuttings, embankments, aqueducts, bridges, tunnels, reservoirs for water supply, etc., are often necessary in constructing canals. Canals have been known from remote times, Egypt being intersected at an early period by canals branching off from the Nile to distant parts of the country, for purposes of irrigation and navigation. Under the Ptolemies, before the Christian era, there existed a canal between the Red Sea and the Nile. In China, also, canals were early made on a very large scale. In Holland, where the country is flat and water abundant, canals were constructed as early as the twelfth cen-tury. The lock, however, was not invented until the fifteenth century, both the Dutch and the Italians claiming the honor. Since then Europe has been provided with numerous canals, which being connected usually with navigable rivers, give access by water to most parts of its interior.

Among the numerous canals of Holland, the most important is now the great ship canal, from 200 to 300 ft. wide and 23 ft. deep, which connects Amsterdam with the North Sea. In France there are many canals and canalized rivers. the principal being the Canal du Midi, branching off from the Garonne at Toulouse, and falling into the Gulf of Lyons at Narbonne, thus connecting the Bay of Biscay and Mediterranean, and three canals connecting the basins of the Rhone, Loire, Seine, and Rhine. The canals of France have a total length of 3,000 mi. In Belgium there is the Ghent-Terneuzen Canal, which allows large vessels to sail to Ghent from the Scheldt estuary. The chief canals in Germany are the Ludwigs Canal in Bavaria, connecting (through the Main and Regnitz) the Rhine and the Danube; and the Holstein Canal, connecting the North Sea and Baltic by means of the Eider. The latter will be super-seded by the Great Baltic Canal for sea-going vessels, which is to be constructed at a cost of \$40,000,000, starting near the mouth of the Elbe and reaching the Baltic near Kiel. In Russla there is canal and river communica-

tion between the Caspian and the Baltic, large part of the route consisting of the Volga. In Britain one of the earliest and most celebrated is the Bridgewater Canal (1761-65), in Lancashire and Cheshire, with a length of 38 mi. In Scotland there are the Forth and Clyde Canal, 35 mi. long, joining these two rivers; and the Caledonian, 601 mi. (including lakes), from the Moray Firth on the east coast to Loch Eil on the west, passing through Loch Ness, Loch Oich, and Loch Lochy. In the British Islands there is a total length of canals of about 3,000 mi., more than five sixths being in England. In America the most extensive undertaking of this kind is the canal connecting the Hudson with Lake Erie. It is 363 mi. in length, and carries an immense traffic. In Canada the government has constructed, at great expense, the Welland Canal, uniting Lakes Erie and Ontario, and avoiding the Niagara River and its falls: and there are also other important canals. The greatest achievement in canalmaking has been the Suez Canal. It is an example of a canal without locks, open at both ends to the sea, and freely supplied with seawater.

Among the greatest canals now in use is the Manchester Ship Canal, opened in January, 1804, which connects Manchester with the Mersey, the Shropshire Union Canal, and the Weaver Navigation and Trent and Mersey Canal—the length is 35½ mi., breadth 172 ft., and the depth 26 ft.

On June 21, 1895, the Kaiser Wilhelm Canal was opened by the Emperor of Germany This C. connects the North and Baltic Seas by passing through Schleswig-Holstein from the northern side of the mouth of the Elbe to the western shore of Kiel Fiord. On June 3, 1887, the foundation stone was laid by the Emperor William I. Far back in the Middle Ages. schemes for uniting the two seals were considered, and plans and estimates were drawn up for carrying out the undertaking; yet it was not until the last century that a canal was actually formed. This was the Eider C., which, however, was suitable only for vessels of small draught. The Kaiser Wilhelm C. affords passage to the largest vessels affoat, and the squadrons of the different nations, represented at the opening ceremony, steamed through the C. from end to end without any difficulty or delay.

In 1881 a ship C. was commenced across the Isthmus of Panama, a distance of 46 mi. In 1888 the C. Company fell into monetary difficulties, and in the following year passed into liquidation. M. de Lesseps, the chief promoter of the scheme, retired from the management owing to failing health. Several of the directors were proceeded against criminally, and convicted of fraudulent practises in connection with the undertaking. In 1893 further attempts were made to organize a new company, and in 1894 the work was resumed as a tentative measure, but at the present time (1897) the whole matter is in suspense.

The alternative project and which found more favor in the U.S. was the Nicaragua Canal (which see). Expense and engineering difficulties have delayed this work. The Chicago Drainage Canal, blasted for miles through solid rock and destined to convey the waters of Lake Michigan into the Illinois River at Joliet, is one of the great engineering works of the century.

**Canal**, CHICAGO DRAINAGE, a channel for the removal of Chicago's sewage, begun Sept. 3, 1892, and one of the greatest engineering projects of the century. It is an undertaking of the Sanitary District of Chicago, which was organized in 1889, under the authority of the legislature. Trustees were elected by the people of Chicago in 1890. Some sections are excavated in solid rock, are 160 ft. wide, with perpendicular walls, and 30 to 35 ft. deep. When it is full earth-cut the bottom of the channel is 202 ft. wide. The full length of the channel is 28 mi. Its capacity per minute is 600,000 cubic ft; maximum velocity of current per hour, 3 mi.; length of spillway, 397 ft. About 6,000 men are employed in construction: the average amount of material removed daily is 60,000 cubic yards. This great work will probably be completed early in 1898, at an estimated cost of \$20,000,000. It is one of the most interesting places in the world for the study of glacial geology. The most important fact, however, regarding this wonderful channel, is that it completes a link in the chain of great waterways, which will some day connect the entire inland commerce of this country with that of South America, Asia, and the isles of the Pacific.

Much of the machinery used for handling material in excavating the canal has been invented since the work was commenced. The traveling cableways consist of two towers 700 ft. apart: the head tower is 93 ft. high and the tail tower is 73 ft. high. The head tower carries the engine, boilers, and machinery. The excavated material is dumped on the side of the canal which has the tail tower. A steel cable is stretched from tower to tower, directly across and high above the channel. On this cable travels a cable carriage which carries the pulley wheels and sheaves of the tackle that raises the loaded "skip" from the bed of the canal. The engineer does all the excavating except loading the skips. Each tower stands on trucks, the wheels of which run on tracks laid parallel to the channel. The skips are hoisted and travel over the cableway at the rate of 1,000 ft. a minute, and over 600 cubic vards of stone have been handled in 10 hours. Another machine is the cantalever conveyor. This machine resembles a swing bridge. One arm of the bridge extends over the working face, the other over the dumping bank. The inside arm is much lower than the outside. The cantalever is about 350 ft. long and is supported by a tower in the center, which rises from a platform on which is all the machinery for lifting the material and moving the can-talever. The bridge carries a track on which a trolley car runs. This car is hauled up and down by an endless cable. The skips have a capacity of 75 cubic ft., and each is lifted, run
out, and dumped on the spoil bank and returned to the pit in about 50 seconds. One of these conveyors has been known to remove 890 cubic yards in 10 hours and 45 minutes. Other machines used are revolving derricks which swing around on a turn-table like a swing bridge. The derrick has two long booms reaching out from a revolving tower. The skips are filled, lifted up, and swung around on the boom from the spoil bank. The channeling machine works upon a track laid along the edge of the rock channel with a long, heavy chisel shaped like the letter Z. It cuts a groove in the limestone nearly 3 in. wide and 10 or 12 it. deep. This cut makes a smooth wall for the channel and prevents injury to the sides from blasting.

**Canaletto.**—1, A Venetian painter (1697-1768), whose true name was Antonio Canale. He is chiefly celebrated for his pictures of Venice, and is said to have been the first to use the camera obscura for perspective, etc. 2, His nephew, BERNARDO BELOTTI (1724-1780), who was likewise a good artist, lived in Dresden, where he was a member of the Academy of Painters. The Canaletti developed the pictorial treatment of architecture to a very high point.

Canandaigua, Ontario co., N. Y., on Canandaigua Lake, 29 mi. s.e. of Rochester. Railroads: New York Central, Auburn Div.; N. Y. C., Batavia branch; and Northern Central. Industries: two flouring mills, two iron foundries, anti-rust tin works, brewery. factories for the manufacture of agricultural implements and pressed brick. Natural gas is found in limited quantities. The name Canandaigua is derived from the Indian "Canadarque," signifying "The Chosen Spot." The town was first settled in 1789, and became a village in 1815. Pop. est. 1897, 6,200.

Canary Bird, a singing bird, a kind of finch

### Norwich Canary.

from the Canary Islands. They were introduced into Europe 300 or 400 years ago. A large proportion of the cage canaries are really mules, produced by the interbreeding of canaries with allied species, such as the goldfinch, siskin, linnet, bullfinch.

**Canary Flower**, an annual climbing plant of the Indian cress family, a native of New Granada, cultivated in Europe for its showy yellow flowers.

Cana'ry Islands (or Canaries), a cluster of islands in the Atlantic, 60 or 70 mi. from the n.w. coast of Africa, and belonging to Spain. They are thirteen in number, seven of which are considerable, viz., Palma, Ferro, Gomera, Teneriffe, Grand Canary, Fuerteventura, and Lancerota. The other six are very small: Lancerota. The other six are very small: Graciosa, Roca or Rocca, Allegranza, St. Clara, Inferno, and Lobos. All are volcanic, rugged, and mountainous, frequently presenting precipitous cliffs to the sea. The princi-pal peak is that of Teneriffe, 12,182 ft.; El Cumber in Gran Canaria is 6,650 ft. The area of the whole has been estimated at 2,808 sq. Their fine climate and their fertility, mi. which owes little to cultivation, justified their ancient name of Fortunate Islands. There are no rivers of note, though streams are not infrequent. All the islands furnish good wine, especially Palma and Teneriffe. The exports amount to \$1,500,000 annually, and consist of cochineal, wine, raw silk, fruits, etc. Of the Guanches, the mysterious tribe who originally inhabited these islands, we know little. The islands were discovered and conquered by the Spaniards between 1316 and 1334; they then passed into the hands of the Portuguese, but were reconquered toward the end of the fifteenth century by the Spaniards, who extirpated the inhabitants, and now constitute the great bulk of the population. The fortified capital is Santa Cruz, and the city Laguna is the seat of the bishop (Roman Catholic). The Canaries form a Spanish province. Area 2,810

sq. mi. Pop. 291,625. **Canary Seed**, the seed of the canary grass. The seed is used as food in the Canaries. Barbary, and Italy, and is largely collected for canary birds. It has been successfully cultivated in England and the European continent

vated in England and the European continent. Cana'ry Wood, the light orange-colored wood of two trees of the laurel family, belonging to the Canaries and Madeira

Canby, EDWARD RICHARD S. (1819-1873), American soldier, b. in Kentucky. He graduated at West Point in 1839, served on the frontier and took an active part in the Mexican War. In 1861, he became colonel of the nineteenth U. S. infantry. During the draft riots in New York City in 1863, Canby, then a brigadier general, had command of the U. S. troops. As major general of volunteers, he captured Mobile. Gen. Richard Taylor surrendered to him the last Confederate army in the field. Iu 1873, Brigadier General Canby was sent, with two others, as a commission to treat with the Modoc Indians, who, under their chief, "Captain Jack," had sought refuge in the lava beds of Oregon. He was treacherously killed with his companions while under a flag of truce.

**Cancer** (L., a crab), in astronomy, the fourth sign in the zodiac, entered by the sun on or about the 21st of June, and quitted about the 22d of July. The constellation Cancer is no longer in the sign of Cancer, but at present occupies the place of the sign Leo.

Cancer (or Carcino' ma), a malignant growth of structure in some part of the human body, which can extend itself and spread to neighboring parts, and even form again after re-moval, and usually causes death. Cancer is divided into scirrhous, encephaloid, colloid, and epithelial cancer. Scirrhous cancer is a hard, firm, incompressible, and nodulated mass, at first non-adherent to the skin and attended with little or no pain. On section it is smooth and glistening, and exudes, on pressure, a small quantity of milky-looking juice. Encephaloid cancer is a soft elastic tumor, less circumscribed and increasing more rapidly than the preceding. It ends in a fungous vascular ulcer, to which the term fungus hamatodes has been given, and which has a great tendency to bleed. Colloid cancer occurs most frequently in the stomach and alimentary canal, and consists of fibers arranged so as to form loculi which contain a soft viscous matter of a yellowish, gravish, or reddish color. Epithelial cancer, occurring on the skin and mucous membranes, commences as a hard little tubercle, often resembling a wart, and like the other varieties ends in an ulcer with an ichorous discharge. Cancer is often a very painful disease, but in many cases is not attended with pain. No cure for it can be said to exist, though excision, if performed in time, may not be followed by a recurrence.

**Cancer Root** (or Beech Drop), an American parasitic plant, growing on the exposed root of the beech tree. The whole plant is powerfully astringent, and the root brownish, spongy, and of a very nauseous, bitter taste. It has been used in cases of cancer.

Can'dle, an artificial source of light, in the form of a long thin cylinder, or slightly conical rod, composed of fatty substances enclosing a wick of cotton rovings twisted or plaited together. Ancient Roman candles consisted of the pith of a kind of rush surrounded with tallow or wax. In England during the Anglo-Saxon period, ordinary candles were merely masses of fat plastered round splinters of wood. Candles are made by two processes, dipping and mokling, but chiefly the latter, and when well made they are white, hard, glossy, dry, and not greasy to the touch. Dips are made by stringing a number of twisted wicks upon a rod, and dipping repeatedly into a trough of melted tallow, allowing the dip to solidify after each immersion. Dipping is continued till the candles have acquired the requisite thickness. Molds are made with molds of thin pewter or glass, slightly taper-ing, which are arranged in a wooden frame with the narrow ends, which shape the points of the candles, downward. The wicks are stretched along the axes of the molds by means of wires, and the melted fat is then run into the molds. Next day the candles are withdrawn, cut, and trimmed at the base, and stored for use. In large manufactories, machinery is employed in molding as well as in dipping. Before use the tallow is purified by mechanical or chemical means of its fibrous tissue and other extraneous matter. Wax candles are seldom molded, on account of their adhesion to the molds, and contraction in cool-A different method of manufacture, ing. termed basting, is accordingly resorted to. Wax candles are still employed in the Catholic and Greek churches as indispensable accessories of the altar. Sperm candles are composed of spermaceti obtained from the brain of a species of whale, mixed with beeswax. Palm and cocoanut oils are now extensively used in candle making, and the enormous development of late years of this industry is to be attributed to the successful separation of stearic and palmitic acids from animal and vegetable fats. Stearine candles. - The stearic acid which abounds in animal fats, as beef and mutton suct, lard, etc., and in cocoanut oil, is the material of which these candles are made. Belmont sperm candles are made chiefly from palmitic acid obtained from palmitin, the principal ingredient in palm oil. The fat is raised to a high temperature, mixed with one twentieth of its weight of sulphuric acid; lime is added to neutralize the acid, and on distilling the product glycerine passes over first. Composite candles vary in composition. A beautiful transparent kind is made with nine tenths of stearic acid and one tenth of beeswax; another variety is formed of the stearic acid of tallow with the stearine of cocoanut oil.

Parafine candle manufacture is now carried on on a most extensive scale. They are much in demand on account of their cheapness and the clearness and brilliancy of their light. Electricity, gas, and the cheapness of mineral oils have done much to displace the commercial use of candles.

**Candleberry** (Candleberry Myrtle, Wax Myrtle, etc.), a shrub growing from 4 to 18 ft. high, and common in N. A., where candles are made from its drupes or berries, which are about the size of peppercorns, and covered with a greenish-white wax popularly known as Blayberry tallow. The wax is collected by boiling the drupes in water and skimming off the surface. A bushel of berries yields from 4 to 5 lbs. of wax. Another plant belonging to the same genus is the sweetgale, which grows abundantly in bogs and marshes in Scotland — a small shrub, with leaves somewhat like the myrtle or willow, of a fragrant odor and bitter taste, and yielding an essential oil by distillation.

**Candle Fish,** a sea-fish of the salmon family frequenting the northwestern shores of America, of about the size of the smelt. It is converted by the Indians into a candle simply by passing the pith of a rush or a strip of the bark of the cypress tree through it as a wick, when its extreme ofliness keeps the wick blazing. It is called also Oubichon.

**Can'dlemas**, a church feast instituted in 492 in commemoration of the presentation of

Christ in the temple and of the purification of Mary. It falls on February 2, and on this day among Catholics lighted candles are carried about in procession, and all candles and tapers which are to be used in the churches during the entire year are consecrated.

**Candle Nut**, the nut of a tree of India, the Moluccas, Pacific Islands, etc. It is about the size of a walnut, and yields an oil used for food and for lamps, while the oily kernels are also strung together and lighted as torches.

**Candy** (or Kandy), a city, Ceylon, near the center of the island, 72 mi. n.e. Colombo. The residence of the governor at the n.e. extremity is among the finest structures in Ceylon. Other noteworthy places are the Buddhist temple, called "the palace of the tooth," the most sacred in the Buddhist world, the old royal cemetery, the military magazine in the center of a lake, the government brick works, etc. Pop. 22,000.

Candy Making. The largest ingredient of candy is sugar. A small amount of glucose is added to the sugar to give it the proper consistency. This composition is boiled in water until the syrup is thick and almost clear. This syrup is then poured out upon huge marble slabs, where it is allowed to cool for a time. It is then worked by means of long iron paddles much as a plasterer would stir mortar. Under this treatment it becomes hard, white, and almost crystalline This process is sometimes carried on in copper kettles, which not , only cook the ingredients, but beat them white and hard by means of a rotating dasher. The candy is now ready to be cast into various sizes and shapes. Candy is cast in corn starch molds. The starch is placed in narrow, shallow boxes, and smoothed off at the top. The boxes are run under a press, the lower part of which is covered by projections of just the size required. When the press goes down a little hammer taps the top of it automatically, and the corn starch is punctured with rows of smooth, clear-cut holes. When the molds are complete, they are filled from a tank with cream candy. Marshmallows are cast in the cream candy. Marshmattows are called in the molds is some way. When the candy in the molds is taken to a machine dry and hard the boxes are taken to a machine called the "starch-buck." Here the starch and candy are dumped into a hopper, under which are a series of sieves. The starch falls through the meshes, and the candy is carried on through a series of brushes to take off the remaining starch. Chocolate creams are dipped by means of a little wire spoon, after which they are placed on a piece of oilcloth and set in a frame to dry. For the manufacture of lozenges and candy hearts the sugar is mixed cold in large tubs, and the lozenges are pressed out in molds. Mottoes are printed on the hearts with a rubber stamp. For the cocoanut candy the nuts are bought whole, and the hard white meat is taken out and placed in a kettle, where it is boiled and violently stirred at the same time by means of rotating dashers. Sugar is added, and when the mass is sufficiently cooked it is placed on a marble slab, and rolled down even with a long piece

of gas pipe. Cocoanut is colored and molded into various forms, and sliced up in strips with a patent cutting machine. Caramels are made of sugar and pure cream carefully boiled together until they are of proper consistency, and then poured on marble slabs to cool. They are then cut and wrapped. Hard candy is made of sugar boiled over an open fire and then colored in various shades. The batches are mixed and rolled out by hand until they are the size of an ordinary stick of candy, after which they are cut up into the regular lengths. Rock candy and many of the sugared nuts are made by the crystallization process. A tin box in which numerous strings run from top to bottom, is filled with sugar and set away in a warm place. The crystals of sugar form on the strings and harden there, thus making the well-known rock candy. In the same way crystals are allowed to form on almonds, and other nuts and fruit.

**Cane**, a term sometimes indiscriminately applied to any small and smooth rod, of the thickness of a walking stick or less; but more correctly limited to the stems of the smaller palms and the larger grasses. We thus speak of sugar cane, bamboo cane, etc., among the latter; while among the former this name is particularly appropriated to the species of the genus Calamus, also called Rattan (the Malay name or a corruption of it). To this genus belong the canes largely imported from the tropical regions of the East for making bottoms of chairs, couches, etc. See Walking stick.

**Cane'a** (or Khania), a seaport of Crete or Candia, on the north coast, the principal mart for the commerce of the island in wax, soap, oil, silks, fruits, wool, and provisions. Pop. 8,000.

**Canel'la**, WHITE, a tree belonging to the West Indies, growing to the height of 10 to 50 ft., with a straight stem branched only at the top. It is covered with a whitish bark, which is freed from its outward covering, dried in the shade, and brought to Europe in long quills, somewhat thicker than those of cinnamon. It is moderately warm to the taste, and is esteemed as a pleasing and aromatic bitter.

**Cane phorus**, one of the bearers of the baskets containing the implements of sacrifice in the processions of the Dionysia, Panathenea, and other ancient Grecian festivals, an office of honor much coveted by the virgins of antiquity. The term is applied to architectural figures bearing baskets on their heads, sometimes improperly confounded with Caryatides.

**Cane Sugar**, the product of the sugar cane plant (which see). The process of making cane sugar in Louisiana, the old method, is to bring the cane in from the field as fast as it is cut, and keep in a sufficient supply to run the mill night and day. The cane is dumped from the wagons on to a traveling platform which carries it to the roller mill, where it is crushed. The roller mill is a ponderous piece of machinery and very massive, for the sugar cane has a tough. hard skin and must be subjected to great pressure to secure its juice. Either three, five or nine rollers are used. As soon as the sugar

cane is crushed by this mill, it becomes "bagasse." The bagasse is carried to the boiler room where it is used as fuel under the boilers. When the cane and bagasse are crushed, the juice runs down, a greenish, sticky liquid, through a strainer, to a well or vat, from which it is pumped to the clarifiers. Here milk of lime is stirred in and heat is applied. The lime neutralizes the acids in the juice, for the moment the cane is cut a chemical change begins in the juice, part of it fermenting and becoming acid.

The thick scum which rises when the lime is stirred into the juice is removed, and the clarified juice is drawn off in a kettle where the old method of making sugar is used. Sometimes the juice is bleached by fumes of burning sulphur before it is taken to the battery. The juice is boiled to a syrup, and then to sugar in large, open kettles. In the first kettle the juice is boiled to a certain density which is determined by a sacchrameter. This is a tube-like affair which is divided into degrees, so that the sugar maker, by simply placing it in the juice, can tell when it has reached the proper density. The impurities which rise to the top are constantly skimmed off. The juice becomes syrup in the second kettle, and as it grows thicker it is transferred from one kettle to another. In the last kettle the syrup is cooked until it can be drawn out in a candied string. When the grain is felt, and the sacchrameter shows that the proper density has been reached, the heavy syrup is placed in cooling vats made of wood. As the syrup cools, the sugar crystallizes, but it is mixed with molasses which will not crystallize so it is scooped out of the cooling vat into large hogsheads made of cypress wood, which have a large number of holes bored in the bottom. Bits of sugar plug these holes loosely, allowing the molasses to drip down into the molasses tank. The sugar then goes to the refinery where it is granulated. Such is the old method of making sugar.

In the new method the juice and syrup go from the mill to the clarifiers and on to the finished product untouched by hand. After the juice has been treated with lime and sul-phur, it is dumped into the first clarifier. which has a steam coil in the bottom. From one to the other of the four clarifiers the syrup goes, being constantly skimmed, and when the proper density has been secured, the syrup is dumped into the settling tank, whence it goes to the vacuum pan. This pan is a close, spherical vessel with copper steam coils in the bottom, and can be made air tight. An air pump or condenser removes the air, thus making a vacuum. In a vacuum, liquid boils at a much lower temperature than 212<sup>o</sup>, the boiling point in open air; and as there is no atmospheric weight on the liquid, the heat causes the liquid to boil furiously at about 115<sup>o</sup>. By using the vacuum pan no sugar is burned, and the syrup does not become brown. The boiling continues until crystallization is effected, and then the valve at the bottom is opened, and the whole charge is

dumped into the mixer, directly under the vacuum pan. The mixer is a trough-like arrangement, in which a long shaft with steel arms revolves, mixing the sugar so that the crystallization progresses uniformly. This sugar, with its molasses, is shoveled into the centrifugal machine. This is a kettle-shaped vessel, which revolves about 1,200 times a minute. Its sides are perforated so that the molasses in the sugar caught up by the centrifugal force flies through the perforations, leaving the sugar dry and snow white. The sugar is then dumped into the granulator and placed in barrels. See Sugar Cane. **Canes Venatici** (kā'nēz vē-nat'i-sī) ("the

**Canes Venatici** (kā'nēz vē-nat'i-sī) ("the hunting dogs"), a northern constellation, within the limits of which several remarkable nebulæ occur.

**Canic' ula**, the dog star or Sirius; hence Canicular days, the dog days.

**Ca**' **nis**, the genus of animals to which the dog, wolf, and fox belong.

**Canis Major** ("the greater dog"), a constellation of the southern hemisphere, remarkable as containing *Sirius*, the brightest star. CANIS MINOR ("the lesser dog") is a constellation in the northern hemisphere, immediately above Canis Major, the chief star in which is *Procyon*.

**Canker**, 1, in medicine, a collection of small sloughing ulcers in the mouth, especially of children; called also water canker. 2, In horticulture, a kind of gangrenous disease to which fruit trees especially are liable, beginning in the younger shoots and gradually extending to the trunk. 3, In farriery, a disease in horses' feet causing a discharge of fetid matter from the cleft in the middle of the frog, generally originating in a diseased thrush.

**Caunabina**'ceæ, the order of plants to which only two plants, hemp and the hop, belong, closely allied to the nettle order.

**Caninge**, a town of South Italy, province of Bari, near the mouth of the Ofanto, formerly the Aufidus. Here the Roman army sustained a terrible defeat by Hannibal. The Romans numbered 80,000 infantry and 6,000 cavalry, whereas Hannibal's army consisted of 10,000 cavalry, but only about 40,000 infantry. Of the Romans 70,000 fell, including the Consul Lucius Paulus, and 80 men of senatorial rank. Hannibal lost not quite 6,000.

**Cannes** (kan), a seaport of France, on the shore of the Mediterranean, dep. Alpes-Maritimes; famous as a winter residence, and as the place where Napoleon landed when he returned from Elba, March 1, 1815. Pop. 19.385.

**Canning,** the name of three noted English statesmen. 1, CHARLES JOHN, Earl Canning (1812-1862), noted for his moderation in dealing with the Indian mutiny. 2, His father, GEORGE CANNING (1770-1827), a noted author and statesman. 3, STRATFORD CANNING, Viscount Stratford de Redcliffe (1788-1880), a noted English diplomatist.

**Canning Fruits and Vegetables.**— The process of canning fruits and vegetables is one of great interest and of increasing importance. The tomatoes, fruit, or corn are brought to the

29

### **Canning Fruits and Vegetables**

factory and dumped into bins at the end of a long, steamy room, where they are left until the workmen are ready to feed them into the mouth of the machine, from the farther end of which they are to roll all canned and labeled. The skins are loosened by an ingenious machine resembling a large steam boiler. In-side a great augur is kept boring away by means of a wheel connected by belting with the power shaft. The tomatoes, for instance, are dumped into a funnel-shaped hole at the lower end of the boiler and fall into a bath of hot water which stands at the bottom. The augur catches them and lifts them gradually cut. At the open end of the boiler there is a spout down which they slip into pails that are brought under it by means of a revolving table. These steaming pails are carried to the peelers, who by one or two quick movements remove the skin. The tomatoes are then dumped into the bin ready for the fillers, and filler is a great box which tapers off to a funnel at the bottom. There is a long chute on one The side. Into this empty tin cans are fed. tomatoes having been dumped into the box, they are crushed downward by means of a plunger into the mouth of the can which has slipped into the slot below. As soon as a can is filled the stream of tomatoes is cut off automatically, the full can moves on and an empty one takes its place. A large number of cans can be filled at the same time by this process. The full cans are then carried to the soldering machine, six at a time. This soldering is all done by automatic machinery. The sealing and cooking machine is more than fifty feet long, and two sections of it are enclosed in covered iron chambers. After the filled cans leave the soldering machine they are carried to the cooking machine. They descend into the first iron chamber and travel along through a bath of water raised to a temperature of  $212^{\circ}$ . A small vent hole is left in the cover of the cans for the escape of any surplus liquid. Eight minutes are required for the cans to pass through the first chamber. They are then carried to the soldering place, where the vent holes are closed. The cans then go into a shallow bath of water and close watch is kept for any bubbles, for such would indicate that some of the cansleak. The cans are next carried into the second chamber of hot water, where they are to remain thirty minutes until their contents are completely cooked. At the farther end they come out and after being dried, they are ready for the labeling machine.

The device for labeling is an automatic machine. The can is started at the top, and in rolling downward comes in contact with a paste-brush, and then strikes the pile of paper labels, and in passing downward it moves two swinging levers which turn the paste-daubers by means of a crank-wheel. The process of preparing peaches, pears, and corn, differ in some respects, but they are all substantially the same. The whole process is done by ten to fifteen men, and as many as 30,000 cans can be turned out in a single day. **Cannon**, JOSEPH G., b. 1836, American statesman; removed to Illinois and practised law; was states attorney 1861-68. In 1874 he was elected to Congress as a republican from the fifteenth district of Illinois and has held office by constant re-election ever since. He was chairman of the ways and means committee in 1894-96.

Cannon, a big gun or piece of ordnance. The precise period at which engines for projecting missiles by mechanical force (catapults, etc.) were supplanted by those utilizing explosive materials is a matter of controversy, the invention of cannon being even attributed to the Chinese, from whom the Saracens may have acquired the knowledge. A doubtful authority asserts their use at the siege of Belgrade in 1073; but they were certainly brought into use in France as early as 1338. At first they were made of wood, well secured by iron hoops, the earliest shape being somewhat conical, with wide muzzles, and afterward cylindrical. They were then made of iron bars firmly bound together with iron hoops like casks. Mons Meg at Edinburgh being a good example. Bronze was used in the second half of the fourteenth century, toward the close of which and during the fifteenth century castiron ordnance came into use. A form of breechloading cannon was introduced in the s'xteenth century. Cannon were formerly dignified with great names. Twelve cast by Louis XII were called after the twelve peers of France, and Charles V had twelve called after the twelve apostles. Later such names as the following came into general use; cannon royal, or carthoun, carrying 48 pounds; culverin, 18; demiculverin, 9: falcon, 6: basilisk, 48; siren, 60; Cannon were then named from the etc. weight of the balls which they carried: 6-pounders, 12-pounders, etc.; but are now usually, especially the large ones, designated by their weight, as a 25-ton gun, an 80-ton gun, Their caliber or diameter of bore is also etc. used in designating them.

Great improvements and changes in the manufacture of cannon have been introduced in recent times. Not so long ago they were all made of iron, brass, or gun-metal (a variety of bronze) by casting. The introduction of rifled small arms led the way to that of rifled cannon, and the adoption of heavy armor for ships of war rendered guns of enormous power and magnitude necessary in order to penetrate their sides. The increased inertia of the projectiles and their rapid rotation in these rifled guns tried the piece so severely that cast-iron and even bronze have been largely used.

The process of making modern cannon begins in the office of the factory draughtsman, and the drawings and figures of every dimension are made with the greatest accuracy. Specifications when completed go to the shop where the forgings of steel are all in waiting. The gun is made up of a central tube, covered by a jacket, and rings on the outside. The process of putting these pieces together is known as assembling, and the work is done in a shrinking pit. The gun goes through a

long course of lathes and boring machines: some of these lathes are 130 ft. long and have a swing of 8 ft., and are capable of boring a gun 50 ft. long and weighing more than 120 tons. The gun may be turned on the outside and bored on the inside at the same time. When a gun leaves the lathe it is carried along to a revolving machine by a traveling crane over-head. The revolving machine plows the interior surface of the gun with a spiral groove which gives the shell a rotary motion when fired. These cuttings are made to the thou-sandth part of an inch. The climax of the operation is the assembling of the gun. The principle of the whole process lies in keeping the tube of the cannon cool and expanding the jacket by means of hot air so it will slip easily over the tube. When the jacket cools it contracts and grasps the tube almost as closely as if they were one piece of metal. The heating is done entirely by hot air. In the pit there is one furnace filled with coils of pipe through which air is forced by a compressing pump. Underneath air is heated by a gas fire. In this condition it is forced into the cylindrical department in which stands the gun-jacket, after which it is passed off by a chimney. After the heating process has gone on for a day or two, the lid of the jacket apartment is lifted and the top of the cylinder of iron is measured to see if the expansion has made it large enough to fit over the tube. It is necessary that the inside diameter of the jacket be about one tenth of an inch greater than the exterior of the tube. The tube of the cannon is placed upright in the pit, with the upper 15 ft. smooth and shiny for the reception of the jacket. Inside of it cold water is kept flowing so that the steel will be as much contracted as possible. When all is much contracted as possible. When all is ready, the lid of the jacket apartment is thrown open and the traveling crane carries the jacket directly over the tube where it is accurately plumbed so that it will slip down over the tube without touching it. This op-eration must be performed very quickly so that the jacket will not contract too much. After the jacket has been put on, the gun remains in the pit for about two days to cool, when it is taken to the lathe again to be prepared for the hoops or cylindrical pieces of steel. Nine of these are shrunk on while the gun is in a horizontal position. The making of the gun carriage is another part of the work but does not require so much skill.

Ca'no, Alonso (1601-1664), a painter, sculptor, and architect, who has been called the Michael Angelo of Spain. He first made himself known by his statues for the great church of Lebrija, and was in 1638 appointed painter to the king. His wife having been murdered by a servant or pupil, he was suspected and put to torture; but his right arm was spared from respect for his talents. He afterward became a priest and was made a racionero (resident) of Granada, where he passed the remainder of his life.

**Cance** (ka-nö') (through the Spanish canca, from the native West Indian name), a light

## Canova

boat narrow in the beam, and adapted to be propelled by

paddles, often in conjunction with sails. The name was originally given 'to the boats of uncivilized races, but its application has been considerably extended, and canoes of home make may be seen on the waters of the most civilized coun-

Trapper's Canoe.

They are of the most diverse materials tries. and construction. Often they are hollowed out of a single log. The Indian cances of Can-ada are of bark on a wooden frame. The Eskimo kaiaks consist of a light wooden frame, covered with seal skins sewed together with sinews, and having only one opening to admit the boatman to his seat. In the islands of the Pacific the natives have double canoes, united by a strong platform, serving in this way as one vessel.

**Cañon** (kan-yon'), the Spanish word for tube, funnel, cannon; applied by the Spanish Americans, and hence in North America generally (often with the spelling canyon), to long and narrow river gorges or deep ravines with precipitous and almost perpendicular sides occur-ring frequently in the Rocky Mountains, the Sierra Nevada, and great western plateaus of North America.

Canonization, a ceremony in the Catholic Church, by which deceased persons are declared saints. The pope institutes a formal investigation of the miraculous and other qualifications of the deceased person recom-mended for canonization; and an advocate of the devil, as he is called, is appointed to assail the memory of the candidate. If the examination is satisfactory, the pope pronounces the beatification of the candidate, the actual years afterward, when a day is dedicated to his honor, his name inserted in the canon or Litany of the Saints in the Mass, and his remains preserved as holy relics.

Canon Law, a collection of ecclesiastical constitutions for the regulation of the Church of Rome, consisting for the most part of ordinances of general and provincial councils, decrees promulgated by the popes with the sanction of the cardinals, and decretal epistles and bulls of the popes. There is also a canon law for the regulation of the Church of England, which under certain restrictions is used in ecclesiastical courts and in the courts of the two universities.

Cano'pus, an ancient Egyptian city, between Alexandria and the western mouth of the Nile, once the chief harbor of the Delta. It had a popular temple of Serapis. Cano'va, ANTONIO (1757-1822), an Italian

sculptor. He went to the Academy of Venice, where he had a brilliant career. In 1779 he was sent by the senate of Venice to Rome and there produced his Theseus and the Slain Minotaur. In 1783 Canova undertook the execution of the tomb of Pope Clement XIV in the Church of the Apostles, a work in the Bernini manner, and inferior to his second public monument, the tomb of Pope Clement XIII (1792) in St. Peter's. He produced his group of Venus and Adonis, the Psyche and Butterfty, a Repentant Magdalene, the well-known Hebe, the colossal Hercules Hurling Lichas into the Sea, the Pugilists, and the group of Cupid and Psyche. In 1796 and 1797 Canova finished the model of the celebrated tomb of the Archduchess Christina of Austria, and in 1797 made the colossal model of a statue of the king of Naples executed in marble in 1803. He afterward executed in Rome his Perseus with the Head of Medusa, which, when the Belcedere Apollo was carried to France, was thought not unworthy of its place and pedestal. In 1802 he was invited by Bonaparte to Paris to make the model of his colossal statue. Among the later works of the artist are a colossal Washington, the tombs of the Cardinal of York and of Pius VII; a Venus Rising from the Bath; the colossal group of Theseus Killing the Minolaur; the tomb of Alfieri; the Graces Rising from the Bath; a Dancing Girl; a colossal Hector; a Paris, etc. After the second fall of Napoleon, in 1815, Canova was commissioned by the pope to demand the restoration of the works of art carried from Rome.

**Canovas del Castilio**, ANTONIO (1828-07), Spanish statesman. He became a journalist, in 1854 was elected to the Cortes and is still a member of that body. He held cabinet positions during Isabella's reign. He was instrumental in placing Alfonso XII on the throne in 1864. He was prime minister of Spain 1874-75, and from 1870 until August. 1897, when he was assassinated at Santa Agueda.

**Conrobert,** FRANCOIS-CERTAIN (1809-1895), marshal of France. He served many years in Africa, and was wounded in the siege of Constantine. He commanded a division in the Crimean War, after which he was promoted to commander in chief. He commanded a corps at Magenta and Solferino, and was made marshal of France and grand cross of the Legion of Honor. In the Franco-Prussian War his corps was cut to pieces by the crown prince of Prussia at Woerth, 1870. He was shut up in Metz with Bazaine, and after the surrender, was sent a prisoner to Germany. In 1876, and again in 1879, he was elected to the senate.

**Can'so**, GUT OR STRAIT OF, a narrow strait or channel, about 17 mi. long. separating Nova Scotia from Cape Breton Island. One of the Atlantic cables lands here.

**Cantab'rian Mountains,** the general name of the various mountain ranges extending from the Western Pyrenees along the n. coast of Spain to Cape Finisterre.

Cantal', a central department in France, area 2,217 sq. mi.; capital, Aurillac. This department, formerly part of Upper Auvergne, is named from its highest mountain, the Plomb du Cantal, 6,094 ft. in height. The principal crops are rye, buckwheat, potatoes, and chestnuts, hemp and flax. Cattle, sheep, pigs, horses and mules are reared in large numbers. Large quantities of cheese ("Auvergne cheese") are made. Hot mineral springs are abundant. Pop. 239,601.

**Cantalever**, a wooden or iron block framed into the wall of a house and projecting from it to carry moldings, eaves, balconies, etc. Also a large projecting framework forming part of an iron bridge directly carrying part of the roadway, and also supporting beams or girders bridging over a space between it and another similar structure.

**Can'taloupe** (-löp), a small round variety of muskmelon, globular, ribbed, of pale green or yellow color, and of delicate flavor; first grown in Europe at the castle of Cantaloupe.

in Europe at the castle of Cantaloupe. Can'terbury, a city of England in Kent, 55 mi. s.e. of London, giving name to an archiepiscopal see, the occupant of which is primate of all England. The Roman name was Durovernum, and the place was of early impor-tance. Its present name is a modification of the Saxon Cant-wara-byrig, the Kentishmen's city. The foundation of the archiepiscopal see took place soon after the arrival of St. Augustine in 596. In the eighth, ninth, tenth, and eleventh centuries the city was dreadfully ravaged by the Danes, but at the Conquest its buildings exceeded in extent those of London. The ecclesiastical importance of the place was consummated by the murder of Thomas & Becket in the cathedral, the priory and see benefiting by the offerings of devotees and pilgrims at his shrine. Henry VIII dis-solved the priory in 1539, and ordered the bones of Becket to be burned; and the troops of Oliver Cromwell made a stable of the cathedral. The cathedral, one of the finest ecclesiastical structures in England, 530 ft. in length and 154 in breadth, has been built in different ages, the oldest part dating from about 1174. The great tower, 235 ft. in height, is a splendid specimen of the Pointed style. The old archiepiscopal palace is now represented by a mere fragment, and the archbishops have long resided at Lambeth. There are extensive barracks for cavalry and infantry. Pop. 23.062.

**Canterbury**, a district occupying most of the center of South Island, New Zealand, with a coast line of 200 mi., and a greatest breadth of about 150 mi. The famous "Canterbury Plains." extending along the coast, are admirably adapted for agriculture, while the interior is fine pastoral country. though, except near the highlands, very destitute of trees. Its considerable mineral resources are as yet not well developed, though some coal—of which there are large beds—is raised. The chief places in the province are Christchurch, the capital; and Lyttelton, the port town, 8 mi. from Christchurch. Pop. 121,400.

**Canton**, Fulton co., 111., 30 mi. w. of Peoria. Railroads: C. B. & Q., and T. P. & W. Industries: two iron foundries, flour mill, eighteen

cigar factories, gun and bicycle factory, and a cigar box factory. The surrounding country is agricultural and mineral (coal). The town was first settled in 1822 and was blown away in June, 1835, became a city in 1854. Pop. est. 1897, 7,500.

Canton (Chinese, Quang-chow-foo), an important city of Southern China, in the province of Quang-tung (of which name Canton is a cor-ruption). The city proper is enclosed by walls and divided into two parts by a wall running east and west: the larger portion north of this wall being called the old, that on the south of it the new city. The foreign mercantile houses, and the British, French, and American consulates, have as their special quarter an area in the suburbs of the south west of the city, with water on two sides of it. In the European quarter are churches, schools, and other buildings in the European style. The river opposite the city for the space of four or five miles is crowded with boats, a large number of which -as many it is said as 40,000-are fixed residences, containing a population of 200,000. The industries of Canton are varied and important, embracing silk, cotton, porcelain, glass, paper, sugar, lacquered ware, ivory carving, metal goods, etc. It was the chief foreign emporium in China until 1850, when Shanghai began to surpass and other ports to compete with it; but its exports and imports together often still amount to about \$40,000,000. Since the establishment of the colony of Hong-Kong a flotilla of river steamers ply daily between Canton, Hong-Kong, and Macao. In 1856 the foreign factories were pillaged and destroyed by the Chinese, and about a year after this Canton was taken by an English force, and occupied by an English and French garrison until 1861. Pop. est. at over 1,600,000.

**Canton**, Stark co., O., 56 mi. s.e. of Cleveland. Railroads: Cleveland & Canton; Canton & Waynes; Valley; P., F. W. & C. Industries: Harvesting and threshing machines, flour mills, machinery, iron bridges, steel cutlery, safes, woolens, and soap. Surrounding country agricultural and mineral. It is the home of President McKinley. Pop. est. 1897, 30,000.

**Cantyre** (kan-tīr') (or Kintyre), a peninsula, Scotland, between the Firth of Clyde and the Atlantic, forming the southern division of Argyleshire.

Canute (or Cnut) (ka-nūt', knut) king of England and Denmark, succeeded his father Swegen or Sweyn on his death in England in 1014 A. D., and confirmed the Danish power in England. He began by devastating the eastern coast, and extended his ravages in the south. where, however, he failed to establish himself until after the assassination of Edmund Ironside, when he was accepted king of the whole of England (1017). Canute, who began his reign with barbarity and crime, afterward became a humane and wise monarch. He restored the English customs at a general assembly, and ensured to the Danes and English equal rights and equal protection of person and property, and even preferred English subjects to the most important posts. His power was confirmed by his marriage with Emma, Ethelred's widow. At Harold's death in 1018 he gained Denmark: in 1028 he conquered Norway; and in 1031 he made Malcolm of Scotland admit his superiority. Sweden also was vassal to him. He d. in 1036 at Shaftesbury, leaving Norway to his eldest son, Sweyn; to the second, Harold, England: to the third, Hardicanute, Denmark.

**Can'vas**, a coarse and strong cloth. made of flax or hemp, and used for sails, tents, etc. When prepared for portrait painting it is classed as *kit-cat*, 28 by 36 inches; *three quarters*, 25 by 30; *half-length*, 40 by 50; *bishop's half-length*, 44 or 45 by 56; *bishop's whole length*, 58 by 94.

• **Canvas-back Duck**, a bird peculiar to North America, and considered the finest of the waterfowl for the table. They arrive in the U. S. from the north about the middle of October, sometimes assembling in immense numbers. The plumage is black, white, chestnut-brown, and slate color; length, about 20 inches.

Caoutchouc (kö'chök or kou'chök), an elastic gummy substance, chemically a hydrocarbon, contained in the milky juice of a number of tropical trees of various orders, growing in South America. The name is also used as an equivalent of india rubber, but strictly caoutchouc is only the chief ingredient of india rubber. The crude india rubber is most commonly obtained by making incisions in the trunks of the trees, whence the sap exudes in the form of a milky fluid, which gradually thickens and solidifies. Caoutchouc is a non-conductor of electricity and a bad conductor of heat. It is not dissolved by water, hot or cold, but chloroform, oil of turpentine, bisulphide of carbon. etc., dissolve it. It was not until about the year 1736 that india rubber was known in Europe. It was at first only used to rub out pencil marks, but before the end of last century it was used to render leather and other substances water-tight, and in 1823 Mackintosh took out a patent for the waterproof materials prepared with caoutchouc which bear his name. To the American inventor, Goodyear, belongs the credit of discovering vulcanization and of making commercial use of india rubber. Latterly its uses have become innumerable. Guttapercha is a similar substance to caoutchouc. and is often popularly confounded with it. See India Rubber

**Cap**, a covering for the head, usually of softer materials and less definite form than a hat. Cap of maintenance, a cap formerly worn by dukes and commanders in token of excellency, now an ornament of state carried before the sovereigns of England at their coronation, and also before the mayors of some cities.

**Cape Breton**, an island of the Dominion of Canada, separated from Nova Scotia, to which province it belongs, by the narrow Gut or Strait of Canso; area 3,120 sq. mi. The surface is rather rugged and only small portions are suited for agriculture, but it possesses much timber, valuable minerals (several coa mines being worked), and the coast abounds in fish. Timber, fish, and coal are exported. The island belonged to France from 1632 to 1763, and Louisburg, its capital, was long an important military post. It was separate from Nova Scotia between 1784 and 1820. Chief town, Sydney. Pop. of Cape Breton, 34,244.

**Cape Coast Castle**, a town and fort in West Africa, capital of the British possessions on the Gold Coast. The fortress stands on a rock close to the sea; the town chiefly consists of mud huts, and is a mart for native barter. Climate unhealthy; principal exports, gold dust, ivory, and palm oil. Pop. 11,614. **Cape Cod**, a noted peninsula on the south side

**Cape Cod**, a noted peninsula on the south side of Massachusetts Bay in the state of Massachusetts, 65 mi. long and from 1 to 20 broad. It is mostly sandy and barren, but populous.

Cape Colony, a British colony occupying the southern extremity of Africa. Area 221,311 sq. mi.; pop. 1,527,224. Several ranges of mountains, running nearly parallel to the southern coast, divide the country into successive terraces, rising as they recede inland, between which lie belts of fertile land, or vast barren-looking plains, one of them, the Great Karroo, being 300 mi. long and 100 broad. These plains make valuable sheep-walks, and the soil, where there is a sufficiency of water, is generally fertile. Irrigation, however, is greatly required, and large reservoirs are now being constructed. The principal and furthest inland mountain terrace, averaging 6,000 or 7,000 ft. in height, commences in Namaqualand and runs to the northeast frontier. The culminating point is the Compass Berg, over 8,000 ft. The Table Mountain at Cape Town rises almost perpendicularly about 3,585 ft. in The colony is deficient in navigable height. rivers, and many of the streams are dry or al-most so in the warm weather. The climate is very healthy and generally pleasant. Except along the coast, especially the southeast coast district, where there are extensive forests, timber is scarce, but with irrigation trees can be grown anywhere. The quadrupeds of the colony comprise the African elephant, still found in the forests of the southeast coast region; buffalo, wild boar, zebra, quagga, leopard, hyena, numerous antelopes, baboon, armadillo, etc. The birds include vultures, eagles, the serpent-cater, pelicans, flamingoes, and, most important of all, the ostrich, now bred in farms for the sake of its feathers. The The princobra and other reptiles are found. cipal minerals are copper ore, coal, iron ore, manganese, and diamonds. amethysts, agates, etc. Coal and copper are worked, and the diamonds have brought a great amount of money into the colony since 1869, and have given rise to the town of Kimberley, the center of the diamond fields. Wheat, maize, and other cereals can be grown almost everywhere, if there is sufficient moisture, in some years All kinds yielding a surplus for exportation. of European vegetables, pot-herbs, and fruits thrive excellently, and fruits dried and pre-served are exported. The vine is cultivated, and excellent wines are made. Sheep-rearing,

especially that of pure merinoes, is the most important industry, and wool the chief export. Ostrich feathers, hides, and skins are also exported. Both native and Angora goats are bred, and the export of mohair is important. Cattle breeding is also carried on to some extent. There are as yet no manufactures of importance. The colony is intersected by 1,600 mi. of railway, far-inland Kimberley being now thus connected with Cape Town and Port Elizabeth. The European inhabitants consist in part of English and Scottish settlers and their descendants, but, not with-standing the recent influx of settlers from Britain, the majority are still probably of Dutch origin. The colored people are chiefly Hottentots, Kaffirs, Basutos, Griquas. Malays, and a mixed race. The laborers are chiefly Hottentots and Kaffirs. Responsible government has been possessed by the colony since 1872. The executive is vested in the governor (who is appointed by the crown and is also commander in chief) and an executive council of office-holders appointed by the crown. The legislative is in the hands of a council of twenty-two members (the Upper House); and a representative house of assembly of seventysix members (Lower House), elected for five After Cape Town the chief towns are vears. Port Elizabeth, Graham's Town, Kimberley, Stellenbosch, King William's Town, and Graaff Reinet. The Dutch first colonized the Cape in 1652, and till the end of the eighteenth century the colony was under the Dutch East India Company. It was held by the British from 1795-1801, and it came finally into British possession in 1806. The progress of the colony was long retarded by a series of Kaffir wars, the last of which was in 1851-53.

**Cape Elizabeth**, Cumberland co., Me., 14 mi. s. of Portland. Railroad, Boston & Maine. Principal industries include lead works, oil refineries, and rolling mills. Pop. est. 1897, 6,000.

**Cape Hat' teras, a** dangerous cape on the coast of North Carolina, the projecting point of a long reef of sand.

**Cape Hay'tien**, a town on the north coast of Hayti. It has an excellent harbor, but has declined in importance since the last century. Pop. about 16,000.

**Cape Horn** (or The Horn), the southern extremity of an island of the same name, forming the most southerly point of South America. It is a dark, precipitous headland, 500 to 600 ft. high, running far into the sea. Navigation round it is dangerous on account of frequent tempests. The cape was first doubled in 1616 by Schouten, a native of Hoorn, in Holland, whence its name.

**Cap'elin**, a small fish of the salmon family abundant on the banks of Newfoundland and used as bait for cod and also as food.

**Cape of Good Hope**, a promontory near the southern extremity of Africa, at the termination of a small peninsula extending south from Table Mountain which overlooks Cape Town. This peninsula forms the west side of False Bay, and on its inner coast is Simon's Bay and Simon's town, where there is a safe anchorage

and a British naval station. Bartholomew Diaz, who discovered the cape in 1487, called it Cape of Storms; but John II of Portugal changed this to its present designation. It was first doubled by Vasco da Gama in 1497.

**Caper**, the unopened flower bud of a low trailing shrub which grows from the crevices of rocks and walls, and among rubbish, in the countries bordering on the Mediterranean. Picked and pickled in vinegar and salt they are much used as a condiment (caper sauce being especially the accompaniment of broiled mutton). The plant was introduced into Britain as early as 1506, but has never been grown on a large scale. The flower buds of the marsh-marigold and nasturtium are frequently pickled and eaten as a substitute for capers.

<sup>•</sup> Capercail'zie (Capercail'lie, or Cock of the Wood), the wood grouse, the largest of the gallinaceous birds of Europe, weighing from 9 to 12 lbs. In the male the neck and head are ashy black, the wings and shoulders brown with

#### Capercailzie.

small black dots, the breast variable green, the belly black with white spots, the rump and flanks black with zigzag lines of an ashy color, and the tail feathers black, with small white spots near their extremities. The female, about one third less than the male, is striped and spotted with red or bay, black, and white, and has the feathers of the head, breast, and tail of a more or less ruddy hue. It is common in Northern Asia, in parts of Russia, and throughout Scandinavia. For some time it was almost or wholly extinct in Great Britain, but has been successfully reintroduced.

**Capernaum**, a town in ancient Palestine, on the west side of the Sea of Tiberias. Nothing of it now remains, but the site is identified with Tel Hum.

**Cape St. Vincent**, the southwest point of Portugal; noted for the naval victory gained off it by Sir John Jervis (afterward earl of St. Vincent) on Feb. 14, 1797.

Ca'pet, the name of the French race of kings which has given 118 sovereigns to Europe, viz., 36 kings of France, 22 kings of Portugal, 11 of Naples and Sicily, 5 of Spain, 3 of Hungary, 3 emperors of Constantinople, 3 kings of Navarre, 17 dukes of Burgundy, 12 dukes of Brittany, 2 dukes of Lorraine, and 4 dukes of Parma. The first of the Capets known in history was Robert the Strong, a Saxon, made count of Anjou by Charles the Bold, and afterward duke of the IIe de France. His descendant, Hugh, son of Hugh the Great, was in 987 clected king of France in place of the Carlovingians. On the failure of the direct line at the death of Charles IV the French throne was kept in the family by the accession of the indirect line of Valois, and in 1589 by that of Bourbon. Capet being thus regarded as the family name of the kings of France, Louis XVI was arraigned before the National Convention under the name of Louis Capet.

**Cape Town**, capital of the Cape Colony, South Africa, at the head of Table Bay, and at the base of Table Mountain, 30 mi. from the Cape of Good Hope. The port has a breakwater 2,000 ft. long, 2 docks 16 acres in area, and a large graving dock. Besides the railway going inland, a railway connects the town with Simon's Town on False Bay. Pop. 51,251; including suburbs, 83,718.

**Cape Verd**, the extreme west point of Africa, between the Senegal and the Gambia, discovered by Fernandez, 1445.

**Cape Verd Islands**, a group of ten or fifteen volcanic islands and rocks in the Atlantic, 320 mi. w. of Cape Verd (see above), belonging to Portugal. They produce rice, maize, coffee, tobacco, the sugar cane, physic nuts, and various fruits. Coffee, hides, archil, physic nuts, etc., are exported. Most of the inhabitants are negroes or of mixed race. The chief town is Praia, a seaport on São Thiago (Santiago), the largest island. Porto Grande, on São Vicente, is a coaling station for steamers. Pop. about 110,000.

**Cape Wrath**, the northwest extremity of Scotland, county Sutherland. It is a pyramid of gneiss bearing a lighthouse, the light of which is 400 ft. above sea level.

Capillaries.

a.- the artery; b.- the diameter of the bore, vein; c.-the interven- and that the surface of

**Cap'illaries**, in anatomy, the fine blood-vessels which form the links of connection between the extremities of the arteries and the beginnings of the veins.

Capillar' ity, the general name for certain phenomena exhibited by fluid surfaces when the vessels containing. the liquid are very narrow, and also exhibited by that portion of the fluid surface which is in close proximity to the sides of a larger vessel, or to any inserted object. Thus if an open tube of small bore be inserted in water, it will be noted that the liquid rises within it above its former level to a height varying inversely as the

## Capital

this column is more or less concave in form. The same phenomenon occurs in any fluid which will wet the tube; but in the case of a fluid like mercury, which does not wet the glass, the converse phenomenon appears, the liquid being depressed in the tube below its former level, and the portion within the tube exhibiting a convex surface. Similarly round the sides of the respective vessels, and round the outsides of the inserted tubes, we find in the first case an ascension, and in the second a depression of the liquid, with a corresponding concavity or convexity at its extreme edge. Two parallel plates immersed in the liquids give kindred results. As these phenomena occur equally in air and in vacuo they cannot be attributed to the action of the atmosphere, but depend upon molecular actions taking place between the particles of the liquid itself, and between the liquid and the solid, these actions being confined to a very thin layer forming the superficial boundary of the fluid. Every liquid, in fact, behaves as if a thin film in a state of tension formed its external layer: and although the theory that such tension really exists in the superficial layer must be regarded as a scientific fiction, yet it adequately represents the effects of the real cause, whatever that may be. Scientific calculations with respect to capillary depressions and elevations proceed, therefore, on the working theory that the superficial film at the free surface is to be regarded as pressing the liquid inward, or pulling it outward according as the surface is convex or concave-the convex or concave film being known as the meniscus (crescent). The part which capillarity plays among natural phenomena is a very varied one. By it the fluids circulate in the porous tissues of animal bodies: the sap rises in plants, and moisture is absorbed from air and soil by the foliage and roots. For the same reason a sponge or lump of sugar, or a piece of blotting paper soaks in moisture, the oil rises in the wick of a lamp, etc.

**Cap'ital**, in trade, the term applied, as the equivalent of "stock," to the money, or property convertible into money, used by a producer or trader for carrying on his business; in political economy, that portion of the produce of former labor which is reserved from consumption for employment in the further production of wealth - the apparatus of production. It is commonly divided under two main headscirculating capital and fixed capital. Circu lating capital comprises those forms of capital which require renewal after every use in production, being consumed (absorbed or transformed) in the single use, e. g., raw materials and wages Fixed capital, on the other hand, comprises every form of capital which is capable of use in a series of similar productive acts, e.g., machinery, tools, etc. From the ordinary economic point of view capital is conveniently limited to material objects directly employed in the reproduction of material wealth, but from the higher social point of view many things less immediately concerned in productive work may be regarded as capital. Thus Adam Smith includes in the fixed capital of a

## **Capital** Punishment

country, "the acquired and useful abilities of all the inhabitants;" and the wealth sunk in prisons, educational institutions, etc., plays ultimately a scarcely less important part in production than that invested in directly productive machinery.

**Capital**, an architectural term, usually restricted to the upper portion of a column, the part resting immediately on the shaft. In classic architecture each order has its distinctive capital, but in Egyptian, Indian, Saracenic, Norman, and Gothic they are much diversified.

Capital Punishment, in criminal law, the punishment by death. Formerly in Great Britain, as in many other countries, it was the ordinary form of punishment for felonies of all kinds; but a more accurate knowledge of the nature and remedies of crime, a more discriminating sense of degrees in criminality, and an increased regard for human life have latterly tended to restrict, if not to abolish, the em-ployment of the penalty of death. The improvement in the penal laws of Europe in this respect may be traced in large part to the publication of Beccaria's treatise on Crimes and Punishments in 1764. At that time in England, as Blackstone a year later pointed out with some amount of feeling, there were 160 capital offenses in the statute book. The work of practical reform was initiated in 1770 by Sir William Meredith, who moved for a committee of inquiry into the state of the criminal laws; but the modifications secured by it were few, owing to the opposition of the House of Lords, which continued down to 1832 to oppose systematically all attempts at criminal law reform. The publication of Madan's Thoughts on Executive Justice, in 1774, urging the stricter administration of the law as it then stood, brought out the opposition of Sir Samuel Romilly, who replied to it in 1785, and introduced at short intervals a series of bills for the abolition of the extreme sentence for minor offenses. The influence of Paley and Lord Ellenborough, and the reaction from the revolutionary principles, which prior to the reign of terror had inaugurated great penal changes in France, told strongly against his efforts; and even his Shoplifting act, to abolish the sentence of death in cases of theft to the value of five shillings, was resolutely rejected, though passed by the Commons in 1810, 1811, 1813, and 1816. Romilly's work was taken up by Sir James Mackintosh in 1820, and under Peel's ministry with greater success. At his death, however, in the year of the passage of the Reform bill (1832) forty kinds of forgery with many less serious offenses were still capital, though from that time the amelioration was rapid. In the five years following the Reform act, the capital offenses were reduced to 37, and subsequent changes left in 1861 only four capital charges -setting fire to H. M. dockyards or arsenals, piracy with violence, treason, and murder. At the present time the last of these may be regarded as the only capital crime; and the statement holds good for Scotland also, though robbery, rape, incest, and wilful fire raising are

## Capitanis

still capital crimes in Scottish common law. In several other European countries-Sweden, Denmark, North Germany, Bavaria, Austriathere is even a greater unwillingness to enforce capital punishment than is found in Great Britain, though the penalty remains upon the statute books. In Belgium there has been no execution since 1863. In Switzerland capital punishment was abolished in 1874, and though the right of restoring it was allowed to each canton in consequence of an increase of murders, only 7 out of a total of 22 have availed themselves of it. In Roumania it was abol-ished in 1864; in Holland in 1870; and it has also been discontinued in Portugal. In several of the states-Michigan, Wisconsin, Rhode Island, and Maine-imprisonment for life has been substituted for murder in the first degree: in the remainder capital punishment is retained, though the experiment of its abolition was made for a short time in New York and lowa.

The manner of inflicting the punishment of death has varied greatly. Barbarous nations are generally inclined to severe and vindictive punishments: and even in civilized countries, in cases of a political nature, or of very great atrocity, the punishment has been sometimes inflicted with many horrible accompaniments, such as tearing the criminal to pieces, starving him to death, breaking his limbs upon the wheel, pressing him to death in a slow and lingering manner, burning him at the stake, crucifixion, etc. In modern times among civilized nations, public opinion is strongly disposed to discountenance the punishment of death by any but simple means: and even in governments where torture is still counte-nanced by the laws it is rarely or never resorted to. In Great Britain and in most parts of the U. S. the method of execution is by hanging, except in the states of New York and Colorado, where electricity is employed. In Germany and France the sword and the guillotine are the usual means; in Spain, strangulation by means of the *garrole*, a sort of iron collar tightened by a screw. Since 1868 the law of England has required all executions to take place privately within the prison walls, and this system was adopted in 1877 by Ger-Capital punishment cannot be inmany. flicted, by the general humanity of the laws of modern nations, upon persons who are insane or who are pregnant, until the latter are delivered and the former become sane. In military law, sentence of death may be passed for various offenses, such as sedition, violence, and gross neglect of duty, desertion, assault upon superior officers, disobedience to lawful commands, etc.

**Capita** 'nis, the hereditary chieftains of certain bands of Christian warriors who, about the beginning of the sixteenth century, retired to the mountain fastnesses of Northern Greece, where they maintained a kind of independence of the Turkish government, and supported themselves by predatory incursions on the neighboring provinces. The Turks tried to organize them as a paid police, but with imperfect success: and in the struggle for Greek independence they not only formed an insurgent body of about 12,000 men, but furnished most of the Greek generals of that period—Odysseus, Karatasso, Marko Bozzaris, etc.

Capitol (now Campidoglio), the citadel of ancient Rome, standing on the Capitoline Hill, the smallest of the seven hills of Rome. It was planned by Tarquinius Priscus, but not completed till after the expulsion of the kings. At the time of the civil commotions under Sulla it was burned down, and rebuilt by the senate. It suffered the same fate twice afterward, and was restored by Vespasian and by Domitian, who instituted there the Capitoline games. The present capitol (Campidoglio), standing partly on the site of the old one, is a modern edifice, begun in 1536 after the design of Michael Angelo. It is used as a hotel de rille, museum, etc., contains some fine statues and paintings, and commands a superb view of the Campagna-the name of capitol is also given to the edifice in Washington where Congress assembles. The various separate states also call their statehouses capitols.

**Capo d'istria**, JOHN ANTHONY, COUNT (1776-1831), Greek statesman. In 1809 he entered the service of Russia and obtained an appointment in the department of foreign affairs. As imperial Russian plenipotentiary he subscribed the Treaty of Paris, Nov. 20, 1815. In 1828 he became president of the Greek Republic, in which office he was very unpopular, and he was assassinated by Constantine and George Mauromichalis.

**Cappado** cia, in antiquity, one of the most important provinces in Asia Minor, the greater part of which is included in the modern province of Karaman. Its boundaries varied greatly at different times. It was conquered by Cyrus, and was ruled by independent kings from the time of Alexander the Great until 17 A.D., when it became a Roman province. It was traversed by the river Halys, and among its chief towns were Comana, Ariarathia, and Tvana.

**Cappagh Brown** (kap'-ah), a bituminous earth, colored by oxide of manganese and iron, which yields pigments of various rich brown colors; called also manganese brown. It derives its name from Cappagh, near Cork, in Ireland.

**Capre'ra**, a small, rocky and infertile Italian island, on the northeast of Sardinia, and separated from it by a narrow strait. Area about 15 sq. mi. It was for many years the place of retirement of the Italian liberator Garibaldi, who died here in 1882.

**Capri** (ancient *Cuprčæ*), an island belonging to Italy, in the Gulf of Naples, 5 mi. long and 2 broad, rising to the height of about 1.900 ft., everywhere well cultivated. The inhabitants, amounting to 6,000, are occupied in the production of oil and wine, in fishing, and in catching quails at the seasons of their migrations. It contains the towns of Capri in the east, and Anacapri in the west, situated on the summit of a rock, and accessible by a stair of 522 steps. The emperor Tiberius spent here

# Capricornus

the last seven years of his life in degrading voluptuousness and infamous cruelty. The ruins of his palaces are still extant, and other ruins are scattered over the island. The island has several stalactitic caverns or grottoes in its steep rocky coast, which are famed for the wondrous colors reflected on the rocks, the Blue Grotto being the most famous. **Cap' ricornus** (Capricorn), a constellation of

**Cap**' ricornus (Capricorn), a constellation of the southern hemisphere, and one of the twelve signs of the zodiac, the one to which belongs the winter solstice, represented by the figure of a goat or a figure having the fore part like a goat and the hind part like a fish. Tropic of Capricorn. See Tropics.

**Cap' ridæ** (L. *caper*, a goat), the goat tribe, a family of ruminating animals, in which the horns are directed upward and backward, and have a bony core.

**Caprivi,** GENERAL VON (George Leo von Caprivi de Caprara de Monteculli), chancellor of the German Empire, was b. in 1831. He entered the Prussian army in 1849; served in the war of 1866 and the Franco-Prussian War, and in 1877 became major general. In December, 1882, he was given command of the third army division and from 1883 to 1888 was at the head of the admiralty. He held command of the tenth army corps, stationed in Hanover. In 1890 he became chancellor, in succession to Prince Bismarck.

**Cap'sicin**, an alkaloid, the active principle of the capsules of *Capsicum annuum*, or Guinea pepper. It has a resinous aspect and a burning taste.

**Cap'sicum**, a genus of annual, sub-shrubby plants, with a wheel-shaped corolla, projecting and converging stamens, and a many-

Capsicum.

seeded berry. They are chiefly natives of the East and West Indies, China, Brazil, and Egypt, but have spread to various other tropical or subtropical countries, being cultivated for their fruit, which in some reaches the size of an orange, is fleshy and variously colored, and contains a pungent principle (see *Capsicia*) which is present also and more largely in the seed. The fruit or pod is used for pickles,

## Capybara

sauces, etc., and also medicinally. Several of them yield Cayenne pepper, and the first (called often Guinea pepper, though originally a native of South America) also yields chillies.

**Caption**, in law, a certificate stating the time and place of executing a commission in chancery, or of taking a deposition, or of the finding of an indictment, and the court or authority before which such act was performed, and such other particulars as are necessary to render it legal and valid.

**Cap** ua, a fortified city of Italy, province Caserta, in a plain 18 mi. n. Naples, on the Volturno, which is crossed by a handsome bridge. It is the residence of an archbishop, and has a cathedral. Pop. 13,880. The ancient city was situated 34 mi. s.e. from the modern town. The site is now occupied by a small town, called Santa-Maria-di-Capua Veterc. The ancient Capua was of such extent as to be compared to Rome and Carthage. It was a favorite place of resort of the Romans on account of its agreeable situation and its healthy climate, and many existing ruins (including an amphitheater) attest its ancient splendor.

**Capuchin Monkey** (kap-u-shēn'), a name given to various species of South American monkeys of the genus *Cebus*. The hair of their heads is so arranged that it has the appearance of a capuchin's cowl. hence the name. The name is most frequently given to the Sai, the Horned Sapajou, as well as to a monkey belonging to an allied species.

**Capuchins** (kap-u-shēnz'), monks of the order of St. Francis, so called from the *capuchon* or *capuce*, a stuff cap or cowl, the distinguishing badge of the order. They are clothed in brown or gray, go barefooted, and never shave their beard.

**Capyba'ra**, a species of rodent, sometimes known by the name of the water hog, and of the family Cavidæ (guinea pig). It attains the length of about 3 ft., and has a very large and thick head, a thick body covered with short,

coarse, brown hair, and short legs, with long feet, which, being in a manner webbed, fit it for an aquatic life. It has no tail. It is common in several parts of South America, and particularly in Brazil. It feeds on vegetables and fish, which it catches somewhat in the manner of the otter.

## Carbobo.

**Carbo' bo,** a state of Venezuela, washed on the n. by the Caribbean Sea. Area about 2,984 sq. mi.; pop. 167,499. The capital is Valencia, the chief port Puerto Cabello.

**Car'acal**, a species of lynx; a native of Northern Africa and Southwestern Asia. It is about the size of a fox, and mostly of a deep-

brown color, having tufts of long black hair which terminate the ears. It possesses great strength and flerceness.

**Caracal ia**, MARCUS AURELIUS ANTONINUS, eldest son of the Emperor Severus (188-217). On the death of his father he succeeded to the throne with his brother Antoninus Geta, whom he speedily murdered. To effect his own security upward of 20,000 other victims were butchered. He was himself assassinated by Macrinus, the prætorian prefect, who succeeded him.

**Carac'as**, a city of South America, capital of Venezuela, situated in a fine valley, about 3,000 ft. above the Caribbean Sea, connected by railway with the port La Guayra, about 10 mi. distant. It is regularly laid out, and has some good buildings, including a cathedral, university, federal palace, and other government buildings, etc. It has various parks and gardens, gas and water supply, telephones, tramways, etc. In 1812 it was in great part destroyed by an earthquake, and nearly 12,000 persons buried in the ruins. Pop. 55.638.

persons buried in the ruins. Pop. 55,638. **Caraccioli** (ká-råch'o-lē), FRANCESCO (1748-1799), Italian admiral. In 1798 he entered the service of the Parthenopean Republic, and repelled, with a few vessels, an attempt of the Sicilian-English fleet to effect alanding. When Ruffo took Naples in 1799 Caraccioli was arrested, and, contrary to the terms of capitulation, was condemned to death, and hanged at the yard arm of a Neapolitan frigate, Lord Nelson consenting to his execution.

**Car'adoc** (or Carac'tacus), a king of the ancient British people called Silures, inhabiting South Wales. He defended his country with great perseverance against the Romans, but was at last defeated, and led in triumph to Rome, A.D. 51, after the war. His noble bearing and pathetic speech before the Emperor Claudius procured his pardon, but he and his relatives appear to have remained in Italy. **Caram'bola**, the fruit of an East Indian tree. It is of the size and shape of a duck's egg, of an agreeable acidulous flavor, used in making sherbets, tarts, and preserves.

**Car' amel**, the brown mass which cane sugar becomes at 220° C., used in cooking as a coloring and flavoring ingredient, in giving a brown color to spirits, etc. The name of a certain preparation of candy.

**Car'at**, a weight of 3.17 troy grains, used by jewelers in weighing precious stones and pearls. The term is also used to express the proportionate fineness of gold. The whole mass of gold is divided into twenty-four equal parts, and it is called gold of so many carats as it contains twenty-four parts of pure metal. Thus if a mass contains twenty-two parts of pure gold out of every twenty-four it is gold of twenty-two carats.

**Carau'sius, a** Roman general, a native of Batavia. He was sent by the Emperor Maximian to defend the Atlantic coasts against the Franks and Saxons; but foreseeing impending disgrace, he landed in Britain and got himself proclaimed emperor by his legions (287 A. D.). In this province he was able to maintain himself six years, when he was assassinated at York by one of his officers named Allectus (293 A.D.).

**Caravaggio** (ki-rá-våj'ö), a town of Northern Italy, prov. of Bergamo, 24 mi. e. of Milan, on the Gera d'Adda. It is celebrated as the birthplace of the two great painters, Polidoro Caldara and Michael Angelo Merighi, both called *Cararaggio*. Pop. 6,089. **Car'avan**, a Persian word used to denote

**Car'avan**, a Persian word used to denote large companies which travel together in Asia and Africa for the sake of security from robbers, having in view, principally, trade or pilgrimages. In Mohammedan countries caravans of pilgrims are annually formed to make the journey to Mecca. The most important are those which annually set out from Damascus and Cairo. Camels are used as a means of conveyance on account of their remarkable powers of endurance.

**Car'avel**, the name of different kinds of vessels, particularly a small ship used by the Spaniards and Portuguese in the fifteenth and sixteenth centuries for long voyages. It was narrow at the poop, wide at the bow, and carried a double tower at its stern and a single one at its bows. It had four masts and a bowsprit, and the principal sails were lateen sails. It was in command of three such caravels that Columbus crossed the Atlantic and discovered America.

**Caravel' las**, a seaport of Brazil, prov. Bahia, the principal port of the surrounding country, and the headquarters of the Abrolhos Islands whale fishery. Pop. about 4,000.

**Car'away**, a biennial plant, with a tapering fleshy root, a striated, furrowed stem, and white or pinkish flowers. It produces a wellknown seed used in confectionery, and from which both a carminative oil is extracted and the liquor called kümmel prepared.

**Carbazot' ic Acid**, a crystallizable acid and bitter substance obtained by the action of ni-

## Carbohydrate

tric acid on indigo and some other animal and vegetable substances. It is of great importance in dyeing. When silk which has been treated with a mordant of alum or cream of tartar, is immersed in a solution of this acid, it is dyed of a beautiful permanent yellow color. Often called *Pieric Acid*.

**Carbohy** '**drate**, an organic compound containing carbon and the elements of water, as starch and cellulose.

Carbol' ic Acid, an acid obtained from coaltar. It is, when pure, a colorless crystalline substance, but it is usually found as an oily liquid, colorless, with a burning taste and the odor of creosote. Carbolic acid is now much employed as a therapeutic and disinfectant. It may be taken internally in cases in which creosote is indicated; but its principal use in medicine is an external application to unhealthy sores, compound fractures, and to abscesses after they have been opened, over which it coagulates, forming a crust impermeable to air and to the organic germs floating in the atmosphere, which produce decomposi-tion in the wound. The action of the acid is not only to exclude these germs but also to destroy such as may have been admitted, for which reason it is introduced into the interior of the wound. Called also Phenic Acid and Phenol.

Carbon, one of the elements, existing uncombined in three forms, charcoal, graphite, or plumbago, and the diamond; chemical symbol C, atomic weight 12. The diamond is the purest form of carbon; in the different varieties of charcoal, in coal, anthracite, etc., it is more or less mixed with other substances. Pure charcoal is a black, brittle, light, and inodorous substance. It is usually the remains of some vegetable body from which all the volatile matter has been expelled by heat; but it may be obtained from most organic matters. animal as well as vegetable, by ignition in close vessels. Carbon being one of those elements which exist in various distinct forms is an example of what is called allotropy. The compounds of this element are more numerous than those of all the other elements taken together. With hydrogen especially it forms a very large number of compounds, called hydrocarbons, which are possessed of the most diverse properties, chemical and physical. With oxygen, again, carbon forms only two compounds, but union between the two elements is easily effected. It is one of the regular and most characteristic constituents of both animals and plants. See Diamond, Charcoal, Graphite, Bone Black, Carbonic Acid, Coke,

**Carbona' ri** (lit. charcoal burners), the name of an Italian political secret society, which appears to have been formed by the Neapolitan republicans during the reign of Joachim (Murat), and had for its object the expulsion of the strangers and the establishment of a democratic government.

**Car'bonates**, compounds formed by the union of carbonic acid with a base, as the carbonate of lime, the carbonate of copper, etc. Carbonates are an important class of salts, many of them being extensively used in the arts and in medicine.

**Car' bondale**, Lackawanna co., Pa., on Lackawanna River, 16 mi. n.e. of Scranton. Railroads: Delaware Hudson; Erie & New York; and Ontario & Western. Industries: Refrigerator factory, three flouring mills, two iron foundries, silk mill, and several other factories. Elk Mountain, two miles distant, is the second highest point in Pennsylvania. The town was first settled in 1826, and became a city in 1850. Pop. est. 1897, 18,000.

Carbon' ic Acid, more properly called Carbonic Anhydride, or Carbon Dioxide, a gaseous compound of 12 parts by weight of carbon and 32 of oxygen, colorless, without smell, twentytwo times as heavy as hydrogen, turning blue litmus slightly red, and existing in the atmosphere to the extent of 1 volume in 2,500. It is incapable of supporting combustion or animal life, acting as a narcotic poison when present in the air to the extent of only 4 or 5 per cent. It is disengaged from fermenting liquors and from decomposing vegetable and animal substances, and is largely evolved from fissures in the earth, constituting the choke damp of mines. From its weight it has a tendency to subside into low places, vaults, and wells, rendering some low-lying places, as the upas valley of Java, and many caves, uninhabitable. It has a pleasant, acidulous, pungent taste, and aerated beverages of all kindsbeer, champagne, and carbonated mineral water-owe their refreshing qualities to its presence, for though poisonous when taken into the lungs, it is agreeable when taken into the stomach. This acid is formed and given out during the respiration of animals, and in all ordinary combustions, from the oxidation of carbon in the fuel. It exists in large quantities in all limestones and marbles. It is evolved from the colored parts of the flowers of plants both by night and day, and from the green parts of plants during the night. During the day, plants absorb it from the atmosphere through their leaves, and it forms an important part of their nourishment.

**Carbonic Oxide**, a substance obtained by transmitting carbonic acid over red-hot fragments of charcoal, contained iu a tube of iron or porcelain, and also by several other processes. It is a colorless, inodorous gas, sp. gr. 0.9727, has neither acid nor alkaline properties, is very poisonous, and burns with a pale lavender flame.

**Carbonif** erous System, in geology, the great group of strata which lie between the Old Red Sandstone below and the Permian or Dyas formation above, named from the quantities of coal, shale, and other carbonaceous matter contained in them. They include the coal measures, millstone grit, and mountain limestone, the first being uppermost and containing the chief coal fields that are worked. Iron ore, limestone, clay, and building stone are also yielded abundantly by the carboniferous strata which are found in many parts of the world, often covering large areas. See

Coal. The thickness of the coal measures in South Wales has been estimated at 10,000 to 13,000 ft. As coal consists essentially of metamorphosed vegetable matter, fossil plants are very numerous in the carboniferous rocks, more than 1,500 species of them having been named, a large proportion of which are ferns, tree lycopods, and large horsetail-like plants. The animals include insects, scorpions, amphibians, numerous corals, crinoids, molluscs, cephalopods, sharks, and other fishes.

**Carbon Points,** in electric lighting, two pieces of very hard, compact carbon, between which the electric current is broken, so that the resistance which they offer to the passage of the current produces a light of extraordinary brilliancy.

**Carbun'cle**, a beautiful gem of a deep red color with a mixture of scarlet, found in the East Indies. When held up to the sun it loses its deep tinge, and becomes exactly of the color of a burning coal. The carbuncle of the ancients is supposed to have been a garnet.

Car'bureted Hydrogen, the name given to two compounds of carbon and hydrogen, one known as *light carbureted hydrogen*, and the other as *olefiant gas*. The former is the compound, which occurs in coal mines (fire damp) and about the neighborhood of stagnant pools. Mixed with atmospheric air from seven to fourteen times that of the gas it explodes. The latter is obtained from distilling coal or fat substances in close vessels. It explodes when mixed with ten or twelve volumes of atmospheric air.

**Carcassonne**, capital of the dep. Aude, France. The old town is surrounded by a double wall, part of it so ancient as to be attributed to the Visigoths. The new town is regularly built, and has many handsome modern houses. The staple manufacture is woolen cloth. Pop. 27,512.

**Card**, an instrument for combing, opening, and breaking wool, flax, etc., freeing it from the coarser parts and from extraneous matter. It is made by inserting bent teeth of wire in a thick piece of leather, and nailing this to a piece of oblong board to which a handle is attached. But wool and cotton are now generally carded in mills by teeth fixed on a wheel moved by machinery. The word is derived through the French carde, a teasel, from L. carduus, a thistle, teasels having been used for cards.

**Car' damoms,** the aromatic capsules of different species of plants, employed in medicine as well as an ingredient in sauces and curries. The cardamoms known in the shops are the large, supposed to be produced by a Madagascar plant; the middle sized and the small, both supposed to be the produce of a native of Sumatra and other Eastern islands. Those recognized in the American pharmacopœia, called *true* or officinal cardamoms and known in commerce as Malabar cardamoms, are the produce of a native of the mountains of Malabar and Canara.

**Cardan** (or CARDA'NO GERONIMO) (1501-1576). Italian philosopher, physician, and mathematician. He acquired extraordinary repu-

tation as a physician, and was invited to Scotland to attend Archbishop Hamilton of St. Andrews, who had been sick for ten years, and who was restored to health by his prescriptions. He made some important discoveries in algebra, studied astrology, pretended to a gift of prophecy, and wrote a large number of books.

**Card'board**, a kind of stiff paper or pasteboard for cards, etc., usually made by sticking together several sheets of paper. **Carde'nas**, a seaport on the north coast of

**Carde'nas**, a seaport on the north coast of Cuba, 103 mi. e. of Havana, with which it is connected by rail. One of the principal commercial centers of the island; chief exports: sugar, molasses, and coffee. Pop. 12,010.

sugar, molasses, and coffee. Pop. 12,910. **Car'diff** ("the city on the Taff"), seaport, the county town of Glamorganshire, Wales, situated at the mouth of the Taff on the estuary of the Severn. It is a rapidly increasing town, and the principal outlet for the mineral produce and manufactures of South Wales. Iron shipbuilding is carried on, and there are iron and other works on a large scale. The docks are extensive and well constructed (total area about 200 acres), and various improvements to the port have been carried out. It is the chief coal port of England. Pop. 128,849.

**Car' digan**, the county town of Cardiganshire, South Wales, on the river Teif, about 3 mi. from its mouth in Cardigan Bay. Pop. 3,447. The county of Cardigan has an area of 443,387 acres, of which two thirds is under crop or pasture. The surface of the northern and eastern parts is mountainous, but interspersed with fertile valleys; while the southern and western districts are more level and produce abundance of corn. It is rich in mevalliferous lodes, the lead mines still yielding largely. The principal town is Aberystwith. Pop. 62,596.

Cardinal Bird, a North American bird of the

Cardinal Finch.

fluch family, with a fine red plumage, and a crest on the head. Its song resembles that of

the nightingale, hence one of its common names, Virginian Nightingale. In size it is about equal to the starling. Called also Scarlet Groebeak or Cardinal Groebeak and Red Bird.

**Cardinal Flower**, the name commonly given to *Lobēlia cardinālus*, because of its large, very showy, and intensely red flowers; it is a native of North America, but is much cultivated in gardens in Britain.

**Carding,** the process wool, cotton, flax, etc., undergo previous to spinning, to lay the fibers all in one direction, and remove all foreign substances. See *Card*.

**Ca**'ret (L., "there is something wanting"), in writing, a mark made thus.  $\wedge$ , which shows that something, omitted in the line, is interlined above or inserted in the margin, and should be read in that place.

**Ca'rey**, HENRY (1690-1743), a British composer, dramatist, and poet. He composed the words and music of many popular songs, including Sally in Our Alley, God Save the King, etc. He also wrote farces and other works. **Carey**, HENRY CHARLES (1793-1870), political

**Carey**, HENRY CHARLES (1703-1879), political economist, b. in Philadelphia. His father, Matthew Carey, was a publisher and political economist. He gave his son a liberal education, and at the age of eight the boy entered his father's bookstore. He was successful in business, and made a study of economic questions. He was a member of the Republican party from its formation, supported the Union during the Civil War, was a trusted adviser of Lincoln and Chase, and was a member of the constitutional convention of Pennsylvania, in 1872. At his death he gave his valuable library to the University of Pennsylvania. He advocated a new system of political economy, and wrote extensively on protection and the currency.

**Ca'ria**, an ancient country forming the s.w. corner of Asia Minor, and partly settled in early times by Greek colonists chiefly of the Dorian race. About B. c. 120 it was incorporated in the Roman province of Asia. Cnidus, Halicarnassus, and Miletus were among the chief towns.

**Caria'co,** a seaport town, Venezuela, situated to the east of the Gulf of Cariaco. near the mouth of a river of the same name. Pop. 7,000. The Gulf of Cariaco is 38 mi. long, from 5 to 10 broad, from 80 to 100 fathoms deep, surrounded by lofty mountains.

**Caribbe an Sea**, that portion of the North Atlantic Ocean lying between the coasts of Central and South America, and the West India Islands. It communicates with the Gulf of Mexico by the Yucatan channel.

**Car' ibbee Bark**, the bark of a tree growing in the West Indies, closely allied to Cinchona, and occasionally substituted for the true species of the latter. It is called also *St. Lucia Bark*.

**Car' iboo** (Caribou), the name of two American species of reindeer, sometimes regarded as specifically identical with the Old World reindeer. The woodland cariboo most nearly resembles the common reindeer. It is found over considerable tracts of Canada, as also in Newfoundland and Labrador, and is migratory in its habits. The Barren Ground cariboo is much smaller, but has larger horns. It executes considerable migrations, going north to the Arctic Ocean in summer, and returning in autumn.

**Car'ibs,** the original inhabitants of the West Indian Islands, and, when Europeans became acquainted with America, also found in certain portions of Central America and the north of South America. At present only a few remain on Trinidad, Dominico, and St. Vincent.

**Car'icature**, a representation of the qualities and peculiarities of an object, but in such a way that beauties are concealed and peculiarities or defects exaggerated, so as to make the person or thing ridiculous, while a general likeness is retained. Though a degenerate, it is one of the oldest forms of art. Egyptian art has numerous specimens of caricature, and it has an important place in Greek and Roman art. It flourished in every European nation during the Middle Ages, and in the present day it is the chief feature in the socalled comic journals.

**Carimat'a**, an island about 50 mi. from the coast of Borneo. It is about 10 mi long and rises to a height of 2,000 ft. It is visited by Malays, who collect tortoise-shell, tripang, and edible birds' nests.

**Carinth'ia**, a province of Austria; area 4,006 sq. mi. The iron, lead, and calamine mines are the main sources of its wealth, though there are several manufactories of woolens, cottons, silk stuffs, etc., most of which are in Klagenfurt, the capital. Pop. 348,730.

**Car'isbrooke**, a village of the Isle of Wight, England. In its ancient castle Charles I was imprisoned thirteen months previous to his execution.

**Carleton,** WILL, American author, was b. in Hudson, Mich., Oct. 21, 1845. He graduated at Hillsdale College in that state; and soon after completing his studenthood, he began to lecture in various parts of the U. S. and Canada. He has more than once visited Europe. His best known works are ballads of domestic life. His fresh and striking *Farm Ballads* (1873), *Farm Legends* (1875), *Farm Festicals* (1881), *City Ballads* (1885), and other poems, possess both vigor and pathos, and have attained a wide popularity on both sides of the Atlantic.

**Carleton, WILLIAM (1798-1869), Irish novelist.** His education commenced at a hedge school, and terminated with two years' training in an academy. Thence he went to Dublin to try his fortune in the walks of literature. There, in 1830-32, were published his *Traits and Stories of the Irish Peasantry*. He published several other popular novels. He enjoyed a government allowance of \$1,000 per annum several years before his death. Barnett-Smith calls him "one of the truest, the most powerful, and the tenderest delineators of Irish life."

**Carlisie**, a town of England, county town of Cumberland. Sacked by the Danes and re-

built by William Rufus. It was held by the Scots during their tenure of Cumberland, and the church of St. Mary's was founded by David I, who d. here. During the border wars Carlisle underwent many sleges. It surrendered to Charles Edward in 1745. The cathedral, begun in the reign of William Rufus, was partly destroyed by Cromwell in 1648. In the various improvements of the city all the walls, gates, and fortifications have been removed, except a portion of the west wall, and the castle. Carlisle is the seat of various manufactures, of which cotton is the principal. Pop. 39, 176.

39,176. Carlisle, Cumberland co., Pa., on Conodoguinet River, 18 mi. w. of Harrisburg. Railroads: Cumberland Valley, and Philadelphia & Reading. Industries: iron foundry, flour mill, three shoe factories, two silk mills, axle works, ice and lumber and wrapper factories, etc. It is the seat of Dickinson Methodist College, founded in 1873, and of Carlisle school for the education of Indian pupils. Pop. est. 1897, 11,000.

**Carlisle**, JOHN GRIFFIN, American statesman. b. in Kentucky, Sept. 5, 1835. He became a lawyer and served several terms in the state legislature. He was state senator, 1866-71. From 1871 to 1875 he was lieutenant governor of the state, and in 1877 took his seat in Congress. From 1883 to 1889 he served as speaker of the House of Representatives. In 1800 he was elected senator to succeed Mr. Beck. He was secretary of the treasury in President Cleveland's second administration.

**Carlos'**, DON (1545-1568), Infant of Spain, son of Philip II. He was deformed in person, of a vindictive disposition. He was presumably murdered, but of this there is no proof. The story of Don Carlos has furnished the subject of several tragedies.

**Carlos de Bourbon**, DON MARIA ISIDOR (1788– 1855), the second son of Charles IV of Spain. His eldest son, Don Carlos, excited insurrections in his favor in his native country, but these attempts were always frustrated. His nephew, Don Carlos, duke of Modena, b. 1848, is the present representative of the Carlists. In 1873 he instigated a rising in the north of Spain, and continued the struggle till after Alfonso XII came to the throne, when he was defeated and withdrew.

**Carlotta**, ex-empress of Mexico, daughter of Leopold I, first king of the Belgians, was b. July 7, 1840. In 1857 she became the wife of the Archduke Maximilian of Austria, who afterward usurped the throne of Mexico. The execution of her husband preyed on her mind, and for many years she was under restraint.

**Carlovin'gians**, the second dynasty of the French or Frankish kings, which supplanted the Merovingians, deriving the name from Charles Martel or his grandson Charlemagne. Charles Martel (715-741) and his son Pepin (741-768) were succeeded by Charlemagne and his brother Carloman (768-771). Charlemagne became sole king in 771, and was succeeded in the Empire of the West by his son Louis le Debonnaire, 814. He divided his empire among his sons, and at his death (840) his son Charles the Bald became king of France. He died in 877, and was succeeded by a number of feeble princes. The dynasty came to an end with Louis V, who d. in 987.

**Car'low**, an inland county of Ireland, province of Leinster. Area 346 sq. mi. From the remarkable fertility of its soil it is altogether an agricultural county, producing a great deal for exportation. Pop. 40,936. Carlow, the county town, is 34 mi. s.w. of Dublin. It is the principal mart for the agricultural produce of the surrounding country. There is a Roman Catholic cathedral and divinity college. On rising ground stand the ruins of the ancient castle of Carlow. Pop. 6,619.

**Carlowitz** (kår'lo-vits), a town of Austrian Slavonia, 7 mi. s.e. Peterwardein; the center of a famous wine-growing district. A peace was concluded here in 1600 between Austria, Russia, and Poland, and the Turks. Pop. 5,800.

**Carlsbad** (kårls' båt) ("Charles's Bath"), a town of Bohemia, famous for its hot mineral springs, and much frequented by visitors from all parts of the world, being useful in diabetes, gout, etc. Pop. about 11,000.

gout, etc. Pop. about 11,000. **Carlscro na** ("Charles's Crown"), a fortified seaport of Sweden, capital of the province of Blekinge or Carlscrona. It is the chief Swedish naval station, the harbor being safe and spacious, with fine dock, shipyards, arsenal, etc. It has a considerable export trade in timber, tar, potash, tallow, etc. Pop. 19,497.

**Carisruhe** (kārls'rö) ("Charles's Rest"), the capital of the Grand-duchy of Baden, Germany. The castle of the grand duke stands as a center, and from this point a number of streets radiate at regular distances, thus forming a kind of fan. The court library contains 100,000 volumes; there are also a large public library, several valuable museums and art collections, a botanic garden, polytechnic school, etc. Pop. 61,074.

Caristadt (karl'stat), ANDREAS RUDOLF BOD-ENSTEIN (1480-1541), a German reformer. About 1517 he became one of Luther's warmest supporters. He was excommunicated by the bull against Luther, and was the first to appeal from the pope to a general council. While Luther was at the Wartburg, Carlstadt instigated the people and students to the destruction of the altars and the images of the saints. In 1524 he declared himself the opponent of Luther, and commenced the controversy respecting the sacrament, denying the bodily presence of Christ in the sacramental elements. This controversy ended in the separation of the Calvinists and Lutherans. After many misfortunes he settled as vicar and professor of theology at Basel, where he d.

**Carlyle,** THOMAS (1795-1881), one of the greatest English writers of the present century, b. at Ecclefechan, Dumfriesshire. He was the eldest son of James Carlyle, a mason, afterward a farmer, and was intended for the church, with which object he was carefully educated. In his fitteenth year he was sent to

## Carmagnole

the University of Edinburgh, where he developed a strong taste for mathematics. Having renounced the idea of becoming a minister, after finishing his curriculum he became a after finishing his curriculum ne became a teacher for about four years. In 1818 he re-moved to Edinburgh, where he supported him-self by literary work. His career as an author may be said to have begun with the issue in monthly portions of his *Life of Schiller* in the London *Magazine*, in 1823, this work being enlarged and published separately in 1825. In 1824 he published a translation of Legendre's Geometry, with an essay on proportion by him-self prefixed. The same year appeared his translation of Goethe's Wilhelm Meister's Apprenticeship. He was next engaged in translating specimens of the German Romance writers, published in 4 vols. in 1827. In 1827 he married Miss Jane Bailie Welsh, a lineal descend-ant of John Knox. After his marriage he resided for a time in Edinburgh, and then withdrew to Craigenputtock. Here he wrote a number of critical and biographical articles for various periodicals, and here was written Sartor Resartus, the most original of his works. The publication of Sartor soon made Carlyle famous. On his removal to London he fixed his abode at Cheyne Row, Chelsea, where his life henceforth was mainly spent. His next work of importance was on the French Revolution. He delivered several series of lectures, the most important of these, on *Heroes and Hero-worship*, being published in 1840. Char-tism, published in 1839, and Past and Present, in 1843, were small works bearing on the af-fairs of the time. In 1845 appeared his Oliver Cromuell's Letters, and Speeches, with Elucidations. In 1850 came out his Latter-day Pamphlets. He next wrote a life of his friend John Sterling, published in 1851. The largest and most laborious work of his life, *The History of Frederick II* of Prussia, called Frederick the Great, next appeared, the first two volumes in 1858, the second two in 1862, and the last two in 1865, and after this time little came from his pen. In 1866, having been elected lord rector of Edinburgh University, he delivered an installation address to the students on the While still in Scotland the Choice of Books. sad news reached him that his wife had died Mrs. Carlyle, besides suddenly in London. being a woman of exceptional intellect. was a most devoted and affectionate wife. He left the estate of Craigenputtock to the University of Edinburgh, stipulating that the income from it should form ten bursaries to be annually competed for-five for proficiency in mathematics and five for classics (including English).

**Carmagnole** (kår-må-nyöl), a name applied in the early times of the French Republic (1792-93) to a highly popular song, and a dance by which it was accompanied.

**Carmar' then** (or Carmar' then), a maritime county, South Wales. It is of a mountainous character generally, and its valleys are noted for the beauty of their scenery. The mineral products of the county are iron, lead, coal, and limestone. The chief towns are Carmarthen and Llanelly. Pop. 130,574. Car-

## Carnegle

marthen, the county town, is situated 9 mi. from the sea, on the Towy. The salmon fishery is extensive. Pop. 10,338.

**Carmel**, a range of hills in Palestine, extending from the Plain of Esdraelon to the Mediterranean. It has a length of about 16 mi., and its highest point is 1,850 ft. above the sea.

**Car' melites,** mendicant friars of the order of Our Lady of Mount Carmel. From probably the fourth century holy men took up their abode as hermits on Mount Carmel in Syria.

**Car' minatives,** medicines obtained chiefly from the vegetable kingdom, and used as remedies for flatulence and spasmodic pains.

**Car'mine**, the fine red coloring matter or principle of cochineal, from which it is prepared in several ways, the result being the precipitation of the carmine. It is used to some extent in dyeing, in water-color painting, to color artificial flowers, confectionery. etc.

**Carnac**, a village of Brittany, France. dep. of Morbihan, on a height near the coast, 15 mi. s.e. of Lorient, and remarkable for the socalled Druidical monuments in its vicinity.

**Carnar' von** (or Caernarvon), a maritime county of North Wales; area 369,477 acres. 11 is traversed by lofty mountains, including the Snowdon range, whose highest peak is 3,571 ft., and the highest mountain in South Britain. Slate is the chief mineral, large quantities of which are exported. Pop. 118,225. CARNARvon, the county town, is a seaport on the southeast side of the Menai Strait. The old part of the town is surrounded by an ancient wall. Pop. 9,804.

**Carnat'ic,** the district in Southeastern India extending from Cape Comorin to the northern Circars, lying east of the Ghats, and reaching to the sea on the Coromandel coast.

**Carnation**, the popular name of varieties of the clove pink. The carnations of the florists are much prized for the beautiful colors of their sweet-scented double flowers. They are arranged into three classes according to color, viz., bizarres, flakes, and picotees.

**Carnegie**, ANDREW, an American millionaire, was b. at Dunfermline, Scotland, 1835, whence his father, a hand-loom weaver, emigrated to America. The family settled in Pittsburgh, where Andrew obtained employment first as a telegraph messenger. A fortunate acquaintance with the sleeping-car patentee laid the foundation of his success: then came lucky ventures in oil and the starting of a rolling mill from which has grown the largest system of iron and steel industries in the world.

**Carnegie**, Alleghany co., Pa., on Chartier's Creek, 30 mi. from Pittsburg. Railroads: Pan Handle; Chartier's Valley; and P. C. & Y. Industries: iron and steel mills and other manufactories. Coal, oil, and natural gas to be found in large quantities. First settled in 1842 by Col. M. B. Brown, and the name was changed from Mansfield Valley to Carnegie in 1894. Carnegie has two weekly papers. Pop. est. 1807, 9,000.

**Carnio la**, province of Austria: area 3,856 sq. mi. There are iron, lead, and quicksilver mines, and abundance of coal, marble, and valuable stone. Pop. 498,958. The capital is Laibach.

**Carnival**, the feast or season of rejoicing before Lent, observed in Catholic countries with much revely and merriment.

Carnivora, a term applicable to any creatures that feed on flesh or animal substances, but now applied specially to an order of mammals which prey upon other animals. The head is small, and the jaws powerful. Two sets of teeth, deciduous or milk and permanent, are always developed in succession, and in both sets incisors, canines, and molars are distinguishable. The stomach is simple and the alimentary canal short. Carnivora are often divided into Plantigrada, comprising the bears, badgers, raccoons, etc.; Digitigrada, comprising lions, tigers, cats, dogs; and Pin-nipedia or Pinnigrada, comprising the seals and walruses. The two former divisions are also classed together as Fissipedia. The Plantigrada are also decidedly carnivorous. In the Pinnigrada the body is long and of a fish shape, the fore and hind limbs are short and expanded into broad webbed swimming paddles.

Carnot, LAZARE NICOLAS MARGUERITE (1753-1823), a French statesman, general, and strate-gist. When the revolution broke up he was captain in the corps of engineers. In 1791 he was sent to the Army of the North, where he took command, and successfully repulsed the enemy. As a member of the Committee Carnot was formally responsible for the decrees of Robespierre. In 1797 Carnot, having unsuccessfully opposed Barras, had to escape to Germany, but returned, and was appointed minister of war by Napoleon (1800). For seven years after this Carnot remained in retirement, publishing several valuable military works. In 1814 Napoleon gave him the chief command at Antwerp, and in 1815 the post of minister of the interior. After the emperor's second fall he retired from France.

**Caroline**, British queen (1768-1821), a daughter of the Duke of Brunswick-Wolfenbüttel. In 1795 she was married to the Prince of Wales, afterward George IV. When the Prince of Wales assumed the throne in 1820 he offered her an income of \$250,000 on condition that she would never return to England, on account of reports which were circulated against her honor. She refused, and in June of same year entered London amid public demonstrations of welcome. The government now instituted proceedings against her for adultery, but the public feeling and the splendid defense of Brougham obliged the ministry to give up the Divorce bill after it had passed the Lords. Though banished from the court, the queen assumed a style suitable to her rank.

**Caroline Islands** (or New Phillppines), a large archipelago, North Pacific Ocean, between the Philippines and the Marshall Isles, first discovered by the Spaniards in 1543, if not by the Portuguese in 1525. The most impor-

tant vegetable productions are palms, breadfruit trees, and bananas. The islands are claimed by Spain.

**Caron,** SIR ADOLPHE, Canadian statesman (1843), practised law and became queen's counsel in 1879. He entered the Dominion Parliament as a Conservative in 1873, became minister of militia in November, 1880, which position he held for over ten years.

**Caro'tid Arteries,** the two great arteries which convey the blood from the aorta to the head and brain. The common carotids, one on either side of the neck, divide each into an external and an internal branch. The external carotid passes up to the level of the angle of the lower jaw, where it ends in branches to the neck, face, and outer parts of the head. The internal carotid passes deeply into the neck, and through an opening in the skull behind the ear enters the brain, supplying it and the eye with blood.

**Carp**, a genus of soft-finned abdominal fish distinguished by the small mouth, toothless

a.-fore fin; b.-hind fin; c.-anal fin; d.-large barbule.

jaws, and gills of three flat rays. The common carp is olive green above and yellowish below, and in many parts is bred in ponds for the use of the table. It is said to live to the great age of 100 or even 200 years. The wellknown goldfish is of this family and is believed to be originally from China.

**Carpa** thian Mountains, a range of mountains in Southern Europe, chiefly in Austria, forming a great semicircular belt of nearly 800 mi. in length. The Carpathian range is rich in minerals, including gold, silver, quicksilver, copper, and iron.

**Car' pel**, in botany, a single-celled seed-vessel, or a single cell of a seed-vessel. The pistil or fruit often consists of only one carpel, in which case it is called *simple*; when either consists of more than one carpel it is called *compound*.

**Carpenta**' ria, GULF OF, a large gulf on the north coast of Australia.

**Carpenter,** MATTHEW HALE (1824-1881), American jurist and statesman. He spent two years at West Point. In 1847 he was admitted to the bar in Vermont. The year following he settled at Beloit, Wis., from whence he removed to Milwaukee in 1856. He was considered the greatest constitutional lawyer of his time. and tried many important cases before the U. S. Supreme Court. From 1869 to 1875, he was U. S. senator from Wisconsin.

30

# Carpenter

In 1870 he was again elected to the Senate, and died in office.

**Carpenter**, WILLIAM BENJAMIN (1813-1885), an English physiologist. He wrote several well-known works on physiology: *Principles of General and Comparative Physiology; Principles of Mental Physiology; Principles of Human Physiology;* a Manual of Zoology, etc. He took a leading part in the expeditions sent out by government in 1868-70 for deep-sea exploration in the North Atlantic. **Carpenter Bee**, the common name of the

**Carpenter Bee**, the common name of the different species of hymenopterous insects of the genus *Xylocopa*. The species are numerous in Asia, Africa, and America, and one

Carpenter Bee (Xylocopa).

Showing the cells for eggs and larvæ, excavated in dead wood.

species inhabits the South of Europe. They are generally of a dark, violet blue, and of considerable size.

Car' pentry is the art of combining pieces of timber to support a weight or sustain pressure. The work of the carpenter is intended to give stability to a structure, that of the joiner is ap-plied to finishing and decoration. The term frame is applied to any assemblage of pieces of timber firmly connected together. The points of meeting of the pieces of timber in a frame are called *joints.* Lengthening a beam is uniting pieces of timber into one length by joining their extremities. When neatness is not required this is done by fishing, that is, placing a piece of timber on each side of where the beams meet and securing it by bolts passed through the whole. When the width of the beam must be kept the same throughout scarf-ing is employed. When greater strength is required than can be produced by a single beam building and trussing beams are resorted to. In trussing the beam is cut in two in the direction of its length, and supported with cross beams, as in roofing. Mortise and tenon is a mode of jointing timber. The timber frame-work of floors is called naked flooring, and is single if there be but a single series of joists, double if there are cross binding joists, and framed if there are girders or beams in addition to the joists. The roof is the framework by which the covering of a building is supported. The principal instruments used in carpentry

#### **Carpet Sweepers**

are saws, as the circular, band, and tenon saws; planes, as the jack plane, smoothing plane, molding plane, chisels, gouges, gimlets, etc.

Carpet, a thick fabric, generally composed wholly or principally of wool, for covering the floors of apartments, staircases, and passages in the interior of a house. They were origi-nally introduced from the East, where they were fabricated in pieces, like the modern rugs, for sitting on. Eastern carpets are still highly thought of in Europe. The Persian, Turkish. and Indian carpets are all woven by hand, and the design is formed by knotting into the warp tufts of woolen threads. Of carpets made in this country and Europe Brussels carpet is a common and highly esteemed variety. It is composed of linen thread and worsted, the lat-ter forming the pattern. The linen basis does not appear on the surface, being concealed by the worsted, which is drawn through the reticulations and looped over wires that are afterward withdrawn, giving the surface a ribbed appearance. Wilton carpets are similar to Brussels in process of manufacture, but in them the loops are cut open by using wires with a knifeedge, and the surface thus gets a pile.

**Carpet-bagger**, a needy political adventurer who goes about the country pandering to the prejudices of the ignorant with the view of getting into place or power, so called because regarded as having no more property than might fill a *carpet-bag*. Originally applied to needy adventurers of the Northern states of America who tried in this way to gain the votes of the negroes of the Southern states.

of the negroes of the Southern states. **Carpet Sweepers.**—The first sweepers were manufactured in 1858 in Boston. The original sweeper was very crude as it was made almost entirely by hand. The infant industry was ruined by the war but sprung up again in the early '70's when several factories were established in different parts of the country. There are now carpet-sweeper factories in several countries of Europe, but they have not perfected automatic machinery to the extent that Americans have, and in consequence their product is of inferior quality.

uct is of inferior quality. The principal parts of a carpet sweeper are the bail, case, brush, and wheels. The bail is a metal attachment which circles half way around the sweeper and to which the handle is attached. It is of malleable iron and comes to the sweeper factory warped and crooked. It is placed in a press, which, with a single blow, straightens it out completely. The bail is then polished on emery wheels or belts and is passed to a room where it is boiled in lye and copper and nickel-plated or Japanned before receiving the final polish on cloth wheels. preparatory to being sent to the assembly rooms. The wooden case is usually made of oak. It is run through dry-kilns and allowed to season thoroughly before it is cut up into the proper sizes. The brush is a wooden roller thickly studded with bristles. They are turned out in machines which work automatically. and are given a coat of black filler before reaching the factory. These rollers are first placed in a machine which bores the holes for the

## Carracci

bristles which are put in by machinery. They are arranged on a long tray and are fed into the machine from the back. A little prong jerks out just enough of the bristles for a bunch and passes it to a pair of metal fingers, which encircle the bunch around the middle with a staple of wire, and then pass it to another pair of fingers, which press the bunch of hair into the hole in the roller, and spread the staple until it penetrates the wood and anchors the bristles far stronger than could be done with glue. The brush is put through a machine where it is properly trimmed when it goes to the assembling room. The wooden wheels are turned out at the rate of 100 a minute and are carefully finished and painted. The metal wheels are sent to the rubbering room where rubber bands are put on. The tin for the bot-tom pans is cut and put in proper shape by automatic machinery. The wire for the springs of the sweeper comes in heavy coils and is also cut into the required length by automatic machinery. Every part of the sweeper is constantly moving toward the assembly room. Each part is kept separate and has an apartment for itself. In the assembling room the parts are all put together and the machine thoroughly tested.

Carracci (kar-rach-ē), Ludovico, Agostino, and ANNIBALE (1555-1619), the three founders of the Bologna, or, as it has been called, the eclectic school of painting.

Carrageen. See Irish Moss.

**Carra'ra**, a city of Northern Italy, 59 mi. s.w. of Modena. It is surrounded by hills which contain fine white statuary marble. Pop. 11,869. The Carrara marble is the variety generally employed by statuaries. Although the Carrara quarries have been worked for 2,000 years, having furnished the material for the Pantheon at Rome, the supply is still practically inexhaustible. They employ 6,000 or 7,000 men.

Carrickfer'gus, seaport of Ireland, county Antrim: memorable as the landing place of King William III, 1690. There are some manufactures, principally linen, and extensive fisheries. Pop. 10,009.

Carrier (kar-yā), JEAN BAPTISTE (1746-1794), an infamous character of the first French revolution. In 1792 he was chosen member of the National Convention. In October, 1793, he was sent to Nantes to suppress the civil war, and to finally put down the Vendeans. He first caused ninety-four priests to be conveyed to a boat with a perforated bottom, under pretense of transporting them, but in-stead they were drowned by night. This artifice was repeated a number of times, while Carrier also caused multitudes of prisoners to be shot without any pretense of trial. Some months before the fall of Robespierre, Carrier was recalled and guillotined.

Carrier Pigeon, a variety of the common domestic pigeon used for the purpose of carrying messages. Several varieties are thus employed but what is distinctively called the carrier pigeon is a large bird with long wings, large tuberculated mass of naked skin at

the base of the beak and with a circle of naked skin around the eyes. Pigeons have been employed in this way at a very ancient date, but there appear to be some differences of opinion as to who first so utilized them. Probably the first on record who employed pigeons in this Homing Pigeon, capacity was Joshua. who,

or Messenger. when invading Palestine (in the sixteenth century B.C.), employed them as mediums of communication between headquarters and camps in lands far on the other side of the Jordan. The Chinese are said to have used pigeons to carry messages at even an earlier date than this. The Greek poet Anacreon, who lived 500 years B.C., mentions the use of pigeons as bearers of epistles. Pliny, the Roman naturalist, speaks of communications being kept up between Hirtius and Decimus Brutus at the siege of Mutina (Modena) by means of pigeons; and there is an instance recorded of their having been employed during the crusade of St. Louis. One writer has recorded the employment of pigeons to carry messages to Mahmoud Malek-al-Adel Nour-Eddin, sultan of Egypt, in the twelfth century. During the siege of Paris, 150,000 official messages were carried into the city by pigeon post. Carrier pigeons in calm weather fly on an average 1,200 yards a minute; with a moderate breeze in their favor they make 1.500 yards a minute; while with the wind strongly in their favor, they attain a speed of 2,000 yards per minute. The record for distance is held by an American homing pigeon, which recently made a journey of 1,040 mi. without a stoppage. An actual post system in which pigeons were the messengers was established at Bagdad by the Sultan Nureddin Mahmud, who died in 1174, and lasted until 1258 when Bagdad fell into the hands of the Mongols. These birds can be used in this way only in virtue of what is called their "homing" faculty or instinct, which enables them to find their way back home from surprising distances. They are better to get some training by trying them first with short distances, which are then gradually increased. Large numbers of these birds are now kept in England, Belgium, France, etc., there being numerous pigeon clubs which hold pigeon races to test the speed of the birds. These races to test the speed of the birds. pigeons are also kept in several European countries for military purposes.

Carrion Crow, the common crow, so called because it often feeds on carrion. The name is also given to a small species of vulture, called the black vulture.

Carroll, CHARLES, of Carrollton (1737-1832), American statesman. At the outbreak of the Revolution he was the wealthiest man in the colonies, and he was ever ready to use his influence and means for the aid of liberty. As early as 1770, he had protested against arbitrary taxation, in 1774 was appointed one of the committee of correspondence for the province, and in 1775 was elected a member of the Council of Safety. In 1776 he was elected to the Continental Congress from Maryland, and signed the Declaration of Independence. He was again a delegate to Congress in 1777, and served on the committee which visited Valley Forge to investigate complaints about General Washington. In 1788 he was elected the first senator from Maryland under the Constitution of the U. S., serving until 1791. He was again elected to the state senate, and served until 1801. He was the last surviving signer of the Declaration of Independence.

**Carroll**, JOHN (1735-1815), American Catholic archbishop. He was a cousin of Charles Carroll, of Carrollton, being descended from the Carrolls who emigrated to Maryland about the year 1689. In 1789 he was appointed first bishop in the U. S., with his see in Baltimore. He was an ardent Federalist, and one of the most powerful factors of his church in this country. Pious, learned, patriotic, and eloquent, he represented one of the oldest familles of Ireland and Maryland, and its union with the Jesuits. Congress invited him to deliver a panegyric on Washington, on Feb. 22, 1800. His writings are chiefly controversial.

**Carrot**, a biennial umbelliferous plant. There are three chief varieties. The leaves are tripinnate, of a handsome feathery appearance. The plant rises to the height of 2 ft., and produces white flowers. The root is small, tapering, of a white color, and strong flavored; but that of the cultivated variety is large, succulent, and of a red, yellow, or pale straw color, and shows remarkably the improvement which may be effected by cultivation. It is cultivated for the table and as a food for cattle.

**Carson City**, Ormsby co., Nev., in Eagle Valley, near the foot of the Sierra Nevada, 178 mi. n.e. of San Francisco. Surrounding country, lumber and mining. A U. S. branch mint for dealing with the immense quantities of gold and silver produced in this region is located here. Pop. est. 1897, 4,500.

**Carson**, CHRISTOPHER (1809-1868), a famous American frontiersman, better known as "Kit," b. in Kentucky; d. in Colorado. He became famous as a scout and trapper, and guided Fremont across the Rocky Mountains. His name is classed with those paladins of the Western plains such as Crockett, Boone, and W. F. Cody.

**Cart**, a carriage with two wheels, with or without springs, fitted to be drawn by one horse.

**Cartagena**, (or Carthagena) (kár-tà- $\hbar$ ā' nă, kár-thă-jē'na), a seaport of Spain, in the province of and 31 mi. s.s.e. of Murcia; with a harbor which is one of the largest and safest in the Mediterranean, sheltered by lofty hills. It is a naval and military station. Lead smelting is largely carried on; and there are in the neighborhood rich mines of excellent iron. Esparto grass, lead, iron ore, oranges, etc., are exported. Cartagena was founded by the Carthaginians under Hasdrubal about 243 B.C., and was called New Carthage. It was taken by Scipio Africanus B.C. 210, and was long an important Roman town. It was ruined by the Goths, and revived in the time of Philip II. Pop. 84,171.

**Cartagena** (or Carthagena) (kár-tá- $\hbar$ á 'ná, kár-tha-jē'na), a seaport of Colombia. on the Caribbean Sea, capital of the state of Bolivar. The exports are coffee, cotton, ivory nuts, rubber, hides, etc. The trade, which had partly gone to Sabanilla and Santa Marta, is being again recovered since the reopening of the canal to the river Magdalena. Pop. 8,600.

**Carta** 'go, a town of Central America in Costa Rica. It formerly had a population of about 37,000, but was utterly ruined by an earthquake in connection with an eruption of a neighboring volcano in 1841, so that its population has decreased to 6,000.

**Carta'go**, a town in Colombia, in the valley of the Cauca, in a well cultivated district and with a good trade. Pop. 8,000.

**Carte Blanche** (kårt-blånsh) (literally *white* or *blank paper*), a blank paper duly signed, entrusted to a person to fill up as he pleases, and thus giving unlimited power to decide. Thus in 1649 Charles II tried to save his father's life by sending from The Hague to the Parliament a signed carte blanche to be filled up with any terms which they would accept as the price of his safety. In 1832 Earl Grey was said to have been armed with a carte blanche for the creation of new peers.

**Carte' slan Diver**, a hydrostatic toy consisting of a little hollow glass figure, which has a small opening some distance below the top, and is rather lighter than an equal column of water, so as to be able to float. The figure is placed in a bottle or cylindrical vessel of water, closed with a piece of bladder or india rubber so as to exclude air. On pressing this with the finger the air inside the figure is compressed, it sinks down, and from the introduction of a small quantity of water becomes specifically heavier. By removing the pressure the water is expelled.

Car' thage, the most famous city of Africa in antiquity, capital of a rich and powerful commercial republic, situated in the territory now belonging to Tunis. Carthage was the latest of the Phoenician colonies in this district, and is supposed to have been founded by settlers from Tyre and from the neighboring Utica about the middle of the ninth century before Christ. The history of Carthage falls naturally into three epochs. The first, from the foundation to 410 B.C., comprises the rise and culmination of Carthaginian power: the second, from 410 to 265 B.C., is the period of the wars with the Sicilian Greeks; the third, from 265 to 146 B.C., the period of the wars with Rome, ending with the fall of Carthage.

The rise of Carthage may be attributed to the superiority of her site for commercial purposes, and the enterprise of her inhabitants.

In extending her commerce Carthage was naturally led to the conquest of the various islands which from their position might serve as entrepôts for traffic with the northern shores of the Mediterranean. The First Punic War, in which Rome and Carthage contended

for the dominion of Sicily, was prolonged for twenty-three years, B.C. 264 to 241, and ended, through the exhaustion of the resources of Carthage, in her expulsion from the island. The loss of Sicily led to the acquisition of Spain for Carthage. The Second Punic War, arising out of incidents connected with the Carthaginian conquests in Spain, and conducted on the side of the Carthaginians by the genius of Hannibal, and distinguished by his great march on Rome and the victories of Lake Trasimene, Trebia, and Cannæ, lasted seventeen years, B.C. 218 to 201, and after just missing the overthrow of Rome, ended in the complete humiliation of Carthage. The policy of Rome in encouraging the African enemies of Carthage occasioned the Third Punic War, in which Rome was the aggressor. This war, begun B.C. 150, ended B.C. 146, in the total destruction of Carthage.

The constitution of Carthage, like her history, remains in many points obscure. After the destruction of Carthage her territory became the Roman province of Africa. Twentyfour years after her fall an unsuccessful attempt was made to rebuild Carthage by Caius Gracchus. This was finally accomplished by Augustus, and Roman Carthage became one of the most important cities of the empire. It was destroyed by the Arabs in 638. The religion of the Carthaginians was that of their Phenician ancestors. They worshiped Moloch or Baal, to whom they offered human sacrifices: Melkart, the patron deity of Tyre; Astarte, the Phenician Venus, and other deities.

Carthage, Jasper co., Mo., on Spring River, 150 mi. s. of Kansas City. Railroads: St. L. & S. F.; and Missouri Pacific. Industries: stone quarries, five flouring mills, two iron foundries, woolen mill, and carriage, bed spring, and window bracket factories. Surrounding country agricultural and mineral (zinc mines). The town was first settled in 1843 and became a city about 1865. Pop. est. 1897, 12,000.

**Cartier,** SIR GEORGE ÉTIENNE (1814-1873), Canadian statesman. He was admitted to the bar in 1835, took part in the rebellion of 1837, and had for a time to leave Canada. In 1848 he entered the Canadian Parliament, and in 1855 became provincial secretary. Next year he became attorney general for Lower Canada, in which post he was active in behalf of legal reforms. In 1857 he was a member of the Macdonald ministry, and in 1858 he himself became premier. He was active in bringing about the establishment of the Dominion of Canada in 1867, and held a post in the first Dominion cabinet.

**Cartier** (kär-tyä), JACQUES, a French navigator, b. at St. Malo, 1494, time of death not known. He commanded an expedition to North America in 1534, entered the Straits of Belle Isle, and took possession of the mainland of Canada in name of Francis I. He subsequently went to found a settlement in Canada, and built a fort near the site of Quebec. He was living in France in 1552.

Car'tilage (or Gristle), a firm and very elastic

substance occurring in vertebrate animals. When cut, the surface is uniform, and contains no visible cells, cavities, or pores. It enters into the composition of parts whose functions require the combination of firmness with pliancy and flexibility. The ends of bones entering into the formation of a joint are always coated with cartilage. Temporary cartilages are those from which bones are formed by ossification. The permanent cartilages are of various kinds. They are found in the external ear, and aid in forming the nose, the larynx, etc.

Cartoon', in painting, a drawing intended to be used as a model for a large picture in fresco, a process in which it is necessary to complete the picture portion by portion and in which a fault cannot afterward be easily corrected. The cartoon is made exactly the size of the picture intended, and the design is transferred to the surface to be ornamented by tracing or other processes. Cartoons executed in color are used for designs in tapestries, mo-saics, etc. The most famous are those painted by Raphael for the Vatican tapestries. In modern times the term is also applied to a pictorial sketch relating to some notable character or events of the day, and in 1897 an effort was made by legislation in the state of New York to restrain newspapers from printing cartoons without the consent of the person depicted. The attempt failed.

**Cartouche** (kär'tösh), 1. In architecture, a sculptured ornament in the form of a scroll unrolled, often appearing on the cornices of columns, used as a field for inscriptions, etc. 2, In heraldry, a sort of oval shield, much used by the popes and secular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on. 3, The name given to that oval ring or border which includes, in the Egyptian hieroglyphics, the names of persons of high distinction.

**Car' tridge**, a case of paper, parchment, or flannel suited to the bore of firearms, and holding the exact charge, including, in the case of small'arms, both powder and bullet. The cartridges used for breech-loading rifles contain the powder in a case of solid brass, and have the percussion cap by which they are ignited fixed in the base. Such cases can be refilled and used a number of times in succession. Cartridges for large guns are usually made of flannel and contain only the powder. Blank cartridge is a cartridge without ball or shot. Cartridges for blasting are filled with dynamite or other explosive.

**Cartwright,** EDMUND (1743-1823), the inventor of the power loom. He was educated at Oxford, and took orders in the church. In 1785 he brought his first power loom into action. Although much opposed both by manufacturers and workmen, it made its way, and in a developed and improved form is now in universal use. Cartwright spent much of his means in similar inventions, and fell into straitened circumstances. from which a parliamentary grant of \$50,000 relieved him.

Cartwright, SIR RICHARD, b. 1835, Canadian

statesman, entered the Dominion Parliament as a Conservative in 1863, and in 1870 identified himself with the reform party. Minister of finance in 1873 under Mr. Mackenzie.

of finance in 1873 under Mr. Mackenzie. **Caru' pano,** seaport of Venezuela, on the peninsula of Paria. Pop. 12,389.

**Car'ver, JOHN** (1575-1621), the first governor of the Plymouth colony in the New World, was b. in England and went to Leyden, then a refuge for the Puritans. He was an elder in the church, and in 1620 sailed with the Pilgrims in the *Mayflower*. C. was a prudent and firm ruler, but did not long survive his arrival in New England, dying at Plymouth.

**Carvin** (kar-van) (or Carvin Epinay), a town of France, dep. of Pas de Calais; industries: coal mining, iron founding, distilling, beet root sugar, flax-spinning, etc. Pop. 8,000.

**Carving**, as a branch of art, is the process of cutting a hard body by means of a sharp instrument into some particular shape, and is a term generally employed in speaking of figures cut out in ivory or wood. In the early and middle ages wood carving became general for the decoration of Christian churches and altars. One of the latest developments in the art of carving is the modern invention of carving by machinery. A machine patented in 1845 by Jordan is capable of copying any carved design that can be produced, so far as that is possible, by revolving tools; the finish is afterward given by hand labor.

**Cary**, ALICE (1820–1871), American novelist. She published several novels, including *Clover*nook, *Pictures of Country Life*, and *The Bishop's* Son, and wrote many domestic poems.

**Cary,** REV. HENRY FRANCIS (1772-1844), British author. In 1805 appeared his translation of Dante in English blank verse. He subsequently translated the *Birds of Aristophanes* and the *Odes of Pindar*. In 1826 he was appointed assistant librarian in the British Museum, and retired in 1837 on a pension of \$1,000 a year.

**Caryat'ides** (-dēz) (or Car'yatids), in architecture, figures of women dressed in long robes, serving to support entablatures. Corresponding male figures are *Atlantes*.

**Casale** (kā-sā'lā), a city of Northern Italy, province of Alessandria, on the Po, 18 mi. n.n.w. of Alessandria. Silk is the chief industry. Pop. 17,096.

**Casano'va**, GIOVANNI JACOPO, DE SEIN-GALT (1725-1798), known by his *Memoirs* as an adventurer who acted a prominent part in all situations, among all classes of society, and in all the large cities of Europe, by turns acting the part of diplomatist, preacher, abbot, lawyer, and charlatan.

**Casau'bon,** ISAAC DE (1559-1614), classical scholar. In his ninth year he spoke Latin fluently. In 1582 he became professor of the Greek language at Geneva. Henry IV invited him to Paris and made him royal librarian. After the death of Henry IV he followed Sir Henry Wotton, envoy extraordinary from James I, to England, where he was received with distinction, had two benefices and a pension conferred on him.

**Cascade Range**, a range of mountains in the U. S., British Columbia, and Alaska, near the Pacific coast, to which they are parallel, extending from the Sierra Nevada in California northward to Alaska. It contains several active volcances. Highest peak, Mount St. Elias. 19,500 ft. The highest peaks in the U. S. portion of it are in Washington, where Tacoma reaches 14,444 ft.

**Cascaril'la**, the aromatic bitter bark of a small tree of the nat. order Euphorbiaceæ. The name has recently been applied also to a subdivision of the genus *Cinchona*.

**Casco Bay**, a bay of Maine, between Cape Elizabeth on w.s.w. and Cape Small Point on e.n.e. Within these capes are more than 300 small islands, most of them very productive.

small islands, most of them very productive. **Case**, in grammar, a modification or inflection of a noun, pronoun, or adjective, by which a different shade of meaning is communicated to the word. In nouns and pronouns case supplies the place of prepositions, indicating the relation of the word thus modified to other words in the phrase or sentence. There is only one case in English for nouns, the possess-English pronouns have three ive or genitive. cases-nominative, genitive, and accusative. In Sanskrit there are eight cases. In French, Italian, Spanish, and Portuguese the nouns have no case inflections. In German there are four cases, nominative, genitive, dative, accusative.

**Case-hardening** is a process by which iron is superficially converted into steel, in such articles as require the toughness of the former conjointly with the hardness of the latter substance. The articles intended for case hardening are first manufactured in iron, and are then placed in an iron box, with charcoal in powder, and heated to redness. Immersion in water then converts the surface into a coating of steel.

**Casein** (kā'sē-in), that ingredient in milk which is coagulated by the action of acids and constituting the chief part of the nitrogenized matter contained in it. Cheese made from skimmed milk and well pressed is fully half casein. Casein is one of the most important elements of animal food as found in milk and leguminous plants. It consists of carbon 53.7 per cent., hydrogen 7.15, nitrogen 15.65, oxygen 22.65, and sulphur 0.85.

**Case mates**, in fortification, vaults which are proof against bombs, and which may serve as a place for keeping ordnance, ammunition, etc.

**Caser'ta** (or Caserta Nuova), the capital of the province of Caserta, South Italy, 18 mi. from Naples. The principal edifice is the royal palace, a large and richly-decorated structure, commenced in 1752 by Charles III of Spain. Pop. 31,349.

**Case Shot,** in artillery, is formed by putting a quantity of small iron balls into a cylindrical tin box called a *canister*, that just fits the bore of the gun. The shrapnel shell is a modern variety of case shot.

**Cashew'**, a tree common in the West Indies. Its fruit is called the cashew nut. The nut is

Digitized by Google

and the second second second

## Cashmere

small, kidney-shaped, ash-gray, and contains an acrid juice. It is used to flavor Madeira wine, and is eaten cooked in various ways.

Cashew Nut.

The stalk or receptacle of the nut is large and fleshy and has an agreeable acid flavor.

Cash'mere (or Kash'mir), an extensive principality in the n.w. of Hindustan, subject to a ruler belonging to the Sikh race. It is politically subordinate to the British-Indian em-pire. The principality embraces Cashmere, Jamoo or Jummoo, Baltistan or Little Thibet, Ladakh, Gilghit, etc. The area is estimated at 80,900 sq. mi. Cashmere proper, which forms a small portion of the whole, is a valley surrounded by mountains, the Himalaya and Hindu Kush, and traversed by the river There are ten chief passes through Jhelum. the mountains into this valley, varying in height from about 9,000 to 12,000 ft. The elevated situation of the valley, and the mountains of snow which surround it, render the climate rather cold; but the region is well watered by streams and very fertile. Forests on the slopes, fields of corn, rice crops along the sides of the rivers, rich orchards, and an abundant growth of flowers distinguish the district. Among its minerals are iron and plumbago. Sulphur springs are common. Earthquakes frequently occur, and in 1885 one caused the loss of thousands of lives. Bears, leopards, wolves, the ibex and chamois are among the animals. The common European fruits are grown, and attention is now being paid to the culture of the vine. The chief crops are wheat, barley, rice, and Indian corn, and two harvests are reaped in the year. The chief manufacture is that of the celebrated Cashmere shawl. The genuine Cashmere shawls owe their superiority to the material of which they are made, which is properly speaking not wool, but a fine kind of down with which the animals of this region are clad during the winter season, and which in length and fineness far surpasses the merino wool. This down is obtained in

## Cassareep

great quantities from the Cashmere goat, the yak of Thibet, and the wild sheep. It is spun by women and girls, and then passes into the hands of the dyers. From the dyers the yarns are passed to the weaver, and the shawl is woven in stripes which are afterward very skillfully sewed together. The average time taken to manufacture a good Cashmere shawl is from sixteen to twenty weeks. The inhabitants are a fine race physically. There are thirteen separate dialects in use. The capital of the whole principality is Jamoo. Srinagar (or Cashmere) is the maharajah's summer residence and largest town. Pop. 2,543,952.

**Cashmere Goat**, a variety of the common goat remarkable for its fine downy fleece, said to be found in perfection only in Thibet in the neighborhood of Lhassa, but also found in other parts of this region, including Ladakh, now a province of Cashmere. The colder the region where the goat pastures, the heavier is its fleece. A full-grown goat yields not more than 8 oz. A large shawl of the finest quality requires 5 lbs. of the wool; one of the inferior quality from 3 to 4 lbs.

**Casplan Sea**, a large lake or inland sea between Europe and Asia; area 170,000 sq. mi.; the largest isolated sheet of water on the globe. Its surface is 85 ft. below that of the Sea of Azof; greatest depth about 3,250 ft. Russian territory surrounds it on three sides, Persia on the fourth. It abounds in shallows, making navigation difficult. The water is less salt than that of the ocean, of a bitter taste, and of an ochre color, without ebb or flow. The fisheries are valuable. Steam packets are now established on it. The Russians have also a fleet of war ships in the Caspian.

**Cass.** LEWIS (1782-1866), an American statesman, b. in Exeter, New Hampshire. In 1813, having entered the army, he rose to the rank of general; in 1814-30 was governor of Michigan, was minister of war in 1831, was a candidate for the presidency several times, was long a senator, and in 1857-60 was secretary of state. He wrote the *History, Traditions, Lan*guages, etc., of Indians in the United States.

**Cassan'der** (B.C. 354-297), a king of Macedonia. He displaced his brother Polysperchon in the regency, removed in succession the mother, the wife, and the son of Alexander the Great to make way for himself to the throne. He married Thessalonica, Alexander's half-sister, and founded the city of that name in her honor.

**Cassan'dra**, in Greek legend, a daughter of Priam and Hecuba. She is fabled to have been endowed by Apollo with the gift of prophecy. She frequently foretold the fall of Troy, and warned her countrymen in vain against the strategem of the horse.

**Cas' sarcep** (Cassireep), the concentrated juice of the roots of the common or bitter cassava, flavored by aromatics and deprived of its poisonous properties by boiling. Used to give a relish to soups and other dishes, forming the basis of the West Indian "pepper pot." It is a powerful antiseptic, and very useful in keeping meat fresh in a tropical climate. **Cassa'va**, a South American shrub, about 8 ft in height, with broad, shining, and handshaped leaves, and beautiful white and rosecolored flowers. A nutritious starch is obtained from the white, soft root of the plant, and is called by the same name. It is prepared in the West Indies, tropical America, and in Africa. From cassava the tapioca of commerce is prepared. Another species, the sweet cassava, has roots the juice of which is an agreeable and nutritive food.

**Cas'sel** (or Kassel), formerly the residence of the elector of Hesse-Cassel, is now the chief town in the province of Hessen-Nassau, Prussia, on the Fulda, 91 mi. n.n.e. of Frankforton-the-Main. The city has manufactures of machinery, mathematical instruments. gold and silver wares, chemicals, knives, gloves, leather, porcelain, etc. Pop. 58,290.

**Cas' sia**, a large genus of leguminous plants found in the tropical parts of the world. The species consist of trees, shrubs, or herbs; the leaves are abruptly pinnated, and usually bear glands on their stalks. The leatlets of several species constitute the well-known drug called senna. The leaves and flowers are purgative. The bark and roots of several of the Indian species are much used in medicine. *Cassia bark* is a common name for the bark of au entirely different plant belonging to the laurel family. Its flavor resembles that of cinnamon, and as it is cheaper it is often substituted for it. The cassia of the Bible was probably cassia bark.

**Cas' sicus**, an American genus of insessorial birds, the Cassicans (American orioles), allied to the starlings, remarkable for the ingenuity with which they weave their nests. The crested oriole, a South American bird, constructs a pouch-shaped nest of the length of 30 in.

Cassi'ni, a name famous in astronomy and physics for three generations: 1, GIOVANNI DOMENICO (1625-1712), became professor of astronomy at the University of Bologna, but afterward settled in France. He discovered four new satellites of Saturn and the zodiacal light, proved that the axis of the moon is not perpendicular to the plane of the ecliptic, and showed the causes of her libration. 2, JACQUES. his son (1677–1756). After several essays on subjects in natural philosophy, etc., he completed his great work on Saturn's satellites and ring. His labors to determine the figure of the earth are well known. 3. CASSINI DE THURY, CESAR FRANÇOIS (1714-1784), son of the preceding, member of the Academy from his twenty-second year, undertook a geometrical survey of the whole of France, which was com-pleted by his son. 4, CASSINI, JEAN DOMI-NIQUE, COUNT DE THURY (1748-1845), son of the preceding, was a statesman and mathematician. In 1787 he completed the topographical work which was begun by his father.

**Cassi**' no, a game at cards somewhat resembling whist.

**Cassiodorus** (or Cassiodorius), MAGNUS AUER-LIUS, a Roman writer, of the fifth century A. D. He became chief minister of the Ostrogoth king Theodoric, and wrote a collection of letters, Variarum Epistolarum Libri XII, which contain most valuable information with regard to the Ostrogothic rule in Italy.

**Cassiopela** (- $p\bar{o}'ya$ ), a conspicuous constellation in the northern hemisphere, situated next to Cepheus, and often called the *Lady in her Chair*. It contains fifty-five stars, five of which, arranged in the form of a W, are of third magnitude.

**Cassiquiari** (kå-sik-i-ā're) (or Cassiquia're), a large river of South America, in Venezuela, which branches off from the Orinoco and joins the Rio Negro, a tributary of the Amazon. Length 130 mi.

**Cassiter' ides** (-děz), a name derived from the Greek kassiteros, tin, and anciently applied to the tin district of Cornwall, or the Scilly Isles.

**Cassit'erite**, an ore of tin widely distributed, and the one from which most of the metal is obtained. It is a peroxide, and consists of tin 79, oxygen 21.

**Cas' sius** (full name, CAIUS CASSIUS LONGI-NUS), a distinguished Roman, one of the assassins of Julius Cæsar. In the civil war that broke out between Pompey and Cæsar he espoused the cause of the former, and, as commander of his naval forces, rendered him important services. After the battle of Pharsalia he was apparently reconciled with Cæsar, but later was among the more active of the conspirators who assassinated him B.c. 44. He then, together with Brutus, raised an army, but they were met by Octavianus and Antony at Philippi. The wing which Cassius commanded being defeated, he imagined that all was lost, and killed himself, B.C. 42.

**Cas' sowary**, a family of birds akin to the ostrich, emeu, etc., among living, the moa and

Cassowary.

others among extinct, birds. The shortness of their wings totally unfits them for flying, and, like others of their order, the pectoral or wing muscles are comparatively slight and weak, while those of their posterior limbs are very robust and powerful.

**Cast**, in the fine arts, is an impression taken by means of wax or plaster of Paris from a statue, bust, bas relief, or any other model. When plaster casts are to be exposed to the weather their durability is greatly increased by saturating them with linseed oil, with which wax or resin may be combined.

**Casta'lla**, a celebrated fountain in Greece sacred to Apollo and the Muses, and fabled to have the power of inspiring those who drank its waters. It issues from a fissure between two peaked cliffs adjoining Mount Parnassus.

**Cas' tanets,** an instrument composed of two small concave shells of ivory or hardwood, shaped like spoons, placed together, fastened to the thumb, and beat with the middle finger. This instrument is used by the Spaniards and Moors as an accompaniment to their dances and guitars.

**Caste**, a term applied to a distinct class or section of a people marked off from others by certain restrictions, and whose burdens or privileges are hereditary. The word is derived from the Portuguese *casta*, a breed or race, and was originally applied to the classes in India whose occupations, customs, privileges, and duties are hereditary. It is probable that wherever caste exists it was originally grounded on a difference of descent and mode of living, and that the separate castes were originally separate races. It now prevails principally in India, but it is known to exist or to have existed in many other regions.

**Castelar'y Rissoli,** EMILIO, b. 1833, a Spanish statesman and author. In 1856 he was made professor of history in the University of Madrid, but becoming involved in the republican disturbances of 1866, he had to take refuge in Switzerland. Having gone back to Spain in 1868 he was returned to the Cortes in the following year. In 1873 he was elected president of the Republican Cortes, but resigned in January, 1874. After the pronunciamento in favor of Alphonso XII, Dec. 13, 1874, Castelar retired from Spain, but in a year or two returned, and has since been a member of the Cortes. He has published many novels, poems, and political works.

**Castel lamare.**—1, A seaport town of Italy, on the Gulf of Naples. It is fortified, and has a royal dockyard. manufactories of linen, silk, etc. Pop. 34,064. 2, A seaport on the north coast of Sicily, 20 mi. e. of Trapani. Wine, fruit, grain, oil, etc., are exported. Pop. 16,513.

**Castellon-de-la-Plana** (kås-tel-yon'), a town, Spain, capital of the province of Castellon, 40 mi. n.n.e. of Valencia. Manufactures of sailcloth, woolen and hempen fabrics, ropes, paper, soap, etc., and some trade in hemp. grain, and fruit. Pop. of town, 23,204; of province, 323,-474; area of latter, 2,445 sq. mi.

**Castel-Vetra**'no, a town, Sicily, province of Trapani. Industries: silk, linen, cotton, etc. The white wine produced in the neighborhood is esteemed the best in Sicily. Pon 22 448

is esteemed the best in Sicily. Pop. 22,448. **Castiglione** (kås-tēl-yō-nā), BALDASSARE. (1478-1529), one of the most elegant of the older Italian writers. Among his works the Libro del Cortegiano (Book of the Courtier) is the most celebrated.

**Castile** (kas-tēi'), an ancient kingdom of Spain, the nucleus of the Spanish monarchy, extends over a large part of the peninsula from the Bay of Biscay southward. It is divided into New Castile and Old Castile. The former occupies nearly the center of the peninsula; area 44,718 sq. mi. This ancient province now forms the five provinces of Madrid, Ciudad-Real, Cuenca, Guadalajara, and Toledo. Pop. 2,249,769. OLD CASTILE stretches from the Bay of Biscay to New Castile; area 25,-408 sq. mi. Old Castile now forms the provinces of Burgos, Logroño, Santander, Soria, Segovia, Avila, Palencia, and Valladolid. Pop. 1,719,349.

**Castillejo** (kas-til-yā' $h\bar{0}$ ), CRISTO'VAL DE (1494-1556), a Spanish poet. His works possess great originality, and his language is pure and manly, yet sparkling with wit and satire.

**Casting,** the running of melted metal into a mold prepared for the purpose, so as to produce an article of a certain shape. For the various processes, see *Iron*, *Bronze*, *Brass*, *Steel*, etc.

**Cast iron**, the name given to the iron obtained from the blast furnace by running the fused metal into molds prepared for the purpose. The molds are in the form of long narrow channels, from which the iron, when it has cooled and solidified, is taken in bars called *pigs*, between 3 and 4 ft. long and 3 or 4 in. broad.

**Castle**, an edifice serving at once as a residence and as a place of defense, especially such an edifice belonging to feudal times. The first defense of a castle was usually the moat or ditch that sometimes comprised several acres; and behind it was the outer wall, generally of great height and thickness, strengthened with towers at regular distances, and pierced with loopholes through which missiles could be discharged at the assailants. The main entrance through the outer wall was protected by the barbican, with its narrow archway, and strong gates, and portcullis, and inside there were usually an outer and an inner court, and the strong, more or less detached building known as the keep, which formed the residence of the owner and his family. This was the most strongly constructed of all the buildings, to which the defenders retreated only in the last extremity. The walls were all strengthened by towers, either circular, square, oblong, or multangular. projecting both outward and inward. Such towers were capable of being defended independently of the castle. The gatehouses are distinct works covering the entrance; they contain gates, one or two portcullises, and loopholes raking the passage. From the front of these gatehouses the drawbridge was lowered over the ditch. The gate-ways had frequently a barbican attached. This was a passage between high walls, in advance of the main gate, and having an outer gate of entrance, which was defended by towers and the parapet connected with the main gateway. The top of the wall was de-

### Castletown

fended by a battlemented parapet, and frequently pierced by cruciform loopholes.

**Castletown**, a small town and seaport near the southern extremity of the Isle of Man, long the capital of the island. In the center is Castle Rushen, originally a Danish fortress of the tenth century, latterly much extended, and now partly used as a prison and public offices. Pop. 2,243.

**Castor and Pollux,** in Greek mythology, twin divinities, sons of Zeus (Jupiter) and Leda, also called Dioscūri (sons of Zeus). Castor was mortal, but Pollux was immortal. They were the patron deities of mariners. In the heavens they appear as one of the twelve constellations of the zodiac, with the name of *Gemini* (the Twins).

**Castor and Pollúx** are two minerals which are found together in granite in the island of Elba. Castor is a silicate of aluminum and lithium, pollux is a silicate of aluminum and the rare element cæsium.

**Castor oil,** the oil obtained from the seeds of a plant, a native of India, but now distributed over all the warmer regions of the globe. The oil is obtained from the seeds by bruising and pressing. The oil that first comes away, called cold-drawn castor oil, is reckoned the

Castor Oil Plant.

best. The oil is afterward heated to the boiling point, which coagulates and separates the albumen and impurities. Castor oil is used medicinally as a purgative. It is chiefly imported from India. The plant is often cultivated as an ornamental plant.

**Castro**, INEZ DE, a lady of noble birth, secretly married to Pedro, son of Alphonso IV, king of Portugal, after the death of his wife Constantia (1345). The old King Alphonso, fearful that this marriage would injure the interests of his grandson Ferdinand (the son of Pedro by his deceased wife), resolved to put Inez to death.

**Casuari na** (or Botany Bay Oak), the single genus of the Cassowary trees. There are about thirty species, natives chiefly of Australia. They are jointed leafless trees or shrubs, nearly related to the birches, having their male flowers in whorled catkins and their fruits in indurated cones.

**Cat**, a well-known domesticated quadruped, the same name being also given to allied forms of the same order. It is believed that the cat was originally domesticated in Egypt, and the gloved cat of Egypt and Nubia has by some

#### Catacombs

been considered the original stock of the domestic cat, though more probably it was the Egyptian cat. Some have thought that the domestic breed owed its origin to the wild cat. The domestic cat belongs to a genus-that which contains the lion and tiger-better armed for the destruction of animal life than any other quadrupeds. The short and powerful jaws, trenchant teeth, cunning disposition. combined with nocturnal habits (for which their eyesight is naturally adapted) and much patience in pursuit, give these animals great advantages over their prey. The cat in a advantages over their prey. The cat in a degree partakes of all the attributes of her race. Its food in a state of domestication is necessarily various, but always of flesh or fish if it can be obtained. It is a very cleanly animal. Its fur is easily injured by water on account of the want of oil in it, and it can be rendered highly electric by friction. It is usually regarded as less intelligent than the dog, but this is by no means certain. It has a singular power of finding its way home when taken to a distance and covered up by the way. Among the various breeds or races of cat may be mentioned the tailless cat of the Isle of Man (and the Crimea); the tortoise shell, with its color a mixture of black, white, and brownish or fawn color; the large Angora or Persian cat, with its long, silky fur; and the blue or Carthusian, with long, soft, grayishblue fur.

Catacombs, caves or subterranean places for the burial of the dead, the bodies being placed in graves or recesses hollowed out in the sides of the cave. Caves of this kind were common among the Phœnicians, Greeks, Persians, and many Oriental nations. In Sicily and Asia Minor numerous excavations have been discovered containing sepulchers, and the catacombs near Naples are remarkably extensive. Those of Rome, however, are the most im-portant. The term catacumbre is said to have been originally applied to the district near Rome which contains the chapel of St. Sebastian, in the vaults of which, according to tradition, the body of St. Peter was first deposited, but it is now applied in a special way to all the extensive subterranean burial places in the neighborhood of Rome, which extend underneath the town itself as well as the neighboring country, and are said to contain not less than 6,000,000 tombs. They consist of long narrow galleries usually about 8 ft. high and 5 ft. wide, which branch off in all directions, forming a perfect maze of corridors. Different stories of galleries lie one below the other. Vertical shafts run up to the outer air, thus introducing light and air, though in small quantity. The graves or *loculi* lie longwise in the gallerics. They are closed laterally by a slab, on which there is occasionally a brief inscription or a symbol, such as a dove, an anchor, or a palm branch, and sometimes all. The earliest that can be dated with any certainty belongs to the year 111 A.D. It is now regarded as certain that in times of persecution the early Christians frequently took refuge in the catacombs, in order to celebrate there

## Catalani

in secret the ceremonics of their religion; but it is not less certain that the catacombs served also as ordinary places of burial to the early Chrisians, and were for the most part excavated by the Christians themselves. In early times rich Christians constructed underground burying places for themselves and their brethren, which they held as private property under the protection of the law. But in course of time, partly by their coming under the control of the church and partly by accidents of pro-prietorship, these private burying grounds were connected with each other, and became the property, not of particular individuals, but of the Christian community. In the third century A.D. there were already several such common burying places belonging to the Christian congregations, and their number went on increasing till the time of Constantine, when the catacombs ceased to be used as burying places.

**Catala' ni,** ANGELICA (1779-1849), one of the most celebrated of Italian female singers. Family misfortunes compelled her to turn her remarkable voice to account, and in her 16th year she made her first appearance on the stage at Venice. After filling the chief soprano parts in the best opera houses of Italy she visited successively Madrid, Paris, and London, enjoying everywhere great professional triumphs, as she continued to do in similar tours which she repeatedly made afterward.

**Catalaunian Plain**, the wide plain around Chálons-sur-Marne, famous as the field where Attius, the Roman general, and Theodoric, king of the West Goths, gained a complete victory over Attila, 451 A.D.

**Catalep'sy**, a spasmodic disease, generally connected with hysteria, in which there is a sudden suspension of the senses and volition, with a statue-like fixedness of the body and limbs in the attitude immediately preceding the attack, while the action of the heart and lungs continues, and the pulse and temperature remain natural. It is generally the consequence of some other disease, or of a constitution enfeebled by the gradual operation of unobserved causes.

**Catalo nia,** an old province of Spain. Wheat, wine, oil, flax, hemp, vegetables, and almost every kind of fruit are abundant. There are mines of lead, iron, alum, etc. On the coast is a coral fishery. Catalonia stands preeminent for the industry of its inhabitants. Pop. 1,843,549; area 12,480 sq. mi. It comprises the modern provinces of Tarragona, Gerona, Lerida, and Barcelona.

**Catal pa**, a genus of plants, with simple leaves and large, gay, trumpet-shaped flowers. *C. syringifolia*, a North American species, is well adapted for large shrubberies, and has been introduced into England and other parts of Europe. *C. longissima* contains much tannin in its bark, and is known in the West Indies by the name of French oak.

**Catalysis** (or Contact Action), the chemical change which occurs when one body decomposes another without being itself changed;

## Cataract

thus oxide of cobalt decomposes a solution of bleaching powder into chloride of calcium and oxygen, itself remaining without change.

**Catamaran'**, a sort of raft used in the East Indies, Brazil, and elsewhere. Those of the island of Ceylon, like those of Madras and other parts of that coast, are formed of three logs lashed together. Their length is from 20

Indian Catamaran.

to 25 ft., and breadth  $2\frac{1}{4}$  to  $3\frac{1}{4}$  ft. The center log is much the largest, and is pointed at the fore end.

**Catamar'ca**, a province of the Argentine Republic, South America; area about 31,500 sq. mi.; mountainous in all directions except the south. Pop. 102,000. The capital is Catamarca, or more fully San Fernando de Catamarca. Pop. about 6,000.

**Cat'amount** (or Catamountain), the wild cat. The name is also given to the tiger or the puma.

Cata'nia, a city on the east coast of Sicily, in the province of Catania, at the foot of Mount Etna. It has been repeatedly visited by tremendous earthquakes, one of the worst of which was in 1693, when 18,000 people were destroyed, and has been partially laid in ruins by lava from eruptions of Mount Etna. The ruins of the amphitheater, which was more extensive than the Colosseum at Rome, are still to be seen, as also the remains of the theater, baths, aqueducts, sepulchral chambers, hippodrome, and several temples. The harbor was choked up by the eruption of 1669, so that for larger vessels there is nothing but a roadstead. In spite of this Catania has a considerable trade, and exports wheat, barley, wine, oil, etc. Pop. 103,715. Area of the province, 1,917 sq. mi.; pop. 656,827.

**Catanza** ro, a cathedral city, South Italy, capital of province of the same name, on a height, 5 mi. from the Gulf of Squillace, with manufactures of silk and velvet, and some trade in wheat, wine, oil, etc. Pop. 28,960. Area of prov. 2,030 sq. mi.; pop. 462,987.

**Cat'apult**, a machine of the ancients for projecting missiles, chiefly arrows. They may be described as a kind of gigantic cross-bows. *Balista* were engines somewhat similarly constructed, but were chiefly confined to the shooting of stones.

**Cat' aract**, a disease of the eye, consisting in an opacity of the crystalline lens, or its capsule, or both. It is quite different from amaurosis, which is a disease of the retina. In cataract the leus becomes opaque, and is no longer capable of transmitting the light. Its earliest approach is marked by a loss of the natural color of the pupil, and when developed it causes the

pupil to have a milk-white or pearly color. It is most common in old or elderly people, and is quite painless. Cataract is treated by different surgical operations, all of them consisting in removing the diseased lens from its situation opposite the transparent cornea. couching, the lens is depressed, removed downward, and kept from rising by the vitreous humor; but this method is now almost entirely given up in favor of removal of the lens by extraction. Extraction consists in making an incision in the cornea, and in the capsule of the lens, by which the lens may be brought forward, and through the cut in the cornea, so as to be altogether removed. The third opera-tion is by *absorption*. This consists in wounding the capsule, breaking down the crystalline, and bringing the fragments into the anterior chamber of the eye, where they are exposed to the action of the aqueous humor, and are at length absorbed and disappear. Extraction is now the regular method, and after it is effected a special kind of spectacles is required.

Cat'aract (or Waterfall), the leap of a stream over a ledge or precipice occurring in its course. Many cataracts are remarkable for their sublimity, the grandest being the Falls of Niagara, on the Niagara River between lakes Erie and Ontario, and between the U. S. and Canada, the river having there a fall of about 160 ft. Among other notable falls are those of the river Montmorency, a tributary of the St. Lawrence, which are 242 ft. in height; that of the river Potaro, in British Guiana, about 822 ft. high and 369 broad; that of the Yosemite River, California, which makes a perpendicular leap of 2,100 ft.; the Victoria Falls, on the river Zambezi, in South Africa, The about 370 ft. high and 1,860 yds. broad. cataract of the Riukanfoss, on the river Maan, in Norway, is about 900 ft. high. The cascade of Gavarnie, in the Pyrenees, is reputed the The loftiest in Europe, being about 13,000 ft. fall of the Staubbach at Lauterbrunnen, in Switzerland, is between 800 and 900 ft., but has also a very small volume of water; the falls of the Rhine at Schaffhausen, renowned over Europe, are 300 ft. broad and nearly 100 ft. in height. In Italy the Falls of Terni, on the Velino, and those of the Anio, at Tivoli, are artificial but very beautiful. Among British waterfalls, the falls of the Clyde, three in pumber, viz., Bonniton Linn, 30 ft., Corra Linn, 84 ft., and Stonebyres Linn, 80 ft., are remarkable for their beauty and grandeur.

**Catarrh** (kå-tär') (I flow down), an increased secretion of mucus from the membranes of the nose, fauces, and bronchi, accompanied with fever, and attended with sneezing, cough, thirst, lassitude, and want of appetite. There are two species of catarrh, one which is very common, and is called a *cold in the head*; and another, the influenza, or epidemic catarrh.

**Cataw' ba**, a river in North Carolina, giving its name to a light wine of rich Muscadine flavor, which has acquired some celebrity in the U. S., the grape from which it is made having been first discovered near its sources.

Cat Bird, a well-known species of American

thrush, which during the summer is found throughout the Middle and New England states, frequenting thickets and shrubberies. Its note is strikingly similar to the plaint of a kitten in distress. The plumage is a deep slate color above and lighter below, and it is about 9 in. in length. In habit it is lively, familiar, and unsuspicious: the song is largely imitative of those of other birds. During the winter it inhabits the extreme south of the U. S., and is found also in Mexico and Central America.

**Cateau-Cambrésis** (kä-tō-kán-brā-sis), a town, France, dep. Nord, famous for the treaty of its name signed here in 1559, by which Henri II of France gave up Calais to the English, and agreed to a mutual exchange with Spain of all conquered territories. It has various textile manufactures. Pop. 10,544.

Catechism, an elementary book containing a summary of principles in any science or art, but particularly in religion, reduced to the form of questions and answers. The first regular catechisms appear to have been compiled in the eighth and ninth centuries, those by Kero of St. Gall and Otfried of Weissenburg being most famous. Among Protestants the catechisms of Luther (1518, 1520, and 1529) acquired great celebrity, and continue to be used in Germany. The catechism of the Church of England in the first book of Edward VI, March 7, 1549, contained merely the baptismal vow, the creed, the ten commandments. and the Lord's prayer, with explanations, the part relative to the sacraments being subjoined at the revision of the liturgy during the reign The catechism of the Church of of James I. Scotland is that agreed upon by the Assembly of Divines at Westminster, with the assistance of commissioners from the Church of Scotland, and approved of by the General Assembly in the year 1648. What is called the Shorter Catechism is merely an abridgment of the Larger, and is the one in most common use. The best known catechism among Protestant Dissenters was that of Doctor Watts.

**Cat'egory** (or Predicament), in logic, an as-semblage of all the beings contained under any genus or kind ranged in order. The ancients, following Aristotle, held that all beings or objects of thought may be referred to ten categories, viz.: quantity, quality, relation, ac-tion, passion, time, place, situation, and habit. Plato admits only five: substance, identity, diversity, motion, and rest; the Stoics four: subjects. qualities, independent circumstances, relative circumstances. Descartes suggested seven divis-ions: spirit, matter, quantity, substance, figure, motion, and rest. Others make but two categories, substance and attribute, or subject and accident; or three, accident being divided into the inherent and circumstantial. In the philosophy of Kant the term categories is applied to the primitive conceptions originating in the understanding independently of all experience, though incapable of being realized in thought except in their application to experience. These he divides into four classes: quantity, quality. relation, and modality. J. S. Mill applies the term categories to the most general

heads under which everything that may be asserted of any subject may be arranged. Of these he makes five: existence, co-existence, sequence, causation, and resemblance, or, considering causation as a peculiar case of sequence, four.

**Cat'enary Curve,** that curve which is formed by a cord or chain of uniform density and thickness when allowed to hang freely between two points. It is of interest as bearing on the theory of arches and domes, and as the curve assumed by the chains of a supension bridge.

Caterpillar, the larval stage of butterflies and moths, and the representative in this special order of the grub, maggot, or larva phase in the life history of many insects. The caterpillar, so familiar in its external appearance, has usually 12 body rings, not including the head, is provided with strong biting jaws, strikingly contrasted with the mouth organs of the adult, has three pairs of five-jointed clawed legs on the region corresponding to the thorax, and usually five rudimentary stumps or pro-legs on the abdomen. These unjointed appendages are borne on the sixth to the ninth, and on the twelfth segments of the body; some of them may be absent; in the majority of cases they are adapted for clambering. The cases they are adapted for clambering. body may be naked or covered with hairs, bristles, and spines, which, in caterpillars living an exposed life, are usually brightly colored. The large head is divided by a median line, and bears six eye-spots on each side, a pair of short three-jointed feelers, strong upper jaws or mandibles, besides jointed palps onthe two successive pairs of mouth appendages. Two well-developed spinning organs open on the second pair of maxillæ forming the lower lip. On each side, on the first ring, and on the fourth to the eleventh, there are nine pairs of openings into the respiratory air tubes. The colors are familiarly bright in many instances. The surface is often beautifully marked longitudinally, or transversely, or with ring spots and eye spots. Odoriferous and other glands frequently occur on the skin, and are in some cases eversible. Most caterpillars lead an active life, some roving only at night, others also in the daytime. Their movements are guided by an appreciation of the force of gravitation; they usually crawl upward; and they always know their food-plant when they come to it. Their ravages among vegetables and other plants are only too well known. Some forms are carnivorous.

**Catfish**, a remarkably voracious fish, belonging to the family of gobies, the name common to several North American fish. Is known also as the *Horned Pout* and *Bullhead*. It is excellent eating.

**Cat'gut,** a cord made from the intestines of sheep, and sometimes from those of horse, ass, and mule, but not from those of cats. The manufacture is chiefly carried on in Italy and France by a tedious process. Catgut for stringed instruments, as violins and harps, is made mostly in Milan and Naples, the latter having a high reputation for treble strings. **Catharine I,** Empress of all the Russias (1684-1727). She was the daughter of poor parents, who died when she was three years old. In 1701 she married a dragoon of the garrison of Marienburg. The town was taken by the Russians in 1702, and C. was sent with others to Moscow, where she first saw Peter the Great. She now dropped her real name, Martha Rabe, was baptzied in the Greek Church, and took the name of Jékatérina Alexélevna. Peter married her in 1711. She was afterward crowned at Moscow, 1724; and on her husband's death she became empress.

Catharine II (1729-1796), Empress of Russia. In 1745 she was married to Peter, nephew and successor of the Russian Empress Elizabeth. on whose death in 1762 her husband succeeded as Peter III. In danger of being supplanted by the Countess Woronzoff, Catharine, with the assistance of her lover, Gregory Orloff, and others, won over the guards and was pro-claimed monarch (July, 1762). On the death of Augustus III of Poland she caused her old favorite, Poniatowski, to be placed on the throne with a view to the extension of her influence in Poland, by which she profited in the partition of that country in the successive dismemberments of 1772, 1793, and 1795. By the war with the Turks, which occupied a considerable part of her reign, she conquered the Crimea and opened the Black Sea to the Russian navy. Her dream, however, of driving the Turks from Europe and restoring the Byzantine Empire was not to be fulfilled. Her relations with Poland and with other European powers induced her to make peace with Turkey in 1792. She appears to have been successful in improving the administration of justice, ameliorated the condition of the serfs, constructed canals, founded the Russian Academy, and in a variety of ways contributed to the enlightenment and prosperity of the country. Her enthusiasm for reform, however, was summarily checked by the events of the French Revolution; and the dissipation and extravagance of her court were such that there was even a danger of its exhausting the empire. Of her many advisers Potemkin was longest in favor, retaining his influence from 1775 till his death in 1791, directing Russian politics throughout that period in all essential matters. Catharine de Medici (dā-med'i-chē) (1519-

1589), wife of Henry II, king of France, the only daughter of Lorenzo de Medici, duke of Urbino, and the niece of Pope Clement VII. She was married to the duke of Orleans, afterward Henry II, in 1533. The death of Francis placed the reins of government, during the minority of her son Charles IX, in her hands. Wavering between the Guises, who had put themselves at the head of the Catholics, and Condé and Coligny, who had become very powerful by the aid of the Protestants, she played off one faction against the other in the hope of increasing her own power; and the thirty years of civil war which followed were mainly due to her. Her influence with Charles IX was of the worst kind, and the massacre of St. Bartholomew's Day was largely her work.

**Catharine Howard** (1522-1542), queen of England, fifth wife of Henry VIII, daughter of Lord Edmund Howard, son of the duke of Norfolk. Her beauty and vivacity induced the king to marry her in 1540, but her conduct appears to have been of a dubious kind both before and after marriage, and in 1542 she was executed for impropriety of conduct.

was executed for impropriety of conduct. **Catharine of Aragon** (1485-1536), queen of England, the youngest daughter of Ferdinand of Aragon and Isabella of Castile. In 1501 she was married to Arthur, prince of Wales, son of Henry VII. Her husband dying about five months after, the king unwilling to return her dowry, caused her to be contracted to his remaining son, Henry, and a dispensation was procured from the pope for that purpose. On his accession to the throne as Henry VIII in 1509 she was crowned with him, and despite the inequality of their ages retained her ascendency with the king for nearly twenty years. Her children, however, all died in infancy, excepting Mary, and on the advent of Anne Boleyn, Henry affected to doubt the legality of his union with Catharine.

**Catherine Parr** (1512-1548), sixth and last wife of Henry VIII of England, had had two husbands before she became Henry's queen in 1543. After the death of the king, she espoused the lord admiral, Lord Thomas Seymour, uncle to Edward VI; but the union was an unhappy one.

Cathe' dral, the principal church of a diocese, so called from its possessing the episcopal chair or cathedra. This is really what distinguishes a cathedral from other churches, though most cathedrals are also larger and more elaborate structures than ordinary churches, and have various dignitaries and functionaries connected with them. As regards architecture cathedrals naturally vary much. Those in England are almost all in the Gothic style, cruciform or cross-shaped in arrangement, and having connected with them a chapter house, side chapels (varying in number and position), cloisters, crypt, etc. This style and arrangement are also common on the continent of Europe, and in most modern cathedrals; but the Romanesque, Renaissance, and Byzantine styles of architecture are also employed. Many cathedrals furnish the most magnificent examples of the architecture of the Middle Ages. Among the most noted cathedrals are St. Peter's, the largest of all, founded 1450; the cathedral at Milan, founded in 1386, built of white marble; the cathedral at Florence, begun about 1294, one of the finest specimens of the Italian-Gothic style; Cologne cathedral, commenced in 1248 (and only finished recently); Notre Dame, at Paris, begun 1163; and those of Amiens, Chartres, and Rheims. The most noteworthy English cathedrais are St. Paul's, London (1675-1711), in the Renaissance style, and those of Canterbury, Ely, Exeter, Lichfield, Lincoln, Norwich, Salisbury, Wells, Westminster, and York. The cathedrals of Glasgow and Kirkwall are the only entire cathedrals in Scotland, exclusive of modern edifices.

**Cathetom 'eter**, an instrument for measuring small differences of level between two points; in its simplest form, a vertical graduated rod upon which slides a horizontal telescope. With the telescope the observer sights the two objects under examination, and the distance on the graduated rod moved over by the telescope is the measure of the distance of height between the two objects.

Catholic Church.-The term catholic literally signifies "universal." The phrase Catholic Church is therefore equivalent to "universal church," and cannot properly be applied to any particular sect or body, such as the Roman, Anglican, Genevan, Reformed, Lutheran, or Presbyterian, all of which form merely portions more or less pure of the "church universal." It occurs for the first time in the pseudo-Ignatian Epistle to the Smyrnaans. It was first employed from about 160 A. D. to mark the difference between the orthodox "univer-" Christian church and the various sects of sal the Gnostic heretics; though, afterward, it served also to distinguish the all-embracing Christian church from the religious exclusiveness of the pre-Christian ages, in which the church was restricted to a single nation.

Cat'iline(Lucius Sergius Catilina) (B.C. 108-62), a Roman conspirator, of patrician rank. In his youth he attached himself to the party of Sulla, but his physical strength, passionate nature, and unscrupulous daring soon gained him an independent reputation. He was elected prætor in B.C. 68, and governor of Africa in 67. In B.C. 66 he returned to Rome to contest the consulship, but was disqualified by an impeachment for maladministration in his province. Urged on by his necessities as well as his ambition, he entered into a conspiracy with other disaffected nobles. The plot, however. was revealed to Cicero, and measures were at once taken to defeat it. Thwarted by Cicerc at every turn, and driven from the senate by the orator's bold denunciations, Catiline fled, and put himself at the head of a large but illarmed following. The news of the suppression of the conspiracy and execution of the ringleaders at Rome diminished his forces, and he led the rest toward Gaul. Metellus Celer threw himself between the rebels and their goal, while Antonius pressed upon their rear, and, driven to bay, Catiline turned upon the pursuing army and perished fighting. **Catinat** (ka-ti-nä), NICHOLAS (1637-1712), marshal of France. He attracted the notice

**Catinat** (ká-ti-nä), NICHOLAS (1637-1712), marshal of France. He attracted the notice of Louis XIV at the storming of Lille (1667). and by his conduct, especially at the battle of Senef, gained the friendship of Condé. He was sent as lieutenant general against the Duke of Savoy, gained the battles of Staffardo (1690), and Marsaglia (1693), occupied Savoy and part of Piedmont, and was made marshal in 1693. In Flanders he displayed the same activity, and took Ath in 1697. In 1701 he received the command of the army of Italy against Prince Eugene; but his ill-furnished forces were defeated at Carpi, and he was disgraced,

Cat Island, one of the Bahama Islands,

about 46 mi. in length from n. to s., and 3 to 7 in its mean breadth. Pop. 3,000. It was long thought that it was the Guanahani, or San Salvador, where Columbus first touched the New World in 1492.

**Catlin**, GEORGE (1796-1872), the delineator of the Indians. After practising as a lawyer for two years, he set up at New York as a portrait painter, and in 1832 commenced special studies of Indian types, residing many years among them both in North and South America. His finely-illustrated works are: Manners, Customs, and Condition of the North American Indians; North American Portfolio; Eight Years' Tratel in Europe; Last Rambles among the Indians; etc.

**Catimint** (or catnip), a plant of the natural order Labiatæ, widely diffused throughout North America, Europe, etc. It grows erect to a height of 2 or 3 ft., has whorls of rosetinged, whitish flowers, and stalked, downy, heart-shaped leaves. It has much the same fascination for cats as valerian root.

**Cato**, DIONYSIUS, the reputed author of the small collection of moral apophthegms known as *Catonis Disticha de Moribus ad Filium*. Nothing is known of him; but the work, which is apparently in large part a genuine classic, had a high reputation in the Middle Ages.

Cato, MARCUS PORCIUS, the Censor (B.C. 234-149), surnamed Priscus also Sapiens, and Major (the Wise, and the Elder), a celebrated Roman. He inherited from his father, a plebeian, a small estate in the territory of the Sabines. He served his first campaign, at the age of seventeen, under Fabius Maximus, was present at the siege of Capua in 214 B. C.; and five years after fought under the same commander at the siege at Tarentum. After the war was ended, he returned to his farm, but by the advice of Valerius Flaccus removed to Rome, where his forensic abilities had free scope. He rose rapidly, accompanied Scipio to Sicily as quæstor, became an ædile, and in 198 was chosen prætor, and appointed to the province of Sardinia. Three years later he gained the consulship, and in 194 for his brilliant campaign in Spain obtained the honor of a triumph. In 191 he served as military tribune against Antiochus, and then returned to Rome. For some years he exercised a practical censorship, scrutinizing the characters of candidates for office, and denouncing false claims, peculations, etc. His election to the censorship in 184 set an official seal to his efforts, the unsparing severity of which has made his name proverbial. From that year until his death, he held no public office, though zealously continuing his unofficial labors for the state. Cato, MARCUS PORCIUS (B.C. 95-46) (called Cato of Utica, the place of his death, to distinguish him from the censor, his great-grand-father), a distinguished Roman. He formed an intimacy with the Stoic Antipater of Tyre, and ever remained true to the principles of the Stoic philosophy. He distinguished him-self as a volunteer in the war against Sparta-

cus, served as military tribune in Macedonia

in B.C. 67, was made quæstor in B. c. 65. His rigorous reforms won him general respect, and in B.C. 63 he was chosen tribune of the people. During the troubles with Catiline Cato gave Cicero important aid both by his eloquence and sagacity, and at the same time set himself to thwart the ambitious projects of Pompey, Cæsar, and Crassus. To get rid of him they sent him to take possession of Cyprus, but, having successfully accomplished his mission, he returned, opposed the Tribonian law for conferring extraordinary powers on the triumvirs, and in 54 B.C. enforced as prætor, an obnoxious law against bribery. On the breach between Pompey and Cæsar he threw in his lot with Pompey, and guarded the stores at Dyrrhachium, while Pompey pushed on to Pharsalia. After receiving news of Pompey's defeat he sailed to Cyrene and effected a junction with Metellus Scipio at Utica, in B.c. 47. He took command of that city, but its defense appearing hopeless after the defeat of Scipio at Thapsus, he determined on suicide, and after spending some time in the perusal of the Phædo of Plato, stabbed himself with his sword.

**Cat's-eye**, a mineral, a variety of quartz, very hard and semitransparent, and from certain points exhibiting a yellow opalescent radiation or *chatoyant* appearance resembling a cat's eye.

**Catskill**, Greene co., N. Y., on Hudson River, 36 mi. s. of Albany. Railroads: Central Hudson; N. Y. W. S. & B.; and Catskill Mts. & Cairo. Industries: vitrified paving brick, iron foundry, two knitting mills, sash and door factory, brickyards, electric light and gas plants. Surrounding country agricultural. The village was first settled about 1650 by the Dutch. Pop. est. 1897, 5,400.

**Catskill Mountains,** a fine range of mountains in New York state. They lie on the west side of and nearly parallel to the Hudson, from which their base is, at the nearest point, 8 mi. distant. The two most elevated peaks are Round Top and High Peak: the former 3,804 ft., the latter 3,718 ft. high. The Dunderberg is the scene of Washington Irving's inimitable *Rip Van Winkle*.

**Čat'tegat**, a large gulf of the North Sea, between Denmark and Sweden. It is noted for its herring fishery.

**Cattle**, a term applied collectively to the larger domestic quadrupeds, and often exclu-

Shorthorn Bull and Cow. sively to those of the ox genus. The cattle of the U. S. and Canada present almost endless

## Cattle

variety of form and character. They are descended from importations of cattle from Spain, Holland, Sweden, Denmark, France, and England, Scotland, and Ireland. About the year 1525, some six years after the discovery of Mexico by the Spaniard Cortez, cattle were introduced into that country from Spain, and in the abundant pasturage of the Mexican territory they increased rapidly, spreading with the enterprising Spanish settlers into Texas, California, and other parts of the far

Hereford Bull and Cow.

West. Exactly 100 years later the Dutch settlers in New York brought cattle thither from Holland, and a few years earlier small importations of cattle had been made from the West India Islands into Virginia. The earliest of these arrivals in Virginia are assigned to 1610 and 1611, but that colony was broken up in 1622 by the Indians, who massacred 347 men, women, and children, and, it is presumed, also destroyed their cattle. In 1624—four years after the landing of the English Plymouth colony there—cattle were introduced into Massachusetts from England, and many other importations followed during the next few years. The Swedes brought cattle into Delaware in 1627, and in 1631 the two following years Danish emigrants introduced cattle from their enative country into New Hampshire. English emigrants settled in Maryland in 1633, in

Galloway Bull.

Jersey Cow.

North and South Carolina in 1660 and 1670, and in Pennsylvania in 1682, and took with them, or had sent after them, large numbers of English cattle. The French colonists brought cattle into Quebec as early as 1608; and toward the close of the seventeenth century fresh importations of European cattle poured into the great American continent. There is no authentic information as to the character of the cattle first introduced into America, but all the leading breeds of the British Isles, as well as the chief milking breeds of the European continent, are now strongly repre-

## **Caudine Forks**

sented in North America: Hereford, Polled Aberdeen, Angus, Galloway, Devon, Norfolk and Suffolk Red Polls, Jersey, and Dutch breeds. The Texan cattle still retain the rough, coarse character which distinguished their Spanish ancestors. Improvement among the Texan cattle is proceeding very slowly.

the Texan cattle is proceeding very slowly. **Catul'ius**, CAIUS (or QUINTUS) VALERIUS. (B. C. 94-54), a famous Roman lyric poet. Almost all the known details of his life are derived by inference from his works, and relate to such matters as his passion for Lesbia, his journey to Bithynia, and voyage home in his yacht, his pleasant villa on Lake Benacus, etc. He was the first of the Romans who successfully caught the Greek lyric spirit, and gave to Roman literature its most genuine songs.

**Cauca**, (kou'kå), a S. A. river in Colombia, an important tributary of the Magdalena: length 600 to 700 mi. It gives its name to a department or state of Colombia; area 52,000 sq. mi.; pop. 450.000. **Caucasian Race**, a term introduced into eth-

**Caucasian Race**, a term introduced into ethnology by Blumenbach, in whose classification of mankind it was applied to one of the five great races into which all the different nations of the world were divided. Blumenbach believed this to be the original race from which the others were derived, and he gave it the epithet of Caucasian because he believed that its most typical form—which was also that of man in his highest physical perfection—was to be met with among the mountaincers of the Caucasus. In later classifications this "race" is usually divided into Aryan or Indo-European, and Semitic. Most of the tribes inhabiting the Caucasus belong to the Turanian class.

**Cau'casus**, a chain of mountains which gives name to a lieutenancy under Russian government lying to the southeast of Russia proper, between the Black Sea and the Caspian. The total area of the lieutenancy is 179,527 sq. mi. and the pop. about 5,500,000. The Causasus chain of mountains traverses the lieutenancy from northwest to southeast through a length of 700 miles. The heights of the chief summits are Elbruz, 18,572 ft; Koshtan-tau, 17,123; Dych-tau, 16,928; Kasbek, 16,-540.

**Caucus**, a term, originally American, for a private meeting of citizens to agree upon candidates to be proposed for election to offices or to concert measures for supporting a party. Its origin is referred to a fray between some British soldiers and Boston rope makers in 1770, which resulted in democratic meetings of rope makers and caukers, called by the Tories caucus meetings.

**Cau dex,** in botany, the stem of a tree, more especially the scaly trunk of palms and tree ferns. It often appears as a rhizome running along the surface of the earth or underground.

**Caudine Forks,** a pass of Southern Italy, in the form of two lofty fork-shaped defiles, in the Apennines (now called the valley of Arpaia), into which a Roman army was enticed by the Samnites, B.C. 321, and being hemmed in was forced to surrender.

**Cau' liflower**, a garden variety of cabbage, in which cultivation has caused the inflorescence to assume when young the form of a compact, fleshy head, which is highly esteemed as a table vegetable. Broccoli is much the same.

**Caulking** (kgk'ing), of a ship, driving a quantity of oakum into the seams of the planks in the ship's decks or sides in order to prevent the entrance of water. After the oakum is driven very hard into these seams it is covered with hot melted pitch to keep the water from rotting it.

**Cause**, that which produces an effect: that from which anything proceeds and without which it would not exist. In the system of Aristotle the word rendered cause and its equivalents in modern language has a most extensive signification. He divides causes into four kinds: efficient, formal, material, and final. The efficient or first cause is the force or agency by which a result is produced: the formal, the means or instrument by which it is produced; the material, the substance from which it is produced: the final, the purpose or end for which it is produced. In a general sense the term is used for the reason or motive that urges, moves, or impels the mind to act or decide.

**Caustic**, a name given to substances which have the property of burning, corroding, or disintegrating animal matter; or of combining with the principles of organized substances and destroying their texture. Lunar Caustic, a name given to nitrate of silver when cast into sticks for the use of surgeons, etc. Caustic potash, the hydrate of potassium. Caustic soda, protoxide of sodium.

**Caustic,** in optics, the name given to the curve to which the rays of light, reflected or refracted by another curve are tangents. Caustics are consequently of two kinds—*catacaustics* and *diacaustics*—the former being caustics by reflection and the latter caustics by refraction.

**Cavaller** (ka-va-lēr'), a horseman, especially an armed horseman: applied in history to the partisans of Charles I. of England, as opposed to Roundheads, the adherents to the Parliament.

Cav'alry, a body of troops which serve on horseback, one of the three great classes of troops, and a formidable power when properly employed. Its adaptation to speedy movements is a great advantage, which enables a commander to avail himself immediately of a decisive moment, when the enemy exposes a weak point, or when disorder appears in his ranks. It is very serviceable in protecting the wings and center of an army, for escorts, for blockading, for intercepting the supplies of the enemy, for procuring intelligence, for covering a retreat, for foraging, etc. Cavalry are usually armed with sabers, pistols, and car-bines. The total of the ten regiments of cavalry in the U.S. regular army is 9,360; each regiment comprising twelve troops, of 78 privates each.

**Cav'an**, an inland Irish county in Ulster; area 477,390 acres, of which three fourths are

arable. Oats, flax, and potatoes are the chief crops. The principal towns are Cavan, Cootehill, and Belturbet. Pop. 111,917. CAVAN, the county town, 57 mi. n.w. Dublin, has a considerable trade in farm produce. Pop. 2,968.

Cave (or Cavern), an opening of some size in the solid crust of the earth beneath the surface. Caves are principally met with in limestone rocks, sometimes in sandstone, and in volcanic rocks. Some of them have a very grand or picturesque appearance, such as the Mammoth Cave of Kentucky, which encloses an extent of about 40 mi. of subterranean windings, and is celebrated for its great size and subterranean waters. Caves in which the bones of extinct animals are found owe their origin, for the most part, to the action of rainwater on limestone rocks. The deposit contained in them usually consists of clay, sand, and gravel combined. In this are embedded the animal remains, and stones either angular or rounded. Some of the remains found in European caverns belong to animals now found only in the tropical or subtropical regions, and others are the remains of animals now living in more northerly areas: others, again, are the relics of extinct animals. Among the latter class of animals are the cave bear and lion, the mammoth and mastodon, species of rhinoceros. etc. Of others that have only migrated may be mentioned the reindeer, which is no longer found in Southern Europe: and the Hyana crocuta, found in the Gibraltar caves, which now lives in South Africa. The ibex, the chamois, and a species of ground squirrel, are shown to have once lived in the Dordogne, but are now found only on the heights of the Alps and Pyrenees. Thus it is evident that the geographical conditions of the country must have been very different from what they are now. Man's relation to these extinct animals. and his existence at the time these changes took place, are demonstrated by such discoveries as those of human bones and worked flints beneath layers of hyena droppings, as in Wokey's Hole, near Wells, England: mixed up indiscriminately, as in Kent's Hole, near Torquay, with bones of elephant, rhinoceros, hyena, etc.; and by the fact that many bones of the extinct animals are splitup, evidently for the sake of the marrow. In the Dordogne and Savigné caves fragments of horn have been found bearing carved, or rather deeply scratched, outline figures of ibex, reindeer, and mammoth.

**Cave Men,** prehistoric races who lived in caves. That they were at a low state of civilization, though possessed of some artistic faculty, is evidenced by the fact that they were ignorant of the metals, of pottery, and of agriculture, and had no domestic animals.

**Cav'endish**, tobacco which has been softened and pressed into quadrangular cakes, so called from Thomas Cavendish, the Elizabethan circumnavigator.

**Cav'endish,** LORD FREDERICK (1836-1882). English statesman, a younger son of the seventh duke of Devonshire. He sat in the House of 31
# Cavendish

Commons as a Liberal for a Yorkshire district from 1865 until the spring of 1882, when he succeeded W. E. Forster as chief secretary of Ireland. On May 6 he reached Dublin, and on that evening he and Mr. Burke, a subordinate government official, were stabbed to death in Phomix park by "Invincibles."

death in Phonix park by "Invincibles." **Cav'endish**, HENRY (1731-1800), English physicist and chemist. He devoted himself exclusively to science, and greatly contributed to the progress of chemistry, having discovered the peculiar properties of hydrogen, the composition of water, etc. He also wrote on electricity, and determined the mean density of the earth.

**Cavendish** (or Candish), THOMAS (1555-1592), an English circumnavigator in the reign of Elizabeth. Having collected three small vessels for the purpose of making a predatory voyage to the Spanish colonies, he sailed from Plymouth in 1586; took and destroyed many vessels, ravaged the coasts of Chile. Peru, and New Spain, and returned by the Cape of Good Hope, having circumnavigated the globe in two years and forty-nine days, the shortest period in which it had been effected. In 1591 he set sail on a similar expedition, during which he died.

**Cavendish College.** Cambridge, England, founded by the Duke of Devonshire in 1876 for the purpose of giving cheap university education to youths younger than those admitted to other colleges, and leaving earlier.

**Caviare** (kav'i-ār), the roes of certain large fish prepared and salted. The best is made from the roes of the sterlet and sturgeon, caught in the rivers or lakes of Russia.

**Cavite** (ka-vě'tā), a town in the island of Luzon, one of the Philippines. Its docks and arsenal were once famous. It gives name to a province with a pop. of 57,000. Pop. of town about 7,000.

Cavour (kå-vör'), Count Camillo Benso di (1809–1861), a distinguished Italian statesman. He was educated in the military academy at Turin, and after completing his studies he made a journey to England, where he re-mained for several years, making himself acquainted with the principles and working of the British constitution, and forming friendships with some of the most distinguished men. He became a member of the Sardinian Chamber of Deputies in 1849, and the following year minister of commerce and agriculture. In 1852 he became premier, and not long afterward took an active part in cementing an alliance with Great Britain and France, and making common cause with these powers against Russia during the Crimean War. In 1860 Garibaldi's expedition to Sicily took place, but toward this and the subsequent movements of the Italian liberator Count Cavour was forced to maintain an apparent coldness. He lived to see the meeting of the first Italian parliament, which decreed Victor Emmanuel king of Italy.

**Cawnpore**', a town, India, Northwest Provinces. It has manufactures of leather and cotton goods and a large trade. Pop. 188,712. In 1857 the native regiments stationed there mu-

### Caxton

tinied and marched off, placing themselves under the command of the rajah of Bithoor, the notorious Nana Sahib. General Wheeler, the commander of the European forces, defended his position for some days, but was at length induced to surrender on condition of his party being allowed to quit the place uninjured. This was agreed to; but after the Europeans had embarked on the Ganges, they were fired on by the rebels; many were killed, and the remainder conveyed back to the city, where the

### Carpet Loom, Cawnpore.

men were massacred, and the women and children placed in confinement. The approach of General Havelock to Cawnpore roused the brutal instincts of the Nana, and he ordered his prisoners to be slaughtered, and their bodies to be thrown into a well. The following day he was obliged, by the progress of Havelock, to retreat to Bithoor. A memorial has since been erected over the scene of his atrocities, and public gardens now surround the well.

**Caxamarca** (or Cajamarca) (kå-kå-mår'kå), a department and town, Peru; area of the department about 14,200 sq. mi.; pop. 213,400. The town is situated about 70 mi. from the Pacific Ocean, 280 n. of Lima. Pop.18,400. It was the scene of the imprisonment and murder of Atahualpa, the last of the Incas.

**Caxlas**, a town of Brazil, province Maranhão, on the Itapicuru, which is here navigable. Pop. 13,680.

**Caxton**, WILLIAM (1422-1491), the introducer of the art of printing into Britain. He served an apprenticeship to Robert Large, a London mercer. On the death of his master, Caxton went into business for himself at Bruges. He was afterward appointed governor at Bruges to the London Association of Adventurers. He had translated the popular mediæval romance *Collection of the Histories of Trog*, and in order to multiply copies he learned the newly discovered art of printing. It was printed either at Cologne or Bruges about

### Cayenne

1474, and is the earliest specimen of typography in the English language. He translated twenty-one books, mainly romances, from the French, and one from the Dutch, helping materially to fix the literary language of the sixteenth century. He was buried in the church of St. Margaret's, Westminster.

**Cayenne** (ki-en'), the capital of the colony of French Guiana, is a seaport on an island of the same name at the mouth of the Cayenne River. It is a noted penal settlement, has a large but shallow harbor. Pop. 10,870.

**Cayman Islands**, three islands situated about 140 mi. n.w. of Jamaica, of which they are dependencies. Grand Cayman, the largest and the only one inhabited, is 20 mi. long and from 7 to 10 broad, and has two towns or villages. The inhabitants, about 2.500 in number, partly descendants of the buccaneers, are chiefly employed in catching turtle. The other two islands are Little Cayman and Cayman Brac. Pop. 400.

**Cayu ga Lake**, a lake in the state of New York, 38 mi. long and from 1 to 34 mi. wide. It is much frequented by pleasure parties.

**Ceará** (sā-á-rä'), a province on the north coast of Brazil; area 40,255 sq. mi. Among its productions are numerous medicinal plants, gums, balsams, and resins; cotton, coffee, sugar cane, etc., are cultivated. The first Portuguese colony in Ceará was founded in 1610, in the neighborhood of Ceará, the present capital. This town is situated on the coast, and carries on a considerable trade in rubber, coffee, sugar, etc. Pop. of prov. 956,724; of town of Ceará, 33,280.

**Cebu** (thā-bö'), one of the Philippine Islands, lying between Luzon and Mindanao. Sugar cultivation and the manufacture of abaca are the chief industries. Pop. 320,000. The town of Cebu, on the eastern coast of the island, the oldest Spanish settlement on the Philippines, is a place of considerable trade, and has a cathedral and several churches.

**Cecil**, the family name of the Salisbury family of English nobility. In addition to the present Marquis of Salisbury the family has produced several noted statesmen of whom Robert Cecil (1503-1612) and William Cecil (1520-1598) were the most celebrated.

**Cecil** ia, SAINT, the patron saint of music, who has been falsely regarded as the inventress of the organ, and who is said to have suffered martyrdom A. D. 230, although other dates are given. In the Roman Catholic Church her festival (November 22) is made the occasion of splendid music. Her story forms one of Chaucer's *Canterbury Tales*, and Dryden in his *Alexander's Feast*, and Pope in his *Ode on St. Cecilia's Day*, have sung her praises. Raphael. Domenichino, Dolce, and Mignard, have represented her in celebrated paintings.

**Cecro'pia**, a genus of beautiful South American trees, of the bread-fruit order. One of these, the trumpet-wood, is remarkable for its hollow stem and branches, the former being made by the Indians into a kind of drum and the latter into wind instruments. The light porous wood is used by the Indians for procuring fire by friction. The inner bark is fibrous and strong, and used for cordage. This species yields caoutchouc.

Ce'dar, a tree which forms fine woods on the mountains of Syria and Asia Minor. It is an evergreen, grows to a great size, and is remarkable for its durability. Of the famous cedars of Lebanon comparatively few now remain, and the tree does not grow in any other part of Palestine. The most celebrated group is situated not far from the village of Tripoli, at an elevation of about 6,000 ft. above the sea. The circumference of the 12 largest trees here varies from about 18 to 47 ft. Cedar timber was formerly much prized, but in modern times is not regarded as of much value, perhaps from the trees not being of suf-

#### Oedars of Lebanon.

The name is given also to the ficient age. deodar, which is indeed regarded by many botanists as a mere variety of the cedar of Lebanon, and which produces excellent timber. It is a native of India, and is a large and handsome tree, growing in the Himalayas to the height of 150 ft., with a circumference of 30. It has wide-spreading branches, which droop a little at the extremities. The leaves are tufted or solitary, larger than those of the cedar of Lebanon and very numerous, of a dark bluish green, and covered with a glaucous bloom. The cones are rather larger than those of the Lebanon cedar, and very 'resinous. The wood is well adapted for building purposes. The Mount Atlas cedar, as its name implies, is a native of the mountains of North Africa. This cedar, though differing in habit and minor features, is regarded by some botanists as specifically identical with the other two. The name is also applied to many trees which. have no relation to the true cedar, as the Ber-

muda cedar, used for making pencils, the red cedar, the Honduras, or bastard Barbadoes cedar and the red cedar of Australia.

**Cedar Creek**, a stream in Shenandoah co., Va., near which General Sheridan converted a defeat of the Federals by the Confederates into a complete victory, October, 1864.

**Cedar Lake**, a lake in Canada, an expansion of the Saskatchewan before it enters Lake Winnipeg; nearly 30 mi. long, and where widest 25 mi. broad.

Cedar Rapids, Linn co., Ia., on Cedar River, 219 mi. w. of Chicago. Surrounding country agricultural. Railroads: C. & N. W.; B. C. R. & N.; and D. & S. W. It has good water power, a number of mills and manufactories, and several pork-packing establishments. Pop. est. 1807, 10.500.

Celebes (sel'e-bez), one of the larger islands of the Indian Archipelago, between Borneo on the west and the Moluccas on the east. Gold is found in all the valleys of the north penin-. sula, which abounds in sulphur. Copper occurs at various points, and in Macassar, tin also. Diamonds and other precious stones are found. The maritime districts are inhabited by Malays; the Peninsula of Macassar is occupied by Bugis Mandhars dwell in the west of and Macassars. the island, and the mountainous regions in the interior, especially in the north, are inhabited by Alfoories. The inhabitants may be classed into two groups, the Mohammedan semicivilized tribes, and the pagans, who are more or less savages. The capital is Macassar, in the southwest of the island. The trade in trepang is very important, Macassar being the chief staple place for this article of commerce. Celebes was first visited by the Portuguese in 1512, but no factory was established by them there till a few years later. In 1660 Macassar was taken by the Dutch, the southern portion of the island put under Dutch rule, and the Portuguese expelled. In 1683 the northern part likewise fell into their hands. The island was conquered by the British in 1811, but a few years later it was again given up to the Dutch in whose possession it has remained ever since. Pop. est. at 1,154,000.

**Cel'ery**, an umbelliferous plant indigenous in the temperate parts of Europe. In its native state it has the character of being a poisonous plant, but transplanted to a garden it becomes a wholesome vegetable. It is much cultivated in the U. S., principally two varieties, red and white stalked, and of these many sub-varieties. Celery is commonly blanched by heaping up the soil about the plants.

**Celestine**, the name of five popes of Rome (422-1296).

Cel'ibacy, the state of being celebate or unmarried; especially applied to the voluntary life of abstinence from marriage followed by many religious devotees and by some orders of clergy, as those of the Catholic Church. The ancient Egyptian priests preserved a rigid chastity; the priestesses of ancient Greece and Rome were pledged to perpetual virginity; and celibacy is the rule with the Buddhist priests of the East. Among Christians the earliest aspirants to the spiritual perfection supposed to be attainable through celibacy were not ecclesiastics as such, but hermits and anchorites who aimed at superior sanctity.

Cell, a term of various applications. 1, Ecclesiastically it was sometimes applied to a lesser or subordinate religious house, dependent upon a greater. The apartments or private dormitories of monks and nuns are also called cells. The term cell is applied also to the part of the interior of a temple where the image of a god stood. 2, In electricity, the term is applied to a single jar, bath, or division of a compound vessel, containing a couple of plates, generally copper and zinc, united to their opposites or to each other, usually by a wire. 3, In biology, a cell is a microscopically small semi-fluid portion of matter, consisting of a soft mass of living, contractile, jelly-like matter, and a central structure consisting of a small, roundish body, called the nucleus. generally more solid than the rest of the cell, and which may have within it a still more minute body, the nucleolus. The cell substance or protoplasm which surrounds the nucleus is an albuminous substance possessing fundamental vital properties, and believed to be the starting point of all animal and vegetable organisms. The cell wall when present consists of an alteration of the external portion of the cell body. and is not a separate structure.

**Cellini** (chel-lē'nē), BENVENU'TO (1500-1571), a sculptor, engraver, and goldsmith. At the siege of Rome he killed the constable of Bourbon and the Prince of Orange. He was afterward imprisoned on the charge of having stolen the jewels of the papal crown, and with difficulty escaped execution. He then visited the court of Francis I of France. He afterward returned to Florence, and under the patronage of Cosmo de Medici made a Perseus with the head of Medusa in bronze, which is still an ornament of one of the public squares: also a statue of Christ, in the chapel of the Pitti Palace, besides many excellent dies for coins and medals.

**Cellular Tissue**, in physiology, a name for what is also called the *areolar tissue*. In botany, the term is applied to the soft substance of plants, composed of elementary vesicles or cells without woody or vascular tissues.

**Cell'uloid**, an artificial substance extensively used as a substitute for ivory, bone, hard rubber, coral, etc., having a close resemblance to these substances in hardness, elasticity, and texture. It is composed of cellulose or vegetable fibrine reduced by acids to pyroxyline; camphor is then added and the compound molded by heat and pressure to the desired shape. It is used chiefly for buttons, handles for knives, forks, and umbrellas, billiard balls, backs to brushes, piano keys, napkin rings, opera-glass frames, etc. It can be variously colored.

**Cell'ulose**, the substance of which the permanent cell membranes of plants are always composed. It is closely allied to sugar, dextrin, or gum and starch, and is changed into the latter by heat, sulphuric acid, or caustic potash.

**Cel'sius,** the name of a Swedish family, several members of which attained celebrity in science and literature. The best known is Anders Celsius (1701-1744). After being appointed professor of astronomy at the University of Upsala he traveled in Germany, England, France, and Italy; and in 1736 he took part in the expedition of Maupertuis and others for the purpose of measuring a degree of the meridian in Lapland. He is best known as the constructor of the Centigrade thermometer.

**Celsius Scale**, another name for the Centigrade thermometric scale, from that of the inventor, Ander Celsius.

Celts, the earliest Aryan settlers in Europe according to the common theory. They appear to have been driven westward by succeeding waves of Teutons, Slavonians, and others. Herodotus mentions them as mixing with the Iberians who dwelt round the river Ebro, in Spain. At the beginning of the historic period they were the predominant race in Britain. Ireland, France, Belgium, Switzerland, North Italy, Spain, and elsewhere. The Romans called them generally Galli, that is, Gauls or Gael. They appear to have reached the zenith of their power in the second and third centuries B. c. Some tribes of them, overrunning Greece, settled in a part of Asia Minor, to which the name of Galatia was given. They finally went down before the resistless power of Rome, and either became absorbed with the conquering races or were cooped up in the extreme northwest of Europe. At an early date the Celts divided into two great branches, speaking dialects widely differing from each other, but doubtless belonging to the same stock. One of these branches is the Gadhelic or Gaelic, represented by the Highlanders of Scotland, the Celtic Irish, and the Manx: the other is the Cymric, represented by the Welsh, the inhabitants of Cornwall, and those of Brittany. The sun was the principal object of worship among the Celts. All the old Celts seem to have possessed a kind of literary order called Bards.

Celts, the name given to certain prehistoric weapons or other implements of stone or bronze which have been found over nearly the whole surface of the earth. Stone celts are found in the form of hatchets, adzes, chisels, etc. They vary in size from I in. to 2 ft. in length. The breadth is usually about  $\frac{1}{2}$  or  $\frac{1}{2}$  of the length. The materials of which they are made are flint, chert, clay slate, porphyry, various kinds of greenstone, and of metamorphic rocks, and, in short, any very hard and durable stone. Bronze celts belong to a later period than stone ones, and are not so numerous. Some stone celts, however, have been found along with bronze celts in such a manner as to show that stone celts were still used when the method of working bronze had been discovered.

**Cementa' tion**, the conversion of iron into steel by heating the iron in a mass of ground charcoal, and thus causing it to absorb a certain quantity of the charcoal.

Cements', the general name of glutinous or

other substances capable of uniting bodies in close cohesion. In building the name is given to a stronger kind of mortar than that which is ordinarily used, consisting of those hydraulic limes which contain silica and therefore set quickly. Cements are variously composed, according to the nature of the surfaces to which they are applied and their exposure to heat and moisture. *Hydraulic* or *water cements* harden under water and consolidate almost immediately on being mixed. Of this kind are the Roman and Portland cements.

Portland cement is made by two processes, the wet and dry. In the wet process the clay and limestone are mixed with a large quan-tity of water in a mechanical mixer. When it has been thoroughly mixed, it is emptied into large reservoirs and allowed to settle. In time the heavy material or raw cement settles to the bottom. The water is drawn off and the raw cement is left to dry in the air until it is a thick paste. It is then placed in the dry-room until all the moisture is evaporated, when it is burned in a suitable kiln. The kiln is brought to a white heat and the cement is kept in it until it is almost glass, or until it is nearly vitrified. It is taken from the kiln in the form of clinkers which are greenish in color. These clinkers are ground to a fine powder between crushing rolls and packed in bags or barrels ready for shipment. In the dry process the clay and limestone are first separately dried in a dry-kiln until all the moisture is expelled. The clay and carbonate of lime are then mixed and crushed and the powdered mixture is tempered with water to a stiff paste in a brickmaking machine and molded into bricks. The mixture is kept warm during the process by steam coils, and the water used for tempering is made strongly alkaline by adding cal-cined soils or newly burned slaked lime. The bricks are then burned to the cement clinker in kilns, and finally ground into powder. A natural cement is made from limestone which has the proper ingredients, but it is not as good as the manufactured cement because the proportions of silica, alumina, and iron do not run evenly in the limestone. Cement increases in strength with age and a good cement will attain half of its ultimate strength and hardness within two months. It has been estimated that Portland cement made into a stiff paste without sand is able to stand a tensile strain of 400 lbs. to the sectional area of 11 sq. in. several days after the test piece is molded, the sample having been kept under water for six days.

**Čenci** (chen'chē). BEATRICE, called the beautiful parricide, the daughter of Francesco Cenci, a noble and wealthy Roman (1527-98), who, according to the common story, after his second marriage, behaved toward the children of his first marriage in the most shocking manner, procured the assassination of two of his sons, on their return from Spain, and debauched his youngest daughter Beatrice. She failed in an appeal for protection to the pope, and planned and executed the murder of her father. She was beheaded 1599 and the Cenci estates confiscated. She is the alleged subject of an admired painting by Guido, and is the heroine of one of Shelley's most powerful plays.

**Cenis**, (sè-në') MOUNT, a mountain belonging to the Graian Alps, between Savoy and Piedmont, 11,755 ft. high. It is famous for the winding road constructed by Napoleon I which leads over it from France to Italy, and for an immense railway tunnel, which, after nearly fourteen years' labor, was finished in 1871. The total length of the tunnel is nearly 8 mi. The total cost amounted to \$13,000,000, which was borne partly by the French and Italian governments and partly by the Northern Railway Company of Italy.

Cen ser, a vase or pan in which incense is burned; a vessel for burning and wafting incense. Among the ancient Jews the censer was used to offer perfumes in sacrifices. Censers, called also thuribles, are still used in the Roman Catholic Church at mass, vespers, and other offices, as well as in some Anglican and other churches. They are of various forms. In Shakespeare's time the term was applied to a bottle perforated and ornamented at the top, used for sprinkling perfume, or to a pan for burning any odoriferous substance.

**Cen' sors**, two officers in ancient Rome who held office for eighteen months, and whose business was to draw up a register of the citizens and the amount of their property, for the purpose of taxation; to keep watch over the morals of the citizens, for which purpose they had power to censure vice and immorality by inflicting a public mark of ignominy on the offender; and to superintend the fluence administration and the keeping up of public buildings. The office was the highest in the state next to the dictatorship, and was invested with a kind of sacred character. The term is now applied to an officer empowered to examine books before publication.

**Cen'sus,** with the Romans a registered statement of the particulars of a person's property for taxation purposes. In modern times a census is an enumeration of the inhabitants of a country, accompanied by any other information that may be deemed useful. In most civilized countries such enumerations now take place at fixed intervals. In the U.S., England, Switzerland, Sweden, and Norway, Holland, Belgium, and Portugal, a census is taken every ten years.

**Cent** (Centime), the name of a small coin in various countries, so called as being equal to a hundredth part of some other coin. In the U. S. and in Canada, the cent is the hundredth part of a dollar. In France the *centime* is the hundredth part of a franc. Similar coins are the *centaro* of Chile, and the *centesimo* of Italy and Peru. Cents or centimes, and their equivalents, are written simply as decimals of the unit of value.

**Cen'taurs**, in Greek mythology, fabulous beings represented as half man, half horse. The earliest notices of them, however, merely represent them as a race of wild, savage men inhabiting the mountains and forests of Thessaly.

## Centrifugal and Centripetal

**Cen' tipede**, a term applied to various insectlike creatures having many feet, and a body consisting of numerous similar rings or segments. The common centipede, found in the

Giant Centipede.

U. S., is quite harmless, but those of tropical countries inflict severe and often dangerous bites. They sometimes grow to a foot in length.

Central America. See America.

Centralia, Marion co., Ill., 62 mi. e. of St. Louis. Railroads: I. C.; J. L. & S. L.; C. & C.; and L. E. & S. L. Industries: railroad shops, and three flouring mills. Surrounding country mineral (coal mines). The town was first settled in 1850 and became a city in 1859. Pop. est. 1897, 7,000.

Central Provinces, an extensive British territory in India. They became a separate administration in 1861, and are under the authority of a chief commissioner. Their total area is 115,936 sq. mi., of which 86,501 sq. mi. are British territory, and 29,435 the territory of native protected states, fifteen in number. Pop. 12,944,805. Center Board, a sort of movable keel used in

**Center Board**, a sort of movable keel used in American yachts, and capable of being raised and lowered in a well extending longitudinally amidships. It tends to prevent leeway and gives the vessel greater stability when under a press of canvas.

Center of Gravity, that point of a body through which the line of the resultant of the weights of all the particles composing the body always passes, whatever be the position of the body.

**Center of Gyration**, the point at which, if the whole mass of a revolving body were collected, the rotatory effect would remain unaltered.

**Center of Osciliation**, that point of a body suspended by an axis, at which, if all the matter were concentrated, the oscillations would be performed in the same time.

Center of Pressure, that point of a body at which the whole amount of pressure may be applied with the same effect as it would produce if distributed: specifically, in hydrostatics, that point in the side of a vessel containing a liquid, to which, if a force were applied equal to the total pressure and in the opposite direction, it would exactly balance the effort of the total pressure.

Centrif'ugal and Centrip'etal, terms ap-

# **Century Plant**

plied to two kinds of inflorescence, the former being that in which the terminal or central flower is the first to expand, as in a true cyme (examples, elder and valerian), the latter being that kind in which the lower or outer flower is the first to expand, as in spikes, racemes, umbels, and corymbs. The laburnum, hemlock, and daisy are examples.

Century Plant, a popular name of the

American aloe. Cephalo'nia, an island of Greece. the largest of the Ionian Islands; area 348 sq. mi.; pop. 80,543. The coast line is very irregular and the surface is mountainous. There is rather a deficiency of water on the island. The principal towns are Argostoli (9,000 in-habitants) and Lixuri (6,000). The chief exports are currants, oil, and grain: wine, cheese, etc., are also exported. Earthquakes are not infrequent. One of the most destructive was that of the year 1867.

**Ceram'**, an island in the Moluccas, lying west of New Guinea; area about 7,000 sq. mi.; pop. est. at 200,000. The vegetation is luxuriant, the sago-palm supplying the chief food of the inhabitants as well as an article of trade. The inhabitants of the coast are of Malay origin, the interior being peopled by Alfoories. It is under the Dutch.

Ceram' ic Art, that department of plastic art which comprises all objects made of baked clay, as vases, cups, urns, bassi-rilievi, statuettes, etc., and including all the varieties of earthenware and porcelain which can be regarded as works of art. See Pottery.

Cerat'odus, a genus of fishes belonging to the Dipnoi or lung fishes. It is the barramunda or native salmon of the Australian rivers, measures from 3 to 6 ft. in length, and

forms an interesting connecting link between the oldest surviving group of fishes and the lowest air breathing animals.

Cer'berus, in classical mythology, the dog monster of Hades, variously described as having a hundred, fifty, and three heads, with a serpent's tail, and a mane consisting of the heads of various snakes. He was subdued by Hercules.

Ce'reals, a term derived from Ceres, the goddess of corn, though sometimes extended to leguminous plants, as beans, lentils, etc., is more usually and properly confined to the Gramineze, as wheat, barley, rye, oats, and other grasses, cultivated for the sake of their seed as food.

**Ceres** (cē'rēz), a Roman goddess. She was the daughter of Kronos and Rhea, and the mother of Proscrpine and Bacchus. She was the goddess of the earth in its capacity of bringing forth fruits, especially watching over the growth of grain and other plants. The

Romans celebrated in her honor the festival of the Cerealia. Ceres was always represented in full attire, her attributes being ears of corn and poppies, and her sacrifices consisted of pigs and cows. Also a planet discovered by M. Piazzi at Palermo, in Sicily, in 1801. It was the first discovered of the asteroids. Its size is less than that of the moon.

Cerro de Pasco, a town of Peru, capital of the department of Junin, 14,275 ft. above the level of the sea. The town came into existence in 1630, in consequence of the discovery of veins of silver there. The climate is trying and the whole place uninviting, though it still contains the most productive of the Peruvian mines. Pop. about 14,000.

Certaido (Cher-tål'do), a small town of North Italy, 15 mi. s.w. from Florence. It is the birthplace, was long the home, and now contains the ashes of Boccaccio, and many interesting relics.

Cervantes Saavedra (thor-van'tes-sa-a-va'drå), MIGUEL DE (1547-1616), author of Don Quixote, b. at Alcalá de Henares, and removed thence to Madrid at the age of seven. He commenced writing verses at an early age, and his pastoral Filena attracted the notice of Cardinal Acquaviva, whom he accompanied to Italy as page. In 1570 he served under Colonna in the war against the Turks and African corsairs, and in the battle of Lepanto (1571) he lost the use of his left hand. After this he joined the troops at Naples, in the service of the Spanish king, winning the high-est reputation as a soldier. In 1575, while re-turning to his country, he was taken by the corsair Arnaut Mami, and sold in Algiers as a slave — a condition in which he remained for seven years, displaying great fortitude. In 1580 his friends and relations at length ransomed him, and, rejoining his old regiment, he fought in the naval battle and subsequent . storming of Terceira. In 1583, however, he retired from service, and recommenced his literary work, publishing in 1584 his pastoral Galatea. In the same year he married, and lived for a long time by writing for the stage, to which he contributed between twenty and thirty plays, of which two only have survived. From 1588 to 1599 he lived retired at Seville, where he held a small office. He did not appear again as an author till 1605, when he produced the first part of Don Quixote, a work having, as its immediate aim, the satirical treatment of the novels of chivalry then popular, but embodying at the same time human types of cosmopolitan interest, and having a profounder bearing upon life than its express object covered. In 1613 his twelve Exemplary Norels (his best work after Don Quirote), in 1614 his Journey to Parnassus, and in 1615 eight new dramas, with intermezzos, were published.

Cervin. See Matterhorn.

Cesnola, LUIGI PALMA, COUNT DI, b. in Italy, June 29, 1832; served in the U.S. army during the Civil War, and was U. S. consul in Cyprus from 1865 to 1875. He discovered and purchased many interesting Cypriote antiquities,

which are now in the Metropolitan museum at New York, of which General Cesnola is secretary and director.

**Cestus**, in classical mythology, a girdle worn by Aphrodītē, or Venus, endowed with the power of exciting love toward the wearer.

**Cestus**, a leathern thong or bandage, often covered with knots and loaded with lead and iron, anciently worn by Roman pugilists to increase the force of the blow.

Ceta'cea, an order of marine animals, sur-They passing in size all others in existence. are true mammals, since they suckle their young, have warm blood, and respire by means of lungs, for which purpose they come to the surface of the water to take in fresh supplies The body is fishlike in form, but ends of air. in a bilobate tail, which is placed horizontally, not, as in the fishes, vertically. The posterior limbs are wanting, and the anterior are converted into broad paddles or flippers, consisting of a continuous sheath of the thick integument, within which are present representatives of all the bones usually found in the fore limb of The fishlike aspect is further inmammals. creased by the presence of a dorsal fin, but this is a simple fold of integument and does not contain bony spines. The right whale and its allies have no teeth in the adult state, their place being taken by the triangular plates of balcen or whalebone which are developed on transverse ridges of the palate, but the foetal whales possess minute teeth, which are very soon lost. The nostrils open directly upward on the top of the head, and are closed by valvular folds of integument which are under the control of the animal. When it comes to the surface to breathe it expels the air violently, and the vapor it contains becomes condensed into a cloud, which resembles a column of water and spray. The blood-vessels in these animals break up into extensive plexuses or networks, in which a large amount of oxygenated blood is delayed, and they are thus enabled to remain a considerable time under water. Injury to these dilated vessels leads to profuse hemorrhage, and hence the whale is killed by the comparatively triffing wound of The Cetacea are commonly dithe harpoon. vided into five families: 1, Balanida, or whalebone whales, divided into two sections: smooth whales, with smooth skin and no dorsal fin, and furrowed whales, with furrowed skin and a dorsal fin; 2, Physeteridæ, Catodontidæ, sperm whales or cachalots, the palates of which have no baleen plates, and which are furnished with teeth, developed in the lower jaw only; 3. Delphinidæ, a family possessing teeth in both jaws, and including the dolphins, porpoises, and narwhal; 4, Rhynchoceti, a family allied to the sperm whales, but having only a pair or two pairs of teeth in the lower jaw, a pointed snout or beak, a single blow hole, etc.: 5, Zeuglodon $tid\alpha$ , an extinct family, distinguished from all the tooth-bearing whales by the possession of molar teeth implanted by two distinct fangs. The last family is exclusively confined to etc. the Eocene, Miocene, and Pliocene periods. The Sirenia, or manatees and dugongs, have sometimes been classified among the Cetacea, but they must be regarded as forming a separate order.

Cetewayo (kech-wā'õ), a Kaffir chief or king, son of Panda, king of the Zulus. Disturbances as to the succession having arisen in Zululand, Mr. Theophilus Shepstone, representative of the Natal government, secured the recognition of Cetewayo as king in 1873. The latter, however, in spite of the obligations into which he had entered, proved a tyrannical ruler, and maintained a large army. A dispute which had arisen regarding lands on the frontier was settled by arbitration in favor of the Zulus; but on the refusal of Cetewayo to comply with the conditions imposed war was declared against him by the British, and the king made prisoner soon after the battle of Ulundi (July, 1879). In 1882 he was conditionally restored to part of his dominions. In the following year he was driven from power by the chief Usibepu, and remained under the protection of the British until his death in 1884.

**Cette** (set), a fortified seaport. France, dep. Hérault. After Marseilles, Cette is the principal trading port in the south of France, and it is much resorted to as a watering place. Pop. 35,517.

**Cevennes** (sè-venz'), a chain of mountains in . the southeast of France, in the widest sense extending from the Pyrenees in the southwest to the Vosges in the northeast, the Côte d'Or being sometimes considered as a part of it, sometimes as a part of the Vosges system. The length of the chain, exclusive of the Côte d'Or, is about 330 mi., the average height not more than 3,000 ft. The highest peak is Mezenc, 5,753 ft.

**Ceylon** (si-lon'), an island belonging to Great Britain in the Indian Ocean. Area 25,333 sq. mi.; pop. 3,012,224. In respect of climate, it is found that where the jungle has been cleared away, and the land drained and cultivated, the country is perfectly healthy; but where low wooded tracts and flat marshy lands abound it is malarial and insalubrious.

Most of the animals found on the opposite continent are native to this island, excepting the tiger. Elephants are numerous, especially in the north and east provinces, and licenses for their capture and exportation are issued by government. The wild life of the island includes bears, buffaloes, leopards, hyenas, jackals, monkeys, wild hogs, several species of deer, porcupines, armadilloes, mungooses, the pangolin or scaly ant eater, the loris, or Ceylon sloth, flying foxes, crocodiles, numerous snakes, partly poisonous, and a great variety of birds of brilliant plumage. Its most valuable products are coffee, tea, rice, cinnamon (which is found almost exclusively in the southwest), and the cocoanut and Palmyra palm. The south parts of the island produce the jaggery palm. the sap of which yields a coarse sugar, and its fruit a substitute for rice flour. The taliput palm. the jack, and bread-fruit trees, are abundant and the Ceylon areca nut, celebrated for its superior qualities, is exported in large quantities. Excellent tobacco is raised in the north

The island abounds with timber of district. various descriptions, including ebony, satin, rose, sapan, iron, jack, and other beautiful woods adapted for cabinet work. Attention has been directed latterly to the cultivation of cinchona, cacao, and silk. The chief mineral products are iron, plumbago or graphite, and a variety of gems, including sapphires, rubies, etc. The pearl fisheries of Ceylon are famous, but, for some unexplained reason, sometimes fail for years, there having been none between 1837 and 1854, or between 1863 and 1874. The exports comprise coffee, tea, plumbago, areca nuts, cocoanut oil, fiber, and kernels (copra), cinnamon, cinchona, cacao, etc. The principal articles of import are manufactured goods chiefly from Great Britain, as cotton manufactures, apparel and haberdashery, iron and steel manufactures, machinery, etc.; from other countries dried fish, rice, wheat, sugar, tea, cowries, etc. The island is provided with a system of excellent roads, and the railways have a length of about 200 mi.

Ceylon is one of the British colonies, the government being conducted by a governor and two councils, executive and legislative, of both of which the governor is president. The island is divided into eight provinces.

The present population of Ceylon is composed of Singhalese or Cingalese, who are the Ceylonese proper, Tamils (from India), Moormen or Moors, Malays, Veddahs, a small proportion of Europeans and their descendants, and negroes. The Singhalese are in stature rather below the middle size; their limbs slender, but well shaped, eyes dark, finely-cut features, hair long, smooth, and black, turned up and fixed with a tortoise-shell comb on the top of the head; color varying from brown to black, or rather from the lightest to the darkest tints of bronze. The general population of the island was decreasing for several conturies. It is now, however, on the increase, and latterly this increase has been rapid.

The Singhalese possess a native chronicle, the Mahawanso, which records the history of the island from 543 B.C. onward, under a long series of kings reigning most frequently at the ancient capital Anuradhapura, the earliest of these being leader of an invading host from India. Buddhism was introduced 307 B.C. These incomers brought with them the civilization of India; great part of the country became covered with towns and villages having temples and dagobas, agriculture flourished, and the aborigines (represented by the Veddahs of to-day) were compelled to construct artificial lakes, tanks, and other irrigation works. The capital, Anuradhapura, as its ruins still testify, was a place of great extent and magnificence. The island was not known to Europeans till the time of Alexander the Great, and their knowledge of it was long vague and meager. By the time of Pliny it had become better known, and he gained much additional information from Ceylonese envoys that were sent to Rome. In the Middle Ages the country was much troubled by invasions of the Malabars, and for a time it was

even tributary to China. It had greatly declined in prosperity when visited by Europeans, the first of whom was Marco Polo in the end of the thirteenth century. At its most flourishing period its population was probably ten times as great as at present. Little, however, was known in Europe regarding the island until 1505, when the Portuguese established a regular intercourse with it, and When latterly made themselves masters of it. they arrived the Malabars were in possession of the north, the Moors or Arabs held all the seaports, the rest was under petty kings and chiefs. The Portuguese, who were cruel and oppressive rulers, were subsequently expelled by the Dutch in 1658, after a twenty years' The Dutch in turn were driven struggle. from the island by the British in 1796, though a part of the island remained independent under native princes. The king of Kandy, nominally the sovereign of the island, was deposed in 1815 on account of his cruelties, and the island was then finally annexed by Britain, though a rebellion had to be put down in 1817. The principal towns are Colombo (the capital), Kandy, Point de Galle, Jaffna, and Trincomalee.

**Chablis** (shå-blē), a town. France, dep. Yonne, famous for white wines of a beautifully clear and limpid color, good body, and extreme delicacy of flavor. Pop. 2,185.

Chadbourne, PAUL ANSEL (1823-1883), American educator, b. in Maine. He graduated in 1848 at Williams College, of which he became president in 1872, succeeding Mark Hopkins.

**Chaff Cutter**, an agricultural instrument for chopping hay or straw into lengths to be used as food for animals. The economical advantage of the chaff cutter does not depend on its rendering the chopped food more digestible; but on permitting it to be more thoroughly mixed with the more nutritive and palatable food, and preventing the animal from rejecting any part of it. By the use of the chaff cutter animals are therefore induced to consume a much larger proportion of fodder with their food, which not only improves the condition of the stock, but saves time in feeding, thus allowing the animal more time to repose.

**Chaff inch**, a lively and handsome bird of the finch family, very common in Britain, where its haunts are chiefly gardens and shrubberies, hedgerows, plantations, etc. The male is 6 or 7 in. in length, and is very agreeably colored, having a chestnut back, reddish-pink breast and throat, and a yellowish-white bar on the wings. The food consists of seeds and of insects and their larvæ. The nest, which is generally placed in the fork of a tree, is an elegant structure usually covered with moss and lichens.

**Chagos** (chā'gōs) **Islands**, a group of islands in the Indian Ocean belonging to Britain. They are scantily peopled, and the chief product is cocoanut oil,

**Chagres** (chä'gres), a seaport of Colombia, on the north coast of the Isthmus of Panama, at the mouth of the Chagres River, formerly

of some importance. It is destined to be one of the outlets of the Panama canal when that long-delayed project is completed.

**Chain,** in surveying, is a measure consisting of 100 links, each 7.92 in. in length and having a total length of 4 rods, or 66 ft. 1t is sometimes called Gunter's chain, from its inventor.

Chain Making .- For the manufacture of a chain only the softest and best iron obtainable is selected because it is necessary that it weld readily. The iron is brought to the factory in coils about 100 ft. each for the smaller chains and in bars about 18 ft. long for larger chains. The coiling is done when the iron is cold thus proving the quality of it. The coils are taken to a powerful steam shear where each small coil is cut through on one side and the pieces allowed to fall into a keg. These pieces now look like a link open at one end and as the cut was made at an angle, when ' the two ends of the link are brought together they will lap over each other. These open links are put in a furnace and heated to a white heat. Each link is then taken out and hooked through a link which has been finished and which forms a part of the chain which is being made. The open ends of the link are then firmly welded with a hammer. When a large size chain is being made the bars of iron are cut into pieces just long enough for the desired length because it is impossible to coil the larger sizes of iron into spirals. The**s**e pieces are heated and bent into a U shape and then welded. The ends of the links being crossed over each other about an inch to make a stronger weld. In the cheaper grades of machine-made chains the welding is done under a steam hammer. When chains are made for use over sprocket wheels the inside diameter of the links must be of a certain size. The chains that require the greatest skill and care are the heavy chains used on dredges and steam shovels. Before a chain is shipped it is tested by being put in a pulling machine. A machine has recently been invented for manufacturing chains and it is now possible to make excellent chains from a cheaper grade of iron on account of doing away with the weld. The machine consists of four rolls which are so arranged that they work all at the same time on the bar of iron which is put between them. Small curves on the rolls, which look like chain links, are steel dies or cutters highly tempered and hardened. The heated iron is made to pass in between the four rolls of the machine which revolve rapidly. The guides on the four edges of the rolls operate simultaneously on the four flanges of the iron bar pressing it into the form of a chain. This leaves small pins of iron between the links and it is necessary to remove these by means of cutters and molds. Then the chain is heated again and run through the rolls which straighten out the links and give a smooth, finished appearance to the chain. This machine can turn out about one yard of chain per second.

**Chain Pump**, a pump consisting in principle of an endless chain equipped with a number of valves or buckets moving round two wheels, one above and one below. The chain in its ascent passes through a tube closely fitting the valves or buckets, the water being discharged either from the top of the tube or from an orifice in it.

**Chain Shot**, two cannon balls connected by a chain, which, when discharged, revolve upon their shorter axis, and mow down masts, rigging, etc.

**Chalce'don** (kal-sē'don), a Greek city of ancient Bithynia, opposite Constantinople, at the entrance of the Black Sea, about 2 mi. s. of the modern Scutari. It was a flourishing town when it came into possession of the Romans, under the testament of Nicomedes, B.C. 74, as included in the kingdom of Bithynia. It was finally destroyed by the Turks, about 1075.

**Chalced** ony (kal-sed'o-ni), a mineral, a variety of quartz, called also white agate, resembling milk diluted with water, semitransparent or translucent, and more or less clouded with circles and spots. It is found usually in cavities of rocks uncrystallized, in veins, botryoidal masses, etc., and is used in jewelry. There are several varieties, such as the common chalcedony, chrysoprase, sard, and sardonyx.

**Chalcis** (kal'sis), a Greek town, separated by the narrow strait of Euripus from the Beotian coast, on the mainland of Greece. Chalcis early became one of the greatest of the Ionic cities, carrying on an extensive commerce, and planting numerous colonies in Syria, Macedonia, Italy, Sicily, and the islands of the Ægean Sea. It was subsequently a place of importance under the Romans. There is still a town on the site, consisting of an inner walled town and an outer suburb, and said to be one of the prettiest and most attractive of Greek provincial towns. A bridge, so constructed as to let vessels pass through, connects it with the mainland. Pop. 12,250.

**Chalæa**, an ancient geography, the southerly part of Babylonia, or in a wider sense, corresponding to Babylonia itself. The name Chaldæans was especially applied latterly to a portion of the Babylonian Magi, who were devoted to the pursuit of astronomy and magical science.

Chaldee Language, a name often given to the Aramean language, one of the principal varieties of the ancient Semitic. Chaldee literature is usually arranged in two divisions: the Biblical Chaldee, or those portions of the Old Testament which are written in Chaldee, namely, Daniel from 2:4 to 7:28: Ezra 4:8 to 6:18; and 7:12-26; and Jeremiah 10:11; and the Chaldee of the Targums, and other later Jewish writings.

**Chaldeur Bay** (sha-lör'), an inlet of the Gulf of St. Lawrence, between Quebec and New Brunswick. The French fleet was here defeated by the British in 1760.

**Chalk** (chak), a well-known earthy limestone, of an opaque white color, soft and admitting no polish. It is an impure carbonate

# Challemel-Lacour

of lime, and is used as an absorbent and antacid, and for making marks for various purposes, as on the blackboard in schools, and by artisans and others. *Black chalk* is a soft variety of argillaceous slate. *Brown chalk*, a familiar name for umber. *Red chalk*, another name for ruddle. *French chalk*, steatite or soapstone, a soft magnesian mineral. *Drawing chalks* were originally restricted in colors to white, black, and red, but now chalks of every color are used, and are known by the name of *crayons*. In geology chalk is the rock which forms the higher part of a series or group of strata, comprising rocks of different kinds, termed the cretaceous system.

**Chailemei-Lacour**, PAUL ARMAND, French statesman, b. May 19, 1827; became a college professor and was banished by Napoleon III. After the downfall of the empire he was made Prefect of the Rhone. He was elected to the Chamber as a Radical in 1872; became a senator in 1876. In 1879 he was sent as ambassador to Switzerland, and from June, 1880, until February, 1882, represented France in London. In 1883 he became minister of foreign affairs. He founded, and was chief editor of, the *République Française*, an influential journal of Paris.

**Chal' lenge**, to jurors, is an objection either to the whole panel or array, that is, the whole body of jurors returned, or to the *polls*, that is, to the jurors individually: aud it is either *peremptory*, that is, without assigning any reason, or *for cause* assigned. See *Jurg*.

Challenger Expedition, a circumnavigating scientific exploration of the open sea sent out by the British government in 1872-76-earlier expeditions being those of the Lightning (1868) and Porcupine (1870). In 1872 the Challenger, a corvette of 2,306 tons, was completely fitted out and furnished with every scientific appliance for examining the sea from surface to bottom-natural history work room, chemical laboratory, aquarium, etc. The ship was given in charge to a naval surveying staff under Captain Nares; and to a scientific staff, with Professor (afterward Sir) Wyville Thomson at their head, for the purpose of sounding the depths, mapping the basins, and determining the physical and biological conditions of the Atlantic, the Southern, and the Pacific Oceans.

With this new commission the *Challenger* weighed anchor at Sheerness Dec. 7, 1872, and on the evening of May 24, 1876, she dropped anchor at Spithead, having in these three and a half years cruised over 68,900 nautical miles, and made investigations at 362 stations, at each of which were determined the depth of channel; the bottom, surface, and fauna; and the atmospheric and meteorological conditions. The route was by Madeira, the Canaries, the West Indies, Nova Scotia, Bermudas, Azores, Cape Verd, Fernando Noronha, Bahia, Tristan d' Acunha, Cape of Good Hope. Kerguelen, Melbourne, the Chinese Sea, Hong Kong, Japan, Valparaiso, Magellan's Strait, Montevideo, Vigo, and Portsmouth. Between the Admiralty Isles and Japan the *Challenger* made her deepest sounding, on March 23, 1875, 4,575 fathoms.

**Chaimers**, a noted Scotch family, famous as producing 1, Alexander C. (1759-1834), author of several useful works including a general *Biographical Dictionary*; 2, George C. (1742-1825), a famous Scotch anlynarian; and 3, Thomas C. (1780-1847), a noted Scotch preacher and author.

Chalons-sur-Marne (shä-löŋ-sùr-mårn). a city of France, capital of the department Marne (Champagne). There are manufactures of woolen and cotton goods: also cotton mills, tanneries, etc. In 451 Attila was defeated before the walls of Châlons, and from the tenth century it flourished as an independent state under counts-bishops, having about 60,000 inhabitants. After being united to the French crown, in 1360, it declined. A celebrated camp was established by Napoleon III about 18 mi. from Châlons for the purpose of training the French troops, still to some extent employed. Pop. 25,863.,

**Chalybeate Waters** (ka-lib'ē-āt), waters holding iron in solution, either as a carbonate or as a sulphate with or without other salts. All waters containing iron are distinguished by their styptic, inky taste, and by giving a more or less deep color with an infusion of tea or of nutgalls.

**Chalybite** (kal'i-bIt), an ore of iron, a native anhydrous-metacarbonate, existing abundantly under the name of *Spathic* or *Sparry Ore*, or *Siderite*. A siliceous or argillaceous variety called clay ironstone, occurring in the coal measures, is one of the most abundant and valuable ores of iron. Combined with carbonaceous matter it forms the black-band ironstone.

**Chamalari** (Cham'alhari), a peak of the Himalaya Mountains, at the western extremity of the boundary line between Bhutan and Thibet. Height 23,929 ft.

Chamber, a word used in many countries to designate a branch of government whose members assemble in a common apartment, as the chamber of deputies in France, or applied to bodies of various kinds meeting for various purposes. The imperial chamber of the old German Empire was a court established at Wetzlar, near the Rhine, by Maximilian I in 1495, to adjust the disputes between the different independent members of the German Empire, and also such as arose between them and the emperor. Chambers of Commerce are associations of the mercantile men of towns for the purpose of protecting and furthering the interest of the commercial community.

**Chamberlain**, JOSEPH, English statesman, b. in London in 1836, and educated at London University school. He became a member of a firm of screw makers at Birmingham, but gave up active connection with the business in 1874. He early became prominent in Birmingham both in connection with civic and political affairs, being an advanced radical and an able speaker, was chairman of the school board, and thrice in succession mayor of the city (1874-76). In 1876 he entered Parliament as a representative of Birmingham, and at the

general election of 1880 he was chosen for the same city along with Mr. Bright and Mr. Under Mr. Gladstone's premiership Muntz. he now became president of the Board of Trade, and a cabinet minister. In the Gladstone government in 1886 he was president of the Local Government Board; but his leader's Irish policy caused him to resign, and since then, as member for West Birmingham, he has been one of the most pronounced members of the Liberal Unionist party. In the winter of 1887-88 he was in America as one of the British representatives appointed to negotiate a settlement of the fishery disputes between Canada and the U. S., but the treaty which resulted has not yet been ratified. In the Marquis of Salisbury's Coalition cabinet he became colonial secretary.

**Chambers** (chām'berz), EPHRAIM, a miscellaneous writer, and compiler of a popular *Dictionary of Arts and Sciences*, b. at Kendal, in Westmoreland, in the latter part of the seventeenth century. During his apprenticeship to a mathematical instrument and globe maker in London he formed the design of compiling a *Cyclopædia*, and even wrote some of the articles for it behind his master's counter. The first edition was published in 1728. Several subsequent editions appeared previous to his death in 1740, and it was the basis of the cyclopædia of Dr. Abraham Rees.

Chambers, ROBERT (1802-1871), a historical and miscellaneous writer, the younger of two brothers originally composing the publishing firm of W. & R. Chambers. He received his education at the Peebles parish school and in the high school of Edinburgh. His family experiencing a reverse of fortune, he got together all the books belonging to his mother and himself, their value being about \$10, and at the age of sixteen commenced business as a bookseller in Edinburgh. He edited Scottish Ballads and Songs, and a Biographical Dic-tionary of Eminent Scotsmen; then the two brothers commenced Chambers's Edinburgh Journal, which achieved an immense success. From this time they united in the publishing business, and issued a series of works for the entertainment and instruction of "the people." Robert Chambers contributed numerous essays to the Journal, besides editing or compiling many instructive works of a high class, including the Cyclopædia of English Literature. WILLIAM CHAMBERS (1800-1883). He was twice lord provost of Edinburgh, and latterly bore the expense of restoring the old church of St. Giles, Edinburgh. He also presented the town of Peebles with an institution embracing a library and reading-room, museum, etc.

Chambersburg, Franklin co., Pa., 52 mi. s.w. of Harrisburg. Railroads: Cumberland Valley: Phila. & Reading; Western Maryland; Mont Alto and South Penn. Industries: iron foundry, three flouring mills, woolen mill, plow, shoe, furniture. sash and door, and other factories. Surrounding country agricultural and mineral. First settled in 1764 by Benjamin Chambers. Pop. est. 1897, 10,250.

Chambéry (shān-bā-ri), a town of southeast

France, capital of dep. Savoie. In its vicinity are excellent baths, much frequented in summer. It has manufactures and distilleries. Pop. 20,922. Chambord (shän-bör), a castle, park, and village, near Blois, dep. of Loir-et-Cher, in

**Chambord** (shüŋ-bör), a castle, park, and village, near Blois, dep. of Loir-et-Cher, in France. The splendid castle, in the Renaissance style, was mainly built by Francis I. In 1745 it was given by Louis XV to Marshal Saxe, who died there in 1750. Napoleon gave it to Berthier, and in 1821 a company of Legitimists bought it and gave it to the duke of Bordeaux in the name of the people of France.

Chambord (shän-bor), HENRI CHARLES FERdinand Marie Dieudonné, Comte de (1820-1883), duke of Bordeaux, the last representative of the elder branch of the French Bourbon dynasty, called by his partisans Henry V of France. He was b. seven months after the assassination of his father, Prince Charles Ferdinand d'Artois, duke de Berry. Charles X, after the revolutionary outbreak of 1830, abdicated in his favor; but the young count was compelled to leave the country with the royal title unrecognized by the nation. In 1846 he married the Princess Maria-Theresa, eldest daughter of the duke of Modena; and in 1851 inherited the domain of Frohsdorf, near Vienna, where for the most part he subsequently resided. While abstaining from violent attempts to seize the crown, he let slip no opportunity of urging his claims, especially after Sedan; but his belief in divine right, his devotion to the see of Rome, and his failure to recognize accomplished facts and modern tendencies, destroyed all chance of his succession.

**Chambre Ardente** (shän-br-år-dänt), the name formerly given in France to an apartment, hung with black and lighted with tapers, in which sentence of death was pronounced on heinous offenders. The name was afterward more especially given to those extraordinary tribunals which, from the time of Francis I, ferreted out heretics by means of a system of espionage, directed the proceedings against them, pronounced sentence, and also saw it carried into execution.

**Chame' ieon** (ka-mē'li-on), a genus of reptiles belonging to the Saurian or lizard order, a

Chameleon.

native of parts of Asia, Africa, and the south of Europe. The best-known species has a naked body 6 or 7 in. long, with a prehensile

### Chamols

tail of about 5 in., and feet suitable for grasping branches. The skin is cold to the touch, and contains small grains or eminences of a bluish-gray color in the shade, but in the light of the sun all parts of the body become of a grayish-brown or tawny color. It possesses the curious faculty, however, of changing its color, either in accordance with its environment, or with its temper when disturbed, the change being due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilatations being under the influence of the fable that they lived on air, but they are in reality insectivorous, taking their prey by rapid movements of a long viscid tongue. In general habit they are dull and torpid.

**Chamois** (sham'wii), a species of goat-like antelope inhabiting high, inaccessible mountains in Europe and Western Asia. Its horns, which are about 6 or 7 in. long, are round, almost smooth, perpendicular and straight until near the tip, where they suddenly terminate in a hook directed backward and downward. Its hair is brown in winter, brown fawn color in summer, and grayish in spring. The head is of a pale yellow color with a black band

### Chamois.

from the nose to the ears and surrounding the eyes. The tail is black. Its agility, the nature of its haunts, and its powers of smell, render its pursuit an exceedingly difficult and hazardous occupation.

)

**Chamomile** (or Camomile) (kam'o-mIl), a wellknown plant belonging to the natural order Compositæ. It is perennial, and has slender. trailing, hairy, branched stems. The flower is white, with a yellow center. Both leaves and flowers are bitter and aromatic. The fragrance is due to the presence of an essential oil, called oil of chamomile, of a light blue color when first extracted, and used in the preparation of certain medicines. Both the leaves and the flowers are employed in fomentations and poultices, and also in the form of an infusion as a stimulant or anti-spasmodic. It is cultivated in gardens in the U. S., and also found wild. **Chamouni** (or Chamonix) (shā-mö-nē, shā-

# Champaign

mo-në), a celebrated valley in France, department Haute-Savoie, in the Pennine Alps, 3,000 ft. above sealevel. The mountains on the e. side are always snow-clad, and from these proceed numerous glaciers, such as the Glacier de Bossons and the Mer de Glace. The village of Chamouni (pop. 1,500) is much frequented by tourists, and is one of the points from which they visit Mont Blanc.

### Chamomile.

**Champagne** (shāŋ-pāny), an ancient province of France, which before the Revolution formed one of the twelve great military governments of the kingdom. It forms at present the departments of Marne, Haute-Marne, Aube, Ardennes, and part of those of Yonne, Aisne, Seine-et-Marne, and Meuse. Troyes was the capital.

Champagne (sham-pan'), a French wine, white or red, which is made chiefly in the department of Marne, in the former province Champagne, and is generally characterized by the property of creaming, frothing, or effervescing when poured from the bottle, though there are also still Champagne wines. The creaming or slightly sparkling Champagne wines are more highly valued by connoisseurs. and fetch greater prices than the full-frothing wines, in which the small quantity of alcohol they contain escapes from the froth as it rises to the surface, carrying with it the aroma and leaving the liquor nearly vapid. The property of creaming or frothing possessed by these wines is due to the fact that they are partly fermented in the bottle, carbonic acid being thereby produced. Wine of a similar kind can of course be made elsewhere, and some of the German champagnes are hardly to be distinguished from the French. Much artificial or imitation champagne is sold and an excellent wine of similar nature is made in California.

**Champaign**, Champaign co., Ill., 128 mi. s.s.w. of Chicago. Surrounding country agricultural. Railroads: Chicago div. of Central railroad, and the Indianapolis, Bloomington & Western. The Illinois State Industrial University is located here. Principal industries: wagon and furniture manufactories. Pop. est. 1897, 6.000.

**Champ-de-Mars** (shän-dè-märs), that is, Field of Mars, an extensive piece of ground in Paris, used as a place of military exercise. It was here that Louis XVI swore to defend the new constitution in 1790, and it was the site of the exhibitions of 1867 and 1878.

**Champlain** (sham-plān) LAKE, a lake chiefly in the U. S. between the states of New York and Vermont, but having the north end of it in Canada; area about 600 sq. mi. It is connected by canal with the Hudson River, and has for outlet the river Richelieu, or Sorel, flowing north to the St. Lawrence. Its scenery is beautiful, and attracts many visitors.

**Champlain** (shän-plan), SAMUEL (1570-1635), a French naval officer and maritime explorer. His exploits in the maritime war against Spain in 1595 attracted the attention of Henry IV, who commissioned him in 1603 to found establishments in North America. After three voyages for that purpose, in the last of which he founded Quebec, he was in 1620 appointed governor of Canada.

Champollion (shän-pol-yön), JEAN FRANCOIS (1790-1832), French scholar, celebrated for his discoveries in the department of Egyptian hieroglyphics, b. at Figeac, department of Lot, France. He went to Paris, where, with the aid of the trilingual inscription of the Rosetta Stone and the suggestions thrown out by Dr. Thomas Young, he discovered the key to the graphic system of the Egyptians, the three elements of which - figurative, ideographic, and alphabetic-he expounded before the Institute in a series of memoirs in 1823. These were published in 1824 at the expense of the state. In 1826 Charles X appointed him to superintend the department of Egyptian antiq-uities in the Louvre; in 1828 he went as director of a scientific expedition to Egypt; and in 1831 the chair of Egyptian archæology was created for him at the Collége de France.

**Chan'cellorsville**, the site of one of the greatest battles of the American Civil War, in which, on May 2, 3, and 4, 1863, a nominal victory was gained by the Confederates under Generals Lee and Jackson over the Federal troops commanded by General Hooker. The Federal troops, though compelled to retreat across the Rappahannock, carried with them some thousands of prisoners and one more gun than they had lost, while the Confederates lost from 15,000 to 18,000 men and their brilliant leader, "Stonewall" Jackson.

**Chan'cery,** formerly the highest court of justice in England next to Parliament, but since 1873 a division of the High Court of Justice, which is itself one of the two departments of the Supreme Court of Judicature. In American law a court of general equity jurisdiction. Separate courts of chancery or equity exist in some of the states; in others the courts of law sit also as courts of equity;

in others the distinction between law and equity has been abolished or never existed.

**Chandausi** (chan-dou-sē'), a town of India. N. W. Provinces, Moradabad district. Pop. 27,521.

**Chan' dernagore**, ("city of sandalwood"), a town in Hindustan, belonging to France, on the right bank of the Hooghly, 16 mi. n.n.w. of Calcutta. The French established a factory in it in 1676, and in 1688 obtained a formal cession of it, together with its territory of 2,325 acres, from Aurungzebe. It was three times occupied by the British, but was finally restored to the French in 1816. Pop. of town and territory 30,000.

Chandler, WILLIAM EATON, statesman, b. in Concord, N. H., 1835; graduated at Harvard law school in 1855, and in 1862 was elected to the state legislature. From 1868 to 1876 he served as secretary of the Republican national committee. On March 23, 1885, he was nominated for solicitor general of the U. S., but was not confirmed by the senate. In 1882 he became secretary of the navy, and held that office until 1855. In 1837 he was elected to fill a vacancy in the U. S. Senate, and was reelected for the term ending in 1895.

**Chandler**, ZACHARIAH (1813–1879). American statesman. In 1851 he was elected mayor of Detroit, Mich. He assisted in organizing the Republican party, and in 1857 was elected U. S. senator. He was re-elected in 1863 and 1869, and in 1874 he was made secretary of the interior, which post he held until March 1, 1877. In 1876 he was chairman of the Republican national committee. He was re-elected to the U. S. Senate in February, 1879.

**Chang-Chow-Foo**, a city, China, province of Fokien, 36 mi. s.w. of Amoy, which is its port. It stands in a valley surrounded by hills and intersected by a river, and is the center of the silk manufacture of the province. Pop. est. at from 800,000 to 1.000.000.

**Changarnier**, NICOLAS (1793-1877), a French soldier. He distinguished himself in the Algerian campaigns from 1830 to 1847, and became general of division and maréchale-decamp. In May, 1848, he became governor general of Algeria. In the same year he was recalled and was made commander in chief of the national guard of Paris. He was deprived of his command in 1851, and at the *coup d'état* of that year he was arrested and exiled. During the Franco-Prussian War he offered his sword to France and was sent to Metz. He opposed the surrender of that fortness and of Bazaine's army, but was overruled. After the war he was made a senator.

**Channel Islands**, a group of islands in the English Channel, off the west coast of department La Manche, in France. They belong to Britain, and consist of Jersey. Guernsey, Alderney, and Sark, with some dependent islets. The islands have been fortified at great expense. They form the only remains of the Norman provinces once subject to England. Area 112 sq. mi.; pop. 88,289.

**Channing** (chaning), WILLIAM ELLERY (1780-1842), a famous American preacher and writer,

b. at Newport, Rhode Island. in 1780. He studied at Harvard College, became a decided Unitarian, and propagated Unitarian tenets with great zeal and success. His first appointment as a pastor was in 1803, when he obtained the charge of a congregation in Boston, and ere long he became known as one of the most popular preachers of America. His reputation was still further increased by the publication of writings, chiefly sermons, reviews, etc., on popular subjects. His nephew, WILLIAM HENRY CHANNING (1810–1884), also a Unitarian preacher (for some time at Liverpool) and supporter of the socialistic movement, has written a memoir of his uncle, and other works.

**Chantiliy** (shan-tē-yē), a town, France, department of the Oise, 25 mi. n.n.e. of Paris, celebrated for a variety of lace made here and in the neighborhood, for the splendid château, built by the great Condé, but leveled by the mob at the Revolution; and also for another palace built by the Duc d' Aumaie after the estate came into his possession in 1850, which, along with the fine domain, was presented by the duke to the French Institute in 1887. It is a horse-racing center. Pop. 4,000. **Chant' rey**, SIR FRANCIS (1781-1842), a noted

**Chant' rey**, Sir FRANCIS (1781-1842), a noted English sculptor, b. near Sheffield, was the son of a well-to-do carpenter. In 1802 he commenced work for himself at Sheffield by taking portraits in crayons. After studying at the Royal Academy in London, he eventually settled in the metropolis, where he presented numerous busts at the exhibitions of the Royal Academy. His most celebrated works are the Skeping Children, in Litchfield Cathedral; the statue of Lady Louisa Russell, in Woburn Abbey; the bronze statue of William Pitt, in Hanover Square, London; a statue of Washington, in the state house, Boston; and statues of Horner, Canning, Sir J. Makcolm, etc., in Westminster Abbey. His best works are his busts, but his full-length figures betray an insufficient acquaintance with anatomy, and several of his equestrian statues are still more defective.

**Chanzy,** ANTOINE EUGENE ALFRED (1823-1883), a French soldier. He distinguished himself in Italy and Algeria, and in 1870 commanded the army of the Loire. He was defeated at Le Mans, Jan. 12, 1871. In 1873 he was appointed governor general of Algeria, in 1875 was made a life senator, and in 1879 became ambassador at St. Petersburg.

**Chao-Chow**, a city. China, province Quang-Tong, on the river Han, 195 mi. n. e. of Hong-Kong, the center of an important maritime division of the province.

**Chaos** (kā'os), in old theories of the earth, the void out of which sprang all things or in which they existed in a confused, unformed shape before they were separated into kinds.

**Chapola** (chá-pa'la), a picturesque lake of Mexico, states of Xalisco and Michoacan. Area 1,400 sq. mi.

**Chapin**, EDWIN HUBBELL (1814-1880), American clergyman. He was ordained a minister in 1827, and had charge of a church in Richmond, Va., for three years, removing thence to Charlestown, Mass. After six years of service there he became the colleague of Hosea Ballou in the School Street Universalist church, Boston. In 1848 he became pastor of the Fourth Universalist church in New York City. He became one of the most popular and prominent of the preachers of New York. He was a delegate to the Peace Congress at Frankfort-onthe-Main in 1850. He was a trustee of Bellevue Medical College and Hospital, and the Chapin Home for aged men and women was named in his honor.

**Chapleau**, JOSEPH ADOLPHE, Canadian statesman, b. in Quebec, Nov. 9, 1840. In 1873 he became solicitor general of the province. He was a strong conservative, and was considered the leading French-Canadian orator of the time. In 1879 he was premier of Quebec, and in 1882 became secretary of state for Canada.

**Chapman**, GEORGE (1557-1634), an English poet, the earliest, and perhaps the best, translator of Homer. His translation of the *Itiad* was published in three separate portions in 1598, 1600, and 1603. It has been highly commended by such poets as Pope, Keats, and Coleridge, as also by Lamb. Keats's sonnet, On First Looking into Chapman's Homer ("Then felt I like some watcher of the skies," etc.), is well known.

**Chapoo**, a seaport, China, province Chekiang, on the north side of a large bay, 35 mi. n. from Ningpo. It carries on a considerable trade with Japan.

**Char** (or Charr), a European fresh-water fish of the salmon genus, found plentifully in the deeper lakes of England, Wales, and Ireland, more rarely in those of Scotland. The chars inhabit the colder regions of deep waters, where the temperature is less liable to vary. The body somewhat resembles that of a trout, but is longer and more slender, as well as more brilliant in coloring, with crimson, rose, and white spots; weight sometimes 2 lbs., but generally under 1 lb. Char is much esteemed for the table.

**Charade** (sha-räd' or sha-råd'), a kind of riddle, the subject of which is a word that is proposed for discovery from an enigmatical description of its several syllables, taken separately as so many individual and significant words. When dramatic representation is used to indicate the meaning of the syllables and the whole word it is called an acting charade.

**Char'coal**, a term applied to an impure variety of carbon, especially such as is produced by charring wood. One kind of it is also obtained from bones: lampblack and coke are also varieties. Wood charcoal is prepared by piling billets of wood in a pyramid form, with vacuities between them for the admission of air, and causing them to burn slowly under a covering of earth. In consequence of the heat, part of the combustible substance is consumed, part is volatilized, together with a portion of water, and there remains behind the carbon of the wood, retaining the form of the ligneous tissue. Another process consists in heating the wood in close vessels, by which the volatile parts are driven off, and a char-

coal remains in the retorts, not so dense as that obtained by the other process. Wood charcoal, well prepared, is of a deep black color, brittle and porous, tasteless and inodorous. It is infusible in any heat a furnace can raise; but by the intense heat of a powerful galvanic apparatus it is hardened, and at length is volatilized, presenting a surface with a distinct appearance of having undergone Charcoal is insoluble in water, and fusion. is not affected by it at low temperatures; hence, wooden stakes which are to be immersed in water are often charred to preserve them, and the ends of posts stuck in the ground are also thus treated. Owing to its peculiarly porous texture, charcoal possesses the property of absorbing a large quantity of air or other gases at common temperatures, and of yielding the greater part of them when heated. Charcoal likewise absorbs the odoriferous and coloring principles of most animal and vegetable substances, and hence is a valuable deodorizer and disinfectant. It is used as fuel in various arts, where a strong heat is required, without smoke, and in various metallurgic operations. By cementation with charcoal, iron is converted into steel. It is used in the manufacture of gunpowder. In its finer state of aggregation, under the form of ivoryblack, lampblack, etc., it is the basis of black paint; and mixed with fat oils and resinous matter, to give a due consistence, it forms the composition of printing ink.

**Charente** (shā-röŋt), a river in Western France, rising in the department of Haute-Vienne, and falling into the sea about 8 mi. below Rochefort, opposite to the isle of Oleron, after a course of about 200 mi. It gives its name to two departments. CHARENTE, an inland department, formed chiefly out of the ancient province of Angoumois, and traversed by the river Charente; area 2,294 sq. mi.; capital Angoulème. The wines are of inferior quality, but they yield the best brandy in Europe, the celebrated cognac brandy being made in Cognac and other districts. Pop. 360,259. CHARENTE-INFÉRIEURE (an-fā-ri-eur) ("Lower Charente"), a maritime department, comprises parts of the former provinces of Angoumois and Poitou: area 2,635 sq. mi. The wine is of common quality, and chiefly used for making brandy. Oysters and sardines abound on the coast. Salt and brandy are the only articles manufactured to any great extent. Capital La Rochelle. Pop. 450,202.

**Cha'ring Cross,** the titular center of London, so named from a cross which stood until 1647 at the village of Charing in memory of Eleanor, wife of Edward I. It is now a triangular piece of roadway at Trafalgar Square.

**Charlot**, a term applied to vehicles used both for pleasure and in war. Ancient charlots, such as those used among the Egyptians. Assyrians, Greeks, and Romans, were of various forms. A common form was open behind and closed in front, and had only two wheels. The charlot was strongly and even elegantly built. but not well adapted for speed. In ancient warfare charlots were of great importance. In the

## Charlemagne

Egyptian chariots the framework, wheels, pole, and yoke were of wood, and the fittings of the inside, the bindings of the framework, as well as the harness were chiefly of rawhide or tanned leather. We have number of sculp-tures which give a clear idea of the Assyrian chariots. These resemble the Egyptian in all essential features, containing almost invariably three men-the warrior, the shield-bearer, and the charioteer. A peculiarity of both is the quiver or quivers full of arrows attached to the side. From the front of the chariot a singular ornamental appendage stretches forward. War chariots had sometimes scythe-like weapons attached to each extremity of the axle, as among the ancient Persians and Britons. Among the Greeks and Romans chariot races were common.

Charlemagne (or Charles the Great) (747 [742?]-814), king of the Franks and first of the Holy Roman Emperors. Charlemagne was the son of Pepin the Short and grandson of Charles Martel. The Carloringian dynasty takes its name from him, as its greatest representative. With his brother Carloman he succeeded his father (768). In 771 Carloman d., and the free vote of the Franks made Charlemagne sole king. His reign of forty-six years is filled with wars and conquests, as during that time he undertook fifty-two campaigns, the chief of which were against the Lombards, the Saracens, and the Saxons. Desiderius, king of the Lombards, having sought to obtain the succession for the children of Carloman, Charlemagne marched against him, seized all his possessions, and shut the deposed king in a monastery. Charlemagne placed on his own head the famous "Iron Crown of Lombardy" (774). Before leaving Italy he visited Rome and confirmed the donation made by his father to the pope of certain portions of Lombardy. This was the beginning of the papal claims to tem-poral supremacy. In 777 Charlemagne made an expedition against the Saracens in Spain. He was victorious, but on the return march across the Pyrenecs, the rear of his army was attacked by the Gascons and Basques, wild mountaineers of that region, and cut to pieces in the famous Pass of Roncesvalles. Here fell the Christian knight Roland. Charlemagne's most frequent and important campaigns were against the Saxons, one of the few pagan German tribes at this time. He was determined to establish Christianity among them at any cost, but for more than thirty years they re-sisted him. During this struggle Charlemagne caused 4,500 Saxon prisoners to be massacred at one time. They at last yielded. In the year 800 Charlemagne was called to Rome by Pope Leo III to aid him against a hostile faction. The king speedily punished the pope's enemies, and before leaving Rome was magnificently rewarded for his services. During the festivities in the cathedral of St. Peter on Christmas Day, Pope Leo approached the kneeling king, placed on his head a crown of gold, and proclaimed him emperor of the Romans, the consecrated successor of Cæsar Augustus and Constantine. Since 476, when

the Roman Empire fell, the imperial seat had been at Constantinople. Charlemagne's em- king's design. An English army was sent pire, at his death, extended from the Baltic to the Mediterranean, from the Atlantic Ocean to the Danube, including modern France, Germany, Holland, Belgium, Switzerland, Hungary, a little of Spain, and most of Italy. His capital was at Aix-la-Chapelle. This splendid domain only a Charlemagne could rule. After his death it was harassed by the Northmen and by internal dissension, until finally by the treaty of Verdun in 843, it was divided among his three grandsons, Charles, Lothaire, and Lewis, the divisions made laying the foundations, subject to some territorial changes, of the modern nations. France, Italy, and Ger-many respectively. Charlemagne is famed as a statesman and a patron of learning. His laws are in part preserved in decrees called "Capitularies," more than a thousand in number. Commerce was protected, and robbers who preyed upon traveling merchants were severely dealt with. Agriculture was encouraged and improvements taught to the farmers. the emperor's own estates being a praiseworthy model. Charlemagne formed at his court a school for the nobles and their sons. The emperor himself learned to read Latin and even Greek, but could not write legibly. Charlemagne is said to have been of large stature and imposing presence, was regular and temperate. He is charged by some, probably without justice, with immorality. He was married four times and left one son, who became Lewis I, surnamed "Debonair."

Charleroi (shårl-r wä), a town in Belgium, prov. of Hainaut, on both sides of the river Sambre, 20 mi. e.n.e. Mons. It has manufactures of glass, hardware, etc., and woolen stuffs, and in the neighborhood are extensive pits of iron and coal. Pop. 21,879.

Charles, a name frequently used by European monarchs. Of the less important may be mentioned kings of France: Charles the Bald (823-877): Charles the Fat (832-888); Charles the Simple (879-929): Charles the Handsome (1294-1328): Charles the Wise (1337-1380); Charles the Silly (1368-1422): Charles VII, for whose kingdom Joan of Arc fought (1403-1461); Charles VIII (1470-1498): Charles IX (1757-1836). Emperors of Germany: Charles IV (1316-1378): Charles V (1500-1558); Charles VI (1685-1740); and Charles VII (1697-1744). The present reigning monarchs of the name include the kings of Portugal, Roumania, and Wurtemburg.

Charles I (1600-1649), king of England, Scotland, and Ireland, was born at Dunferm-line, Scotland. He married Henrietta Maria, daughter of Henry IV of France, and in 1625 succeeded to the throne. After dissolving three Parliaments he concluded to reign alone. This he did for eleven years, using the arbitrary courts of High Commission and Starchamber as a kind of cover for pure absolutism, and raising money by unconstitutional or doubtful means. The attempts of Charles to introduce an Anglican liturgy into Scotland produced violent tumults, and gave origin to

the famous Covenant in 1638, to oppose the north, but was defeated by the army of the Covenanters, and in 1640 a Parliament was again summoned, which proved to be the famous Long Parliament. The king had on his side the great bulk of the gentry, while nearly all the Puritans and the inhabitants of the great trading towns sided with the Parliament. The first action, the battle of Edgehill (Oct. 23, 1642), gave the king a slight advantage: but nothing very decisive happened till the battle of Marston Moor, in 1644, when Cromwell routed the royalists. The loss of the battle of Naseby, the year following, completed the ruin of the king's cause. Charles at length gave himself up to the Scottish army at Newark (May 5, 1646). He was beheaded before the Banqueting House, Whitehall, meeting his fate with great dignity and composure.

Charles II (1630-1685), king of England, Ireland, and Scotland, son of Charles I and Henrietta Maria of France. Cromwell was all-powerful in England; but Charles accepted an invitation from the Scots, who had pro-claimed him their king July, 1650, and, passing over to Scotland, was crowned at Scone (1651). Cromwell's approach made him take refuge among the English royalists, who, having gathered an army, encountered Cromwell at Worcester, and were totally defeated. Charles escaped to France. On the death of Cromwell the Restoration, effected without a struggle by General Monk, set Charles on the throne after the declaration of Breda, his entry into the capital (May 29, 1660) being made amid universal acclamations. In 1662 he married the Infanta of Portugal, Catharine of Braganza. His reign was characterized by foreign and domestic troubles.

Charles XII (1682-1718), king of Sweden, was b. at Stockholm. On the death of his father, in 1697, when he was but fifteen years old, he was declared of age by the estates. To his jealous neighbors this seemed a favorable time to humble the pride of Sweden. Frederick IV of Denmark, Augustus II of Poland. and the Czar Peter I of Russia concluded an alliance which resulted in war against Sweden. With the aid of an English and Dutch squadron the Danes were soon made to sign peace. but Augustus of Saxony and Poland, and the czar were still in the field. After a long war Charles was defeated at Pultawa. He fied with a small guard and found refuge and an honorable reception at Bender, in the Turkish territory. Here he managed to persuade the Porte to declare war against Russia; but peace was soon procured and the interests of Charles were neglected. He was forced by the Turkish government to leave. Arrived in his own country in 1714, he set about the measures necessary to defend the kingdom, and the fortunes of Sweden were beginning to assume a favorable aspect when he was slain by a cannon ball as he was besieging Frederikshall.

Charles Edward Stuart (1720-1788), called the Young Pretender, grandson of James II,

king of England, son of James Edward and Clementina, daughter of Prince Sobieski, was, b. in 1720 at Rome. In 1742 he went to Paris and persuaded Louis XV to assist him in an attempt to recover the throne of his ancestors. Fifteen thousand men were on the point of sailing from Dunkirk, when the English admiral Norris dispersed the whole fleet. Charles now determined to trust to his own exertions. Accompanied by seven officers he landed on the west coast of Scotland, from a small ship called the Doutelle. Many Lowland nobles and Highland chiefs went over to his party. With a small army thus formed he marched forward, captured Perth, then Edinburgh (Sept. 17, 1745), defeated an army of 4,000 British under Sir John Cope at Prestonpans (September 22), and advancing obtained possession of Carlisle. He now caused his father to be proclaimed king, and himself regent of England; removed his headquarters to Manchester, and soon found himself within 100 mi. of London, where many of his friends awaited his arrival. The rapid successes of the adventurer now caused a part of the British forces in Germany to be recalled. Want of support, disunion, and jealousy among the adherents of the house of Stuart, some errors, and the superior force opposed to him, compelled Prince Charles to retire in the beginning of 1746. The victory at Falkirk (Jan. 28, 1746) was his last. Asa final attempt he risked the battle of Culloden against the Duke of Cumberland, April 16, 1746, in which his army was defeated and entirely dispersed. The prince now wandered about for a long time through the wilds of Scotland, often without food, and the price of \$150,000 was set upon his head. At length, on Sept. 20, 1746, five months after the defeat of Culloden, he escaped in a French frigate. He received a pension yearly from France, and from Spain. Forced to leave France by the terms of the Peace of Aix-la-Chapelle (1748) he went to Italy, and in 1772 married a princess of Stolberg-Gedern, from whom eight years later he was separated. He latterly fell into habits of intoxication, and d. and was buried at Frascati. The funeral service was performed by his only surviving brother, Cardinal York, with whose death in 1807 the Stuart line ended. The cardinal received a pension from Britain of \$20,000 a year till his death.

**Charles Martel'**, ruler of the Franks. was a son of Pepin Héristal. He rendered his rule famous by the great victory which he gained in October, 732, over the Saracens, near Tours, from which he acquired the name of *Martel*, signifying hammer.

**Charles River**, a river in Massachusetts, which flows into Boston harbor, dividing Boston from Charleston.

**Charleston**, Charleston co., S. C., on peninsula between Ashley and Cooper rivers, has one of the finest harbors on the Atlantic coast. It is the port of a naturally rich section which produces abundant cotton and rice. Besides these, great quantities of naval stores and bone phosphate are exported. Railroads: South Carolina; Savannah & Charleston; and the Northwestern. The Santee Canal connects with the Santee River. The manufacturing interests are inferior to the commercial, the most important being in fertillzers and in the preparation of rice. Pop. est. 1897, 61,000.

Charleston, Kanawha co., capital of W. Va., on right bank of Kanawha River at its junction with the Elk, 130 mi. s. by w. of Wheeling. It is the central and distributing point of the valley which yields coal, iron, and hard wood timber. Railroads: Chesapeake & Ohio, and the Kanawha & Ohio. Principal industries: foundries, iron and sawmills, and factories. Pop. est. 1897, over 10,000.

**Charleville** (sharl-vēl), a town, France, department Ardennes. It has wide and regularly built streets, considerable manufactures, and a large trade in coal, iron, wine, etc. Pop. 16,-185.

**Char' lock**, the vulgar name of a common yellow weed in cornfields, also called wild mustard. It also is a common cornfield weed, but having white or straw colored flowers and jointed pods.

Charlotte, Mecklenburg co., N. C., on Sugar Creek, 125 mi. w.s.w. of Raleigh. It is located in the N C. gold region and partially dependent on the mines. Railroads: Wilmington, Charlotte & Rutherford; C. C. & A.; and the N. C. div. of the R. & D. Ry. Principal industries: cotton mills, etc. Pop. est. 1897, 8,000.

Charlotte-Amalie, a town. West Indies, capital of the Island of St. Thomas, one of the Virgin Islands, belonging to the Danes, on the south side of the island. It has an excellent harbor, and is a considerable entrepôt for goods for the neighboring islands. Pop. 12,000.

for the neighboring islands. Pop. 12,000. Charlottenburg (shår-lot'en-burh), a town of Prussia, on the Spree, about 3 mi. from Berlin, with a royal palace and park, and many places of amusement, as also a number of industrial and manufacturing establishments. Pop. 76,859.

Charlottesville, Albemarle co., Va., 97 mi. w. of Richmond. Railroads: Chesapeake & Ohio; and Southern Ry. Industries: woolen mills, knitting factory, and iron foundry. Became a city in 1887. Seat of University of Virginia. Pop. est. 1897, 10,000.

Charlottetown, Queen's co., province of P. E. I. Railroad, P. E. Island R. R., extending e. and w. to chief points of province. Industries: woolen mill, iron foundry, sash and door, soap, butter, and other factories. Surrounding country agricultural. The town was first settled in 1769 and became a city in 1855. Pop. est. 1897, 12,000.

**Charon** (kā'ron), in Greek mythology, the son of Erebus and Night. It was his office to ferry the dead in his boat over the rivers of the infernal regions. He was represented as an old man, with a gloomy aspect, matted beard, and tattered garments.

**Chart**, a hydrographical or marine map, that is a draught or projection of some part of the earth's surface, with the coasts, islands, rocks, banks, channels, or entrances into harbors, rivers, and bays, the points of compass,

soundings, or depth of water, etc., to regulate the courses of ships in their voyages. The term *chart* is applied to a marine map; map is applied to a draught of some portion of land (often including sea also). A *plane chart* is one in which the meridians are supposed parallel to each other, the parallels of latitude at equal distances, and of course the degrees of latitude and longitude everywhere equal to each other. A great number of excellent charts are produced by the hydrographic department of the British admiralty and are sold at a low rate. The U. S. Coast Survey Department produces similar charts. See *Coast Surtext*.

tey. Charter, a written instrument, executed with usual forms, given as evidence of a grant, contract, or other important transaction between man and man. Royal charters are such as are granted by sovereigns to convey certain rights and privileges to their subjects, such as the Great Charter, granted by King John, and charters granted by various sovereigns to boroughs and municipal bodies, to universities and colleges, or to colonies and foreign possessions; somewhat similar to which are charters granted by the state or legislature to banks and other companies or associations, etc.

**Chartres**, a city, France, capital of the department Eure-et-Loire, 49 mi. s.w. Paris. It is a very ancient city. The cathedral. one of the most magnificent in Europe, is rendered conspicuous by its two spires surmounting the height on which the city stands. Manufactures: woolen hosiery, hats, earthenware, and leather; there is a large trade. Pop. 23,108.

**Chartreuse** (chär-treuz) (or Great Chartreuse), a famous Carthusian monastery in Southeastern France, a little northeast of Grenoble, situated at the foot of high mountains, 3,280 ft. above sea level, the headquarters of the order of the Carthusians. It was founded in 1084, but the present building, a huge, plainlooking pile, dates from 1676. The monks of this monastery manufacture the well-known liquor called *Chartreuse*, which owes its special properties to the aromatic plants growing on the Alps.

**Charybdis** (ka-rib'dis), an eddy or whirlpool in the Straits of Messina, celebrated in ancient times, and regarded as the more dangerous to navigators because in endeavoring to escape it they ran the risk of being wrecked upon Scylla, a rock opposite to it.

**Chase**, SALMON PORTLAND (1808–1873), American statesman and jurist, b. in New Hampshire. Having adopted the law as his profession he settled at Cincinnati and acquired a practise there. He early showed himself an opponent of slavery, and was the means of founding the Free-soil party, which in time gave rise to the great Republican party—the power that brought the downfall of slavery. In 1849–55 he was a member of the U. S. Senate, in which he vigorously opposed the extension of slavery into the new territories. In 1855 he was elected governor of Ohio, being re-elected in 1857. In 1860 he was an unsuccessful candidate for the presidency. In 1861 he was nominated secretary of the treasury, and in this post was signally successful in providing funds for carrying on the Civil War. In 1864 he resigned office, and was appointed chief justice of the Supreme Court.

**Chassepot Rifie** (shas-po), a breech-loading rifie, named after its inventor, and adopted as the firearm of the French infantry in 1866, but since given up. It was about 4 lbs. lighter than the needle gun and about 1 lb. lighter than the Martini-Henry rifle.

**Chat**, the popular name of birds of the warbler family. They are small, lively birds, moving incessantly and rapidly about in pursuit of the insects on which they chiefly live. The yellow-breasted chat is a large bird, belonging to the thrush family.

Chateaubriand (shä-tö-bri-än), FRANÇOIS AUGUSTE, VICOMTE DE (1768-1848), a celebrated French author and politician. He went to London and published in 1797 his Essai Historique, which met with but small success. At this time the death of his mother and the accounts of her last moments transmitted to him by his sister helped to effect a certain change in the religious opinions of Châteaubriand, and from a not very profound skeptic he became a not very profound believer. In 1800 he returned to France. and in the following year published his romance of Atala, the scene of which is laid in America. and the year after his celebrated work, Le Génie du Christianisme, which is a kind of brilliant picture of Christianity in an æsthetic and romantic aspect. Style, power of description, and eloquence are the merits of the book rather than any depth of thought; but it carried the author's reputation far and wide, and contributed much to the religious reaction of the time. After a short career as diplomatist under Napoleon, Chauteaubriand made a tour in the East (1806-7), visiting Greece, Asia Minor, and the Holy Land. As the fruit of his travels he published Les Martyrs (1809) and Itinéraire de Paris à Jérusalem (1811). He hailed the restoration of Louis XVIII with enthusiasm, was appointed ambassador to Berlin, and then to London, but in 1824 quarreled with the pre-mier, M. de Villèle, and was summarily dismissed. On the revolution of 1830 he refused to take the oath of allegiance to Louis Phillippe, forfeiting thus a pension of 12,000 francs. At this time his writings were chiefly political, and mostly appeared as newspaper articles, pamphlets, etc. In his later years he wrote several works, but none of the value of his earlier productions.

**Chateau-Lafitte**, famous vineyards, all in the department of the Gironde, France, furnishing the best of the red wines of Bordeaux.

**Chateauroux** (shä-to-rë), a town, France, capital of the department of Indre. It has straight, broad streets, and spacious squares. Cloth, cotton, hosiery, woolen yarn, paper, etc., are made; and there are tanneries and dye works. Pop. 23,924.

**Chatham** (chat'am), a town, naval arsenal, and seaport, England, county Kent, on the Medway, about 341 mi. by rail from London. The importance of Chatham is due to the naval and military establishments at Brompton in its immediate vicinity. The royal dockyard was founded by Queen Elizabeth previous to the sailing of the Armada. It has been greatly enlarged in recent years, and is now about 2 mi. in length, with most capacious docks, in which the heaviest warships can be equipped and sent directly to sea. Building slips, saw mills, metal mills, etc., and all the requisites of a great naval station are here on the largest scale and in the finest order. The military establishments include extensive barracks, arsenal, and park of artillery, hospital, store-houses and magazines. etc. The town is poorly built, but is defended by a strong line of fortifications which also serve as a flank defense for the metropolis. Pop. 59,210.

**Chatham**, a town of Canada, prov. Ontario, on the river Thames, 11 mi. n. of Lake Erie, with manufactures of machinery, iron castings and woolens, and a trade in lumber, etc. Pop. 9,052. **Chatham**, WILLIAM PITT, EARL OF (1708-

1778), one of the most illustrious statesmen of Britain, the son of Robert Pitt of Boconnoc, in Cornwall, educated at Eton and Oxford. He entered Parliament and soon attracted notice as a powerful opponent of Walpole. In spite of the king's dislike Pitt was powerful enough to win a place in the administration, first as vice-treasurer of Ireland, and after-ward as paymaster-general. In 1756 he became secretary of state and the real head of the government. Dismissed in 1757 on account of his opposition to the king's Hanoverian policy, no stable administration could be formed without him, and he returned to power the same year in conjunction with the Duke of Newcastle. It was under this administration and entirely under the inspiration of Pitt that Britain rose to a place among the nations she had not before occupied. Wolfe and Clive, both stimulated and supported in their great designs by Pitt, won Canada and India from the French, and the support the Great Commoner gave Frederick of Prussia contributed not a little to the destruction of French predominance in Europe. The accession of George III brought Lord Bute into power, and Pitt, disagreeing with Bute, re-signed in 1761. In 1766 he strongly advocated conciliatory measures toward the American colonies, and undertook the same year to form an administration, he going to the House of Lords as earl of Chatham. But the ministry was not a success, and in 1768 he resigned. After this his principal work was his appeals for a conciliatory policy toward the colonies. But his advice was disregarded, and the colonies declared themselves independent in 1776. He received a public funeral and a magnificent monument in Westminster Abbey.

**Chatham Islands,** a group of three islands in the South Pacific Ocean, belonging to New Zealand. The soil is in many places fertile, and crops of potatoes, wheat, and vegetables are successfully grown. Cattle and sheep are reared, and thus whaling or other vessels that call are supplied with fresh provisions as well as with water. The present population amounts to only 285. The islands were discovered in 1791.

**Chattahoo' chee**, a river, rising in the Appalachian Mountains in Georgia, and forming for a considerable distance the boundary between Georgia and Alabama. In its lower course, after the junction of the Flint River, it is named the Appalachicola, and is navigable to Columbus in Georgia for steamboats. Total course, about 550 miles.

**Chattanooga**, Hamilton co., Tenn., at foot of Lookout Mountain, on left bank of Tennessee River, 156 mi. s.e. of Nashville. Surrounding country agricultural and mineral. Railroads: N. & C.; W. & A.; A. & C.; Cincinnati Southern; E. T. V. & G.; and Memphis and Charleston. Its industries embrace cotton mills, tanneries, iron, nail, steel, and machine companies, rolling mills. furnaces, railroad car, furniture, and other factories. The wholesale trade is very extensive, having representatives in every branch. Pop. est. 1897. 40.000.

tives in every branch. Pop. est. 1897, 40,000. Chat' terton, THOMAS (1752-1770), a youth whose genius and melancholy fate have gained him much celebrity, was b. at Bristol, England, of poor parents, and educated at a charity school. At the age of fourteen he was apprenticed to an attorney. In 1768, when the new bridge at Bristol was completed, he inserted a paper in the Bristol Journal entitled A Description of the Friars' First Passing over the Old Bridge, which he pretended he had found along with other old manuscripts in an old chest in St. Mary Redcliffe church, Bristol. He also showed his friends several poems of similarly spurious antiquity which he attributed to one Rowley. In 1769 he ventured to write to Horace Walpole, then engaged upon his Anecdotes of Painters, giving him an account of a number of old Bristol painters which was clever enough to deceive Walpole for a time. Dismissed from the attorney's office, he left with his manuscripts for London, where a favorable reception from the booksellers gave him high hopes. For them he wrote numerous pamphlets, satires, letters, etc., but got no substantial return, and his situation became daily more desperate. At last, after having been several days without food, he poisoned himself.

Chau'cer, GEOFFREY (1340-1400), "the father of English poetry." Nothing is known of his education, but in 1350-59 he was a page to Princess Lionel. He tells us himself that in 1359 he bore arms in France and was taken prisoner. He was ransomed next year. In 1367 we find his name as a valet of the king's chamber. In 1367 he received a pension of twenty marks, and between 1370 and 1380 he was employed abroad in seven diplomatic missions. In one of these, in 1372, he was sent to Genoa as a commissioner to negotiate a commercial treaty. In 1374 he was appointed comptroller of the customs on wool at London, also received an annual allowance. In 1377 he was sent to Flanders and France on diplomatic business, and next year to Lombardy. In 1382 he was appointed comptroller of the petty

customs. In 1386 he was returned to Parlia-ment as knight of the shire for Kent, but in the same year he shared the disgrace of his patron, John of Gaunt, was dismissed from his comptrollerships, and reduced to a state of Three years later, comparative poverty. however, he was made clerk of the works, and afterward had other offices and one or two annuities bestowed upon him. In 1399 he got a pension of forty marks from Henry IV, but did not live long to enjoy it. His most cele-brated work, The Canterbury Tales, was written at different periods between 1373 and 1400. It consists of a series of tales in verse (two in prose), supposed to be told by a company of pilgrims to the shrine of St. Thomas (Becket) at Canterbury in 1386. In its pages we get such pictures of English life and English ways of thought in the fourteenth century as are found nowhere else. Besides his great work Chaucer wrote many poems some of which are founded on French or Italian works. He was buried in Westminster Abbey.

**Chaudlère** (shōd-yār), a river of Canada, Quebec province, which rises on the borders of Maine, near the sources of the Kennebec, and flows into the St. Lawrence about 6 mi. above Quebec. The banks of the river are generally steep and rocky, and about 3 mi. above its junction with the St. Lawrence are the Chaudière Falls, about 120 ft. high. On the Ottawa River are two other falls of lesser dimensions known as the Great and the Little Chaudière.

**Chauncey**, ISAAC (1772-1840), American naval officer. He became captain of a merchantship in 1791, and in 1798 entered the U. S. navy as a lieutenant, and was soon promoted. In the War of 1812 he commanded on the lakes, assisted in the capture of Toronto and Fort George, and defeated the British fleet under Sir James Yeo. He afterward commanded in the Mediterranean. For many years he was president of the board of navy commisioners.

**Chaus**(kā'us), a genus of Asiatic and African lynxes or cat-like animals, including the Libyan chaus, and the Caffer-cat. They are fond of the water, and excellent swimmers.

Chautauqua, on Lake Chautauqua in the western part of New York, represents an important educational movement, which originated in 1874 under the leadership of Dr. J. H. Vincent, New York City, and Lewis Miller, Akron, O.; 136 acres of land were laid out in the woods, and trees cut away for cottages and parks. The whole is illuminated with electric lights, has the best of sanitary arrangements, and is abundantly supplied with pure water. The original idea to combine innocent amusements of the summer recreation hours with worthy educational pursuits has been well carried out. Instruction is given on a variety of subjects. A literary and scientific circle was organized in 1872 to promote habits of reading and study at home, among those who had left school, or whose educational ad-vantages had been limited. The Chautauqua circle is a home college for young and old. The course of study adopted requires an aver-

age of forty minutes reading each day for four years. Local circles have been organized in many parts of the world. Graduates receive diplomas. At the first commencement, Aug. 12, 1882, sixteen hundred graduates received diplomas, among the number a lady eighty years old. Every summer there is a sixmonths' session. School of languages, teachers' retreats, missionary institutes, literary and scientific circles, etc., are open. Lectures, concerts, class drills, children's meetings, etc., attract thousands to this sylvan retreat. A model of Palestine, an Egyptian pyramid, an Oriental house, the children's temple, and the art and archeological museum are points of interest. These summer meetings are the inspiration to effort, but the real work is done at the homes.

**Chaux-de-Fonds** (shōd-fon), a town, of Switzerland, in the canton and 9 mi. n.w. of the town of Neufchâtel, in a deep valley of the Jura. The inhabitants are largely engaged in the making of watches and clocks, of which Chaux-de-Fonds and Locle are the chief centers in Switzerland, and in similar branches of industry. Pop. 22,456.

**Cheboygan**, Cheboygan co., Mich., on Straits of Mackinaw and Cheboygan River, 163 mi. n. of Bay City. Railroad, Michigan Central. Industries: tannery, two flouring mills, three iron foundries, nine saw mills, shingle and planing mills, wood works. Surrounding country agricultural. The town was first settled in 1840 and became a city in 1889. Pop. est. 1897, 7,500.

**Check**, a draft or bill on a bank payable on presentation. A check may be drawn payable to the bearer, or to the order of some one named: the first form is transferable without endorsement, and payable to any one who presents it; the second must be endorsed, that is, the person in whose favor it is drawn must write his name on the back of it. Checks are a very important species of mercantile currency wherever there is a well-organized system of banking. The regular use of them for all payments, except of small amount, makes the transfer of funds a mere matter of cross-entrics and transferring of balances among bankers, and tends greatly to economize the use of the precious metals as a currency.

**Checkers**, a game played with "men" on a checkered board, like a chessboard, of sixtyfour black and white squares. It was played in Europe in the sixteenth century, and in 1668 a treatise on the game was published in Paris by Mallet. The Greeks and Romans had a similar game, and the Egyptians are represented on monuments as engaged in some such amusement. The figure represents the board, numbered in the usual method for registering games. Two players, each having a set of twelve men—one set white, the other black (or round and square, or distinguished in any other way)—sit opposite each other, having their men arranged on squares 1 to 12 and 21 to 32 respectively. The men can be placed either on the black or white squares,

# Cheddar

but the whole must be placed on one color only. Whichever color is used, however, the single corners 4 and 29 must be at the players' *left* hand. The object of the game is to clear off the opponent's men altogether from the board, or to so shut them up that they cannot be moved. Generally the black men play first, and as the men are changed each game, the first move becomes alternate. Each player alternately moves one man at a time diagonally forward, always keeping on the same colored squares. When an enemy's man stands in the way, no move can be made unless there be a vacant square immediately beyond, into which the man can be lifted, in which case the man leaped over is "taken." and removed from the

#### Checker Board.

board; and so on, till the game is lost and won, or drawn. When a man on either side has succeeded in making his way to the opposite side of the board, he becomes *crowned*, which is done by putting another man on the top of him, and he can then move in any diagonal direction, but always only one square at a time.

**Ched' dar**, a village, England, county Somerset, 18 mi. s.w. Bristol. The dairies in the neighborhood have long been famous for the excellence of their cheese, which is made from the whole milk, and the whey skimmed off, heated, and added to the curd.

Cheese, one of the most important products of the dairy, is composed principally of casein, which exists in cows' milk to the extent of about 3 or 4 per cent., fat and water. It is made from milk, skimmed wholly, partially, or not at all, the milk being curdled or coagulated, and the watery portion or whey separated from the insoluble curd, which being then worked into a uniform mass, salted and pressed in a vat, or mold forms cheese, but requires to be cured or ripened for a time. The coagulation of the milk may be effected either by adding an acid as in Holland, or sour milk as in Switzerland, or rennet as usual in Britain and this country. There are a great many varieties of cheese, of which the most notable are Stilton. Cheshire, Cheddar, Dunlop, among British; and Parmesan, Gruyère, Gorgonzola, Gouda,

# Chemistry

among foreign ones. In the U. S. immense quantities of cheese are made. Large factories are devoted to the manufacture. Other kinds are known as sour-milk, skimmed milk, cream. sweet-milk, etc., cheese. Sheep's and goat's milk cheese are also made.

**Cheese Fiy**, a small black dipterous insect bred in cheese, of the same family to which the house fly, blow fly, etc., belong. It has a very extensible ovipositor, which it can sink

Cheese Hopper. a.—larva, natural size; b.—larva, magnified, preparing to spring; c.—perfect insect, natural size; d.—magnified.

to a great depth in the cracks of cheese, and lay its eggs there. The maggot, well known as the cheese hopper, is furnished with two horney claw-shaped mandibles, which it uses both for digging into the cheese and for moving itself, having no feet. Its leaps are performed by a jerk, first bringing itself into a circular attitude, when it can project itself twenty to thirty times its own length.

**Che-Klang**, a maritime province of China, including the Chusan Archipelago: area 39,150 sq. mi.; pop. 11,588,692. It is traversed by the Grand Canal, and has as its principal ports Ningpo and Hang-Chow-Foo, the capital. Staple exports, silk and tea.

**Chelsea** (chel'sē), a suburb of London, England, chiefly distinguished for containing a royal military hospital, originally commenced by James I as a theological college, but converted by Charles II for the reception of sick, maimed, superannuated soldiers. Pop. 96,272.

**Chelsea**, Suffolk co., Mass., separated from East Boston by Mystic River. Railroad, Eastern & Grand Junction. Principal industries: foundry and machine ship products, curried leather, cotton goods, tobacco, rubber, linseed oil, woolens, brushes, soap, mattresses, and paper box manufactories. Contains a U.S. marine hospital, naval hospital, and U.S. powder magazine. Pop. est. 1897, 28,000.

**Cheltenham** (chel'tn-am), a fashionable watering place in England, in the county of Gloucester, within the shelter of the Cotswold Hills. It grew rapidly into a place of fashionable resort after the discovery of its saline, sulphuric, and chalybeate springs in 1716, to which, in 1788, George III paid a visit. Pop. 42,914.

**Chemical Rays**, a not very appropriate name given to the blue and violet rays of the spectrum, and also the non-luminous rays at the violet end of the spectrum, which have a peculiarly powerful chemical effect on silver compounds.

**Chemistry**, the science which treats of the nature, laws of combination. and mutual ac-

## Chemistry

tions of the minute particles of the different sorts of matter composing our universe, and the properties of the compounds they form. As a science it is entirely of modern origin, in its earliest phases being identical with alchemy, the great object of which was the discovery of the philosopher's stone. In this pursuit most minerals, especially such as presented the characters of metallic ores, were subjected to numerous experiments, and many important isolated discoveries were made by Basil Valentine, Raymond Lully, Paracelsus, Van Helmont, and others. But during the latter part of the seventeenth century the belief in alchemy was greatly on the wane, and just at its close the German chemist Becher threw out certain speculations regarding the cause of combustion, which were afterward taken up and extended by Stahl in the "phlogistic theory," and constitute the first generalization of the phenomena of chemistry, though the theory itself was diametrically opposed to the truth. About the middle of the last century Doctor Black made his great discovery of a gas differing from atmospheric air, rapidly followed by that of a number of other gases by Cavendish, Rutherford, Priestley, Scheele, etc.; and the discovery of oxygen by the two last-named chemists afforded to Lavoisier the means of revolutionizing and systematizing the science. By a series of experiments he showed that all substances, when burned, unite with oxygen, and that the weight of the products of combustion is exactly equal to that of the combustible consumed and of the oxygen which has disappeared. The application of this theory to the great majority of the most important chemical phenomena was obvious, and the Stahlian hypothesis disappeared from the science. A yet more important step was the discovery by Dalton of the laws of chemical combination. His theory was immediately taken up by Berzelius, to whose influence and careful determination of the chemical equivalents of almost all the elements then known its rapid adoption was mainly due. To Berzelius we owe almost all the modern improvements in the methods of analysis, and to Sir H. Davy the foundation of electro-chemistry. Of late years every branch of the science has advanced, but the most extraordinary progress The inhas been made in organic chemistry. vestigations of chemists have shown that the great majority of the different substances found at the surface of the earth can be broken up into several substances of less complicated nature, which resist all further attempts to decompose them, and appear to consist of only one kind of matter. These substances, by union of which all the different sorts of known matter are built up, are about seventy in number, and are called the chemical elements. The list (given below) includes such substances as gold, iron, oxygen, hydrogen, carbon, calcium, etc. When any two or more of these elements are brought in contact, under the proper conditions, they may unite and form chemical compounds of greater or less complexity, in which the constituents are held in union by a

form of energy which has received the name of ohemical affinity. This affinity is characterized by its acting between dissimilar particles, and producing a new kind of matter, readily distinguishable from either of the substances combining to form it, and which cannot be again separated into its elements by merely mechanical processes.

Laws of Combination.—1, Chemical com-bination takes place between the smallest particles of matter and at inappreciable distances. Thus fragments of phosphorus and iodine may be placed near each other, but do not combine until brought into actual contact. 2, Chemical combination invariably There are effects a change in all bodies. changes of state, temperature, color, volume, taste, smell, etc. 3, Chemical combination takes place with different degrees of force in different bodies. The more unlike two bodies are the greater the violence with which they combine. 4, Chemical combination is much affected by other forces. Heat, light, electricity, mechanical force, etc., may either accelerate or retard chemical combination. 5, All substances, elementary and compound, combine together in fixed and definite proportions by weight. 6, When bodies combine in more than one proportion their other combining proportions are simple multiples of the lowest. Thus, 28 parts of nitrogen combine with 16 parts of oxygen to form nitros oxide, while 28 parts of the former and 32 of the oxygen produce nitric oxide, and an additional 16 of oxygen forms nitric trioxide, etc. 7, Gases combine in fixed and definite proportions by volume as well as by weight. If one volume of each gas be combined together, two volumes of the gaseous compound result. If more than one volume of each combine together, the new compound only occupies two volumes, however great the aggregate number of volumes is before combination takes place. 8, The combining proportions of compounds are the sum of the combining proportions of their constituent elements.

The atomic weight of any element is now assumed to be the smallest quantity which can enter into or be expelled from combination, one part of hydrogen being taken as the standard.

Nomenclature.—The names employed by the old chemists were generally derived from some property of the body or indicated the mode in which it was prepared, and sometimes the substance from which it was obtained. Soon after the introduction of Lavoisier's system, the French Academy of Sciences appointed a committee to improve it; and the chief merit of the one introduced is due to Guyton Morveau. The names applied to the elements were as far as possible derived from some conspicuous property they possess. An attempt has been made to make the name express also the class to which the substance belongs. Thus all the metals (except those long known) are made to terminate in um, as potassium, barium, etc.: and the substances allied to chlorine have a similar termination to it. The nomenclature

## Chemistry

of compounds was based on the existence of two classes of substances opposed to one another in their properties, and known as acids and bases. All the bases known at the close of the last century were oxygen compounds, and they were known by the general name of oxides. The compounds of chlorine, iodine, and bromine, and subsequently those of sulphur. carbon, boron, and silicon, though really belonging to a different class, were called chlorides, iodides, bromides, sulphides, etc. After the atomic theory came into use, the term oxide was confined to a compound containing one atom of oxygen in combination with one of the other elements. The compound containing two atoms of oxygen became a dioxide, that with three a trioxide, and so on; the numeral prefix always expressing the number of atoms of oxygen. So also we speak of a protochloride and bichloride, a protosulphide and bisulphide. So also there are a number of oxides containing two equivalents of metal to three of oxygen; such compounds are called sesquioxides. Of late years it has been found preferable to use names of less precision, and to distinguish only between the larger and smaller propor-tions of oxygen. Thus there are two oxides of iron possessing basic properties, which are called respectively ferrous, and ferric oxide, the termination in ous being used in all cases for the compound containing the smaller, and that in *ic* for the one containing the larger quantity of oxygen, the Latin name of the element being usually employed. Both systems, however, are still in common use.

The nomenclature for compounds possessing acid instead of basic properties, has its origin in part in the belief entertained by chemists in the last century that all acids were oxygen compounds, and that it was therefore unnecessary to indicate the existence of oxygen in them, as the word acid sufficiently did so. Thus sulphur forms two different acid compounds, one with a smaller proportion of oxygen than the other, called respectively sulphurous and sulphuric acids; and similarly we have chlorous and chloric acids, etc. The contrivers of the present nomenclature did not provide for more than two acid compounds of any one element, that being the largest number then known. But since that time it has been found that there may be four or five such compounds necessitating the use of a distinctive prefix. In the case of chlorine and oxygen, after the name chloric acid had been made use of, another acid containing a larger quantity of oxygen was discovered, for which the name of hyperchloric acid, usually short-ened into perchloric acid, was devised. Further observation, however, showed that there were many powerful acids which contained no oxygen, but that hydrogen was invariably present, and it became necessary to distinguish those which contained hydrogen only. Accordingly we have hydrochloric acid, a compound of hydrogen and chlorine, in contrast with chloric acid, a compound of hydrogen, chlorine, and oxygen; and hydrosulphuric acid, a compound of hydrogen and sulphur. in

# Chemistry

contrast with sulphuric acid, a compound of hydrogen, sulphur, and oxygen.

The names of acids were formed in order to enable chemists to have simple designations for salls, a class of bodies produced when a metal takes the place of the hydrogen of an acid. Thus the termination in all expressed the fact that the salt is derived from an acid whose name terminates in *ic*, and the salts of acids whose names end in ous have their termination in *ide*. Very frequently two salts, generally of the same acid, combine to form what is usually known as a double salt, as, for instance, potassium suphate and zinc sulphate combine, and the compound is called the zinco-potassic sulphate.

This system of nomenclature, which fulfilled the requirements of chemistry at the time it was devised, became less and less convenient as more complex compounds were discovered, and many attempts have been made to modify and extend it. These attempts, however, have uniformly failed to meet the approval of chemists.

Symbols.— Very soon after the publication of Dalton's views Berzelius introduced a system of symbols by which the composition of the more complex chemical compounds can be represented with much greater precision than any nomenclature admits of; and the plan proposed by him, though with some modifications, is now universally accepted. Every element is represented by a symbol, which is the initial letter of its Latin name. Where several elements have the same initial a small letter is attached to it for the sake of distinction. These symbols are further understood in all cases to represent an atom of each element. The symbols of compounds are formed by the juxtaposition of those of their elements. Thus—

H Cl,.....Hydrochloric acid, Ba S,.....Baric sulphide,

express the fact that these compounds contain single atoms of their constituents; that hydrochloric acid, for example, is a compound of 1 part of hydrogen and 35.5 of chlorine; and baric sulphide of 137 parts of that metal and 32 of sulphur. When more than one atom of an element exists in any compound this is indicated by a small figure placed after its symbol, and a little below. Where it is necessary to express more than one atom or molecule of the compound this is done by prefixing to the symbol a large number written on the line. By a systematic arrangement of the symbols in each compound an attempt is made to indicate to a certain extent their chemical functions. Thus, in an acid, the hydrogen, which may be replaced by a metal, begins the formula of the compound.

The symbols are also very advantageously used to express the changes which occur during chemical action, and they are then written in the form of an equation, of which one side represents the condition in which the substances exist before the change, the other the result of the reaction.

# Chemistry

Atomicity.-When an atom of chlorine, weighing 35.5, is brought in contact with hydrogen it is found to combine only with one atom of that substance. When an atom of oxygen, weighing 16, comes in contact with hydrogen, however, it combines with two parts, or two atoms, of that element. An atom of nitrogen. weighing 14, combines only with three parts or three atoms of hydrogen. These elements or three atoms of hydrogen. are therefore said to possess different atomicities; hydrogen is called a monatomic element, oxy-With gen biatomic, and nitrogen triatomic. reference to this fact, therefore, the elements have been divided into several classes according to the number of atoms of hydrogen to which they are equivalent, or with which they can combine, and they are described as monads, diads, triads, etc. No physical explanation of the cause of this peculiarity of the different elements has yet been obtained. This variation in atomicity has been accounted for by supposing that two atomicities in an element can neutralize or saturate one another.

Molecules.—The molecule of a compound is the quantity of it which exists in two gaseous volumes, so that we do not speak of the atom of a compound, but of its molecule, that being the smallest quantity of a compound which can be obtained in the separate state. This and other considerations have led to the further hypothesis, that atoms never exist in a separate state, but that, as soon as they are separated from compounds, they enter into combination with one another.

Compound Radicals.—In every perfect molecule all the bonds of the elements which combine are saturated, and the affinities being perfectly satisfied, the molecule has no disposition to combine directly with any other substance; but if several elements are combined in such a manner that one or more bonds remain unsatisfied, the compound so produced has in general very powerful affinities, and unites readily with any substance capable of saturating its uncombined bond.

Classification of Compounds.—The properties of chemical compounds may be classified not merely under the head of the particular elements they contain, but also according to their special chemical functions. The advantages of the latter method were early recognized, and the distinction between acids and alkalies dates back to a period long previous to the ascertainment of their true nature. An acid is now described as a compound containing a certain quantity of hydrogen, easily replaceable by a metal when it comes in contact with it either in the free state or as an oxide.

Bases are compounds which, by reacting on acids, yield salt. The most important bases are oxides of metals, and they are divided into several sections, of which the most important are the alkalies. These substances are the hydrates of the so-called alkaline metals, and may be compared to water in which an atom of hydrogen is replaced by an atom of metal. Most of the bases, excepting the alkalies, are insoluble in water, and without any effect on vegetable colors. Another class of

### Chemulpo

bases of great importance is typified by ammonia.

Sulphides are compounds of the metals with sulphur, and form a very important class of compounds. They are obtained either by heating the metals with sulphur in proper proportions, or by passing a current of hydrosulphurlc acid gas through a solution of a salt. They exist abundantly in the mineral kingdom, and form some of the most important ores. Some of the sulphides are capable of acting as bases and others as acids, and by combination a class of salts, usually distinguished as sulphur salts. can be obtained. The greater part of the sulphides are insoluble in water, and some of them possess extremely fine colors, and are used as paints.

Organic and Inorganic Chemistry.-Organic chemistry is that branch of the science which treats of the compounds existing in plants and animals, or which may be produced from substances found ready formed in their tissues. It was at first believed that these compounds were peculiar in their constitution, quite distinct in their chemical relations, and produced by what was called vital affinity. The discovery by Wöhler, however, that urea could be produced artificially from purely mineral substances entirely altered this view; and since then the artificial production of many organic compounds has practically annulled the distinction between organic and inorganic chemistry, except as a matter of convenience. Organic chemistry is now most commonly defined as the chemistry of the carbon compounds, for that element is found in every substance which can be extracted from plants and animals, in combination with hydrogen, oxygen, nitrogen, and less frequently with sulphur and phos-phorus. These elements are so combined as in many cases to form compounds of extreme complexity, the constitution of some of which is still a matter of much difference of opinion among chemists; but the constitution of the simpler organic compounds is now thoroughly understood

**Chemnitz** (hem'nits) the principal manufacturing town in the kingdom of Saxony, on the Chemnitz. The principal manufactures are white and printed calicoes, ginghams, handkerchiefs, woolen and half-woolen goods, etc. There are also extensive cotton spinning mills, and mills for the spinning of combed wool and floss silk: dye works, print works, bleach works, chemical works: large manufactures of cotton hose, etc. The manufacture of machinery also has now become important. Pop. 110,817.

**Chemosh** ( $k\bar{e}$ ' mosh), the national god of the Moabites, who were on that account called "the people of Chemosh." At an early period the same deity appears too as the national god of the Ammonites, though his worship seems afterward to have given place to that of Moloch, if Moloch be not merely another name for the same deity. The worship of Chemosh was even introduced among the Hebrews by Solomon.

**Chemulpo** (chē-mul'pō), one of the three treaty ports of Corea, exporting beans, gin-

## Chenab

seng, etc., and importing European and American manufactures.

**Chenab** (chen-àb'), a river in Hindustan, one of the five rivers of the Punjab. It rises in the Himalayan ranges of Kashmir, and entering the Punjab near Sialkot, flows in a southwesterly direction till it unites with the Jehlam; length about 800 mi.

**Chency**, CHARLES EDWARD, American clergy man, b. in Canandaigua, N. Y., Feb. 12, 1836. He graduated at Hobart College in 1857, and entered the Episcopal ministry. In 1873 he assisted in organizing the Reformed Episcopal Church of which he was made bishop.

**Chenille** (she-nil'), a sort of ornamental fabric of cord-like form, made by weaving or twisting together warp threads with a transverse filling or weft, the loose ends of which project all round in the form of a pile. Chenille carpets have a weft of chenille, the loose threads of which produce a fine velvety pile.

**Cheops** (kē-ops), the name given by Herodotus to the Egyptian despot whom the Egyptians themselves called Khufu. He belonged to the rulers who had for their capital Memphis; lived about 2800-2700 B. c., and built the largest of the pyramids. According to Herodotus he employed 100,000 men on this work constantly for 20 years.

**Chephren** (kef'ren) (or Cephren), was the successor of Cheops as king of Egypt, and the builder of the second pyramid. His name is properly Khafra.

**Cher** (shār), a river of Central France, a tributary of the Loire, which it enters near Tours; length 200 mi.

**Cher** (shar), a department of Central France, named from the river Cher, and formed from part of the old provinces of Berry and Bourbonnais; area 2,770 sq. mi.; capital Bourges. The forests and pastures are extensive. More grain and wine are produced than the demands of the inhabitants require. The preparation and manufacture of iron, called Berry iron, is the principal branch of industry. The department is divided into three arrondissements. Pop. 355,349.

**Cherbuliez**, VICTOR, French author, b. at Geneva, of French parentage, in July, 1829; studied at Paris, Bonn, and Berlin, and wrote romances of notable excellence. On Nov. 8, 1881, he was elected a member of the French Academy.

**Cheribon** (sher'i-bon), a seaport in the island of Java, capital of the province of the same name. The province lies on the coast toward the northwest, produces coffee, timber, arecanuts, indigo, and sugar, and has about 770,-000 inhabitants. The town lies in a deep bay on the north coast, and is the residence of a Dutch governor. Pop. 11,000.

**Cherimoy er** (cher-), a fruit, native of South and Central America, allied to the custard apple. It is heart-shaped, with a scaly exterior, and numerous seeds buried in a delicious pulp. Both flowers and fruit emit a pleasant fragrance. This fruit is now cultivated in various tropical regions.

Cherokees', a tribe of North American In-

### Chersonesus

dians, occupying an allotted region in the Indian Territory. Their old seats were in Georgia, Alabama, Mississippi, and Tennessee. The Cherokees are the most enlightened of the Indian tribes, have an alphabet, printed books and newspapers in their own language, live in well-built villages, and have an excellent school system. Their numbers are about 20,000.

**Cherry**, a fruit tree of the prune or plum tribe, very ornamental, and therefore much cultivated in shrubberies. It is a native of most temperate countries of the northern hemisphere, and in Britain is quite common in the wild state, besides being cultivated for its fruit. The cultivated varieties probably

Common Cherry; a.-blossom.

belong to two species. They are numerous, as the red or garden cherry, the red heart, the white heart, the black cherry, etc. The fruit of the wild cherry is often as well flavored, if not quite so large, as that of the cultivated It is said that this fruit was varieties. brought from Cerasus, in Pontus, to Italy, by Lucullus about B.c. 70, and introduced into Encland by the Romans about A.D. 46. The cherry is used in making the liquors Kirschwasser and Maraschino. The wood of the cherry tree is hard and tough, and is very serviceable to turners and cabinet makers. An ornamental but not edible species is the bird cherry. The wild cherry of this country is a fine large tree, the timber of which is much used by cabinet makers and others, though the fruit is rather astringent.

**Cherry Laurel**, the common name of an evergreen shrub, a native of Asia Minor, but now naturalized in America and common in shrubberies. It is commonly called laurel, but must not be confounded with the sweet bay or other true species of laurel. The leaves yield an oil nearly identical with that got from bitter almonds. The distilled water (called "laurel water") from the leaves is used in medicine. The Portugal laurel is another species.

**Chersonesus** (ker-so-nē'sus) (Greek, "a peninsula"), anciently a name applied to several peninsulas, as the Cimbrian Chersonesus, now Jutland, etc., the Tauric Chersonesus, the

pennusula formed by the Black Sea and the Sea of Azoff—the Crimea.

**Cherusci** (ke-rus'ci), an ancient German tribe whose territory probably was situated in that part of Germany lying between the Weser and the Elbe, and having the Harz Mountains on the north and the Sudetic range on the south. This tribe was known to the Romans before 50 B. C., and occasionally served in the Roman armies. But when Varus attempted to subject them to the Roman laws they formed a confederation with many smaller tribes, and having decoyed him into the forests, destroyed his whole army in a battle which lasted three days, and in which he himself was slain (A. D. 9). Upon this the Cherusci became the chief object of the attacks of the Romans.

Germanicus marched against them, but though successful in several campaigns did not obtain any permanent advantages. Subsequently the Cherusci were overcome by the Chatti, and latterly they were incorporated among the Franks.

**Ches' apeake Bay**, a spacious bay of North America, in the states of Virginia and Maryland. Its entrance is between Cape Charles and Cape Henry, 16 mi. wide, and it extends 180 mi. to the northward. It is from 10 to 30 mi. broad, and at most places as much as 9 fathoms deep, affording many commodious harbors and a safe and easy navigation. It receives the Susquehanna, Potomac, and James rivers.

**Cheshire** (chesh'ir) (or Chester), a maritime county and county palatine of England, area 657,123 acres. Minerals abound, especially rock salt and coal, which are extensively worked. Cotton manufacture is carried on at Stockport, Stalybridge, and the northeastern district, shipbuilding at Birkenhead and other places. Principal towns, Chester, the county town,

towns, Chester, the county town, Macclesfield, Stockport, Birkenhead, and Stalybridge. Pop. 730,052.

Chess, a well-known game of great antiquity and of Eastern origin, having probably arisen in India, and thence spread through Persia and Arabia to Europe. The name itself as well as many of the terms used in the game are clearly of Eastern origin. The game is played by two persons on a *board* which con-sists of sixty-four squares arranged in eight rows of eight squares each, alternately black and white. Each player has sixteen men, eight of which, known as pauns, are of the lowest grade; the other eight, called pieces, are of various grades. They are, on each side, king and queen; two bishops, two knights, and two rooks or castles. The board must be placed so that each player shall have a white square to his right hand. The men are then set upon the two rows of squares next the players; the pieces on the first, the pawns on the second row, leaving between each side four unoccu-pied rows. The king and queen occupy the

central squares facing the corresponding pieces on the opposite side. The queen always occu-pies her own color, white queen on white square, black on black. The two bishops occupy the squares next the king and queen; the two knights the squares next the bishops; the rooks the last or corner squares. The pawns fill indiscriminately the squares of the second or front row. The men standing on the king's or queen's side of the board are named respectively king's and queen's men. Thus king's bishop or knight is the bishop or knight on the side of the king. The pawns are named from the pieces in front of which they stand; king's pawn, king's knight's pawn, queen's rook's pawn, etc. The names of the men are rook's pawn, etc. The n contracted as follows: King, K.; King's

Black

White

Bishop, K. B.; King's Knight, K. Kt.; King's Rook, K. R.; Queen, Q.; Queen's Bishop, Q. B.; Queen's Knight, Q. Kt.; Queen's Rook, Q. R. The pawns are contracted; K. P., Q.P., K. B.P., Q. Kt.P., etc. The board is divided, inversely from the position of each player, into eight rows and eight files. Counting from White's right hand to his left, or from Black's left to his right, each file is named from the piece which occupies its first square, and counting inversely from the position of each player to that of the other, the rows are numbered from 1 to 8. At White's right hand corner we have thus K. R. square; immediately above this K. R. 2; and so on to K. R. 8, which completes the file; the second file begins with K. Kt. square on the first row, and ends with K. Kt. 8 on the eighth. White's K. R. 8 and K. Kt. 8 are thus Black's K. R. square and K. Kt. square, and the moves of each player are described throughout from his own position, in inverse order to the moves of his opponent.

In chess all the men capture by occupying

the position of the captured man, which is removed from the board. The ordinary move of the Paun is straight forward in the same file; a pawn never moves backward. The first time a P. is moved it may be played forward one square or two; afterward only one square at a time. But in capturing an adverse piece the P. moves diagonally to occupy the position of the captured man. The player may choose any piece except the king, but the queen, the most valuable piece, is generally the piece chosen. This is called queening a pawn, and the player may thus have several queens on the board. The Rook.—The moves of the pieces are not, like those of the pawns, limited to a single direc-The R. moves in any direction and for tion. any distance that is open along either the particular row or the file on which it happens to stand. It can, of course, capture any ob-structing man and occupy its place. The Bishop.—The B.'s, like the R.'s, are unlimited The in range, and move either backward or forward, but their direction is diagonal, and they can never change the color of their square. The Queen.—The Q. combines the moves of the R. and B. She is the most powerful plece on the board, and can move to, or capture at, any distance or direction in a straight line. The King .- The K. is at once the weakest and most valuable piece on the board. In point of direction he is as free as the queen, but for distance he is limited to the adjacent squares. Standing on any central square he commands the eight squares around him and no more. besides his ordinary move the K. has another by special privilege, in which the R. partici-pates. Once in the game, if the squares between K. and R. are clear, if neither K. nor R. has moved, if K. is not attacked by any hostile man, and if no hostile man commands the square over which K. has to pass. K. may move two squares towards either K.R. or Q.R., and R. in the same move may occupy the square over which K. has passed. This is called *castling*. The Knight.—The Kt., unlike the other pieces, never moves in a straight line. His move is limited to two squares at a time, one forward or backward, and one diagonally, and he can leap over any man occupying a square intermediate to that to which he intends to go. The Kt., like the K., when on a central square commands eight squares, but they are at two squares' distance, and all in an oblique direction. All captures in chess are optional.

The definite aim in chess is the reduction to surrender of the opposing king. The K. in chess is supposed to be inviolable, that is, he cannot be taken, he can only be in such a position that if it were any other piece it would be taken. Notice of every direct attack upon him must be given by the adversary saying *check*, and when the K. is attacked all other plans must be abandoned, and all other men sacrificed, if necessary, to remove him from danger, cover the attack, or capture the assailant. It is also a fundamental rule of the game that the K. cannot be moved into check. When the K. can no longer be defended on being checked by the adversary, either by moving him out of danger, or by interposing, or by capture, the game is lost, and the adversary announces this by saying *checkmate*. When, by inadvertence or want of skill, the player having the superior force blocks up his opponent's K. so that he cannot move without going into check, and no other man can be moved without exposing him, the player, reduced to this extremity, cannot, without violating the fundamental rule referred to, play at all. In such a case, the one player being unable to play and the other out of turn, the game is considered *drawn*, that is, concluded without advantage to either player. The laws of the game must be sought in some special manual. Perhaps the best code is that given in Stauton's *Chess Prazis*.

**Chester**, an English borough, county town of Cheshire, situated on the Dee, about 16 mi. from Liverpool. It is a bishop's see, and contains an old and interesting cathedral recently restored. Chester has manufactories of lead pipes, boots and shoes, iron foundries, chemical works, etc.

**Chester**, Delaware co., Pa., on Delaware River, 131 mi. s. of Philadelphia. Railroads: P. W. & B.; B. & O.; P. & R. Industries: shipyards, iron foundry, woolen mills and cotton mills, steel cos., dye-wood mill, brick yards, planing and sash mills, box and other factories. Surrounding country agricultural and quarries. The town was first settled in 1644, and in 1699 William Penn chartered borough of Chester. It became a city in 1866. Pop. est. 1897, 32,000. **Chesterfield**, a town of Derbyshire, England.

**Chesterfield**, a town of Derbyshire, England. The principal manufactures are ginghams, lace, and earthenware, but a majority of the working classes are employed in connection with the collieries, iron mines, and blast furnaces of the vicinity. Pop. 13,242.

Art in the conteries, from mines, and blast furnaces of the vicinity. Pop. 13,242. **Chesterfield**, PHILP DORMER STANHOPE, EARL OF (1694–1773), an English statesman and author. He succeeded his father in the title in 1726, sat in the House of Lords, and acquired some distinction as a speaker. In 1728 he was ambassador to Holland, in 1744 lord lieutenant of Ireland, a position which he occupied with great credit, and in 1746 secretary of state: but in 1748 retired from public affairs. His letters to his godson with a memoir by the Earl of Carnarvon were published in 1889. These writings combine wit and good sense with great knowledge of society.

**Chestnut** (or Chesnut), a genus of plants, allied to the beech. The common or Spanish chestnut is a stately tree, with large, handsome, serrated, dark-green leaves. The fruit consists of two or more seeds enveloped in a prickly husk. Probably a native of Asia Minor, it has long been naturalized in Europe, and was perhaps introduced into Britain by the Romans. The tree grows freely in U.S., and may reach the age of many centuries. Its fruit ripens only in some cases. Chestnuts form a staple article of food among the peasants of Spain and Italy. The timber of the tree was formerly more in use than it is now;

### Chettik

it is inferior to that of the oak, though very similar to it in appearance, especially when old. Two American species of chestnuts have edible fruits. The former is often regarded as identical with the European tree. The name of Cape Chestnut is given to a beautiful tree of the rue family, a native of Cape Colony. The Moreton Bay Chestnut is a leguminous tree of Australia, with fruits resembling those of the chestnut. The water-chestnut is the water

Branchlet, with Catkins, of Common Chestnut (Castanea vulgaris). a.-fruit; b.-seed.

caltrop. The horse-chestnut is quite a different tree from the common chestnut.

**Chettik** (chet'tik), a tree of Java, yielding a very virulent poison called by the same name, more powerful than that obtained from the upas tree, and owing its virulence to the strychnine it contains.

**Chevalier** (chè-và-lya), MICHEL (1806-1879), a noted French economist. He became a councilor of state (1838), professor of political economy in the Collége de France (1840), member of the Chamber of Deputies (1846), and member of the Institute (1851). By this time he had written a number of works: Lettres sur l'Amerique du Nord; Des Intérêts Matériels en France; Essais de Politique Industrielle; Cours d' Economie Politique, etc. He was known as a strong advocate of free trade, and as a specialist on questions of currency. Along with Cobden and Bright he had a great part in the commercial treaty of 1860 between France and Britain.

**Che'viot Hills**, a range on the borders of England and Scotland, stretching s.w. to n.e. for above 35 mi.; culminating point, the Cheviot. 2,688 ft.

**Cheviot Sheep**, a variety of sheep, taking their name from the well-known Border

# Chicago

mountain range, noted for their large carcass and valuable wool, which qualities, combined with a hardiness second only to that of the black-faced breed, constitute them the most valuable race of mountain sheep in the kingdom. The fleece weighs from 3 to 4 lbs., and the carcass of ewes varies from 12 to 16 lbs. per quarter, that of wethers from 16 to 20 lbs.

**Chevreul** (she-vreul), MICHEL EUGENE (1780-1880), a French chemist. In 1813 he became professor of physical science in the Charlemagne Lyceum, in 1824 director of dyeing in the Gobelins manufactory, in 1830 professor of chemistry in the Collége de France. In 1870 he retired. He has written various works on chemistry and dyeing, and an important work on the *Principles of Harmoy and Contrast* of Colors, translated into English.

Cheyenne, Laramie co., Wyo., on Crow Creek. It is the center of the great beef-growing region, and the shipping point for cattle to eastern markets. Railroads: U. P.; Denver Pacific & Colo. Central; Cheyenne & Burlington; and others. Principal industries: railroad machine and repair shops, breweries, book-binderies, saddle and harness, carriage and wagon, woodwork and clgar factories. Near the city are a number of more or less noted silver mines. Pop. est. 1897, 18,000.

**Chiapas** (chi-ä' pås), a state of the Mexican Confederation; area 16,048 sq. mi. It is in many parts mountainous, is intersected by several considerable streams, and covered with immense forests. The valleys are fertile, and produce much maize, sugar, cacao, and cotton, etc. But trade is quite undeveloped on account of the lack of roads. The capital is San Cristobal. Pop. 209,362.

**Chica** (chē'ka), a red coloring matter which the Indians on the upper parts of the Orinoco and the Rio Negro prepare from the leaves of a plant native to that region called *Bignonia Chica*, and with which they paint their skin, in order to be better able to resist the rays of the sun.

Chica (chē'kà), a kind of beer made from maize, in general use in Chile, Peru, and elsewhere in the mountainous regions of South America. The usual method of preparing it is to steep the maize till it begins to grow, when it is exposed to dry in the sun. The malt thus prepared is then ground, mixed with warm water and left to ferment. The beer, when ready, has a dark yellow color, and a pleasant and somewhat bitter and sour taste, and is very intoxicating. Sometimes the Indians instead of grinding the malt chew it, and this variety of the liquor is considered the best. It is the national drink of the Indians, and consumed by them in great quantities.

**Chicago**, Cook co., Ill., metropolis of the Northwest, situated at the foot of Lake Michigan, extending from Evanston on the north to the Indiana State Line on the south. The site was visited by Père Marquette in 1673. Fort Dearborn was built there in 1804, and evacuated in 1812, on the occasion of the memorable massacre by the Indians, and re-

built in 1816. For many years Chicago was the leading Indian trading post in the West. In 1833 the inhabitants, who had been for a number of years gathering there, organized a village board, and by 1835 the population had reached 3,265. A city charter was obtained in 1837, and William B. Ogden was elected the first mayor, 709 votes being cast. The commerce of the great lakes grew enormously, and, together with the construction of the Illinois and Michigan Canal, gave the young city its first impetus. Thus far it had progressed in its career without the aid of rail-roads. But by the year 1850 about 30 mi. of the Galena & Chicago Union Railroad (the present Chicago & Northwestern) had been built, and the population had bounded up to 20,000. The first railway from the East to enter the city was the Lake Shore & Michigan Southern in 1852. Since that period the railway system, of which Chicago is the center, has developed into colossal proportions, so that in 1897 the number of railways centering in or directly tributary to Chicago, were as follows: *Eastern:* Baltimore & Chicago; Chicago &

Eastern: Baltimore & Chicago; Chicago & Erie; Chicago & Eastern Illinois; Chicago & Grand Trunk; Chicago & West Michigan; Cleveland, Cincinnati, Chicago & St. Louis; Elgin, Joliet & Eastern; Grand Trunk; Louisville, New Albany & Chicago; Lake Shore & Michigan Southern; Michigan Central; New York, Chicago & St. Louis; Pennsylvania System; Pennsylvania Company.

Western: Atchison, Topeka & Santa Fé; Burlington, Cedar Rapids & Northern: Canadian Pacific; Chicago & Alton; Chicago, Milwaukee & St. Paul: Chicago & Northwestern; Chicago, St. Paul, Minneapolis & Omaha; Chicago, Burlington & Quincy; Chicago, Rock Island & Pacific; Chicago Great Western; Duluth & Iron Range; Great Northern; Illinois Central; Keokuk & Western: Missouri, Kansas & Texas; Minneapolis & St. Louis; Northern Pacific; Quincy, Omaha & Kansas City; St. Paul & Duluth; Sioux City & Pacific; Wabash; Wisconsin Central lines.

Chicago is the greatest grain center of the world. During the year 1896 the receipts of grain, and of flour in its grain equivalent, aggregated 253,802,134 bushels. The receipts of live stock during the year comprised 14,094,-918 head, aggregating \$187,745,655. The great Union Stock Yards constitute a noted feature of the city, comprising as they do 345 acres, and the cost of the structures being over \$3,-000,000.

On Oct. 8, 9, and 10, 1871, Chicago was visited with the greatest conflagration known in the annals of the world, 2,100 acres having been burned over, and property destroyed to the amount of \$190,000,000, but in less than a decade after this great calamity the metropolis had thoroughly recuperated from the loss.

A notable feature in the history of Chicago was the anarchist riot in 1886, during which a bomb thrown at a meeting of anarchists into a platoon of policemen killed or injured many of the latter. After an exciting trial in which the whole country took a deep interest, a number of the anarchists were condemned to death and subsequently executed.

The park system of Chicago, established by the state legislature in 1869, has scarcely a parallel in America, whether as regards extent of area or ornamentation of grounds. The length of the boulevards, some of them 200 ft. wide, amounts to nearly 60 mi., and new additions are constantly being made to their extent.

The manufactures of the city include nearly every variety of production; but those of, together with the trade in, lumber and iron, should be especially mentioned. The greatest industry of the city, however, is pork and beef packing, which surpasses that of any other city in the world. The number of persons employed in all manufacturing industries in the city in 1896 was 152,806.

A feature of Chicago destined to add vastly to its fame is the colossal Sanitary or Drainage Canal, extending from Chicago to Joliet and about finished to Lockport. This great work is intended to turn the waters of Lake Michigan south into the Kankakee and Illinois rivers, and the width is made 200 ft., with an average depth of over 20 ft., with the design of having it eventually used as a part of a ship canal to the Mississippi River. See Drainage Canal.

The city of Chicago covers an area of 187 sq. mi., and has 2,570 mi. of streets and alleys. The fire department is efficiently organized, with 86 steam engines, 4 fire-boats, 27 chemical engines, 42 hose wagons, 33 hook-and-ladder trucks, 53 chemical extinguishers, and 68 portable pumps.

Its river, with its three branches, is spanned by 33 bridges. It has 20 theaters, 25 orphan asylums, 7 hospitals, and 290 churches.

asylums, 7 hospitals, and 290 churches. There are in Chicago 38 daily publications of all kinds, 280 weekly publications, 56 semimonthly, 319 monthly, and 42 quarterly. 600,-000,000 copies of all descriptions of publications were issued in the city in 1896.

Perhaps no city in the Union is more generously provided with public libraries than Chicago. The Chicago Public Library has 220,000 volumes; the Newberry Library (endowed with \$2,141,201) 145,000 choice and rare volumes, mainly for reference; and the John Crerar Library recently opened (with an endowment fund of \$2,500,000) has now between 30,000 and 40,000 volumes, and the number will be rapidly increased. The city has several great educational and theological institutions, among which the most prominent is the University of Chicago endowed with \$7,000,000.

The population of Chicago, according to a school census taken in 1896, was 1,619,226, and the city council later in the year officially declared it to be 1,750,000.

The following are the mayors of Chicago since the first charter election in 1837: William B. Ogden, 1837-1838; Buckner S. Morris, 1838-39; Benjamin W. Raymond, 1839-40; Alexander Lloyd, 1840-41; Francis C. Sherman, 1841-42; Benjamin W. Raymond, 1842-43; Augustus Garrett, 1843-44; A. S. Sherman, 1844-45; Augustus Garrett, 1845-46; John P.

Chapin, 1846–47; James Curtiss, 1847–48; James H. Woodworth, 1848–50; James Curtiss, 1850– 51; Walter S. Gurnee, 1851–53; Charles M. Gray, 1853–54; Isaac L. Milliken, 1854–55: Levi D. Boone, 1855–56; Thomas Dyer, 1856– 57; John Wentworth, 1857–58; John C. Haynes, 1858–60; John Wentworth, 1860–61; Julian S. Rumsey; 1861–62; Francis C. Sherman, 1862– 65; John B. Rice, 1865–69; Roswell B. Mason, 1869–71; Joseph Medill, 1871–73; Harvey D. Colvin, 1873–76; Monroe Heath, 1876–79; Carter H. Harrison, 1879–87; John A. Roche, 1887–89; Dewitt C. Cregier, 1880–91; Hempstead Washburne, 1891–93; Carter H. Harrison (assassinated) 1893; George B. Swift, 1893; John P. Hopkins, 1893–94; George B. Swift, 1894–97: Carter H. Harrison, Jr., 1897.

**Chicago**, UNIVERSITY OF, was first founded in 1857 by the Baptist Society of Chicago. Its doors were closed in 1886 owing to lack of funds. The present university was founded by John D. Rockefeller who started the endowment fund with \$600,000. Later he added \$4,500,000 besides erecting two dormitories. William Rainey Harper was called in 1891 to the presidency of the new institution, and the first lectures were given in October, 1892. The year is divided into four quarters, each continuing twelve weeks, with a recess of one week between. The annual income is \$1,860,-000; students, 1,850; instructors, 187; buildings, 23; books, 350,000.

**Chickahom'iny**, a river in Virginia, rising about 20 mi. n.w. of Richmond, flowing s.e. till it joins the James River. Near this river many important battles during the Civil War took place--the battle of Williamsburg, of the Seven Pines, of Gaines's Mill, etc.

**Chickamau'ga**, a small tributary of the Tennessee River, where a battle took place Sept. 19-20, 1863, between the Federal troops under Rosecrans and the Confederates under Bragg and Longstreet, the latter gaining the victory.

**Chick asaw Indians**, a tribe of American Indians of the Appalachian nation. In 1833 they gave up to the U. S. the last of their lands south of the Tennessee River, receiving as compensation a money indemnity and new lands on the left bank of the Red River, in the Indian Territory. The Chickasaws number about 8,000. They have made considerable advances toward civilization, have a senate, house of representatives, and more than a million dollars in deposit with the Union government.

**Chickering,** JONAS (1797-1853), American manufacturer. He received a common school education and was apprenticed to a cabinet maker. In 1818 he went to Boston and took a position with a pianoforte maker. In 1823 he set up for himself, in a small way, as a manufacturer of pianos. This business became greatly extended, until he furnished annually about 2,000 instruments. In 1852 his factory was burned, and before the new one had been completed he died. He made many valuable improvements and for many years was the leading maker of pianos both in this country and Europe. **Chicla' na**, a town, Spain, Andalusia, 12 mi. s.e. Cadiz, built of snow-white stone, contains a magnificent hospital, and has manufactures of linen, earthenware, etc. The sulphur baths, temperature  $60^{\circ}$ , are efficacious in cutaneous affections, and are much frequented. Pop. 11,627.

**Chico,** Butte co., Cal., near Sacramento River, 100 mi. n. of Sacramento. Railroad, S. P. O. & C., running from San Francisco to Portland. Industries: lumber mill, flour mill, and iron foundry. Coal, oil, and gas in vicinity. Surrounding country agricultural and mineral. The town was first settled in 1850 and became a city in 1870. Pop. est. 1897, 5,000.

**Chicopee**, Hampden co., Mass., on left bank of Connecticut and mouth of Chicopee River, 95 mi. w.s.w. of Boston. Railroad, Connecticut River. The industries embrace cotton mills, manufacture of agricultural implements, knitting mills, bicycle and rifle factories, large bleachery, machinery, and bronze statuary, brass foundries, bobbin and reel factories. Pop. est. 1897, 12,000.

Chic'ory, a genus of composite plants. The leaves are sometimes blanched, to be used as salad. But the most important part of the plant is its long, fleshy, and milky root. which when roasted and ground is now extensively used for mixing \_ with coffee. Its presence among coffee may easily be detected by putting a spoonful of the mixture into a

Chicory. a.—single flower; b.—separate floret.

glass of clear cold water, when the coffee will float on the surface, and the chicory separate and discolor the water as it subsides.

**Chiem-See** ( $h\bar{e}m'z\bar{a}$ ), a lake in southeastern Bavaria, 48 mi. s.e. Munich; greatest length 10 mi., greatest breadth 9 mi. Its scenery is beautiful, and it contains three pretty islands.

**Chieti** (ki-ā'tē), a town, Southern Italy, capital of province of same name. It is well built, and has manufactures of woolens, etc. Pop. 12,273.

**Chigoe** (chig' $\check{e}$ ) (or Jigger), a very curious insect closely resembling the common flea, but of more minute size, found in the West Indies and South America, and in parts of the U.S. It burrows beneath the skin of the foot, and soon acquires the size of a pea, its abdomen becoming distended with eggs. If these eggs remain to be hatched beneath the skin great irritation and even troublesome sores are sure to result.

Chigoe. a.-male, b.-gravid female.

**Chih-le** (chi- $l\bar{e}'$ ) (or Pe-chi-le), one of the northern provinces of China, watered by the Pei-ho, containing Peking the imperial capital. Area about 59,000 sq. mi.; pop. 18,000,000.

Area about 59,000 sq. mi.; pop. 18,000,000. Chihuahua (chē-wä-wä), a city of Mexico, capital of the state of the same name, generally well built, and supplied with water by a notable aqueduct. It is surrounded by silver mines, and is an important entrepôt of trade. Pop. 12,000. The state is bounded on the n. by the U.S. and on the n.e. by the Rio Grande ded Norte; has a healthy climate, and is rich in silver mines. Pop. 225,941.

Child, LYDIA MARIA (1802-1880), American author; was educated in common schools. She taught for one year in a seminary in Medford, Mass., and kept a private school in Water-town from 1824 till 1828, when she was married to David Lee Child. She became early interested in the antislavery movement and published An Appeal to that Class of Americans Called Africans, which was the first antislavery work printed in America in book form. In 1841 she removed to New York where she was editor of the National Antislavery Standard until 1843. She contributed largely to aid the Union soldiers during the Civil War, and afterward helped the freedmen and gave lavishly for the support of schools for the negroes. Her antislavery writings contributed greatly to the formation of public sentiment.

**Childebert**, the name of three kings of the Merovingian dynasty, France (495-711). The last, Childebert III, was one of those Merovingian kings, who, from their incapacity, received the appellation of *rois fainéants* or *sluggard kings*.

**Childs**, GEORGE WILLIAM (1829-1884), American public man and philanthropist. He was long identified with the *Philadelphia Ledger* which he made most successful, was a heavy contributor to charities and erected many stained glass windows to celebrities. In 1890 he published his *Recollections*.

**Chile** (or Chili) (chē'lā, chē'lē), a country of South America, extending along the Pacific Coast from lat. 18° south nearly to Cape Horn, and including Chiloé and many other islands and part of Terra del Fuego. It is bounded on the n. by Peru, on the n. e. and e. by Bolivia and the Argentine Republic, from which it is separated by the chief range of the Cordilleras. Its length from north to south is about 2,400 mi.; its breadth, on an average, 120 mi.; area 293,310 sq. mi., divided into a number of provinces and territories; pop. (1890)

2,665,926. By the war with Peru and Bolivia which terminated in 1882 Chile gained all the seaboard of Bolivia, and annexed also the Pe-ruvian provinces of Tarapacá and Tacna (the latter for ten years, after which a plebiscite is to decide whether it shall go to Chile or Peru). The chief towns are Santiago, or St. Jago (the capital) and Valparaiso. The rivers are numerous, but small, and have generally rapid Currents; the principal are the Biobio, the Valdivia, Lontue, Maule, Itata, and Chuapa or Illapel. The surface is greatly diversified. Some of the summits rise to 20,000 ft. or more. but the elevation decreases toward the south. Chiloé and numerous other islands fringe the coast in the south. Earthquakes are common. those of 1822, 1835, and 1868 being particularly violent. In the Chilean Andes there are twenty volcanoes at least, three of which (Antuco, Villarica, and Osorno) are still active. The climate is remarkably salubrious. In the northern provinces it rarely rains—in some parts perhaps never; in the central parts rain is sufficiently abundant, while in the extreme south there is even an excess of moisture. Among the minerals of Chile are gold, silver, copper. lead, iron, zinc, antimony, manganese, arsenic. tin, sulphur, alum, salt, and cubic niter. Silver and copper are the two most important metals. The copper mines are most numerous in the northern districts. The cubic niter, or Chile saltpeter, is a great source of wealth Coal is wrought at several places. Though possessing many fertile tracts, a great portion of Chile is incapable of cultivation, being naked and mountainous. In some of the northern districts maize is cultivated; in the southern districts wheat and barley are the chief agricultural products. Fruits are abundant-apples, pears, apricots. peaches, figs, grapes, or anges, watermelons, etc. The spread of European plants has been so great in some places as to crowd out native species, and cultivation is rapidly carrying this farther. The wild animals include the guanaco, puma, or American lion, the chinchilla, coypu, deer, etc. Cattle are raised in great numbers, from 4,000 to 20.-000 being sometimes reared on one farm. The manufactures are of little importance, but include cordage, soap, copper wares, leather. brandy, etc. The commerce is increasing rapidly. Mineral products form five sixths of the total exports, the principal article being cubic niter (or Chile saltpeter). Next come copper. iodine, wheat, silver, etc. Accounts are in pesos or dollars, the silver peso having the value of 77 cents. There are about 1,600 mi. of railway. A line is in progress to cross the Andes into the Argentine Republic.

Chile is a republic, and is considered the best regulated in South America. It is under a president elected for five years and a council of state. The legislature is composed of asenate elected for six years, and a house of deputies elected for three years. The army numbers about 7,000 men; the chief vessels of the navy are three ironclads and one protected cruiser. The Chileans are mostly of Spanish or Indian descent. Schools and colleges have been es-

tablished. The Roman Catholic is the established religion of Chile, but the members of other denominations are allowed to erect edifices in which to worship. The part of Chile lying south of the River Biobio is inhabited chiefly by Indians. The Araucanians inhabit the region lying between the rivers Biobio and Valdivia, and long maintained their independence, till in 1882 they became subjects of the Chilean government.

Chile originally belonged to the Incas of Peru, from whom it was wrested by the Spaniards under Pizarro and Almagro in 1535. From this period Chile continued a colony of Spain till 1810, when a revolution commenced, which terminated in 1817 in the independence of Chile. A war begun with Spain in 1865 led to the blockade of the coast by the Spanish fleet, and the bombardment of Valparaiso in 1866. In 1879 a war broke out with Bolivia and Peru, in reference to the rights of Chile in the mineral district of Atacama. This war was virtually finished in 1881, and the victorious Chileans gained a large accession of territory from both Bolivia and Peru. In 1891 an insurrection, headed by influential members of congress, caused by dissatisfaction with President Balmaceda's administration, was successful, and resulted in his overthrow.

**Chilian** (chil-yán'), a town, Chile, capital of the province Nuble, in an angle between the Chillan and Nuble, connected by rail with Talcahuano and Santiago. Pop. about 20,000.

**Chilled Iron,** iron cast in metal molds called *chills*, where, on account of the rapid conducting of the heat, the iron cools more quickly on the surface than it would do if cast in sand. Chilled iron is whiter and has a harder surface than iron cast in any other way. **Chillicothe,** Livingston co., Mo., 75 mi. e. of

**Chillicothe,** Livingston co., Mo., 75 mi. e. of Kansas City. Railroads: Hannibal & St. Jo; C. M. & St. P.; and Wabash. Industries: railroad round houses, and machine shops, furniture factory, foundry, 3 flouring mills and 3 cigar factories. Surrounding country is agricultural. The town was first settled in 1835 and became a city in 1845. Pop. est. 1897, 10.000.

**Chillicothe**, Ross co., O., on right bank of Scioto River, 50 mi. s. of Columbus. Railroad, C. W. & B. Principal industries: flouring and paper mills, shoe and furniture factories, carriage, and wagon, and farm implement works. The town was founded in 1796 and is pleasantly situated in a valley surrounded by hills nearly 500 ft. high. Pop. est. 1897, 15,000.

**Chillon** (shē-yon), a castle, Switzerland, on the Lake of Geneva, 64 mi. s.e. of Vevay, once an important stronghold of the Counts of Savoy, and the prison house of Francis Bonnivard, prior of St. Victor, Geneva, from 1530 to 1536. It has acquired interest from Byron's poem, The Prisoner of Chillon. **Chiloé** (chēl-wā'), a province and island of

**Chiloé** (chēl-wā'), a province and island of Chile. The province comprehends the island of Chiloé, together with a number of other islands, and a portion of the mainland. The island of Chiloé is for the most part covered with dense forests, but large tracts of it are still unexplored. The chief town is San Carlos, or Ancud. The exports consist chiefly of timber from the forests of the island and the mainland. The climate is healthy but very wet. Area of the province, 30,981 sq. m; pop. 71,388.

**Chilon** (kī'lon) (or Chilo), one of the so-called seven wise men of Greece. He flourished about the beginning of the sixth century B.C., and was a native of Sparta, and one of the Ephori, or chief magistrates. A collection of his sayings is extant.

**Chimæra** (Chimera) (ki-mē'ra), in classical mythology, a fire-breathing monster, the foreparts of whose body were those of a lion, the middle of a goat, and the hinder of a dragon. Thus the name came to be used for an unnatural production of the fancy.

**Chimbora'zo**, a mountain of Ecuador, in the province of Quito, about 90 mi. s. by w. of Quito. Though not the loftiest summit of the Andes, it rises to the height of 20,703 ft. above the level of the sea, and is covered with perpetual snow 2.600 feet from the summit and upward. In 1880 it was ascended to the top for the first time by E. Whymper.

**Chimes**, a species of music, mechanically produced by the strokes of hammers against a series of bells, tuned agreeably to a given musical scale. The hammers are lifted by levers acted upon by metallic pins, or wooden pegs. stuck into a large barrel, which is made to revolve by clock-work, and is so connected with the striking part of the clock mechanism that it is set in motion by it at certain intervals of time, usually every hour, or every quarter of an hour. The chime mechanism is sometimes so constructed that it may be played like a piano, but with the fist instead of the fingers.

**Chim' ney,** an erection generally of stone or brick containing a passage by which the smoke of a fire or furnace escapes to the open air. In this sense the first chimneys we hear of are no earlier than the Middle Ages. The longer a chimney is the more perfect is its draught, provided the fire is great enough to heat the column of air in it, because the tendency of the smoke to draw upward is in proportion to the difference of weight between the heated air in a chimney and an equal column of external air.

**Chimpan'zee**, the native Guinea name of a large West and Central African ape belonging to the anthropoid or man-like monkeys, and to the same genus as the gorilla. When full grown it is sometimes about 5 ft. high, with black hair, and is not so large and powerful as the gorilla. Like the orang it has the hair on its forearm turned backward, but differs from it in having an additional dorsal vertebra and a thirteenth pair of ribs. It walks erect better than most of the apes. It feeds on fruits, often robs the gardens of the natives, and constructs a sort of nest among the branches. It is common in menageries, where it shows much intelligence and docility.

**China,** an immense empire stretching from the center of Asia for 3,000 mi. to the east

### China

coast of Korea, and from the Siberian frontjer at the river Amoor for 2,400 mi. southward to the island of Hainan. The vast empire, second in magnitude only to that of Russia and Great Britain, has an area of about 4,500,000 sq. mi., and a population variously estimated at 300,000,-000, 400,000,000, or more, and is usually divided into China Proper and the dependencies Manchuria, Mongolia, Eastern Turkestan, Dzoungaria, and Thibet, of which Thibet is practically autonomous, although controlled in its foreign relations by the Chinese government. Korea acknowledges the suzerainty of China, but hardly forms part of the empire. The dependencies, though they cover more than 3,000,000 sq. mi., contain but a small and relatively unimportant part of the population (about 30,000,000), China Proper being the center of power and population.

CHINA PROPER, known to Marco Polo and earlier travelers by the Tartar name of *Cathay*, called "Middle Kingdom" by the Chinese,

Chimpanzee.

comprises the following provinces: Chihle, Shantung, Shansi, Honan, Kiangsu, Nganhwuy, Kiangsi, Chekiang, Fukien, Hupeh, Hunan, Shensi, Kansu, Szechuen, Kwantung, Kwangsi, Yunnan, Queichow. The total extent is about 1.554,000 sq. mi. Peking is the capital. There are many large and populous cities.

Physical Features.—Great part of the country is not well known. The coast line forms an irregular curve of about 2,500 miles. It is not deeply penetrated by gulfs, the only one of great extent being that of Pe-che-le in the northeast, but numerous indentations of sufficient dimensions to form safe and capacious roadsteads are found in every quarter. It is characterized by a fringe of islands and islets, the largest of which are Formosa and Hainan. The Gulf of Pe-che-le, the Yellow Sea, and the China Sea wash the eastern and southeastern shores, and are characterized by destructive

# China

The inland boundaries are formed storms. mainly by Tonquin, Burmah, Thibet, and, on the north, partly by the Great Wall separating China from Mongolia, one of the most remarkable of human structures, being an artificial barrier 1,500 mi. long. Two thirds of the interior are estimated to be mountainous. The general slope is from west to east, and the mountains are a continuation of those of Thibet and Central Asia. The great Kuen-lun range throws off branches, the Tsing-Ling, Fu-niushan, and Mu-ling, which, running eastward between the great valleys of the Hoang-Ho and Yang-tse-kiang, traverse almost the whole breadth of China. Farther north the Nan-shan branch of the Kuen-lun range runs under various names (Kuliang, Alashan, Inshan, etc.) along the northeast of China till it reaches the frontier of Manchuria, north of Peking. The third great mountain system of China is in as the Nanshan, the Ta-yu-ling, and Pu-ling stretch on the south side of the Yang-tsekiang all the way from the highlands of Yun-nan to the eastern seaboard. Between these mountain systems, and following courses which may be roughly described as parallel, run the two great rivers of China, the Hoang-Ho and the Yang-tse-kiang. Here lie the central aud richest provinces of China. On both sides of the lower Hoang-Ho is an immense delta plain. consisting generally of a deep alluvial soil of unparalleled fertility. As they approach the seacoast the two rivers are connected by the Grand Canal, 700 miles in length, thus completing a magnificent system of inland naviga-tion. The Hoang-Ho has changed its lower course several times, and is subject to tremen-dous and disastrous floods. Besides these rivers and their numerous tributaries, the most deserving of notice are the Se-kiang in the south. of considerable size, but still more commercial importance, having at or near its embou-chere Canton, Hong-Kong, and Maceo; and the Pei-ho, which, though much smaller, forms a waterway between Peking and the gulf of Pe-che-le. There are a number of lakes, Pe-che-le. mostly of no great size: the largest is Tung-ting, near the center of China. A remarkable feature of the surface of Northern China is the deposit of *loess*, a brownish yellow earth of great fertility, which covers an immense area both of mountain and valley, and enables agriculture to be successfully carried to the height 7,000 or 8,000 ft.

Climate.—The greater part of China belongs to the temperate zone, but it has what is called an excessive climate. At Peking in summer the heat ranges from 90° to 100° in the shade, while the winter is so cold that the rivers are usually frozen from December to March. At Shanghai the maximum temperature reaches  $100^\circ$ , and the minimum falls at least to  $20^\circ$  below freezing point ( $12^\circ$  F.). In the south the climate is of a tropical character, the summer heat rising to  $120^\circ$ . Here the southwest and northeast mouscons blow with great regularity, and divide the year between them. Among the greatest scourges of the country are the dread-

ful gales known as typhoons, from the Chinese Ta-fung, or "great wind." They never fail to commit great devastation, though happily they always give such timely notice of their approach that preparations can be made. The Hoang-Ho and Yang-tse-kiang basins have a pretty equable temperature, due to the soft moist winds of the Pacific.

Productions.-China is well supplied with minerals, including gold, silver, copper, iron, and other metals, and there are very extensive coal fields, though the quantity raised from them is comparatively small. Salt is abundant. and there are inexhaustible beds of kaolin, or porcelain earth. Among animals it is difficult to mention any that are characteristic of the country; many of them are identical with or differ but little from those of Europe. In the south and southwest the tiger, the rhinoceros, and elephant are found; bears are common in many parts; other carnivora are the wild cat, badger, lynx, marten, etc. Camels and elephants are used in a domestic state, but the chief domesticated animal is the buffalo. The horses are of a poor breed. Among birds the most beautiful are the gold and silver pheas-Fish swarm in all inland waters as well ants. as on the coast, the natural supply being immensely increased by artificial means. As regards the flora of China, it is tropical in the south (coco and sago palms, banana, pandanus, etc.), sub-tropical farther north, and still farther north prevails a number of plants and trees identical with or closely akin to those of middle Europe. Flowering plants, shrubs, and trees are so exceedingly abundant as to form a feature. The bamboo, from the immense number of uses to which it is put, is one of the most valuable of trees. Oaks, the chestnut, hazel, pines, yew, walnut, etc., are among for-est trees. Wax and camphor trees abound. Azaleas are exceedingly numerous; other flowering plants are the camellia rose, passion flower, cactus, lagerstroemia, etc. Fruits are abundant and varied. The soil, especially of the country comprising the two great river basins, is extremely fertile, and agriculture has always been held in high veneration in China. Rice, as the principal food of the people, is the staple crop. The rich alluvial plains which cover a great part of the surface are admirably adapted for its culture, and by careful man-agement yield amazing crops. In the north there is a variety called dry-soil rice, which is cultivated like any other cereal. Wheat, barley, and millet are the other chief grain crops. Other crops are maize, buckwheat, a great variety of beans, peas, and pulse generally, sugar cane, tobacco, and vegetables in endless variety, including potatoes, turnips, etc., and at the ports the best European and American vegetables. Varieties of the cabbage tribe are extensively cultivated for the oil extracted from the seeds. Three plants of the greatest economical importance to China are the mulberry, cultivated to provide food for silkworms, cotton, and tea, the last for long regarded as exclusively a Chinese product. Another important crop is the opium poppy, which is ex-

tensively grown, though the product is inferior to that of India.

Manufactures. - In arts and industry the Chinese have made considerable progress. One peculiar feature in their processes is the general absence of machinery, and the preponderance of manual labor. Among the chief industries is the silk manufacture, which produces some varieties of stuffs unsurpassed anywhere. Everybody wears silks: it is the prescribed attire of high officers. The finer kinds of it form the ordinary dresses of the opulent, while the poorest manage to deck themselves in coarser, if not on common, at least on gala days. The embroidery of silk is carried on to an amazing extent. Cotton goods are also largely made, though great quantities of European and American manufactures are also imported. Flax is not grown, but a good substitute for it is found in the fibers of two or three plants, from which the beautiful grass cloth, similar in appearance to linen, is extensively woven. Woolens are made only to a limited extent. The porcelain of China has been famous from the earliest periods, and the manufacture of the finest forms of it was long known to the Chinese alone, though their productions are now surpassed by those of Europe. In lacquered ware the Chinese continue unsurpassed. In working in metals they have only attained to mediocrity. The metallic products most deserving of notice are gongs, mirrors, statuettes in copper and bronze, and various kinds of carved, chased, and filigree work, both in gold and silver. In a great number of minor articles the workmanship is exquisite—fans, card cases, seals, combs, chess men of wood, ivory, mother-of-pearl, tortoise shell, etc. Paper is made of a great variety of substances, and the art of making it-like various others-was practised in China long before Europe acquired it.

Commerce.-The inland trade of China, aided by its vast system of water communication, is of incalculable magnitude, the rivers and canals literally swarming with junks, barges, and boats of all sizes. Roads, however, are few and bad, and railways have as yet only madea mere commencement. Telegraphs have made more progress, though the lines as yet do not much exceed 3,000 mi. A defective postal system is kept up, partly by the government, partly by private enterprise. By the opening of the principal ports (the "treaty" ports, twenty-two in number) the foreign commerce has been immensely increased. The chief of these ports are, Shanghai (by far the first), Canton, Hankow, Swatow, Tientsin, Ning-po, and Foo-chow. The main articles of export are tea and raw and manufactured silk; the main imports, cotton goods, opium, metals, and metal goods. The total exports and imports usually amount to more than \$200,000,000. Among the countries trading with China the principal are the U.S., Great Britain, India, and Russia. The quantity of opium imported, almost wholly from India, reaches the value of \$25,000,000 or \$30,000,000 annually. There are no national gold and silver coins. The usual

# China

unit or denomination of money is the *tael*, the value of which varies according to the rate of exchange. Silver and gold bullion, usually stamped with the name of the banker and the year and district in which it is cast, are used in larger transactions. Private bankers are found in all large towns. They issue paper money, which passes current in the particular districts where they are known. The Mexican dollar, of the value of \$1, is current in Canton and the south of China.

People.—The Chinese belong to the Mongolian race, but in them its harsher features, as represented in the genuine Tartars, are considerably softened. They are generally of low stature, have small hands and feet (the last artificially made so small in the females as to become a deformity), a dark complexion, a wide forehead, black hair, eyes and eyebrows obliquely turned upward at the outer extremities. In bodily strength they are far inferior to Europeans, but superior to most Asiatics, and their great assiduity and patient endurance of fatigue make them valuable as laborers. They are considered to be deficient in courage. In their moral qualities there is much that is amiable. They are strongly attached to their homes, hold age in respect, toil hard for the support of their families, and in the interior, where the worst kind of foreign intercourse has not debased them, exhibit un-

Foot of Chinese Girl (aged 16 years), in three positions: Copied from a cast in Trinity College, Dublin. (Length of foot, 4% inches.)

sophisticated simplicity of manners which recalls the age of the patriarchs. In the great mass these qualities are counterbalanced, or rather supplanted, by numerous vices-treachery, lying, and various others. The Chinese use great politeness in their intercourse with each other: but there is perhaps a want of frankness and sincerity. They scrupulously avoid all contradiction and offensive expressions in conversation. Gambling is a universal vice. Drunkenness has hitherto been rare among them, but the habit of opium-smoking has much extended of late. But, with many vicious characteristics, the Chinese are preserved from degeneration by their universal frugality and thrift. Hard work, done in the most uncomplaining way, has become second nature with them. Filial piety is also a striking feature of their character, and is, in fact, the principle upon which Chinese society is constituted. They have chambers set apart for the worship of their ancestors, where religious ceremonies are regularly performed.

Language, Religion, Etc.-The Chinese is the most important and most widely spread of the so-called monosyllabic languages of Eastern Asia, in which each word is uttered by a single movement of the organs of speech. There is no alphabet, each word being represented by a single symbol or character. These written characters appear to have been originally hieroglyphics or rude copies of the objects designed to be expressed by them; but the hieroglyphic features have almost entirely disappeared, and many of the symbols are formed of what seems to be an arbitrary combination of lines, or are built up of other symbols combined. In writing or printing the characters are arranged in vertical columns, to be read from top to bottom. The art of making paper is said to have been known in the first century after Christ, and printing from wooden blocks in the seventh or eighth century, hundreds of years before these valuable arts were reinvented in Europe; and the Chinese literature is now very extensive. There are great numbers of treatises on almost all subjects - science, history, geography, belles-lettres, and poetry; literary eminence is the sure avenue to the highest honors and offices of the state, and hence "the literati are the gentry, the magistrates, the governors, the negotiators, the ministers of China." Among the more comfortable classes education of the kind which promises to be best rewarded is almost universal, and in every village there are schools for the lower classes, but attendance is not so general as was at one time supposed. The chief religions in China are Confucianism, Taouism, and Buddhism, the last introduced subsequently to the others. The religion of the learned and of the state, if it may be so called, is that founded by Kong-Fu-Tse or Confucius, about 550 B. C. Taouism, founded by Laotsze, is a compound of mystical and superstitious elements. But among the great mass of the people a form of Buddhism prevails, or a sort of mixture of the other three religions. In the western parts Mohammedanism has many followers. The most important Christian missions are those of the French Roman Catholics. who have been longest in the country and have numerous stations. Various Protestant bodies also carry on missionary operations in China, but hitherto with indifferent success, the Protestant converts only numbering from 25,000 to 30,000.

Gorernment, Administration, etc.—The government is an absolute despotism. The reigning dynasty is of Manchu Tartar blood. The emperor unites in his person the attributes of supreme magistrate and sovereign pontiff, and as the "Son of Heaven" is in theory accountable only to heaven. Four principal ministers, two of whom are Manchus and two Chinese. form, along with two assistants, the inner council of state. The government business is distributed among seven boards, having cognizance respectively of all civil officers, of revenue, of rites and ceremonies, of military affairs. desides these, there is the board of general supervision, or censorate composed of forty or

## China

fifty mandarins, who go out into the empire as imperial inspectors, and are privileged to make any remonstrance to the emperor without en-dangering their lives. The provinces, either single or by twos, are under a governor and sub-governor, and each province has also a chief criminal judge and a treasurer. Particular magistrates preside over particular districts and cities, and instead of being permanent are changed about once in three years. Although very excellent in theory, the public administration is very deficient in integrity and efficiency. There is no check on the authorities, and the lower mandarins devote their attention to raising money to make up for their insufficient salaries or to purchase higher offices. The Chinese military force consists of the Manchurian army, 270,000 strong, and an army composed of Chinese and other races numbering about 800,000. Under English officers their training and discipline have much improved of late, and the newest kinds of rifles and cannons have been imported from Europe. The navy consists of two fleets-one for rivers and another for sea;. but though it numbers many vessels, it is not very efficient, and is scarcely able to clear the Chinese coast from the pirates who infest the numerous creeks and islets. It has lately, however, been much strengthened by a number of steel corvettes built in England and Germany. The revenue of the empire is derived from customs, excise, taxes on land and property, and is said to amount to \$250,000,000, of which one half is paid in kind. The external debt is only about \$25,000,000.

History .- The early history of the Chinese is shrouded in fable, but it is certain that civilization had advanced much among them when it was only beginning to dawn on the nations of Europe. The Chow dynasty, which was founded by Woo-wang, and lasted from about 1100 B.C. to 258 B.C., is perhaps the earliest that can be regarded as historic, and even of it not much more is historic than the name. Under Ling-wang, one of the sovereigns of this dynasty, Confucius is said to have been born, some time in the sixth century B.C. During the latter half of the period during which this line of sovereigns held sway there appear to have been a number of rival kings in China, who lived in strife with one another. Chow-siang, who was the founder of the Tsin dynasty, from which China takes its name, gained the superiority over his rivals, and d. in 251 B.c. His great-grandson, a national hero of the Chinese, was the first to assume the title of "Hoang" (emperor), and called himself Che-Hoang-ti. He ruled over an empire nearly conterminous with modern China proper. In his reign, the great wall, designed as a protection against marauding Tartars, was begun in 214 B.C. Buddhism was intro-duced in 65 A.D. Subsequently the empire broke up into three or more states, and a long period of confusion and weak government ensued. In 960 a strong ruler managed to consolidate the empire, but the attacks of the Tartars were now causing much trouble. In

the thirteenth century the Mongols under Jenghis Khan and his son Ogdai conquered China, and in 1259 the celebrated Kublai Khan, a nephew of the latter, ascended the throne and founded the Mongol dynasty. His ninth descendant was driven from the throne, and a native dynasty called\_Ming again succeeded in 1368 in the person of Hungwu. A long period of peace ensued, but was broken about 1618, when the Manchus gained the ascendency, and after a war of twenty-seven years founded the existing Tartar dynasty in the person of Tungchi, establishing their capital in the northern city of Peking, which was nearer their native country and resources than the old capital Nan-king. The earliest authentic accounts of China published in Europe are those of Marco Polo, who visited the country in the thirteenth century. The first British intercourse was attempted under Queen Elizabeth in 1596, and a trade was subsequently established by the East India Company, but no direct intercourse between the governments took place till the embassy of Lord Macartney in 1792. A second embassy in 1816, by Lord Amherst. was treated with insolence; and subsequently the treatment of the British merchants became such that a collision was inevitable. In 1840 the British, on being refused redress for injuries, partly real and partly alleged, proceeded to hostilities, and after scattering, almost without a struggle, every force which was opposed to them, were preparing to lay siege to Nanking, when the Chinese found it necessary to sue for peace. A treaty was then concluded (1842), by which the five ports of Canton, Amoy, Foochow-foo, Ningpo, and Shanghai were opened to British merchants, the island of Hong-Kong ceded to the British in perpetuity, and the payment of \$21,000,000 agreed to be made by the Chinese. In 1850 an insurrection, headed by Hung-seu-tseuan or Tien-te, broke out in the provinces adjoining Canton, with the object of expelling the Manchu dynasty from the throne, as well as of restoring the ancient national religion of Shan-ti, and of making Tiente the founder of a new dynasty, which he called that of Tai-ping, or Universal Peace. After a long period of civil war the Tai-Ping rebellion was at length suppressed in 1865, chiefly by the exertions of General Gordon and other American and British officers at the head of the Chinese army. In October, 1856, the crew of a vessel belonging to Hong-Kong were seized by the Chinese. The men were afterward brought back, but all reparation or apology was refused. In consequence of this a war with China commenced, in which the French took part with the British. Peking had to be taken (1860) before the Chinese government finally gave way, and granted a treaty securing important privileges to the allies. A revolt of the Mohammedans in Turkestan had meantime taken place, but in 1874 it was at last suppressed, and in 1881 Russia restored the province of Kulja, thus completing the establishment of Chinese authority in Eastern Turkestan. The present emperor, Tsaitien, succeeded in 1875, but only assumed the reins
of government in 1887, on reaching the age of sixteen. The following succinct statement of recent progress in China was made in 1887 by Dr. Williamson, who has labored as a missionary in the country since 1863: "Who among us, ten years ago, would have dared to imagine that to-day China would have 1, a national fleet; 2, the telegraph radiating to the most distant provinces; 3, government colleges for engineering. navigation, military tactics, elec-tricity, and medicine, each college manned both by foreigners and educated natives: 4, the Kai-ping mines supplying steamers and north ports with excellent and cheap coal: 5, envoys to the leading countries, and consuls at Nagasaki, etc.; 6, Korea open; 7, the China Merchants' Steam Navigation fleet of over forty large vessels: 8, the Kai-ping railway, worked for nearly four years so successfully that an edict has been issued for its extension; 9, a national post office begun; 10, scientific questions added to those presented at several of the last triennial provincial examinations."

China, GREAT WALL OF, the largest artificial structure on the face of the earth, a barrier extending for about 1,500 mi. in the north of China proper, of which it partly forms the boundary. Its western end is in the deserts of Central Asia, its eastern reaches the sea to the northeast of Peking. It was erected as a barrier against the inroads of the barbarous tribes, and dates from about 214 B. c. It is carried over height and hollow, and avoids no inequality of the ground, reaching in one place the height of over 5,000 ft. above the sea. Earth, gravel, brick, and stone were used in its construction, and in some places it is much more substantial than in others. Its greatest height, including the parapet on its top, is about 50 ft., and it is strengthened by towers at regular distances.

China Grass, a plant of the nettle family, a native of Southern and Eastern Asia and the Asiatic islands, and now more or less cultivated in many other countries, such as South-ern France, Algeria, Natal, Mauritius, Australia, the U. S., Mexico, Jamaica, etc. It yields a fiber which possesses most valuable properties, and has long been made in China into a beautiful cloth, and is probably destined to play a much more important part as a textile material. It is very strong, presents unusual resistance to the effects of moisture, and is fine and silky in appearance. With wool, hemp, cotton, and flax it is believed that it may successfully compete, but its full capabilities are hardly as yet known, though it is long since trials have been made with it as a subject of manufacture. Recently considerable quantities have been used in France, and woven both pure and mixed into various beautiful fabrics. In England such articles as ladies' scarfs, handerchiefs, umbrella-covers, etc., are made of it. Hitherto, however, its high price, owing to the difficulty of preparing it in a suitable form for manufacture, has been against its use, but a sufficiently cheap process of preparation is said to have been recently invented. Called also Rhea. Rheea, Ramie, or Ramee,

China Ink, a black solid, which, when rubbed down with water, forms a very pure black indelible ink. It has been used in China from There are different actime immemorial. counts of the process, but it appears to be made by boiling the juices of certain plants with water to a syrup, adding to this a quantity of gelatin, and then thoroughly incorporating the carbonaceous matter. There is generally added some perfume - a little musk or camphor. The mass is then made into square columns of different sizes, which are often decorated with figures and Chinese char-Many attempts have been made to acters. imitate Chinese ink, some of which have been tolerably successful. Good Chinese ink should have a velvety-black appearance, with a gloss which becomes very conspicuous on rubbing. The color it gives on paper should be pure, black, and homogeneous, and if water be passed over it, it should not run or become streaky. It is indelible by ordinary solvents, but may be removed sometimes mechanically.

**Chinandega** (chē-nan-dā'ga), a town of Central America, Nicaragua, 20 mi. n.w. of Leon, connected by railway with the port of Corinto, and carrying on a considerable trade. Pop. 8,000.

China Rose, the name given to a number of varieties of garden rose chiefly derived from two natives of China. Also a name sometimes given to one of the mallow tribe, common in China and the East Indies, and an ornament in hothouses.

China Sea, that part of the North Pacific Ocean bounded n. by Formosa. n.w. by China, w. by Anam and the Malay Peninsula. s.e. by Borneo, and e. by the Philippines. It contains numerous islands, receives several considerable rivers, and forms the important Gulfs of Siam and Tonquin.

China Ware, porcelain, the finest and most beautiful of all the kinds of earthenware, so called from China being the country which first supplied it to Europeans. The Chinese are said to have manufactured porcelain previous to the Christian era, but it was not till five or six centuries later that they attained any great perfection in the art. Japan also appears to have been early acquainted with the manufacture. In the beginning of the sixteenth century the ware was first introduced into Europe, and won immediate popularity by its beauty and novelty. For long it was thought impossible to fabricate anything similar in Europe, but at length John Frederick Böttcher or Böttiger, a native of Saxony who had long devoted himself to alchemy, discovered a means of producing a porcelain equal in whiteness to that of China. This led to the establishment by the government of the farfamed porcelain manufactory at Meissen, near Dresden. The Saxon porcelain soon became celebrated over Europe, and rivaled that of China in the excellence of its quality and the beauty of its decorations. Subsequently porcelain works were established at Vienna, Munich, and elsewhere in Germany. In France also about the middle of the eighteenth cen-

tury the celebrated factory at Sèvres was set up and soon acquired a great renown. The first successful attempt in England to manufacture porcelain was made by some Germans, who established a factory at Chelsea, from which, in 1748, it was transferred to Derby. About twenty years afterward the valuable discovery in Cornwall of an excellent species of clay contributed greatly to improve the quality of English porcelain, which now began to be largely manufactured in Staffordshire under the auspices of the celebrated Josiah Wedgwood. China ware, when broken, presents a granular surface, with a texture compact, dense, firm, hard, vitreous, and durable. It is semi-transparent, with a covering of white glass, clear, smooth, unaffected by all acids excepting the hydrofluoric, and resisting uninjured sudden changes of temperature. For the process of manufacture, see Pottery.

**China Wax**, a sort of wax deposited by insects on a deciduous tree with light green, ovate, serrated leaves, cultivated in the province of Si-chuen (Ssu-chuan) in Southwestern China. The insects, a species of Coccus are bred in galls which are formed on a different tree, an evergreen, and these galls are transported in great quantities to the districts where the wax trees are grown, to the branches of which they are suspended. Having emerged from the galls the insects spread themselves over the branches, which gradually become coated with a white waxy substance, reaching in 90 or 100 days the thickness of a quarter of an inch. The branches are then lopped off and the wax removed. It is white in color and is chiefly made into candles; it melts at 160° whereas tallow melts at about 95°.

Chincha Islands (chin'chà), a group of small islands off the coast of Peru. Immense deposits of guano used to exist here, but are now exhausted. Guano from these islands began to be imported into Europe on an experimental scale about 1832, and the trade rapidly grew into importance. The Peruvian government retained the monopoly of the export, and made it one of the chief sources of its revenues.

Chinchil' la, a genus of South American her-

Chinchilla.

bivorous rodents very closely allied to the rabbit, which they resemble in the general shape of the body, in the limbs being longer behind than before, in the conformation of the rootless molars, and by the nature of the fur, which is more woolly and silky; but differing from the rabbit in the number of their incisors and molars, in a greater length of tail, and also in having broader and more rounded ears. C. Lanigera, a species about 15 in. long, is covered with a beautiful pearly-gray fur, which is highly esteemed as stuff for muffs, pelisses, linings, etc. The chinchilla lives gregariously in the mountains of most parts of South America, and makes numerous and very deep burrows. It is of a gentle nature and very sportive.

Chinese Exclusion Act (or Geary Law).-The act of May 5, 1892, contains all laws now in force prohibiting and regulating the coming into the U.S. of Chinese persons and persons of Chinese descent, such act to remain in force for ten years from its passage. Any Chinese adjudged to be not lawfully entitled to remain in the U.S. shall be removed to China, unless he shall make it appear that he is a subject or citizen of some other country, in which case he shall be removed to such other country. All Chinese laborers within the U.S. must apply to the collector of internal revenue of their respective districts, within one year, for a certificate of residence; and any Chinese neglecting to do this shall be adjudged to be here unlawfully, and may be arrested and taken before a U. S. judge, who shall order that he be deported from the U. S., unless he shall prove that by sickness or unavoidable cause he has been unable to procure his certificate, and by at least one credible white person that he was a resident of the U.S. at the time of the passage of this act; and if upon the hearing it shall appear that he is so entitled to a certificate, it shall be granted upon his paying the cost. Any Chinaman other than a laborer, having a right to remain in the U.S., desiring such certificate, may apply for and receive the same. The constitutionality of this act was affirmed by the U. S. Supreme Court, May 15, 1893.

Ching leput (ching gl-put) (or Chengalpat), a coast district, and its capital, Hindustan, presidency Madras. The district, which lies s. of Arcot and Madras—area about 2,842 sq. mi—has generally a bad soil, broken up frequently by granite rocks. Pop. 981,381. This tract of country was in 1750 and in 1763 obtained by the East India Company from the Nabob of Arcot. The town is 15 mi. w. from the Bay of Bengal, and 35 mi. s.s.w. Madras, and has a pop. of 5.617.

chink 'apin, the American dwarf chestnut. Chink 'apin, the American dwarf chestnut. Chin-Kiang (or Tchang - Kiang), a city, China, province of Kiangsu, right bank of the Yang-tse-Kiang, near the junction of the Imperial Canal; one of the treaty ports, advantageously situated for trade, which it carries on to the value of several millions sterling a year. In 1842 it was taken by the British, after a determined resistance on the part of the Manchu garrison. It suffered severely in the Tai-Ping rebellion. Pop. 135,000.

# Chinsurah

**Chinsu rah**, a town in Hindustan, 20 mi. n. of Calcutta, beautifully situated on the Hoogli, closely adjoining the town of Hoogli, and now included in its municipality. It is a military station, was formerly a Dutch settlement, and contains many neat houses in the Dutch style. Pop. 34,761.

Pop. 34,761. Chioggia (ki-od'jå), a seaport town of Italy, on one of the lagoon islands of the Adriatic, 15 mi. from Venice. It is built partly on piles, and has some handsome edifices. Its harbor is fortified, and it has shipbuilding yards, fisheries, and a coasting trade. Pop. 20,381.

**Chip' munk,** the popular name in America of the ground squirrel, genus *Tamias*,

**Chippeways** (chip'e-wāz) (or Ojibbeways), a tribe of North American Indians, U. S. and Canada. They are distributed in bands round both sides of the basin of Lake Superior, where they once owned vast tracts. They are of the

Chipmunk.

Algonquin stock, tall, active, and well formed, subsist chiefly by hunting and fishing, and number about 18,000.

**Chiquimula** (chi-ki-mö'lå), a department of the Central American state of Guatemala. Area 4,000 sq. mi.; pop. 53,000.

**Chiquitos** (chi-k $\bar{s}$ 't $\bar{o}s$ ), an Indian people of Bolivia, about the head waters of the Madeira and Paraguay. They number about 22,000, distributed among ten missions which still survive as a monument of Jesuit perseverance.

**Chiriqui** (chi-ri- $k\bar{e}'$ ), a district in the state or department of Panama, Colombia. It is naturally very fertile, and has good harbors both on the Caribbean and Pacific coasts. The name is also given to a lagoon and an archipelago on the coast of this state.

**Chiron** (kī-ron), the most famous of the Centaurs, a race fabled as half men, half horses. He lived at the foot of Mt. Pelion in Thessaly, and was celebrated through all Greece for his wisdom and acquirements, particularly for his skill in medicine and music; and the greatest princes and heroes of the time — Bacchus, Jason, Hercules, Achilles, etc., — were represented as his pupils.

**Chitaldrúg** (chit-al-drög'), a district and town of India, Mysore native state. The district, which is arid and stony, has an area of 4,571 sq. mi.; pop. 376,310. The town has fortifications constructed by Haider Ali, and was a station for British troops. Pop. 4,271.

# Chivairy

**Chitons** (kī' tonz) (Chitonidæ), a family of gasteropods, affording the only instance known of a molluscan shell formed of many successive portions, often in contact and overlapping each other, but never truly articulated. The

Chiton.

shell in the typical genus *Chiton* is composed of eight pieces, the animal adhering to rocks or stones after the fashion of the limpet. The species are numerous, and there are few rocky shores without some of them.

**Chittagong** (chit-), a district. Hindustan, in the southeast of Bengal, having the Bay of Bengal on the west; area 2,567 sq. mi.: pop. 1,132,-341. The level lands, chiefly on the coast and the valleys are very fertile. A considerable majority of the inhabitants are Mohammedans. Chittagong is also the name of a commissionership or division of Bengal. Area 12,118 sq. mi.: pop. 3,574,048. The city of Chittagong, chief town of the district and second port in Bengal, is situated on the Karnaphuli about 12 mi. from its mouth. Though very unhealthy, its trade has of late been steadily increasing. Pop. 20,969. **Chittagong Wood**, the wood of several

**Chittagong Wood**, the wood of several Indian trees, especially of *Chickrawsia tabulāris*, order Cedrelaceæ, a light-colored, beautifully grained wood used by cabinet makers.

Chivairy (chiv'al-ri), a term which indicates strictly the organization of knighthood as it existed in the Middle Ages, and in a general sense the spirit and aims which distinguished the knights of those times. The chief characteristics of the chivalric ages were a war-like spirit. a lofty devotion to the female sex, a love of adventure, and an undefinable thirst for glory. The Crusades gave for a time a religious turn to the spirit of chivalry, and various religious orders of knighthood arose, such as the Knights of St. John, the Templars, the Teu-tonic Knights, etc. The education of a knight in the days of chivalry was as follows: In his twelfth year he was sent to the court of some baron or noble knight, where he spent his time chiefly in attending on the ladies, and acquiring skill in the use of arms, in riding, etc. When advancing age and experience in the use of arms had qualified the page for war, he became an esquire or squire. This word is from L. scutum, a shield, it being among other

offices the squire's business to carry the shield of the knight whom he served. The third and highest rank of chivalry was that of knighthood, which was not conferred before the twenty-first year, except in the case of distin-guished birth or great achievements. The individual prepared himself by confessing, fasting, etc.; religious rites were performed, and then, after promising to be faithful, to protect ladies and orphans, never to lie nor utter slander, to live in harmony with his equals, etc., he received the accolade, a slight blow on the neck with the flat of the sword from the person who dubbed him a knight. This was often done on the eve of battle, to stimulate the new knight to deeds of valor; or after the combat, to reward signal bravery. Though chivalry had its defects, chief among which, perhaps, we may note a tendency to certain affectations and exaggerations of sentiment and profession, yet it is to be regarded as tempering in a very beneficial manner the natural rudeness of feudal society. As a system of education for the nobles it taught them the best ideals, social and moral, which the times could understand, and filled a place in civilization which as yet the arts and letters could hardly occupy

Chiadni (Mad'nē), ERNST FLORENT FRIED-RICH (1756-1827), German physicist. He investigated the laws of sound and made important experiments on the vibration of metallic and glass plates of various forms. His works include Discoveries Concerning the Theory of Sound (1787); Acoustics (1802); Contributions to Practical Acoustics, with Remarks on the Making of Instruments (1822); etc.

Chio'ral, a liquid first prepared by Liebig by passing dry chlorine gas through absolute alcohol to saturation, afterward by Städeler by the action of hydrochloric acid and man-ganese on starch. The hydrate of chloral, as now prepared is a white crystalline substance, which, in contact with alkalies, separates into chloroform and formic acid. Chloral kills by paralyzing the action of the heart. It is a hypnotic as well as an anæsthetic, and is frequently substituted for morphia. It has been successfully used in delirium tremens, St. Vitus's dance, poisoning by strychnia, in tetanus, and in some cases of asthma and whooping cough. It should be taken with great caution and under medical advice, as an extra dose may produce serious symptoms and even death. The treatment of poisoning by chloral is to keep the person warm by means of blankets, warm bottles, etc. Warm stimulating drinks should also be administered, such as hot coffee, hot tea, negus, etc. It has been shown that an animal kept warm by wrapping in cotton wool recovered from a dose of chloral that otherwise would have killed it.

**Chlo'rate**, a salt of chloric acid. The chlorates are very analogous to the nitrates. They are decomposed by a red heat, nearly all of them being converted into metallic chlorides, with evolution of pure oxygen. They deflagrate with inflammable substances with such facility that an explosion is produced by slight causes. The chlorates of sodium and potassium are used in medicine. The latter, in doses of from five to twenty grains, is largely used in scarlet fever, inflamed throat, etc. It is also used in the manufacture of lucifer matches, fireworks, and percussion caps.

**Chloric Ether**, a volatile liquid obtained by passing hydrochloric acid gas into alcohol to saturation and distilling the products.

Chlo'rine, an elementary gaseous substance discovered by Scheele in 1774, who named it dephlogisticated marine acid. It was afterward proved by Davy to be a simple body, and from its peculiar yellowish-green color the appellation of chlorine was given to it. It is always found in nature in a state of combination. United with sodium it occurs very largely as the chloride of sodium or common salt, from which it is liberated by the action of sulphuric acid and manganese dioxide. Chlorine is a very heavy gas, being about two and a half times as heavy as ordinary air; it has a peculiar smell, and irritates the nostrils most violently when inhaled, as also the windpipe and lungs. It exercises a corrosive action upon organic tissues. It is not combustible, though it supports the combustion of many bodies, and, indeed, spontaneously burns several. In combination with other elements it forms chlorides, which act most important parts in many manufacturing processes. This gas may be liquefied by cold and pressure, when it becomes a transparent, greenish-yellow, limpid liquid. Chlorine is one of the most powerful bleaching agents, this property belonging to it through its strong affinity for hydrogen. Hence in the manufacture of bleaching powder it is used in immense quantities. When applied to moistened colored fabrics it acts by decomposing the moisture present, the oxygen of which then destroys the coloring matter of the cloth, etc. It is a valuable disinfectant where it can be conveniently applied, as in the form of chloride of lime.

**Chlo'rite**, a mineral of a grass-green color, opaque, usually friable or easily pulverized, composed of little spangles, scales, prisms, or shining small grains, and consisting of silica, alumina. magnesia, and protoxide of iron. It is closely allied in character to mica and talc. There are four sub-species—chlorite earth, common chlorite, chlorite slate, and foliated chlorite.

**Chlo'roform**, the perchloride of formyle, a volatile, coloriess liquid of an agreeable, fragrant, sweetish, apple taste and smell, of the specific gravity of 1.48, and discovered by Soubeiran and Liebig in 1832. It is prepared by cautiously distilling together a mixture of alcohol, water, and chloride of lime or bleaching powder. Its use as an anæsthetic was introduced in 1847 by Professor (afterward Sir) James Y. Simpson, of Edinburgh. For this purpose its vapor is inhaled. The inhalation of chloroform first produces slight intoxication; then, frequently, slight muscular contractions, unruliness, and dreaming; then loss of voluntary motion and consciousness, the patient appearing as if sound asleep; and at last, if too much be given, death by coma and syncope. When skillfully administered in proper cases it is considered one of the safest of anæsthetics; but it requires to be used under certain precautions, as its application has frequently proved fatal. Chloroform is a powerful solvent, dissolving resins, wax, iodine, etc., as well as strychnine and other alkaloids.

Chio'rophyll, the green coloring matter of plants. It plays an important part in the life of the plant, as it breaks up the carbonic acid gas taken in by the stomata of the leaves into its two elements, carbon and oxygen, returning the oxygen to the air, and converting the carbon with the water obtained from the roots into starch. Light is indispensable to the formation of chlorophyll, and hence arises the etiolation or bleaching of plants by privation of light, either by the art of the gardener or from accidental causes.

**Choate**, RUFUS (1799–1859), American jurist and orator. In 1830 he was elected to Congress; also in 1832. In 1841 he succeeded Daniel Webster in the U. S. Senate, serving until 1845. In many respects he was the most scholarly of American public men, and among the greatest forensic advocates America has produced.

Choc'olate, a paste composed of the kernels of the cacao-tree, ground and combined with sugar and vanilla, cinnamon, or other flavoring substance; also a beverage made by dissolving chocolate in boiling water or milk. It was used in Mexico long before the arrival of the Spaniards, and is now largely used in South America, Spain, Italy, and Germany, but in Britain cocoa, which is a preparation from the same fruit, is much more common. The cocoa bean, from which chocolate is made, is the seed of a mushy pod which is the fruit of the cacao or cocoa tree. This tree is found in Central America, Mexico, South America, the West and East Indies, Brazil, and Caracas. The cocoa bean is about the size of a pecan nut. The kernel of the bean is called the nib, and from the nibs chocolate and cocoa are made. The beans are roasted in a cylindrical machine which turns slowly over a coal fire. The roasting is for the purpose of making the shells brittle so they will come off easily. After the roasting process the beans are allowed to cool and are then carried to a machine known as a "cracker and fanner." This machine cracks and removes the shell and then fans the shell out of the way, leaving the nibs. The nibs are then put into a grinding machine. The bean is about half oil and this is apparent when the nibs are fed into the grinding machine. The first revolution sends out thick chocolate paste. As it comes from the stones the chocolate looks just as it does when it is mixed for chocolate cake. The ground chocolate is then placed in kettles for the purpose of completing the stirring up. Afterward it is placed in little tins and carried to the cooling room to solidify into cakes, which are then wrapped for shipment.

Choc'taws, a North American Indian tribe

now settled on a portion (10,450 sq. mi.) of the Indian Territory on the Red River. They formerly inhabited what is now the west part of Alabama and south part of Mississippi. They cultivate the soil, are partially civilized, having regular constitution prefaced with a bill of rights, courts of justice, books and newspapers.

**Choiseul** (shwä-seul), an ancient French family which has furnished many distinguished individuals. One of the best known is Etienne François, duke of Choiseul-Amboise(1719-1785). After distinguishing himself on various occasions in the Austrian War of Succession, he returned to Paris, where his intimacy with Madame de Pompadour furnished the means of gratifying his ambition. After having been ambassador at Rome, and at Vienna, he became in reality prime minister of France. He negotiated the famous Family Compact which reunited the various members of the Bourbon family, and restored Corsica to France. His fall was brought about in 1770 by a court intrigue, supported by Madame du Barry, the new favorite of the king. He was banished to his estates, but his advice in political matters was frequently taken by Louis XVI.

**Choke-damp** (or After-damp), the name given to the irrespirable gas found in coal mines after an explosion of fire-damp or light carbureted hydrogen.

**Cholera** (kol'é-ra), an acute contagious and very fatal disease. In its more ordinary form it commences with sickness, vomiting, or perhaps two or three loose evacuations of the bowels; after which follow a sense of burning at the præcordia, an increased purging and vomiting of a white or colorless fluid, great prostration of strength, spasms at the extremities, which increase in violence with the vomiting and purging. Such cases may last from twelve to thirty-six hours; after this the patient generally sinks into a state of extreme collapse, and this stage in most cases passes by a gradual transition into a febrile one, which in a major-ity of instances proves fatal. Sometimes the patient is suddenly stricken down and dies, collapsed within a few hours without diarrhœa or vomiting. This disease is endemic in certain parts of Asia (hence it is sometimes called Asiatic cholera), and is liable to spread to other parts of the world, usually by the ordinary channels of commercial intercourse. It first appeared in Europe in 1829, and reached Britain in 1831, spreading thence to America. Western Eu-rope was again visited by it in 1847, 1853, 1865, 1873, 1875, and in 1885, when Spain and the south of France suffered severely.

The primary and essential element in the production of cholera has been ascertained to be a constituent of the excreta of cholera patients. Whether this particular substance is the germ of a fungus or other form of minute life is not quite certain, but that it is an organism capable of propagating itself when it is taken into the alimentary canal in food. impure water, or the like, is beyond a doubt. Doctor Koch asserts that the essential cause is a bacillus, having the form of a curved rod,

hence called the common bacillus, and that the disease is caused by the multiplication of this organism in the small intestines. The fact that great numbers are present in persons suffering from cholera is generally admitted, but it is doubted by other experts if they do actually produce the disease. A method of protective inoculation against cholera has been lately tried in Spain, but with small success. The contagion of cholera is not so likely to be conveyed by personal intercourse as by residence in an infected district. Sanitary measures have proved to be the only efficacious means of arresting an epidemic; insanitary conditions decidedly favor it.

What is called *cholera morbus* is a bilious disease, long known in most countries, and is characterized by copious vomiting and purging, with violent griping, cramps of the muscles of the abdomen and lower extremities, and great depression of strength. *Cholera infantum* (infants' cholera) is the name sometimes given to a severe and dangerous diarrhoma to which infants are liable in hot climates or in the hot season.

**Cholesterine** (kö-les'ter-in), a substance found in bile, blood, etc., which may be obtained in the form of beautiful pearly crystalline scales, without taste and odor. It is widely distributed in the animal economy, being essential to the brain and nerve substance, and having been found in milk, and many portions of the body, both as a normal and a pathological constituent.

**Cholos** (chō' lõs), in Peru, the name for those who are partly of white, partly of Indian parentage, the most numerous class of the community.

**Cholula** (chō-lö'là), a town of Mexico, 60 mi. s.e. by e. of Mexico, formerly a large city, the seat of the religion of the ancient Mexicans, with more than 400 temples. One of these temples still remains, built in the form of a pyramid, each side of its base measuring 1,440 ft., and its height in all 164 ft. On the top is a chapel of Spanish origin. Pop. 10,000.

a chapel of Spanish origin. Pop. 10,000. **Chonos Archipelago** (chō' nōs), a group of islands lying off the west coast of Patagonia. Two are large, but they are all barren and scantily inhabited:

**Chopin** (sho-pan), FRÉDÉRIC FRANÇOIS (1810 -1849), pianist and musical composer, of French extraction, was b. at Warsaw, went to Paris in 1831 on account of the political troubles of Poland, and died there. He wrote numerous pieces for the pianoforte, chiefly in the form of nocturnes, polonaises, waltzes, and mazurkas; all of which display much poetic fancy, abounding in subtle ideas with graceful harmonic effects.

**Chopine** (chop-ēn'), a very high shoe or elevated clog, introduced into England from Venice, in the reign of Queen Elizabeth, and which became the fashionable wear of court ladies during that reign. They were made of wood covered with leather of sundry colors, white, red, yellow, and sometimes gilt. Some of them were of great height, as much as 18 in., the

height of the chopine being seemingly regarded as a mark of the rank of the wearer.

**Chop Sticks**, the Chinese substitute for our knife, fork, and spoon at meals, consisting of two smooth sticks of bamboo, wood, or ivory, which are used for conveying meat to the mouth with wonderful dexterity.

**Choragus** (ko-rā-'), a name given by the Greeks to the leader or director of the choruses furnished for the public festivals and who also defrayed the expenses of the chorus. The choragus who was adjudged to have performed his duty best received a tripod of brass, for which he had to build a monument, on which it was placed. A street in Athens which contained a great number of these choragic monuments was called the "street of the tripods." A handsome choragic monument was erected near the Art Palace at the World's Columbian Exposition in Chicago in 1893.

**Chord** (kord), in music, the simultaneous combination of different sounds, consonant or dissonant. The common chord consists of a fundamental or bass note with its third and fifth. When the interval between the bass note and its third is two full tones the combination is a major chord; when the interval is a tone and a half the combination is termed a minor chord; when the intervals between the bass note and its third and the third and the fifth are each a tone and a half, the chord is The tonic chord is made up called diminished. of the key note and its third and fifth; the dominant chord consists of the dominant or fifth of the scale accompanied by its third and fifth; the subdominant chord has for its root or bass the subdominant or fourth of the scale, accompanied with its third and fifth. In geom. a chord is a straight line drawn, or supposed to extend, from one end of an arc of a circle to the other.

**Chorley** (chor'li), a market town of England, Lancashire, 20 mi. n.w. of Manchester, with manufactures of cotton goods, calico printing, and dye-wood works, floor cloth works, iron foundries, etc. In the vicinity are coal, lead, and iron mines. Pop. 23,082.

Chorus (kô' rus), originally an ancient Greek term for a troop of singers and dancers, intended to heighten the pomp and solemnity of festivals. During the most flourishing period of ancient tragedy (B.C. 500-400) the Greek chorus was a troop of males and females, who, during the whole representation, were spectators of the action, never quitting the stage. In the intervals of the action the chorus chanted songs, which related to the subject of the performance. Sometimes it even took part in the performance, by observations on the conduct of the personages, by advice, consolation, exhortation, or dissuasion. In the beginning it consisted of a great number of persons, sometimes as many as fifty; but the number was afterward limited to fifteen. The exhibition of a chorus was in Athens an honorable civil charge, and was called *choragy*. Sometimes the chorus was divided into two parts, who sung alternately. The divisions of the chorus were not stationary, but moved from one side of the

stage to the other; from which circumstance the names of the portions of verse which they recited, *strophe*, *antistrophe*, and *epode*, are derived. In music, the chorus is that part of a composite vocal performance which is executed by the whole body of the singers, in contradistinction to the solo airs, and concerted pieces for selected voices. The singers who join in the chorus are also called the chorus. The term is also applied to the verses of a song in which the company join the singer in repeating certain couplets or verses at certain periods in a song.

**Chose in Action** (Fr. *chose*, "a thing") is one of the two great classes of what the English law calls chattels personal. The one class is "choses in possession," such as goods, household furniture, cattle, etc; the other class is "choses in action," such as the right to sue for a debt, a legacy, damages, etc. In the U. S. that quality of a chose in action rendering it unassignable at common law is fast disappearing. In some states a chose in action may not only be assigned, but the assignee may bring a suit for possession in his own name; while in others the name of the assignor is used as plaintiff in the action, to the use of the assignee. Courts of law generally follow the rules of equity in this respect.

Chosroes I (kos'ro-es) (A. D. 531-579), surnamed the "Just," the greatest of the Sassanid kings of Persia. At his accession Persia was involved in a war with the Emperor Justinian, which Chosroes terminated successfully, obliging Justinian to purchase peace by the payment of a large sum of money. In 540, however, jealous of the victories of Belisarius. the great general of the empire, Constantine violated the peace, invaded Syria, laid Antioch in ashes, and returned home laden with spoils. The war continued till 562, when the emperor again purchased peace by an annual tribute of 30,000 pieces of gold. The peace continued for ten years, when the war was renewed with Justin, the successor of Justinian, when Chosroes was again successful. The following emperor, Tiberius, at length completely defeated the Persians in 578.

**Chota Nagpore** (or Chutia Nágpur), a divislon of British India, presidency Bengal, divided into the districts of Lohardaga, Hazaribagh, Singbhum, and Manbhum, and 9 feudatory states. Total area 43,020 sq. mi.; pop. 4,003,991.

**Chouans** (shö-än), a name given to the royalist peasantry of Brittany and Lower Maine, who carried on a petty warfare against the republican government from an early period of the French Revolution. The name was finally extended to all the Vendeans. The name was derived from the first chief of the Chouans, Jean Cottereau, who with his three brothers organized these bands in 1792. Cottereau had joined a band of dealers in contrabaud salt, and acquired the surname *Chouan* from the cry of the screech owl, which he used as a signal with his companions. He was killed in an engagement with the republican troops in 1794. The Chouans were not suppressed till 1799, and even after that occasional spurts of insurrection occurred down till 1830, when they were finally put down.

till 1830, when they were finally put down. **Chough** (chuf) (Cornish Chough, or Redlegged Crow), a bird belonging to the crow family, but nearly allied to the starlings. *F.* graculus is the only British or European

species, and frequents, in England, chiefly the coasts of Cornwall. Its general color is black, contrasting well with the vermillion red of the beak, legs, and toes. There are other species, natives of Australia, Java, etc.

Christ, a title of our Saviour, now used almost as a name or part of his name.

**Christchurch**, a town of England, county of Hampshire, 21 mi. s.w. of Southampton. There is a fine old priory church, dating from the time of William Rufus, with a magnificent stone altar screen. Pop. 53,270.

**Christchurch**, a town of New Zealand, capital of the province of Canterbury, and the see of the primate of New Zealand, is situated on the Avon River, 7 mi. from Port Lyttelton, with which it has railway communication. It contains a number of handsome buildings, among which are the provincial government offices, the cathedral, St. Michael's Church, the supreme court, hospital, museum, town library, etc. There are a fine park, a botanic garden, and high class educational and other institutions. Pop. 16,223, or including extensive suburbs, 47,846.

Christ Church College, OXFORD, a college protected by Cardinal Wolsey, and established in 1546 by Henry VIII. It has the patronage of above ninety livings.

**Christian**, the name of nine Danish kings. Of these CHRISTIAN II (1480-1559), king of Denmark, Norway, and Sweden, attained the throne in 1513, and in 1518 usurped the throne of Sweden, from which he was expelled by Gustavus Vasa in 1522. He was deposed by his Danish subjects in 1523, and retired to the Netherlands, whence he returned in 1531 with an army, but was defeated, and kept in confinement till his death. CHRISTIAN IV (1577-

1648), king of Denmark, son of Frederick II and the Princess Sophia of Mecklenburg, succeeded to the throne as a minor in 1588. In the Thirty Years' War he was beaten by Tilly at Lutter in 1626, but afterward, in conjunction with Gustavus Adolphus, obtained the treaty of Lübeck, 1628. He has the merit of having laid the foundation of the Danish navy, extended the trade of his subjects to the East Indies, and fitted out several expeditions for the .

Christian Era, the great era now almost universally employed in Christian countries for the computation of time. It is generally supposed to begin with the year of the birth of Christ; but that event seems to have taken place four years before the present established beginning of the era. Time before Christ is marked B.C., after Christ A.D. The era is computed from January 1, in the fourth year of the 194th Olympiad, and the 753d from the building of Rome. It was first used by Dionysius, a Syrian monk, in the sixth century, but did not become general until about the middle of the fifteenth century.

Christiania, a city and port, the capital of Norway, province Aggershuus or Christiania, at the head of the long, narrow inlet called Christiania Fjord, about 60 mi. from the open sea or Skagerrack. The houses are mostly of brick and stone, generally plain buildings, devoid of architectural pretension. Important public buildings are the royal palace, the house of representatives or Storthing, the governor's palace and cathedral. An interesting building is the fine old castle of Aggershuus, with its church and citadel crowning a point jutting out into the fjord. Attached to the university-the only one in Norway, opened in 1813—is a museum, containing a fine col-lection of antiquities. The manufactures of the city consist of woolen cloth, ironware, tobacco, paper, leather, soap, spirits, glass, etc., and there are extensive breweries. The exports are principally timber and iron. The environs are exceedingly beautiful. Pop. 122,424.

Christianity, the religion instituted by Jesus Christ. Though the great moral principles which it reveals and teaches, and the main doctrines of the gospel, have been preserved without interruption, the genius of the differ-ent nations and ages have materially colored its character. The first community of the followers of Jesus was formed at Jerusalem soon after the death of their Master. Another at Antioch in Syria first assumed (about 65) the name of Christians; and the travels of the apostles spread Christianity through the provinces of the Roman Empire. Palestine, Syria, Asia Minor, Greece, the islands of the Mediterranean, Italy, and the northern coast of Africa, as early as the first century, contained societies of Christians. At the end of the third century almost one half of the inhabitants of the Roman Empire, and of several neighboring countries, professed this belief. While Christianity as a system was thus spreading, many heretical branches had sprung from the main trunk. From the Gnostics, who date from the days of the apostles, to the Nestorians of the fifth century, the number of sects was large, and some of them exist to the present day. The most important events in the subsequent history of Christianity are the separation of the Eastern and Western churches early in the eighth century; and the Western reformation, which may be said to have commenced with the sectaries of the thirteenth century, and ended with the establishment of Protestantism in the sixteenth. The number of Christians now in the world is computed at 450,000,000. Of these about 212,-000,000 are Roman Catholics, 83,000,000 belong to the Greek Church, and 155,000,000 are Protestants. Of the various sects of Protestants the most numerous are the Lutheran, the Calvinistic, and the Anglican Church.

**Christians** (or Christian Connection), the name of a denomination in the U. S. and Canada, adopted to express their renunciation of all sectarianism. They are to be met with in all parts of the country, the number of their churches being estimated at over 1,000. Each church is an independent body; the Scriptures are their only rule of faith, and admission to the church is obtained by a simple profession of belief in Christianity. As a rule they are anti-trinitarians and baptists.

Christian IX, king of Denmark, b. April 8, 1818; succeeded to the throne in 1863. His eldest daughter, Alexandra, is married to the Prince of Wales; his second daughter, Dagmar, is the wife of the reigning czar. and his second son, George, is king of the Hellenes.

**Christian**, prince of Schleswig-Holstein, b. in 1835; married, 1866, the Princess Helena, third daughter of Queen Victoria. He is a general in the British army.

**Christiansand**, a seaport in the south of Norway, with manufactures of tobacco and machinery, brewing, etc., and a considerable export of timber and fish. Pop. 12,749.

**Christiansted**, a fortified town, capital of the island of St. Croix, Danish West Indies, with a good harbor and some trade. Pop. 9,600.

Christi'na, Queen of Sweden (1626-1689), daughter of Gustavus Adolphus. After the death of Gustavus, at Lützen, in 1632, the states-general appointed guardians to the Queen Christina, then but 6 years old. Her education was continued according to the plan of Gustavus Adolphus. She learned the ancient languages, history, geography, politics, and renounced the pleasures of her age in order to devote herself entirely to study. In 1644 she took upon herself the government. A great talent for business, and great firmness of purpose, distinguished her first steps. She terminated the war with Denmark begun in 1644, and obtained several provinces by the treaty concluded at Bromsebro in 1645. Her subjects wished that she should choose a husband, but she manifested a constant aversion to marriage. During this time her patronage of learned men, artists, and the like, was lavish. In 1650 she caused herself to be crowned with great pomp, and with the title of king.

From that time a striking change in her conduct was perceptible. She neglected her ancient ministers, and listened to the advice of ambitious favorites. Intrigues and base passions succeeded to her former noble and use-The public treasure was squanful views. dered with extravagant profusion. In 1654 she abdicated in favor of her cousin Charles Gustavus, reserving to herself a certain income, entire independence, and full power over her suite and household. A few days after, she left Sweden and went to Brussels, where she made a public entry and remained for some time. There she made a secret profession of the Catholic religion which she afterward publicly confirmed in Innsbruck. From Innsbruck she went to Rome, which she entered on horseback in the costume of an Amazon, with great pomp. When the Pope Alexander VII confirmed her she adopted the surname of Alessandra. For some time she resided at Paris, and incurred great odium by the execution of her Italian equerry Monaldeschi for betrayal of confidence. Subsequent attempts which she made to resume the crown of Sweden failed, and she spent the rest of her life in artistic and other studies at Rome. She left an immense art collection and a large number of valuable MSS. Her writings were collected and published in 1752. Christina, Queen-regent of Spain, b. July

**Christina**, Queen-regent of Spain, b. July 21, 1858; second daughter of the late Archduke Charles of Austria. In 1879 she was married to Alfonso XII of Spain, to whom she bore two children; the Infanta Mercedes, and Alfonso, present king of Spain.

Christmas(kris'mas), the festival of the Christian church observed annually on December 25 in memory of the birth of Christ, and celebrated by a particular church service. The time when the festival was first observed is not known with certainty; but it is spoken of in the beginning of the third century by Clement of Alexandria, and in the latter part of the fourth century Chrysostom speaks of it as of great antiquity. As to the day on which it was celebrated, there was long considerable diversity, but by the time of Chrysostom the Western church had fixed on December 25, though no certain knowledge of the day of Christ's birth existed. The Eastern church, which previously had generally favored January 6, gradually adopted the same date. Many believe that the existence of heathen festivals celebrated on or about this day had great influence on its being selected; and the Brumalia, a Roman festival held at the winter solstice. when the sun is as it were born anew, has often been instanced as having a strong bearing on the question. In the Catholic, Greek, Anglican, and Lutheran churches, there is a special religious service for Christmas day; and, contrary to the general rule, a Catholic priest can celebrate three masses on this day. Most other churches hold no special service, but almost everywhere throughout Christendom it is kept as a holiday and occasion of social enjoyment.

Christmas Cards, ornamental cards con-

taining words of Christmas greeting to friends to whom they are sent. The first of them appeared about 1862, and consisted of pictures of robins, holly, etc.; since then highly artistic designs have been introduced, and their manufacture is considerable in the U. S., Germany, France, and England. Immense quantities of them pass through the post office every Christmas.

**Christmas Carol**, a carol or song descriptive of the birth of Christ, or of incidents connected with it, sung specially at Christmas.

**Christmas Rose**, the black hellebore, so called from its flower, which resembles a large white rose. Its foliage is dark and evergreeu, and the plant blossoms during the winter months.

**Christmas Tree**, a small fir tree lighted up by means of tiny candles of colored wax, or small Chinese lanterns, ornamented with flags. tinsel ornaments, etc., and hung all over with gifts for children.

Christophe (kris-tof), HENRI (1767-1820), king of Hayti, was b. in the West Indies, and was employed as a slave in St. Domingo on the outbreak of the blacks against the French in 1793. From the commencement of the troubles he signalized himself by his energy, boldness, and activity in many bloody engagements. Toussaint-L'Ouverture gave him the commission of brigadier general, and he was largely instrumental in driving the French from the island. After the death of Dessalines, Christophe became master of the northern part of the island. In 1811 he had himself proclaimed king of Hayti by the name of Henri I. He also sought to perpetuate the name by the compilation of the Code Henri-a digest founded upon the Code Napoleon. His cruelty provoked a revolt, which being unable to quell he shot himself.

**Christopher's,** ST., a British island in the West Indies, one of the Leeward Islands, 23 mi. in length, and in general about 5 in breadth: area 68 sq. mi. The interior consists of many rugged precipices and barren mountains. Of these the loftiest is Mount Misery (evidently an extinguished volcano), 4,100 ft. high. The chief town, a seaport with open roadstead, is Basse-Terre. The island has a legislature of its own, with an executive subordinate to the governor of the Leeward Islands, resident in Antigua. It was discovered by Columbus in 1493, and colonized by the English in 1623. Pop. 20,127.

**Christ's College,** one of the colleges of the University of Cambridge, England, founded originally by Henry VI, but remodeled and liberally endowed by Margaret, countess of Richmond and Derby, mother of Henry VII, in 1505.

**Chromat** ic, in music, a term applied to notes and peculiarities not belonging to the diatonic scale. Thus a *chromatic chord* is a chord which contains a note or notes foreign to diatonic progression; *chromatic harmong*, harmony consisting of chromatic chords. The *chromatic scale* is a scale made up of thirteen successive semitones, that is, the eight diatonic tones and the five intermediate tones.

**Chrome iron Ore,** an ore of chromium, is a mineral of very considerable importance as affording chromate of potash, whence are obtained various other preparations of this metal used in the arts.

**Chrome Yellow,** a chromate of lead, a beautiful pigment, varying in shade from deep orange to a very pale canary yellow, much used in the arts.

Chro'mium, a metal which forms very hard steel-gray masses; it never occurs native, but may be obtained by reducing the oxide. In its highest degree of oxidation it forms a compound of a ruby-red color. By itself it has received no practical applications. It takes its name from the various and beautiful colors which its oxide and acid communicate to minerals into whose composition they enter. It is the coloring matter of the emerald and beryl. Chromium is employed to give a fine, deep green to the enamel of porcelain, to glass, etc. The oxide of chromium is of a bright grassgreen or pale yellow color. This element was originally discovered in 1797 by Vanquelin. in the native chromate of lead of Siberia. See preceding articles.

**Chromo-lithography**, a method of producing a colored or tinted lithographic picture, by using various stones having different portions of the picture drawn upon them with inks of various colors and so arranged as to blend into a complete picture. Sometimes as many as twenty different colors are employed. In printing, lighter shades are printed off first and the darkest last.

Chro'mosphere, the name given to the gaseous envelope which exists round the body of the sun, through which the light of the photosphere, an inner envelope of incandescent matter, passes. During total eclipses it had been observed that a red-colored envelope surrounded the sun, shooting up to great distances from the surface. It seems to have been more commonly described as "redcolored protuberances" and "red flames. To this red envelope the name chromosphere was given by Mr. Lockyer. The light from it is much fainter than that from the photo-sphere; and till 1868, when M. Janssen and Mr. Lockyer almost simultaneously pointed out a method of viewing it, it was never seen except during eclipses. The chromosphere and its prominences, when examined with the telespectroscope, exhibits a spectrum of bright lines, due to incandescent gases. The most elevated portions consist entirely or almost entirely of hydrogen, the lightest of the gases. Lower down are found the gases or vapors of the heavier metals - of sodium, magnesium, barium, iron, and others. The lower the layer of the chromosphere examined the more densely is the spectrum filled with lines of metals, and in the prominences the red hydrogen flames tower high above all.

**Chron'icles**, BOOKS OF, two books of the Old Testament which formed only one book in the Hebrew canon, in which it is placed last. Its division into two parts is the work of the

Seventy. The Hebrew name means "acts of the days," and is thus much the same as our "journals." The title given to it by the Seventy was Paraleipomena, meaning "things omitted." The name Chronicles was given to it by Jerome. The book is one of the latest compositions of the Old Testament, and is supposed to have been written by the same hand as Ezra and Nehemiah. According to its contents the book forms three great parts: 1, genealogical tables; 2, the history of the reigns of David and Solomon; 3, the history of the kingdom of Judah from the separation under Rehoboam to the Babylonian captivity, with a notice in the last two verses of the permission granted by Cyrus to the exiles to return home and rebuild their temple. The Chronicles The Chronicles present many points of contact with the earlier scriptures, historical and prophetical, more especially, however, with the books of Samuel and of Kings.

**Chron ogram**, a device by which a date is given in numeral letters by selecting certain letters of an inscription and printing them larger than the others, as in the motto of a medal struck by Gustavus Adolphus in 1632: ChrIstVs DVX: ergo trIVMphVs; where the values of C and the other capitals regarded as Roman numerals gives the required figure when added together.

Chron ograph, the name given to various devices for measuring and registering very minute portions of time with extreme precision. Benson's chronograph is, in principle, a lever watch with a double secondhand, the one superimposed on the other. The outer end of the lowermost hand has a small cup filled with a black viscid fluid, with a minute hole at the bottom, while the corresponding end of the uppermost is bent down so as just to reach the hole. At the starting of a horserace, the observer pulls a string, whereupon the bent end of the upper hand passes through the hole and makes a black mark on the dial, instantly rebounding. Again, as each horse passes the winning-post the string is redrawn and a dot made, and thus the time occupied by each horse is noted. This chronograph registers to one tenth of a second. Strange's chronograph is connected with the pendulum of an astronomical clock, which makes a mark on a sheet of paper at the beginning and end of each swing. By touching a spring on the appearance of a particular star in the field of a telescope, an additional dot is made intermediate between the two extreme ones, and by measuring the distance of this from either of these extremes the exact time can be ascertained to one hundredth of a second. Schultze's chronograph, in which electricity is applied, is yet far more precise, registering time to the five-hundred-thousandth part of a second.

**Chronol ogy,** the science which treats of time, and has for its object the arrangement and exhibition of historical events in order of time and the ascertaining of the intervals between them. Its basis is necessarily the method of measuring or computing time by

#### Chronometer

regular divisions or periods, according to the revolutions of the earth or moon. The motions of these bodies produce the natural division of time into years, months, and days. As there can be no exact computation of time or placing of events without a fixed point from which to start, dates are fixed from an arbitrary point or *epoch*, which forms the beginning of an *era*. The more important of these are the creation of the world among the Jews; the birth of Christ among Christians; the Olympiads among the Greeks; the building of Mome among the Romans; the Hejira or flight of Mohammed among the Mohammedans, etc.

Chronom'eter, any instrument that measures time, as a clock, watch. or dial; but, specifically, this term is applied to those timekeepers which are used for determining the longitude at sea, or for any other purpose where an accurate measure of time is required, with great portability in the instru-The chronometer differs from the ment. ordinary watch in the principle of its escapement, which is so constructed that the balance is free from the wheels during the greater part of its vibration, and also in being fitted with a "compensation adjustment," calculated to prevent the expansion and contraction of the metal by the action of heat and cold from affecting its movements. Marine chronometers generally beat half seconds, and are hung in gimbals in boxes 6 or 8 in. square. The pocket chronometer does not differ in appearance from a watch except that it is somewhat larger.

**Chronoscope**, an instrument for measuring the duration of extremely short-lived phenomena, such as the electric spark; more especially the name given to instruments of various forms for measuring the velocity of projectiles. **Chrys'alis**, a form which butterflies, moths,

and most other insects assume when they change from the state of larva, or caterpillar, and before they arrive at their winged or perfect state. 1ii the chrysalis form the animal is in a state of @ rest or insensibility, and exists without nutriment, the length of time varying with the species and season. During this period an elaboration is going on in the interior of the chrysalis, giving to the organs of the future animal their proper development

Chrysan'themum, a large genus of composite plants consisting of herbs or shrubs with single, largestalked, yellow flowers or with many small

or with many small Yellow Chrysanthemum.

#### Church

flowers; the rays are sometimes white. Two species are common weeds in Britain, the oxeye daisy, a meadow plant with white ray flowers, and the corn marigold, a cornfield weed with golden-yellow ray-flowers. The chrysanthemum of gardens is a Chinese half shrubby plant whose numerous varieties constitute one of the chief ornaments of our American gardens in October, November, and December.

Chrys'olite, a mineral composed of silica. magnesium, and iron. Its prevailing color is some shade of green. It is harder than glass, but less hard than quartz; often transparent. sometimes only translucent. Very fine specimens are found in Egypt and Brazil, but it is not of high repute as a jeweler's stone.

not of high repute as a jeweler's stone. **Chrysophan'ic Acid**, the yellow coloring matter of rhubarb. With potash it gives a fine. purple solution, and thus affords a delicate test for the presence of alkalies.

Chrys'ostom, JOHN, ST. (344-407) ("golden mouthed"), a celebrated Greek father of the church. He studied eloquence with Libanius, the most famous orator of his time, and scon excelled his master. After having studied philosophy with Andragathius he devoted himself to the Holy Scriptures, and determined upon quitting the world and consecrating his life to God in the deserts of Syria. He spent several years in solitary retirement, studying and meditating with a view to the church.

**Chub**, a European river fish, of the genus Cyprinus or carps; or, as some regard it, of the sub-genus *Leuciscus*. The body is oblong. nearly round; the head and back green, the sides silvery, and the belly white. It frequents deep holes in rivers shaded by trees.

but in warm weather floats near the surface, and furnishes sport for anglers. It is indifferent food, and rarely attains the weight of 5 lbs. Allied American species receive the same name.

**Chuprah** (or Chapra) (chap-rä), a town, Hindustan, division of Bahar, on the Gogra. about a mile above its confluence with the Ganges: extending along the river for nearly four miles, with an active trade in cotton, sugar, and saltpeter. Pop. 51,670.

**Chuquisaca** (chö-kē-sà'kà) (or Sucre), a city of South America, the capital of Bolivia; well situated on a plateau between the Amazon and La Plata rivers, 9,343 ft. above the sea level. It has a cathedral and a university. It was founded by one of Pizarro's officers in 1539. Pop. formerly 27,000, now est. 12,000. The province of Chuquisaca has an area of 72,-706 sq. mi.; a pop. of 274,000.

Church, FREDERIC EDWIN, American artist. b. in Hartford, Conn., May 4, 1826. He went to New York, and in 1849 was elected a mem-

ber of the National academy. In 1853-57 he traveled in South America. Later he went on an expedition to the coast of Labrador, and on his 'return painted his great picture *Icolergs*. He traveled through the West Indies, Europe, and Palestine in 1866. His best work is the *Great Fall at Niagara*. For many years he has spent his winters in Mexico. He has studios in New York and on the Hudson.

Church, a word which in its widest sense denotes the whole community of Christians, and was thus used by the New Testament writers. In more restricted significations it denotes a peculiar section of the Christian community differing in doctrinal matters from the remainder, as the Roman Catholic Church, the Protestant Church, etc.; or to designate the leading church of a nation, as the English, Scotch, or French Church. In yet another sense it signifies the edifice appropriated to Christian worship. After the conversion of Constantine the basilicæ or public halls and courts of judicature and some of the heathen temples were consecrated as Christian churches. When churches came to be specially built for Christian worship their forms were various - round, octagonal, etc. Later on the form with the cross aisle or transept became common. Early British churches were built of wood; the first stone churches erected being that 'of Whithorn, Galloway (sixth century), and that of York (seventh century). Any building set apart for religious ordinances is called a church, though when of a minor kind it is usually designated a *chapel*. The term church, however, is often restricted to the buildings for worship connected with a national establish-ment. They are classed as *cathedral*, when containing a bishop's throne: *collegiate*, when served by a dean and chapter; conventual or minster, when connected with a convent or monastery; abbey or priory, when under an abbot or prior; and parochial, when the charge of a secular priest.

Churchill, CHARLES (1731-1764). English poet and satirist. He was educated at Westminster School, but made so bad a use of his time that he was refused admission to the University of Oxford. An early and imprudent marriage was soon followed by his admission to holy orders and a Welsh curacy of \$150 a year. On the death of his father he obtained his curacy of St. John's, Westminster; but owing to his love of gaiety he was soon overwhelmed with debt, and had to compound with his creditors. In 1761 he published anonymously a poem called The Rosciad, a clever satire on the chief actors of the day. Its success was increased by the vehemence with which the players replied to it, and Churchill seized the opportunity of giving the town a new satire, The Apology. A course of dissipation and intem-perance followed, which excited much animadversion, and elicited from him his next satire, Night. Churchill now threw aside all regard for his profession, and became a complete man about town and a professional political satirist. His other productions include The Ghost, in which Dr. Johnson is satirized.

Churchill, RANDOLPH HENRY SPENCER, LORD (1849-1805), second son of the sixth duke of Marlborough. Having entered Parliament in 1874, by 1884 he had risen to the position of a recognized leader of the Conservative party, and in 1885 became Indian secretary in Lord Salisbury's government. On the defeat of Gladstone's Irish Hill in 1886 Churchill became leader of the House of Commons and chancellor of exchequer, posts which he resigned in December, 1880.

**Churchill River**, a river of the Northwest Territories of Canada, which rises in La Crosse Lake, forms or passes through various lakes or lake-like expansions, the largest being Big or Indian Lake, and enters Hudson's Bay after a northeasterly course of about 800 mi. It is called also Missinippi or English River.

**Churn**, a vessel for preparing butter from cream or milk, in which cream is agitated to separate its buttery globules in a solid mass from the fluid portions. Churns are made of various forms; in a very common kind a perforated circular board is made to move up and down in a vessel containing the cream, and having the shape of the frustum of a cone by means of a long stalk or rod fixed to it, called the churn staff. In others the churning is performed by a circular motion.

**Churubusco** (chu-ru-bus'ko), a village 6 mi. s. of Mexico, the scene of a battle between the Mexicans under Santa Anna, and the U. S. troops under Scott, Aug. 20, 1847, in which the former were defeated.

**Chusan Islands**, a group of islands on the east coast of China, the largest in the archipelago having the name Chusan, and being about 21 mi. long, and from 6 to 11 broad. Pop. about 200,000. Chief town Ting-hae, pop. 40,000. Rice and tea are the principal products. From its situation near the mouths of the Yang-tse-kiang, which river forms the great channel of communication with the capital of the empire, Chusan is considered as the key to China, and was temporarily taken possession of by the British in 1840, 1841, and 1860. The sacred island of Pu-tu to the east of the above is covered with Buddhist temples, monasteries, etc., and is entirely inhabited by priests.

**Chyme** (kim), food after it has been digested in the stomach. In the stomach it forms a pulpy mass which passes on into the small intestine, and being acted on by the bile, pancreatic fluid, and intestinal juice, is separated into chyle and non-nutritious matters, which latter are carried off by the evacuations.

**Cialdini,** ENRICO, Italian soldier, b. in Modena Aug. 8, 1811; fought in the Austro-Italian War of 1849 and in the Crimea. In 1860 he defeated the Papal troops, and in 1861 took Gaeta and Messma. He became general of the army and viceroy of Naples, was made senator in 1864 and fought against the Austrians in 1866. In 1870 he annexed the States of the Church to Italy, and in 1876 became ambassador at Paris. He resigned the position in 1881.

**Cibber,** COLLEY (1671-1757), a dramatic writer and actor. He took to the stage in 1689. His first dramatic effort, *Love's Last Shift*, appeared in 1695: and it was followed by *Woman's Wit*, the *Careless Husband*, and the *Nonjuror*, of which the *Hypocrite* of the modern stage is a new version. A court pension and the appointment of poet-laureate drew upon him the rancor of the wits and poets of the day, including Pope.

**Cica'da**, the popular and generic name of certain insects belonging to the order Hemiptera, suborder Homopotera, of many species. The males have on

cies. The males have on each side of the body a kind of drum, with which they can make a considerable noise. This, regarded as the insect's song, was much admired by the ancients, and is frequently referred to by their poets. The largest European species are about an inch long, but some American species are much larger, and can be heard a mile off. They are nearly all natives of tropical or warm temperate regions.

Cicada.

**Cicely** (sis'e-li), a popular name applied to several umbelliferous plants. Sweet cicely, or sweet chervil, is a plant common to Britain and in other parts of Europe. It was formerly used in medicine, and in some parts of Europe is used as an ingredient in soups. Sweet cicely is found in our woods from Canada to Virginia.

Cicero, MARCUS TULLIUS (B. C. 106-43), the greatest Roman orator. His family was of equestrian rank, and his father, though living in retirement, was a friend of some of the chief public men. He received the best education available. At the age of twenty-five he came forward as a pleader. He visited Greece B. C. 79, conversed with the philosophers of all the schools, and profited by the instruction of the masters of oratory. Here he formed that close friendship with Atticus of which his letters furnished such interesting evidence. 'He also made a tour in Asia Minor and remained some time at Rhodes, where he visited the most distinguished orators and took part in their exercises. On his return to Rome his displays of eloquence proved the value of his Grecian instruction, and he became one of the most distinguished orators in the forum. In B. c. 76 he was appointed quæstor of Sicily, and behaved with such justice that the Sicilians gratefully remembered him and requested that he would conduct their suit against their governor Verres. He appeared against this powerful robber, and the crimes of Verres were painted in the liveliest colors in his immortal speeches. Seven of the Verrine orations are preserved, but only two of them were delivered, and Verres went into voluntary exile. After this suit Cicero was elected to the office of ædile in B.C. 70, became prætor in 67, and consul in 63. It was now that he succeeded

in defeating the conspiracy of Catiline, after whose fall he received greater honors than had ever before been bestowed upon a Roman citizen. He was hailed as the savior of the state and the father of his country, and thanksgivings in his name were voted to the gods. But Cicero's fortune had now reached the culminating point. The Catilinarian conspirators who had been executed had not been sentenced according to law, and Cicero, as chief magistrate, was responsible for the irregularity. Publius Clodius, the tribune of the people, raised such a storm against him that he was obliged to go into exile (B.c. 58). On the fall of the Clodian faction he was recalled to Rome, but he never succeeded in regaining the influence he had once possessed. In B. c. 52 he became proconsul of Cilicia, a province which he administered with eminent success. As soon as his term of office had expired he returned to Rome (January, B. c. 49), which was threatened with serious disturbances owing to the rupture between Cæsar and Pompey. He espoused the cause of Pompey, but after the battle of Pharsalia he made his peace with Cæsar, with whom he continued to all appearance friendly, and by whom he was kindly treated, until the assassination of the latter (44 B. c.). He now hoped to regain his political influence. The conspirators shared with him the honor of an enterprise in which no part had been assigned him, and the less he had contributed to it himself the more anxious was he to justify the deed and pursue the advantages which it offered. Antony having taken Cæsar's place, Cicero composed those admirable orations against him, delivered in B.C. 43, which are known to us by the name of Philippics (after the speeches of Demosthenes against Philip of Macedon). His implacable enmity towards Antony induced him to favor young Octavianus, who professed to entertain the most friendly feeling toward him. Octavianus, however, having possessed himself of the consulate, and formed an alliance with Antony and Lepidus, Cicero was proscribed. In endeavoring to escape from Tusculum, where he was living when the news of the proscription arrived, he was overtaken and murdered by a party of soldiers: and his head and hands were publicly exhibited in the forum at Cicero's eloquence has always re-Rome. mained a model. After the revival of learning he was the most admired of the ancient writers: and the purity and elegance of his style will always place him in the first rank of Roman classics. The life of Cicero was written by Plutarch, and there are modern lives by Middleton, Forsyth, and others. Cicero left a son of the same name by his wife Teren-Young MARCUS was b. in B.C. 65, was tia. carefully educated, and distinguished himself in military service. In B. C. 30 Octavianus (Augustus) assumed him as his colleague in the consulship, and he was afterward governor of Asia or Syria. Cicero had also a daughter, Tullia, who d. in 45 B.C.

Cid, an epithet applied to Ruy or Roderigo Diaz, count of Bivar (1026-1099), the national

hero of Spain. He signalized himself by his exploits in the reigns of Ferdinand, Sancho, and Alphonso VI of Leon and Castile. His life appears to have been entirely spent in flerce warfare with the Moors, then masters of a great part of Spain.

Cl'der, a fermented liquor made from the expressed juice of apples. The apples are ground and crushed until they are reduced to a pulp, the juice is allowed to run into casks, where it is freely exposed to the air until fermentation takes place, when a clear liquor of a pale brown or amber color is the result.

**Cienfuegos** (thē-on-fü-gos), a seaport of Cuba, on the south coast of the island, with a safe and capacious harbor on the Bay of Jagua, 130 mi. s. e. of Havana, with which (and other towns) it is connected by railway. It is among the finest towns of the island, and exports sugar, wax, timber, etc., to the value of over \$5-000,000 annually. Pop. about 16,000.

**Cigar** (si-gür'), a small roll of manufactured tobacco leaves carefully made up, and intended to be smoked by lighting at one end and drawing the smoke through it. The choicest cigars are those made in and imported from Havana. Good cigars are made in the U. S. and elsewhere. Medicated cigars, or cigars made of some substance having remedial properties, are often used for certain complaints, as stramonium cigars for asthma. *Cheroots* are peculiarly shaped cigars much thicker at one end than the other, and are largely imported from Manilla.

Cignani (chē-nyä' nē). CARLO (1628-1719), Italian painter, the last great painter of the Bolognese school. His finest paintings are frescoes in the saloon of the Farnese Palace, Bologna, and in the cupola of the church of the Madonna del Fuoco at Forli. His paintings have been engraved by various artists.

**Cil'ia**, small, generally microscopic, hairlike organs or appendages, found on the surface of the tissues of most animals, and in some vegetable organisms, chiefly on tissues which are in contact with water, or which produce fluid secretions. They are constantly in active movement, and communicate to the fluid with which they are in contact a like motion.

**Cllic'ia**, in ancient geography, the region between Pamphylia and Syria, lying south of Mount Taurus. Alexander made Cilicia a Macedonian province: it then passed to the Syrians. Under Augustus it became an imperial province. It now forms the Turkish' vilayet of Adana.

**Cim'abue**(chē-måbö-ā), GIOVANNI(1240-1302), Italian painter, b. at Florence. Two Greek artists, who were invited to Florence to paint a chapel in the church of Santa Maria Novella, were his first masters. He is considered one of the chief restorers of the art of painting in Italy, which at that time had degenerated into mechanical conventionalism. His best paintings are in the church of Santa Maria Novella at Florence, and in the sacro convento at Assisi. Among his pupils was Giotto, whom he discovered drawing figures on the smooth surface of a rock while tending his sheep.

### Cincinnati

**Cimbri** (sim'bri). a tribe of ancient Europe, the origin of which is involved in obscurity They were regarded as Germans by the Romans, who gave the name of Chersonesus Cimbrica to what is now Julland. Greek writers connected them with the Scythian Cimmerii of the Crimea; while modern writers suppose that they were Celtic, and that Cimbri is the same as the Cymri of Britain. In the second century B. c. they made formidable incursions into Gaul and Spain, but were finally routed by the Consul Marius at Vercelli B. c. 101.

**Cl'mon**, an ancient Athenian general and statesman. He fought against the Persians in the battle of Salamis (480 B.C.), and shared with Aristides the chief command of the fleet sent to Asia to deliver the Greek colonies from the Persian yoke.

**Cinchona** (sin-kō'na or sin-chō'na), an important genus of trees, type of the order Cinchonaceæ, which consists of gamopetalous, calycifloral dicotyledons, sometimes regarded

as a sub-order of Rubiaceæ. They are trees, shrubs, or herbaceous plants, with simple opposite leaves, flowers arranged in panicles or corymbs; calyx adherent, entire or toothed; corolla regular; stamens attached to corolla; ovary two-celled; fruit inferior, dry, or succu-lent. They are found almost exclusively in the tropics, and many of the species are of great medicinal importance as tonics, febrifuges, emetics, and purgatives. From the wasteful method of cutting down the trees to get their bark it was believed that there would soon be a dearth of the valuable medicine, and hence cinchona plants were taken from their native regions and plantations formed in various tropical countries, so that Ceylon, India, Java. etc., are now important sources of Peruvian bark. The bark is taken off in strips longitudinally, and is in time renewed by natural growth.

**Cincinnati**, Hamilton co., O., on north bank of Ohio River, opposite the mouth of the Licking River. It is the largest city in Ohio,

### Cincinnatus

lying in a valley surrounded by hills, forming an amphitheater of great beauty. Railroads: The railroads entering the city number 24, the principal ones being B. & O.; C. Southern; Ohio & Mississippi; C. H. & D.; C. I. St. L. & C.; and C. & Marietta. The first railroad to the city was built in 1842. The Miami and Erie Canal, popularly termed the "Rhine" traverses the city in a southeast direction, and empties by an underground tunnel into the Ohio. Cincinnati is a port of entry and has some foreign commerce. The principal articles of export are whisky, cotton, tobacco, iron and steel. It is a great market for cotton. Principal industries are manufacture of liquor, clothing, meat products, candles, carriages, boots and shoes, furniture and iron. Among the prominent educational institutions are the University of Cincinnati, Wesleyan College, Hebrew College, two Roman Catholic colleges, and Lane Theological Seminary. The place was first settled about 1788 and was incorporated as a city in 1819. Pop. est. 1897, 325,000.

**Cincinna tus**, Lucit's Quintus, a wealthy patrician in the early days of the Roman Republic, b. about 519 B.c. After violently opposing the passage of the Terentilian law for the equalization at law of patricians and plebeians, he succeeded Publicola in the consulship, and then retired to cultivate his small estate beyond the Tiber. Here, when Minucius was surrounded by the Æquians, the messengers of the senate found him at work when

they came to summon him to the dictatorship. He rescued the army from its peril. marched to Rome laden with spoil, and then returned quietly to his farm. At the age of eighty he was again appointed dictator to oppose the ambitious 🖗 designs of Spurius Maelius

Cinera'ria, a genus of plants consisting of herbs or

#### Cineraria.

small shrubs with small-sized heads of yellow flowers. They are chiefly found in South Africa, but a number of varieties have been much cultivated for garden purposes.

**Cinna**, LUCIUS CORNELIUS, an eminent Roman, an adherent of Marius, who, obtaining the consulship B. C. 87, along with Cneius Octavius, impeached Sulla and endeavored to secure the recall of Marius. Being driven from the city by Octavius, he rased the Italian cities, and invested Rome while Marius blockaded it from the sea. On its capture the friends of Sulla were massacred, and Cinna and Marius made themselves consuls (B.C. 86); but after the death of Marius the army refused to follow Cinna against Sulla, and put him to death in B.C. 84.

**Cin'nabar**, red sulphide of mercury, the principal ore from which that metal is obtained, occurring abundantly in California, Spain, China, etc. It is of a cochineal-red color, and is used as a pigment under the name of vermillion. **Cin'namon**,

the bark of the under branches of a species of laurel. which is chiefly found in Ceylon, but grows also in Malabar and other parts of the East Indies. The tree attains the height of 20 or 30 ft., has oval leaves, paleyellow flowers, and. acornshaped fruit. The Ceylonese bark their trees in April

and November, the bark curling up into rolls or quills in the process of drying; the smaller quills being introduced into the larger ones. These are then assorted according to quality by tasters, and made up into bundles. An oil of cinnamon is prepared in Ceylon, but the oil of cassia is generally substituted for it; indeed, the cassia bark is often substituted for cinnamon, to which it has some resemblance. although in its qualities it is much weaker. The leaves, the fruit, and the root of the cinnamon plant all yield oil of considerable value: that from the fruit, being highly fragrant and of thick consistence, was formerly made into candles for the sole use of the king of Ceylon.

**Cin'tra**, a town, Portugal, 15 mi. w.n.w. Lisbon, finely situated on the slope of the Sierra de Cintra, and much resorted to by the wealthier inhabitants of Lisbon. The kings of Portugal have a palace with fine gardens at Cintra. The town is celebrated for the convention entered into there in 1808, by which the French, after their defeat at Vimeira, were conveyed to France. Pop. 4,751.

**Circassi** (or Tcherkessia), a mountainous region in the southeast of European Russia, lying chiefly on the north slope of the Caucasus, partly also on the south, and bounded on the west by the Black Sea, and now forming part of the lieutenancy of the Caucasus. The mountains of which the culminating heights are those of Mount Elbruz, are intersected everywhere with steep ravines and clothed with thick forests, and the territory is prin-

cipally drained by the Kuban and its tributaries. Its inhabitants are divided into several tribes speaking widely different dialects. While they retained their independence their government was of a patriarchal character, but every free Circassian had the right of expressing his opinion in the assemblies. They pos-sessed traditional annals and laws. The duties of hospitality and vengeance were alike binding, and a Spartan morality existed in the matter of theft. Their religion, which is nominally Moslem, is in many cases a jumble of Christian, Jewish, and heathen traditions and ceremonies. As a race the Circassians are comely, the men being prized by the Russians as warriors, and the women by the Turks as mistresses, a position generally desired by the women themselves. Between the tenth and thirteenth centuries it formed a portion of the empire of Georgia, but in 1424 the Circassians were an independent people, and at war with the Tartars of the Crimea, etc., to whose khans, however, some were occasionally trib-ulary. In 1705 the Tartars were defeated in a decisive battle, but shortly after, the territorial encroachment of the Russians on the Caucasian regions began, and in 1829 the country was formally annexed by them. A heroic resistance was made by the Circassians under their leader Schamyl, and on being reduced to submission numbers of the inhabitants emigrated to the Turkish provinces. In the north and east, however, tribes of the Circassian stock remain. The Circassians, properly so called, have been estimated to number from 500,000 to 600,000.

**Circe** (ser-sē), a fabled sorceress of Greek mythology, who lived in the island of Ææa, represented by Homer as having converted the companions of Ulysses into swine after causing them to partake of an enchanted beverage. Ulysses, under the guidance of Hermes, compelled her to restore his companions, and afterward had two sons by her.

Circle is a plane figure contained by one line, which is called the *circumference*, and is such that all straight lines drawn from a certain point (the center) within the figure to the circumference are equal to one another. The properties of the circle are investigated in books on geometry and trigonometry. Properly, the curve belongs to the class of conic sections, and is a curve of the second order. A great circle of a sphere is one that has its center coinciding with that of the sphere. The cele-brated problem of "squaring the circle" is to find a square whose area shall be equal to the area of any given circle. It is not possible to do so. All that can be done is to express approximately the ratio of the length of the circumference of the circle to the diameter, and to deduce the area of the figure from this approximation. If the diameter is called unity, the length of the circumference of the circle is 3.1415926535...; and the area of the circle is found by multiplying this number by the square of the radius. Thus the area of a circle of 2 ft. radius is 3.14159x4, or 12.56636 sq. ft. approximately. For trigonometrical calculations the circumference of the circle is divided into 360 equal parts called degrees, each degree is divided into 60 minutes, and each minute into 60 seconds.

**Circuit Courts**, a term applied distinctively to a class of the Federal courts of the U.S., of which terms are held in two or more places successively in the various circuits into which the country is divided for the purpose.

**Circular Notes,** notes or letters of credit furnished by bankers to persons about to travel abroad. Along with the notes the traveler receives a "letter of indication" bearing the names of certain foreign bankers who will cash such notes on presentation, in which letter the traveler must write his name. On presentation the foreign banker can demand to see the letter of indication, and by causing the presenter to write his name can compare the signature thus made with that in the letter, and so far satisfy himself as to the identity of the person presenting the note.

Circulation, in an organism, the flowing of sap or blood through the veins or channels, by means of which the perpetual and simultaneous movements of composition and decomposition manifested in organic life are carried on. Although Galen, who had observed the opposite directions of the blood in the arteries and veins, may be said to have been upon the very point of discovering the circulation, the discovery was reserved for William Harvey, who in 1628 pointed out the continuity of the con-nections between the heart, arteries, and veins, the reverse directions taken by the blood in the different vessels, the arrangements of values in the heart and veins so that the blood could flow only in one direction, and the necessity of the return of a large proportion of blood to the heart to maintain the In 1661 Malpighi exhibited microsupply. scopically the circulation in the web of a frog's foot, and showed that the blood passed from arteries to veins by capillaries or inter-mediate vessels. This finally established the theory with regard to animals, but the movewith difficulty and after numerous experi-ments. Many physiologists indeed are still disposed to refuse the term "circulation" to this portion of the economy of plants; but though sap, unlike the blood, does not exhibit movements in determinate vessels to and from a common center, a definite course is observable. In the stem of a dicotyledonous tree, for example, the sap describes a sort of circle, passing upward from the roots through the newer woody tissue to the leaves, where it is elaborated under the action of air and light; and thence descending through the bark toward the root, where what remains of it is either excreted or mixed with the new fluid, entering from the soil for a new period of In infusorial animalcules the circulation. movement of the fluids of the body is maintained by that of the animal itself and by the disturbing influence of nutritive absorption. In the Collenterata the movement receives aid besides from the action of cilia on the inner

# Circumnavigators

walls of the body. The Annelids, as the earthworm, possess contractile vessels traversing the length of the body. The insects, crusta-ceans, Myriapods, and spiders have a dorsal tube, a portion of which may be specially de-veloped as a heart. The blood is driven to the tissues, in some cases along arterial trunks, being distributed not in special vessels, but simply through the interstices of the tissues. From the tissues it is conveyed, it may be by special venous trunks, to a venous sinus which surrounds the heart and opens it by valvular apertures. The Mollusca have the heart provided with an auricle and a ventricle, as in the snail and whelk; two auricles, one on either side of the ventricle, as in the fresh-water mussel: or two auricles and two ventricles, as in the ark-shells. Among the ascidians, which stand low in that division of animals to which the molluscs belong, the remarkable phenomenon is encountered of an alternating current, which is rhythmically propelled for equal periods in opposite directions. All vertebrated animals have a heart, which in most fishes consists of an auricle and ventricle, but in the mudfishes there are two auricles and one ventricle; and this trilocular heart is found in the amphibians, and in most reptiles except the crocodiles, which, like birds and mammals, have a four-chambered organ consisting of two auricles and two ventricles. In these two last-named classes the venous and arterial blood are kept apart; in the trilocular hearts the two currents are mixed in the ventricle.

Circumnav'igators, a term usually applied to the early navigators who sailed the globe. Magellan, a Portuguese in the service of Spain, headed the first expedition which succeeded in circumnavigating the globe, though he did not live to complete the voyage. He sailed with five ships from San Lucar, Sept. 20, 1519, passed the straits named after him in November, 1520, and was killed in the Philippine Islands in April, 1521, Juan Sebastian del Cano continuing the voyage and reaching San Lucar with the only remaining ship in September, 1522. The principal early navigators, after Magellan, who succeeded in making the voyage round the globe were Grijalva and Alvaradi (Spaniards), 1537; Mendana (Spanish), 1567; Drake (English), 1577-80; Cavendish. 1580-88; Le Maire (Dutch), 1615-17; Quiros (Spanish), 1625; Tasman (Dutch), 1642; Cowley, 1683; Dampier, 1689; Cooke, 1708; Clipperton, 1719; Roggewein (Dutch), 1721-23; Anson, 1740-44; Byron, -1764-66; Wallis, 1766-68; Carteret, 1766-60; Bougainville, 1766-69; Cook, 1768-71; and Portlocke, 1788.

**Cir'cus**, among the Romans, a nearly oblong building without a roof, in which public chariot-races and exhibitions of pugilism and wrestling, etc., took place. It was rectangular, except that one short side formed a half-circle; and on both sides, and on the semicircular end, were the seats of the spectators, rising gradually one above another, like steps. On the outside the circus was surrounded with colonnades, galleries, shops, and public places. The largest of these buildings in Rome was

the Circus Maximus, capable, according to Pliny, of containing 260,000, and according to Aurelius Victor, 385,000 spectators. At present, however, but few vestiges of it remain, and the circus of Caracalla is in the best preservation. The games celebrated in these structures were known collectively by the name of ludi circenses, circensian games, or games of the circus, which under the emperors attained the greatest magnificence. The principal games of the circus were the Roman or Great Games which were celebrated from September 4-14, in honor of the great gods, so called. The passion of the common or poorer class of people for these shows appears from the cry with which they addressed their rulers: "Bread and the games!" The festival was opened by a splendid procession, or pompa, in which the magistrates, senate, priests, augurs, vestal virgins, and athletea, took part, carrying with them the images of the great gods, the Sibylline books, and sometimes the spoils of war. On reaching the circus the procession went round once in a circle, the sacrifices were performed. the spectators took their places, and the games These were: 1, Races with commenced. horses and chariots, in which men of the high-est rank engaged. 2, The gymnastic contests. 3, The Trojan games, prize contests on horseback, revived by Julius Cæsar. 4. The combats with wild beasts, in which beasts fought with beasts or with men, criminals or volunteers. 5, Representations of naval engagements, for which purpose the circus could be laid under water. The expense of these games was often immense. Pompey, in his second consulship, brought forward 500 lions at one combat of wild beasts, which, with eighteen elephants, were slain in five days.

The modern circus is a place where horses are trained to perform antics, and where exhibitions of acrobats and various pageantries, including a large amount of buffoonery, are represented.

**Cisalpine Republic**, a state set up in 1797 by Napoleon I in North Italy, recognized by Germany as an independent power at the Peace of Campo-Formio. It comprised Austrian Lombardy, together with the Mantuan and the Venetian provinces, Bergamo, Brescia. Crema, Verona, and Rovigo, the duchy of Modena, the principality of Massa and Carrara, Bologna, Ferrara, and Romagna, and latterly its area was 16.337 sq. mi.; its pop. 3,500,000. The legislative body held its sessions in Milan. On Jan. 25, 1802, it received the name of the *Italian Republic*; from 1805 to 1814 it formed part of the kingdom of Italy; and it was given to Austria by the Congress of Vienna in 1815 as the Lombardo-Venetian kingdom.

**Cithæ'ron** (the modern Elatéa), a mountain of Greece, which, stretching northwest, separates Bœotia from Megaris and Attica. Its loftiest summit is 4,620 ft. in height.

Cities of Refuge, six out of the forty-eight cities given to the tribe of Levi in the division of Canaan, set apart by the law of Moses as places of refuge for the manslayer or accidental homicide. Their names were Kedesh.

----

Shechem, and Hebron on the west side of Jordan; and Bezer, Ramoth-Gilead, and Golan on the east.

**Citric Acid**, the acid of lemons, limes, and other fruits. It is generally prepared from lemon-juice, and when pure is white, inodorous, and extremely sharp in its taste. In combination with metals it forms crystalline salts known as citrates. The acid is used as a discharge in calico printing and as a substitute for lemon in making beverages.

**Cit'ron**, a small evergreen shrub yielding a fruit which is candied with sugar. The rind is

a.-fruit; b.-transverse section of fruit.

considered superior to the pulp; it is imported in a preserved state, and is used in confectionery.

**Cit' rus**, an important genus of trees, nat. order Aurantiacæ, or that of the orange, characterized by simple ovate acuminate leaves or leaffets united by a distinct joint to the leaflike stalk; by having the stamens united by their filaments into several irregular bundles, and by yielding a pulpy fruit with a spongy rind. *Citrus Medica* is the citron. Other species are the lemon, the sweet orange, the shaddock, and the forbidden fruit, sometimes used as an ornamental addition to dessert. The genus *Citrus* furnishes the essential oils of orange and lemon peels, of orange flowers, of citron peel, of bergamot, and oil of orange leaves—all much esteemed in perfumery.

City, in a general sense, a town holding, from extent of population, favorable situation, or other causes, a leading place in the community in which it is situated. Popularly, also, it is used, both in Britain and in France, to designate the old and central nucleus as distinguished from the suburban growths of large towns. The ecclesiastical sense of the term city is a town which is, or has been, the see of a bishop. This seems to be the historical use of the term in England, and still possesses some authority there, but to a considerable extent it has been superseded by the wider one. In America the application of the term is dependent upon the nature and extent of the

# Civilization

municipal privileges possessed by corporations and a town is raised to the dignity of a city by special charter. Generally the term implies the existence of a mayor at the head of the municipality.

**Ciudad-Real** (thi- $\ddot{o}$ - $d\ddot{a}d$ - $r\ddot{a}$ - $\dot{a}l'$ ) ("royal town") a town of Spain, capital of the province of same name, on a low plain near the Guadiana, 100 mi. s. of Madrid. The principal edifice is the church of Santa Maria, a magnificent structure, though consisting only of a single nave. Pop. 13.801. The province occupies the south extremity of New Castile, between the parallel ranges of the Sierra Toledo and Sierra Morena. Area 7,940 sq. mi.; pop. 280,-075.

**Ciudad-Rodrigo** (thi- $\ddot{o}$ -d $\ddot{a}$ d-rod-r $\ddot{e}$ 'g $\ddot{o}$ ) ("Roderick town"), a fortress in Spain, in Leon, on the river Aguada, was a place of considerable importance in the early Spanish history as a fortress on the Portuguese frontier, and was of some importance in the Peninsular War, being taken by storm by the British under Wellington, after a siege of eleven days. The Cortes gave Wellington the title of Duke of Ciudad-Rodrigo,

**Civ** et, a genus of carnivorous mammals found in North Africa, and in Asia from Arabia to Malabar and Java, and distinguished by having a secretory apparatus in which collects the odoriferous faity substance known as *ciret*. The animal, which in form is intermediate between the weasel and the fox, and from 2 to 3 ft. long by 10 in. high, is of a cinereous color, tinged with yellow and marked

Civet.

by dusky spots disposed in rows. They are nocturnal, and prey upon birds and small animals, and may be considered as forming the transition from the musteline or marten kind to the feline race.

**Civiliza** tion, the sum at any given time of the attainments and tendencies by which the human race or any section of it is removed from the savage state. The history of progress in civilization is usually presented from one of two points of view—the first conceiving the race as starting from a high civilization, to which in point of intellectual and moral power it has yet to return; the second viewing the

civilization of any period as the result of a constant and increasingly successful stream of effort upward from an origin comparable with the condition of the lower animals. The latter is the prevailing scientific theory, which finds the secret of progress in the interaction of function and environment. According to it primitive man, at first feeding on wild fruits and berries, and sheltering himself under overhanging rocks or caves, entered upon the stone age, in which, as the contemporary of the mammoth and cave bear, he made himself sharp-edged tools by chipping the flakes of flint found in the drift under gravel and clay. In the newer stone age he learned the art of polishing these rough implements, with which he cut down trees to make cances, killed wild animals for food, and broke their bones for marrow, or shaped them into weapons. Fire he turned to account to hollow out trees, to cook his food, to fashion clay ware. Artificial means of shelter were constructed by piling rude huts of stones, by digging holes in the ground, or by driving piles into the beds of The lakes and raising dwellings on them. artistic instincts found expression in drawings of animals scratched upon bone or slate. The discovery of metals constituted a great step in advance. Gold and copper came early into use, and bronze was soon discovered, though a long time passed before iron was smelted and substituted for bronze where hardness was required. Gradually the roving savage became a nomadic shepherd and herdsman, or a tiller of the soil, according to his environment. The practise of barter was in part superseded by the beginnings of some sort of currency. Gesture language gave place in part to an enlarged vocabulary, and picture writing to the use of phonetic signs. In the meantime man had begun to question himself and the world on profounder issues, entering upon the mythmaking age, in which was projected outward on the chief phenomena of nature some shadow of his own personality. The worship of the sun, moon, and stars, a faith in a future life, the worship of dead ancestors, fetiches, animals, etc., the belief in magic and witchcraft, all sprang into being. Prayer came spontaneously to him: the idea of propitiation by sacrifice would arise from his dealings with his fellows and his foes; the sacred books began to shape themselves. Tribal and national relations, arising from ties of family and exigen-cies of defense, were cemented by unity of faith, and the higher social unit began to perfect itself under the rule of the patriarch, the bravest warrior, etc. With varying needs, arising from diversity of environment, dis-tinctions of nationality became more and more emphatic, and the history of civilization becomes the history of the nations viewed from the philosophic standpoint.

**Civil Law**, among the Romans the term nearly corresponding to what in modern times is implied by the phrase *positive law*, that is, the rules of right established by any government. They contradistinguished it from natural law (*jus naturāle*), by which they meant a

certain natural order followed by all living beings; also from the general laws of mankind established by the agreement of all nations and governments (*jus gentium*). With the growth and multiplication of the edicts issued by the prætors (in whose hands was the supreme administration of justice) for the modification and extension of the positive enactments a further distinction became necessary, the whole prætorian law being known by the name of jus honorarium as opposed to the strict formal law (jus civile). The latter, however, included both the private law (jus privatum), which relates to the various legal relations of the different members of the state the citizens - and the public law (jus publicum), that is, the rules respecting the limits, rights, obligations, etc., of the public authori-ties. The final digest of Roman law was made in the sixth century A. D. under the Emperor Justinian, but at first was only admitted as formally binding in a small part of Italy. After the eleventh century, in Upper Italy, particularly in the school of Bologna, the body of the Roman law, put together by Justinian, was formed by degrees into a system applicable to the wants of all nations; and on this model the ecclesiastical and papal decrees were arranged and to a considerable degree the native laws of the new Teutonic states. From all these the Roman law was distinguished under the name of civil law. In this sense, therefore, civil law means ancient Roman law; and it is contradistinguished from canon law and feudal law, though the feudal codes of the Lombards have been received into the corpus juris civilis or body of civil law. As the Roman code exerted the greatest influence on modern Europe, the expression civil law is also used to embrace all the rules relating to the private rights of citizens. Under the term civil law, therefore, in America and Europe, is to be understood not only the Roman law, but also the modern private law of the various countries; for example, in Germany, Das ge-meine Deutsche Privatrecht; in France, the Code civil des Français or Code Napoléon. In this sense it is chiefly opposed to criminal law, particularly in reference to the administration of justice, which is to be divided into ciril justice and criminal justice.

Civil Service .--- Under this head are classed all officers who do not belong to the military or naval service, but are engaged in the administration of the civil affairs of the state, such as the collection of revenue, performance of executive duties of the government, and representation of the country abroad. Originally the civil service was a body small in number. but the number of persons employed under the government has vastly increased and new departments have been organized to carry out the laws of the states. It will readily be seen that the administration of such affairs calls for unbiased action and it should be done independent of any party. Its success, in fact, depends upon its being done wholly on business principles. General Jackson's statement that "to the victors belong the spoils" has

Digitized by Google

. . . . . .

been, to a great extent, set aside in the civil service of the U.S. In the first year of his presidency 490 postmasters and 240 officials were removed.

Henry Clay wrote: "Among the official corps there is the greatest solicitude. The members of it feel something like the inhabitants of Cairo when the plague strikes it. No one knows who is next to encounter the stroke of death or, which with many of them is the same thing, to be dismissed from office."

In 1840 Horace Greeley wrote from Washington: "We have nothing new here in politics, but large and numerous swarms of office-hunting locusts sweeping into Washington daily: all the rotten land speculators, broken bank directors, swindling cashiers, etc., are in full cry for office, office; and even so humble a man as I am is run down by letters, letters."

General Grant, in 1872, undertook to suppress the evil of office seeking, and appointed a commission to make rules and regulations for admission to and continuance in the civil service. The rules reported, however, by this commission were never carried out to any considerable extent on account of the political pressure which was brought to bear on the members of Congress. President Hayes un-dertook to carry out Grant's plan, and a reform was noticed in several of the large post offices of the country. In January, 1883, Congress passed a law to prevent the abuse of the appointing power of the officers of the government. The president was authorized to appoint, with the advice and consent of the Senate, three civil service commissioners whose duty is to aid the president in preparing suit-able rules which shall provide for open, com-petitive examinations, for testing the fitness of applicants for the public service, such examinations to be practical in their character, and so far as may be relating to those matters which will fairly test the relative capacity and fitness of the person examined, to discharge the duties of the service. All the of-fices, places, and employments ranged in classes or grades, are to be filled by selection according to grade from among those graded highest as the result of such competitive examination. Appointments to the public service in the departments at Washington are to be proportioned upon the basis of population to the several states. The law provides that all persons in the public service shall be exempted from any obligation to contribute to any political fund, or to render any political service. It forbids any person in the public service using his official authority to coerce the political action of any other person or body. Non-competitive examinations in all proper cases are provided for, after notice given of a vacancy. The appointing power should give notice in writing to the civil service commission, of the persons selected for appointment among those who have been examined. Power is given this commission to make regulations for, and have control of, such examinations subject to the rules made by the president. Provision is made for holding examinations at convenient places in every state and territory of the U.S. The commission punishes by fine and imprisonment all in the public service who willfully defeat, obstruct, or deceive any person in respect to his right of examination, or who shall corruptly or falsely mark, grade, estimate, or report upon the proper standing of any person examined, or aid in so doing, or who shall furnish to any person any special or secret information for the purpose of either improving or injuring the prospects of any person so examined being appointed, employed, or promoted. It further provides that no person in the habit of using intoxicating liquors is to be appointed to or retained in offices to which the act applies. Since the passage of this act, the system of competitive examinations has been extended, not only of the federal offices but also to the civil service in several of the states and the large cities.

Rules for federal appointments include the following:---

Applicants. — Applicants for examination must be citizens of the U. S., of the proper age. No discrimination is made on account of sex, color, or political or religious opinions. The limitations of age vary with the different services; but the age limitations do not apply to any person honorably discharged from the military or naval service of the U.S. by reason of disability resulting from wounds or sickness incurred in the line of duty. Everyone seek-ing to be examined must file an application blank. The blank for the Departmental, Railway Mail, Indian School, or Government Printing Office Service should be requested directly of the Civil Service Commission at Washington. The blank for the Customs, Postal, or Internal Revenue Service must be requested in writing by the persons desiring examination of the Customs, Postal, or Internal Revenue Board of Examiners at the office where service is sought. The service classified under the act, and to which it and the rules apply, embraces the employees in the Executive Departments at Washington, the employees at the Executive Mansion, and the employees at the Civil Service Commission, the Department of Labor, the Commission of Fish and Fisheries, the Interstate Commerce Commission, under the Superintendent of the State, War, and Navy Building, the Smithsonian Institution, the Library of Congress, and the Government Printing Office, the employees in the Weather Bureau, and all officers and employees of whatever designation, except persons merely employed as laborers or workmen, and persons whose appointments are subject to confirmation by the senate, however or for whatever purpose employed, whether compensated by a fixed salary, or otherwise, who are serving in. or on detail from, the several Executive Departments, the Commissions and offices in the District of Columbia, the Railway Mail Service, the Indian Service, the several Pension Agencies, the Steamboat Inspection Service. the Marine Hospital Service, the Light House Service, the Life Saving Service, the several

mints and assay offices, the Revenue Cutter Service, the force employed under custodians of public buildings, the several sub-treasuries, the Engineer Department at large, and the Ordnance Department at large, all executive officers and employees outside the District of Columbia of whatever designation, except persons merely employed as laborers or workmen, and persons whose appointments are subject to confirmation by the senate, whether compensated by a fixed salary, or otherwise, who are serving in a clerical capacity, or whose duties are in whole or in part of a clerical nature; who are serving in the capacity of watchman or messenger; who are serving in the capacity of physician, hospital steward, nurse, or whose duties are of a medical nature: who are serving in the capacity of draughtsman, civil engineer, steam engineer, electrical engineer, computer or fireman; who are in the service of the supervising architect's office in the capacity of superintendent of construction, superintendent of repair, or foreman; who are in the service of the Treasury Department, in any capacity; and who are employed in the Department of Justice under the annual appropriation for the investigation of official acts, records, and accounts of officers of the courts; all free delivery post offices, the Indian school, and agency service, the customs districts in each of which there are five or more employees, and the Internal Revenue service at large.

The applicants to enter the service designated are examined as to their relative capacity and fitness. The ordinary clerical ex-aminations are used only in the Customs, De-partmental, the Internal Revenue services for clerkships requiring no particular information or skill. They are limited to the following subjects: First, orthography, penmanship, and copying; second, arithmetic, fundamental rules, fractions, and percentage; third, interest and discount, elements of bookkeeping, and accounts; fourth, elements of the English language, letter writing, and the proper construc-tion of sentences. For places in which a lower degree of education suffices, as for employees in post offices, compositors, and other trade employees, and those below the grade of clerks in customhouses, and in the Departments at Washington, the Commission limits the examination to less than these four subjects, omitting the third and parts of the fourth subject. The examinations relate as nearly as possible to the duties to be performed, and wherever applicable include experience and practical No one is certified for appointment tests. whose standing in the examination is less than 70 per cent. of complete proficiency, except that applicants claiming military or naval preference need obtain but 65 per cent. The law also prescribes competitive examinations to test the fitness of persons in the service for promotion therein. The Commission gives a certificate to the person examined, stating whether he passed or failed to pass.

Civil Service in Cities.—Civil service in the large cities is now, to a considerable extent,

under civil service laws. The most marked effect of the civil service laws in the cities has been to relieve the mayors and heads of departments from the pressure of applicants for office, thus leaving them free to attend to their more important public duties. It has also relieved city employees from the unfair burden of political assessment. No officer or employee can solicit or receive pay or be in any manner concerned in soliciting, receiving, or paying any assessment, subscription, or contribution for any party or political purpose whatever. Applications for admission to examination are made on blanks in a definite form and manner, and supported by such certificates of persons acquainted with the applicant as may be prescribed. Blanks for such applications are furnished by the civil service commission.

Every applicant must be a citizen of the U. S. and of good moral character, sound health, and physically able to perform the duties of the office applied for. The exami-nations are absolutely impartial, practical in their character, and intended to fairly test the relative capacity and fitness of the persons examined for the service which they seek to enter. No questions relating to political or religious opinions or affiliations are asked. Applicants must average not less than 70 per cent. of complete proficiency in the subjects of the examination. Physical examinations are made to determine the physical qualifications and health of the applicant, and each applicant is notified of the general average he has obtained, and any person who has failed to pass the examination cannot be re-examined within six months from date of his failure. All competitors who attain a general average of 70 per cent. or over, are eligible for ap-pointment, and their names are enrolled in the order of general average upon proper registers. The names remain upon the register of eligibles for two years from date of enrollment. Any person whose name is on the register of eligibles may accept temporary appointment without losing his position on the register of eligibles. All promotion in the civil service, unless otherwise provided, is from grade to grade, and is made upon voluntary, open, competitive examinations.

The official service is divided into medical; civil engineers; clerical service, embracing copyists, clerks, pages, messengers, recorders, bookkeepers, stenographers, ti me ke ep ers, weighers, etc.; police service; electrical service; fire service; mechanical engineers; bridge employees; inspectors; janitors; elevator conductors; library service, etc. For examination in the medical service, applicants for position must be regular graduates of some reputable medical college, and have been actively engaged in the practise of medicine. In the clerical service, applicants for places are usually examined in handwriting, spelling, copying, fundamental rules of arithmetic, fractions, percentage, copying from rough draft, clear and correct statement, letter writing, etc. For police service applicants must

Digitized by Google

pass the physical test and examination in handwriting, spelling, copying, etc.

**Civita Vecchia** (chē-vē-tä-vek'i-a), one of the best seaports of Central Italy, lying in a barren and unhealthy district, 38 mi. n. w. Rome. It is a fortified naval port, and has an arsenal, shipyards, cathedral, etc. Pop. 11,330.

**Clackman** nan, the smallest county of Scotland, containing little more than 47 sq. mi.

Claiborne, WILLIAM (1589-1676), a famous colonist. He was appointed, under the London Company, surveyor of the Virginia plantations. He arrived in Jamestown, and located in James City in October, 1621. Soon afterward he acquired an estate amounting to 45,000 acres. In 1625 he became secretary of state for the colony, and in 1628 was commissioned to make discoveries southward, and open trade with the Indians. He settled the Isle of Kent, and established a trading post, bought out the interest of the natives in that island, and induced many settlers to locate on his lands. When Lord Baltimore's first colony arrived at St. Marie's, in March, 1634, they claimed con-trol over the Isle of Kent. The dispute was continued for many years, until Virginia, in 1776, released all claims to the territory of Maryland beyond the Potomac River. When Lord Baltimore's colony had been founded on St. Mary's River, trouble began between them and the party of Claiborne, and in course of time the latter's settlement on the Isle of Kent became a failure. Claiborne had become involved in serious difficulties, and in 1637 sailed for England. He bought Palmer's Island from the Indians, but was unable to maintain his right thereto. Claiborne was made treasurer of the colony of Virginia for life by King Charles I. on April 6, 1642. When the Cromwellian revolution began to make headway in Great Britain, Claiborne saw fit to join the Parliamentary party, and in 1651 was appointed a commissioner by Parliament to reduce Virginia and the plantations on Chesapeake Bay. An English expedition arrived in Virginia in 1652 and established a Roundhead government with Claiborne as secretary of state.

**Claiborne**, WILLIAM CHARLES COLE (1775-1817), governor of Louisiana. He was a member of the convention which prepared the state constitution of 1796, and in 1797 was elected to Congress, where he served two terms. In 1802 he was appointed governor of the territory of Mississippi, and in 1803, when Louisiana was bought from the French, he was appointed a commissioner with Gen. James Wilkinson to take possession of the new territory, of which he was made governor in 1804. When Louisiana was made a state in 1812, he was elected governor. In 1816 he was elected to the U.S. Senate but was prevented by impaired health from taking his seat.

**Clairvoyance** (that is "clear-seeing"), an alleged faculty by which certain persons in certain states, or under certain conditions, are said to be able to see things by some sort of mental or spiritual vision apart altogether from the sense of sight. It is claimed that clairvoyance is the result of a kind of natural state of trance, or may be induced by mesmerism: and in evidence of its existence in ancient times, the utterances of prophets, sibyls, etc., have been adduced.

**Clam**, the popular name of certain bivalvular shellfish of various genera and species, e.g., the thorny clam, the yellow clam, the giant clam, the common clam of America, etc. The giant clam has the largest shell known, and the animal is used as food in the Pacific. The clam is a justly-esteemed table delicacy.

Clan, among the Highlanders of Scotland, consisted of the common descendants of the, same progenitor, under the patriarchal con-trol of a chief, who represented the common ancestor. The name of the clan was frequently formed of that of the original progenitor with the affix mac (son): thus the Mac-Donalds were the sons of Donald, and every individual of this name was considered a descendant of the founder of the clan, and a brother of every one of its members. The chief exercised his authority by right of primogeniture, as the father of his clan; the clansmen revered and served the chief with the blind devotion of children. The clans each occupied a certain portion of the country, and hostilities with neighboring clans were extremely common. Next in rank to the chief were a certain number of persons, commonly near relations of the chief, to whom portions of land were assigned, during pleasure or on short leases. Each of these usually had a subdivision of the clan under him, of which he was chieftain, subject, however, to the general head of the sept. The jurisdiction of the chiefs was not very accurately defined, and it was necessary to consult, in some measure, the opinions of the most influential clansmen and the general wishes of the whole body. It was latterly the policy of the government in Scotland to oblige the clans to find a representative of rank to become security at court for their good behavior; the clans who could not procure a suitable representative, or who were unwilling to do so, were called broken clans, and existed in a sort of outlawry. Few traces of this institution now remain, except such as have a merely sentimental character; thus all those who possess the same clan name may still talk of their "chief," though the latter have now neither land nor influence.

**Clap' ham**, a southern suburban district of London. Clapham Common is a fine open space of over 200 acres. Pop. 96,952.

**Clap Net**, a ground-net used by bird catchers, consisting of two equal parts about 12 yards long by 24 wide, and each having a slight frame. They are placed about four yards apart, and are pulled over by a string so as to enclose any birds on the intervening space.

**Clap' perton**, HUGH (1788-1827), African traveler, b. in Annan, Dumfriesshire. He became a lieutenant in the army in 1816. He then accompanied Doctor Oudney and Lieutenant Denham to Africa, where he remained till 1825. On his return to England Clapperton received the rank of captain, and immediately engaged in a second expedition. to start from the Bight of Benin. Leaving Badagry, December, 1825, he penetrated to Katunga, within thirty miles of the Quorra or Niger, but was not permitted to visit it. At Soccatoo the Sultan Bello refused to allow him to proceed to Bornu, and detained him a long time in his capital. The disappointment preyed upon him, and he died, at Chungary, a village near Soccatoo. He was the first European who traversed the whole of Central Africa from the Bight of Benin to the Mediterranean.

**Clare**, a maritime county, Ireland, province Munster (capital, Ennis), between Galway Bay and the Shannon estuary; area 827,994 acres. Oats, potatoes, wheat, and barley are the principal crops. The chief minerals are limestone, lead, and slate, but the produce of the county is almost wholly agricultural. The salmon fisheries are valuable, and there are immense oyster beds in some places. Pop. 123,859.

**Clare Island,** an island of Ireland, county Mayo. It has a lofty lighthouse.

**Claremont,** Sullivan co., N. H., 48 mi. w. by n. of Concord. It is on the Concord & Claremont R. R., and near the Vermont Central. There is abundant water power which runs several paper, cotton, and woolen mills, forming the principal industries, Printing and bookbinding are also carried on to a considerable extent. The town was settled in 1762. Pop. est. 1897, about 5,000.

Clar'ence, GEORGE, DUKE OF, son of Richard, duke of York, and brother of Edward IV, king of England. On his brother's accession, in 1461, he was created duke of Clarence, and in 1462 lord-lieutenant of Ireland, but afterward joined the disaffected Warwick and married his daughter. On the eve of battle he rejoined his brother, and was afterward involved in a quarrel with his brother Richard, who had married Warwick's younger daughter, about the inheritance of their father-in-law. On the death of his wife Clarence sought the hand of Mary of Burgundy, but Edward interposed and a serious breach ensued. A gentleman of the household of Clarence having at this time been condemned for using necromancy against the king, Clarence interfered with the execution of the sentence. He was impeached by the king in person, condemned in 1478, and The secretly made away with in the tower. tradition that he was drowned in a butt of malmsey wine is unsupported by evidence.

**Clar'endon**, CONSTITUTIONS OF, a code of laws adopted in the tenth year of Henry II (January, 1164), at a council of prelates and barons held at the village of Clarendon, Wiltshire. These laws, which were finally digested into sixteen articles, were brought forward by the king as "the ancient customs of the realm," and were enacted as such by the council, but they really involved a great scheme of administrative reform in the assertion of the supremacy of the state over clergy and laity alike. The power of the ecclesiastical courts was restricted, the crown secured the right of interference in elections to ecclesiastical offices, appeals to Rome were made dependent on the king's leave. ecclesiastical dignitaries were deprived of their freedom to leave the country without the royal permission, etc.

Clar'endon, Edward Hyde, Earl of (1608-1674), lord high-chancellor of England, son of a private gentleman of Dinton, Wilts, where he was b. He commenced his political career in 1640 as member for Wootton Basset, and was again returned to the Long Parliament (November, 1640) by the borough of Saltash, at first acting with the more moderate of the popular party, but gradually separating himself from the democratic movement until, by the autumn of 1641, he was recognized as the real leader of the king's party in the House. Upon the breaking out of the civil war he joined the king at York, was knighted, made privy councilor, and appointed chancellor of the exchequer. In September, 1649, he joined Charles at The Hague, and was sent by him on an embassy to Madrid. Soon after his return he resumed the business of the exiled court. After Cromwell's death he contributed more than any other man to promote the Restoration, when he was placed at the head of the English administration. In 1660 he was elected chancellor of the University of Oxford, and in 1661 was created Baron Hyde, Viscount Corn-bury, and earl of Clarendon. The marriage of the Duke of York with his daughter, Anne Hyde, confirmed for a time his power, but in 1663 Lord Bristol made an unsuccessful attempt to impeach him, his influence with the king declined, and his station as prime minister made the nation regard him as answerable for the ill success of the war against Holland. the sale of Dunkirk, etc. The king's displeasure deepened when his plan of repudiating his wife and marrying the beautiful Lady Stuart was defeated by Clarendon, who effected a marriage between this lady and the Duke of Richmond. The king deprived him of his offices, an impeachment for high treason was commenced against him, and he was compelled to seek refuge in Calais. He lived six years at Montpellier, Moulins, and Rouen. where he d. His remains were afterward removed to Westminster Abbey.

**Clarifica' tion**, or the separation of the insoluble particles that prevent a liquid from being transparent, may be performed by *depuration*, in which the liquid is allowed to stand until the particles are precipitated, and then decanted; by *filtration*, or straining through wood, sand, charcoal, etc.: or by *congulation*, in which the albumen contained in or added to the liquid is solidified and precipitated by the action either of heat or of acids, the extrancous substances being precipitated with it.

**Clarinet** (or clarionet), a wind instrument of the reed kind, played by holes and keys. Its lowest note is E below the F clef, from which it is capable, in the hands of good performers, of ascending more than three octaves. The keys of C and F, however, are those in which it is heard to most advantage, though there are B flat, A, D, B, and G clarinets.

**Clark**, ALVIN (1804-1887), b. in Ashfield. Mass. He and his son, Alvin Graham Clark.

became the leading manufacturers of object glasses for telescopes, and made the 36-inch refractor for the Lick observatory

Clark, ALVIN GRAHAM (1832-1897), was b. in Fall River, Mass. He was the son of Alvin Clark, and a descendant of Thomas Clark, who was one of the Pilgrims. He was educated in the public schools at Cambridge, and afterward learned the trade of a machinist. He subsequently worked with his brother George at lens making in East Cambridge, and became a member of the firm of Alvin Clark & Sons, telescope-makers, in 1852. Continuing in the work of making telescopes after the death of his father and brother, and retaining the firm name, he completed the celebrated 36-inch Lick telescope in 1887 and the Yerkes lens of 40 inches aperture for the University of Chicago. In addition to his work as manufacturer of telescopes he was also a practi-

cal astronomer, and as a result Clarinet. of his independent astronomical observation, discovered fourteen intricate double stars, among them the companion of Sirius, for which discovery the Lalande gold medal for 1862 was awarded him by the French Imperial Academy of Sciences.

Clark, George Rogers (1752-1818), American He began life as a land surveyor, and pioneer. commanded a company of militia in Lord Dunmore's war with the Indians. In 1772 he commanded a force of armed settlers in Kentucky. In December, 1877, Major Clark obtained permission and means from Virginia to attack the fort at Kaskaskia, which he captured on July 4, 1778. To retaliate an invasion of Kentucky by 600 Canadians and Indians, he destroyed an Indian town in Ohio in 1780. In the same year he went to Richmond to obtain approval from the authorities for his plans for the capture of Detroit, and while there took a command under Baron Steuben to defend Virginia against an invasion by a British force. In 1781 Clark became brigadier general. In 1782 he gathered a large force and marched against Indian towns on the Miami and Scioto, five of which were destroyed. About 1794 he accepted a commission as major general in the French army, to conduct an expedition against the Spanish possessions on the Mississippi, but when the French minister to the U.S., who gave him the commission, was recalled, this was annulled. General Clark's latter years were spent in poverty

Clark, JAMES (1788-1870). a noted British physician. For many years he was physician in ordinary to Queén Victoria, by whom he was created a baronet. His chief works were trea-

# Claudlus

tises on the Sanative Influence of Climate, and on Pulmonary Consumption and Scrofula.

Clarke, CHARLES COWDEN (1737-1877), Eng-lish writer. He was one of the minor members of the Shelley, Keats, and Leigh Hunt group. His publications include his Hundred Wonders, Adam the Gardener, Shakespeare Char-acters, and Molière Characters. He is best known, however, by the edition of Shakespeare which he annotated in conjuction with his wife, and by the Shakespeare Key.

Clarke, JAMES FREEMAN (1810-1888), American clergyman, b. in Hanover, N. H. After graduation at Harvard in 1829, and at the Cambridge divinity school in 1833, he became pastor of the Unitarian church in Louisville, Ky. serving from 1833 till 1840. From 1836 till 1839 he was editor of the Western Messenger, pub-lished in Louisville. Returning to Boston he founded in 1841, the Church of the Disciples, of which he was the pastor until 1886. This became one of the leading religious institutions of Boston. From 1867 till 1871 he was professor of natural religion and Christian doctrine in Harvard, and in 1876-7, lecturer there on ethnic religions. He was an overseer of Harvard, a member of the state board of education, and a trustee of the Boston public library. He was the author of several historical works and theological essays. He d. at Jamaica Plain, Mass.

Clarke, JOHN S., actor, b. in Maryland in 1835; began his theatrical career in 1852 in Philadelphia, and was speedily recognized as the best exponent of low comedy then on the boards. He starred the country for years, owned and managed theaters in Philadelphia and Boston, and from 1867 to 1870 played in England with great success.

Clarke's River, a river of the U.S., rising in the Rocky Mountains, and after a winding n.w. course of about 700 mi., falling into the Columbia, in Washington.

**Clarksville**, Montgomery co., Tenn., on Cumberland River, 60 mi. below Nashville. Railroad, Louisville & Nashville. It is the center of a productive tobacco-growing trade. with a very extensive trade in leaf and man-ufactured tobacco. The tobacco exchange handles about 100,000,000 pounds annually. Pop. est. 1897, over 8,000.

Claude Lorraine (1600-1682), a landscape When twelve years old he went to painter. live with his brother, an engraver in wood at Friburg, went from him to study under Godfrey Waats at Naples, and was afterward employed at Rome by the painter Agostino Tassi, to grind his colors and do the household On leaving Tassi he traveled in drudgery. Italy, France, and Germany, but settled in 1627 in Rome, where his works were greatly sought for, and where he lived much at his ease until his death. The principal galleries of Italy, France, England, Spain, and Ger-many are adorned with his paintings.

Clau' dius, (or, in full, TIBERIUS CLAUDIUS DRUSUS NERO GERMANICUS) (B. C. 10-A. D. 54), a Roman Emperor, son of Claudius Drusus Nero, stepson of Augustus and Antonia, the

daughter of Augustus's sister. He lived in privacy, occupying himself with literature, the composition of a Roman history, and other works, until the murder of Caligula, when he was dragged from his hiding place and pro-claimed emperor (41 A. D.). His reign was marked by the restoration of the exiles, the embellishment of Rome, and successes in Germany and Britain. But latterly he became debauched, left the government to his wives, and in particular to Messalina, who with his freedmen committed the greatest enormities. He was poisoned by his fourth wife, Agrippina (mother of Nero).

Clay, the name of various earths, which consist of hydrated silicate of aluminum, with small proportions of the silicates of iron, calcium, magnesium, potassium, and sodium. All the varieties are characterized by being firmly coherent, weighty, compact, and hard when dry, but plastic when moist, smooth to touch. not readily diffusible in water, but when mixed not readily subsiding in it. Their • tenacity and ductility when moist and their hardness when dry has made them from the earliest times the materials of bricks, tiles, pottery, etc. Of the chief varieties porcelain clay, kaolin, or china clay, a white clay with occasional gray and yellow tones, is the purest. Potter's clay and pipe clay, which are similar but less pure, are generally of a yellowish or gravish color, from the presence of iron. Fire clay is a very refractory variety, always found lying immediately below the coal; it is used for making fire bricks, crucibles. etc. Loam is the same substance mixed with sand, oxide of iron, and various other foreign ingredients. The boles, which are of a red or yellow color from the presence of oxide of iron, are distinguished by their conchoidal fracture. The ochres are similar to the boles. contain-ing only more oxide of iron. Other varieties are fullers' earth, Tripoli, and boulder clay, the last a hard clay of a dark brown color, with rounded masses of rock of all sizes embedded in it, the result of glacial action. The distinctive property of clays as ingredients of the soil is their power of absorbing ammonia and other gases and vapors generated on fertile and manured lands; indeed no soil will long remain fertile unless it has a fair proportion of clay in its composition. The best wheats are grown on calcareous clays, as also the finest fruits and flowers of the rosaceous kind.

Ciay, CASSIUS MARCELLUS, American statesman; b. in 1810: graduated at Yale in 1832. He published in 1845 an abolitionist paper entitled The True American. His presses were seized by pro-slavery mobs, and he was threatened with assassination. He was a member of the Kentucky legislature in 1835, 1837, and 1840. During the Mexican War he was taken prisoner. In 1850 he ran as antislavery candidate for governor, but got few votes. In March, 1861, he was appointed minister to Russia. In June, 1862, he was commissioned major general of volunteers, but resigned the following March, and was again sent to St. Petersburg. In 1877 he shot and killed a negro who had threatened his life, and was tried and

acquitted by a jury. Ciay, HENRY (1777-1852), an American states-man; b. in Hanover co., Va. After acting as clerk in two or three state offices he commenced business in 1797 as a lawyer at Lexington, Ky. He soon became famous as a public speaker, and at the age of 26 was a member of the Kentucky legislature. In 1806 he was elected to the U.S. Senate; and in 1811 to the House of Representatives, where he was at once made speaker. In 1814 he proceeded to Europe and acted as one of the commissioners for adjusting the treaty of peace at Ghent between America and Great Britain. He was an unsuccessful candidate for the presidency in 1824, 1832, and 1844. He is best known for his endeavors to shut out European influences from America, and in connection with the "Missouri Compromise of 1820," restricting slavery to the states south of lat. 36° 30' n.; and another similar compromise of 1850 regarding the admission of California, and establishment of territorial governments in New Mexico, Utah, Clay was unquestionably one of the etc. greatest orators America has produced; a splendid party chief, idolized by his followers.

Clay Slate, in geology, a rock consisting of clay which has been hardened and otherwise changed, for the most part extremely fissile and often affording good roofing slate. In color it varies from greenish or bluish gray to lead color.

Clayton, JOHN MIDDLETON (1796-1856), Amefican jurist, b. in Sussex co., Del., educated at Yale, studied law, became U. S. senator, and secretary of state 1850; negotated treaty with England.

Clayton-Bulwer Treaty, a treaty between Britain and the U.S. concluded in 1850, and having reference to the construction of a ship canal across the Isthmus of Panama. Both parties agreed not to erect fortifications here. nor to acquire any part of the Central American territory.

Clayton, Powell, b. at Bethel, Pa., Aug. 7, 1833, and was educated at the Bristol Academy in Pennsylvania, later studying civil engineer-ing at Wilmington, Del. In 1859 he was chosen engineer and surveyor of Leavenworth, Kan., and began his life in the West. At the beginning of the war he enlisted as captain of the First Kansas Infantry, and a year later was appointed lieutenant colonel of the Fifth Kansas Cavalry, in the same year, 1862, being made colonel. The greater part of his military service was carried on in Arkansas. where he led several minor expeditions, for which he was commissioned brigadier general. and where he settled as a planter at the close of the war. In 1868 he was elected governor of Arkansas, and from 1871 to 1877 was U.S. senator. In 1897 he was appointed minister to Mexico.

Clear, CAPE, a promontory 400 ft. high at the southern extremity of Clear Island, and the most southern point of Ireland, about 74 mi. s.e. of Baltimore, county Cork. Clear Island is about 3<sup>1</sup> mi. long and about 1 broad.

It is wild and romantic, and has a fishing population of over 1,000.

Clearing House, a place or institution where the settlement of mutual claims, especially of banks, is effected by the payment of differ-ences called balances. In the earliest history of finance in the Old World experience showed the need and value of a discriminating and definite system of interchanging checks, notes, or other analagous evidences of indebtedness, whereby labor might be saved and the cash balances required in settlements reduced. The Lyons bourse, in France, had in 1667 a system similar in practise to our modern clearinghouse, and the Scotch bank-note exchanges which existed as far back as 1752 were a species of clearing house. But the system, as it exists in this country to-day, originated in London, and in 1810 the Lombard Street Clearing House was established. The joint-stock banks were not admitted until 1854, and four years later. the Country Check Clearing House was established. It was not until 1864 that the Bank of England was admitted into the association, and less than thirty banks in that great city are members to-day. The Vienna, Paris, and Berlin clearing houses were organized in 1864, 1872, and 1883 respectively, but the transactions of none of them are on a scale to compare with that of New York.

Albert Gallatin, one of the early secretaries of the treasury, suggested the adoption of a clearing house system in a pamphlet issued by him in 1831. He recognized the fact that those engaged in the business of banking, by standing together and thus building up mutual confidence, could to a large extent, prevent panics and sustain private credit, and, conse-quently, public credit as well. But his views were slow in finding approval, and it was many years before they were put in practise in this country. The first clearing house organized in America was started in New York City in the year 1853, and during the first year it did a business of \$5,750,455,985. The Boston Clearing House was established in 1856, and that of Philadelphia in 1858. The Chicago Clearing House was organized in 1865, with nineteen members. Its ranks were greatly thinned during the trying financial period from 1873 to 1877, but at present its transactions, as compared with those of 1866, show an increase of 900 per cent.

The following description of the modus operandi of a clearing house will apply to all institutions of the kind in the U. S., as they are conducted without exception on the same general system:—

The clearings are made in a large room capable of holding without inconvenience several scores of persons. Each bank sends two representatives, a clerk and a messenger. Lengthwise of the room run two long rows of high desks, numbered from 1 to 40, or whatever the number of banks in the association is. Upon arriving at the clearing house a few minutes before 11 A.M., each clerk stations himself opposite the number of his bank, after having delivered a ticket at the manager's table, which

## **Clearing Nut**

stands at the head of the double tier of desks. On each ticket respectively, is the total amount of checks brought by each bank. As each ticket is laid before the manager, he enters it to the credit of the bank sending it. He has before him a sheet ruled in four columns, one each for debit and credit amounts of exchanges, and for debit and credit balances. After the incoming tickets are entered and footed, the total represents the credit to all the banks clear-The grand total brought by each bank is ing. subdivided into say twenty other totals. These are represented by bundles of checks strapped together and marked with the amounts charged to the respective banks on which they are drawn, and which should be the sum of checks in each strap. As the gong strikes, the deputies assembled all bend their energies to the work in hand, for time is short, and there is much rapid figuring to be done in five minutes. A procession of messengers, each with a bag or an armful of bundles of checks, moves slowly up and down the outside of the double tier of desks. As they pass in front of each clerk, they deposit before him the checks drawn on the bank he represents. They pass from clerk to clerk a sheet upon which is entered the amount to the debit of each bank, and upon which the clerk receipts for checks so received, also entering upon a book before him the amount opposite the name of the bank delivering them. In about four minutes messenger No. 1 has reached the point from which he started, and each clerk has before him a double column of figures, one representing what he brought, the other what he takes away. The difference between the totals of the two col umns will of course be the balance. If the sum of what he brings exceeds that of what he carries away, he has a credit balance, and vice *rersa.* As soon as he has rapidly footed the columns he fills out a ticket, the following being a sample:

		Chicago,	Aug.	30,	1897.
No 1.	Amount	received		. \$3.	,000,000
	Amount	brought		. 3,	,500,000

Debit—Bal. due Clearing-house ..... Credit—Bal. due National Bank..... 500,000 ..... Settling Clerk.

..... Setting Olerk.

The clerk then hastens with his ticket thus filled out to the manager's desk, who enters the *debtor* amount and balance in the proper column (the *credit* having been already entered). After all the clerks have handed in their tickets, the columns are added up, and if the "amount received" and "amount brought" agree, and the "Dr. balance" and "Cr. balance" also agree, the announcement "all right" is made. The clerks return to their several banks, and by 12:30 all debtor members must be on hand ready to pay in the amount due, and by 12:45 the creditors to collect. This operation is repeated every business day in the year.

**Clearing Nut**, a small tree of the same genus as the nux vomica, common in Indian forests. Its seeds being rubbed on the inside of a vessel

### Cleavage

containing turbid water speedily precipitate the impurities, this result being due it is said to the clarifying effect of the albumin and casein they contain.

Cleavage, the manner or direction in which substances regularly cleave or split. The regular structure of most crystallized bodies becomes manifest as soon as they are broken. Each fragment presents the form of a small polyhedron, and the very dust appears under the microscope an assemblage of minute solids, regularly terminated. The directions in which such bodies thus break up are called their planes of cleavage; and the cleavage is called basal, cubic, diagonal, or lateral, according as it is parallel to the base of a crystal, to the faces of a cube, to a diagonal plane, or to the lateral planes. In certain rocks again there is a tendency to split along planes which may coincide with the original plane of stratification, but which more frequently cross it at an angle: This tendency is the consequence of the readjustment by pressure and heat of the components of rocks, which is one of the phases of metamorphism.

**Cleburne**, Johnson co., Tex., 28 mi. s. of Fort Worth. Railroad: Gulf Colorado & Santa Fé. Industries: railroad machine shops, flour mill, soda water, broom and cigar factories. Surrounding country agricultural. The town was first settled in 1850, and became a city in 1867. Pop. est. 1897, 7,000.

**Cleef** (klaf), 1, JOSEPH VAN, surnamed the Fool (1480-1529), b. at Antwerp, one of the most celebrated painters of his time, who in regard to beauty of coloring may challenge comparison with the Italian masters. 2. JOHN, a painter (1646-1716), belongs to the Flemish school, of which he is one of the most eminent masters. His works show more breadth of style than skill in coloring.

**Clem'atis**, a genus of woody climbing plants. The most common species, virgin's bower or traveler's joy, is conspicuous in the hedges both of England and the south of Scotland, first by its copious clusters of white

blossoms, and afterward by its feather-tailed silky tufts attached to the fruits. The fruit and leaves of the common clematis are acid and vesicant.

Clem'ens, SAMUEL LANGHORNE, an Ameri-

can humorist, b. in 1835, at Florida, Mo., more generally known by his pseudonym, "Mark Twain." He worked for some time as a compositor in Philadelphia and New York, and then in 1851 learned the business of pilot on the Mississippi. Thence he went to the Nevada mines: became in 1862 local editor of a newspaper in Virginia City: went to San Francisco; was for some time a reporter, and worked in the Calaveras gold diggings. In 1806 he went to the Sandwich Islands, and on his return commenced his lecturing career. He edited for a time a paper in Buffalo, and finally married and settled in Hartford, Conn. His chief books are The Jumping Frog, etc.; Roughing It; The Innocents Abroad; Tom Sauyer; A Tramp Abroad; The Prince and the Pauper; Life on the Mississippi; Huckleberry Finn; and Life of Joan of Arc; etc.

Joan of Arc; etc. **Clem 'ent**, the name assumed by many popes, the first being Clement of Rome. CLEMENT XIV who abolished the order of Jesuits, was one of the most distinguished. He d. in 1774.

**Clemen'ti,** MUZIO (1752-1832), pianist and composer. He was engaged as director of the orchestra of the opera in London, and his fame having rapidly increased he went in 1780 to Paris, and in 1781 to Vienna, where he played with Mozart before the emperor. In 1784 he repeated his visit to Paris, but after that remained in England till 1802, when he went back to the Continent. He returned in 1810 to England, where he settled down as superintendent of one of the principal musical establishments in London. He was interred in Westminster Abbey.

**Cleobu'lus,** one of the seren wise men of ancient Greece, a native of Lindus, who traveled to Egypt to learn wisdom, and became king of Rhodes. He flourished B.C. 560.

**Cleom 'enes** (-něz), the name of three kings of Sparta, the most distinguished of whom is Cleomenes III, the last of the Heraclidæ, king from 236 to 220 B. c. He intended to reform Sparta, and to restore the institutions of Lycurgus, and therefore put to death the ephori, made a new division of lands, introduced again the old Spartan system of education, made his brother his colleague, and extended the franchise.

**Cle'on**, an Athenian demagogue. He distinguished himself by the proposal to put to death the adult males of the revolted Mytileneans and sell the women and children as slaves. In 425 he took Sphacteria from the Spartans; but in 423 and 422 he was violently attacked by Aristophanes in *The Knights* and in *The Wusps*. He was sent, however, in 422 against Brasidas, but allowed himself to be taken unawares, and was slain while attempting to flee.

**Cleopat** ra (B. c. 69-30), a Greek queen of Egypt, daughter of Ptolemy Auletës. When she was seventeen her father died, leaving her as joint heir to the throne with his eldest son Ptolemy, whom she was to marry—such marriages being common among the Ptolemies. Being deprived of her part in the government (B. c. 49), she won Cæsar to her cause, and was reinstated by his influence. In a second dis-

## Cleopatra's Needles

turbance Ptolemy lost his life, and Cæsar proclaimed Cleopatra queen of Egypt, though she was compelled to take her brother, the younger Ptolemy, as husband and colleague. Cæsar continued some time at Cleopatra's court, and had a son by her named Cæsarion. By poisoning her brother she remained sole possessor of the regal power, took the part of the triumvirs in the civil war at Rome, and after the battle of Philippi sailed to join Antony at Tarsus. Their meeting was celebrated by splendid festivals; she accompanied him to Tyre, and was followed by him on her return to Egypt. A fter his conquest of Armenia he again returned to her, and made his three sons by her, and also Cæsarion, kings. On the commencement of the war between Augustus and Antony, the latter lost a whole year in festivals and amusements with Cleopatra at Ephesus, Samos, and Athens, and when at last the fleets met at Actium, Cleopatra suddenly took to flight, with all her ships, and Antony immediately fol-lowed her. They fied to Egypt, and declared to Augustus that if Egypt were left to Cleopatra's children they would thenceforth live in retirement. Augustus, however, demanded Antony's death, and advanced on Alexandria. Believing Cleopatra, who had taken refuge in her mausoleum, to be treacherous and dead, Antony threw himself on his sword, and shortly afterward Cleopatra killed herself by applying an asp to her arm to escape the ignominy of being led in a Roman triumph. With her the dynasty of the Ptolemies ended.

**Cleopatra's Needles,** the name given to two Egyptian obelisks, formerly at Alexandria, but one of which is now in New York, the other in London. They are made of the rosered granite of Syene, and were originally erected by the Egyptian king Thothmes III in front of the great temple of Heliopolis, the On of the Scriptures, where Moses was b. They were taken to Alexandria shortly before the commencement of the Christian era, and after the death of Cleopatra, but possibly in pursuance of a design originated by her. The New York obelisk was presented to America by the Khedive of Egypt, and was set up in Central Park in 1881.

**Clep'sydra** (or Waterclock), an ancient instrument for the measurement of time by the escape of water from a vessel through an orifice. In the older ones the hours were estimated simply by the sinking of the surface of the water, in others the water surface is connected with a dial plate and hand by a system of weights and floats.

**Clergy**, the body of ecclesiastical persons, in contradistinction to the *kaity*. The Greek word came into use to indicate that this class was to be considered as the particular inheritance and property of God, or else, which is more probable, because it was customary to select by lot those set apart for special religious functions. At first there was no strongly marked distinction between clergy and laity, but the former soon drew apart, consisting, after the apostolic age, of bishops, priests, and deacons, and in the fourth century of many additional inferior orders, such as sub-deacons, acolytes, etc. With the increased complexity of the hierarchy there was a steady accretion of privileges until the burden of these became intolerable to the laity. Few of these now re-main, the clergy being generally regarded as invested with no inherent claim to regard. A clergyman cannot, however, be compelled to serve as juryman; he is exempted from arrest while celebrating divine worship, from acting as bailiff, constable, or like office. The Episcopalians recognize three classes of clergybishops, priests, and deacons; and generally hold the doctrine of the apostolic succession. Large numbers of Protestants, however, reject this dogma, and believe in the ministry of only one order.

**Clermont-Ferrand**, a town of France, capital of department Puyde-Dôme. It is an antique and gloomy town built of dark volcanic stone. The most remarkable edifices are the cathedral, a huge, irregular, gloomy pile, and the church of Notre Dame, founded in 580. The manufactures are more numerous than extensive; but the position of the town makes it an important center of trade. Pop. 50,119.

**Cleveiand**, Cuyahoga co., O., second city in the state, situated on the south shore of Lake Erie, at the mouth of the Cuyahoga River. There are seven railroads centering at Cleveland: L. S. & M. S.; C. & P.; C. C. C. & I.; N. Y. C. & St. L.; N. Y. L. E. & W.; C. & C.; and the Valley. The most important articles of trade are coal, coke, iron, petroleum, lumber, flour and grain, and wool. The principal manufactures are those under the head of iron industries, also ship and lumber yards, flouring mills, iron foundries and factories, oil and chemical works, brick yards, rolling mills, etc. The city contains several very fine parks and numerous educational institutions. Among the latter are Adelbert College, Case School of Applied Science, and St. Mary's Theological Seminary. The city was first settled in 1706. Pop. est. 1897, 275,000.

Cleveland, GROVER, an American statesman, twice president of the U.S., b. in Caldwell, Essex co., N. J., March 18, 1837. His father, Richard F., was a Presbyterian clergyman. After the death of his father Grover became a clerk and assistant teacher in the N. Y. institution for the blind, and in 1855 he went West. He was admitted to the bar in 1859 in Buffalo. In 1863-1866 he was district attorney of Erie county. He was made sheriff of Erie county in 1870. In 1881 he was elected mayor of Buffalo. In 1882 he was elected governor of New York. He was nominated for president of the U.S. at the National Democratic Convention held in Chicago in 1884, and was inaugurated March 4, 1885, serving until 1889. During the latter part of Cleveland's term the head of the department of agriculture was made a cabinet officer. On March 13, 1885, he issued a proclamation to remove the white intruders from Oklahoma, Indian Territory, and after the burning of Aspinwall, Panama, by the revolutionists, March 31, 1885, ordered a naval expe-dition to protect the Americans and their

property. In 1888 he was Democratic candidate for president, but he was defeated by the Republican candidate, Benjamin Harrison. He then removed to New York, and practised law. On June 2, 1886, he married Miss Frances Folsom, the daughter of Oscar Folsom. The wedding took place in the White House. He was again elected president in 1892 to serve until 1897 and as such opened the World's Columbian Exposition. His second administration was memorable for the stand he took on the financial question, and railroad strikes, and for the Venezuela message.

**Clevenger**, SHOBAL VAIL (1812-1843), American sculptor. His father was a weaver, who went to Cincinnati with his son, and apprenticed him to a stonecutter. He at once manifested artistic ability in carving tombstone work, and learned to hew busts in freestone. Subsequently he chose the career of a sculptor, and as such settled in New York City. Many of his works are contained in the art galleries of New York, Boston, and Philadelphia. In 1840 he went to Rome, where he produced his *North American Indian*. He d. on the Mediterranean, within a day's sail of Gibraltar.

**Cleves** (klēvz), formerly the capital of the dukedom of Cleves, a town in Rhenish Prussia, 70 mi. n.w. of Cologne, about a league from the Rhine, with which it is connected by a canal. It has manufactures of tobacco, leather, and cottons, and a mineral spring with baths, etc. Pop. 10,170.

**Cli'ents**, in ancient Rome, were citizens of the lower ranks who chose a patron from the higher classes, whose duty it was to advise and assist them, particularly in legal cases, and in general to protect them. The clients, on the other hand, were obliged to portion the daughters of the patron if he had not sufficient fortune: to follow him to the wars; to vote for him if he was candidate for an office, etc. This relation continued till the time of the emperors.

Cliff Dwellers, an aboriginal American race of people who built their houses in the cliffs and rocks. Their cave dwellings were often artificial caverns closed and strengthened by stone walls, while their cliff houses were veritable fortresses, to which the inhabitants retreated when menaced by any serious danger. Everywhere on the cliffs, in the inequalities of the rocks, in grottoes and promontories, the Cliff Dwellers succeeded in building their Any situation pleased them provided houses. it gave hope of a little security. These dwellings have even been found hollowed in layers of volcanic ashes hardened by time, while all around pieces of cut silex and fragments of pottery attest the long sojourn of man. One "Cliff Palace" has a length of 421 ft., contains 127 rooms, and 23 estufas, and is capable of affording shelter to 1,500 persons. The dwellings are constructed either of sorted stones held together with moistened clay, or of adobe or sun-dried bricks. The circular ruins contain a number of small cells, and a building, often half subterranean in the center, which

the Spaniards have called an "estufa." Some contend that these estufas were the council chambers where the principal men of the tribe assembled, while others hold that they were meant to keep the sacred fire, which is even to-day an object of veneration with the In-dians. The cliff houses take the shape of the platform on which they stand, and the walls are soldered to the sides of the rock. The walls are built with stones cemented by a mixture of charcoal and ashes, further consolidated by the insertion of small pebbles and bits of pottery. Even to-day the marks of the tools and the workmen's fingers can be seen on the masonry. Sometimes the homes of the Cliff Dwellers were at a great altitude, being as high as 800 ft. above the level of the river. Late researches have revealed the existence of springs which had been tapped and brought into nau-ral and skillfully made reservoirs. The entire San Juan valley is strewn with ruins. There is one long, narrow structure running in front of a cave 200 ft. wide at the mouth, where windows 18 in. sq. are the only means of entrance. there being no door. Several human hands painted in ochre are to be seen on the walls. A small number of cemeteries have been found dating from the epoch of the Cliff people. Recent explorations have brought to light a small number of mummies in a fair state of preservation. Side by side with the bodies, weapons, utensils, and ornaments were found. Like the Mound Builders and all ancient peoples of America, the Cliff Dwellers died in the hope of a future life. Everything points to a civilization superior, and probably posterior, to that of the Mound Builders. There is abundant proof that the family and the owning of private property was established here, as evidenced by the existence of isolated dwellings.

Arizona presents interesting objects of study. The mountains rise to a height of 6.500 ft. above the level of the valley. Everywhere the rock has been pierced, and everywhere had man established his home. The access to them is very difficult. A narrow, dangerous path leads down from the top of the cliff, but is barred by a house built of quarried and wellcemented stone, of better and probably later construction than the other dwellings. Proofs of man's existence have also been found in the lava of volcanoes, extinct in the quaternary period. Agriculture seems to have been more perfect among the inhabitants of Arizona than among the ancient New Mexicans. They cultivated maize, beans, watermelons, cotton, and tobacco. Among their domestic animals we may mention the turkey, and probably the rabbit and species of llama. Neither here nor anywhere else in these regions have the excavations resulted in the discovery of any metal objects, with the exception of a few small amulets made of copper. On the other hand a great variety of pottery has been found, always tastefully decorated. Numerous weapons of polished stone, bone implements, and sea shells have also been discovered. The designs on the Arizona pottery resemble the ornaments in the temple of Mitla, and these again recall

the ancient peoples of Italy. Some of the pottery is shaped after the human form, but more frequently after the forms of animals and The duck seems to have been the favorbirds. ite model with the Mound Builders, and the owl is common with the Cliff Dwellers. Lightness was evidently a quality sought after, and the potter succeeded in reducing the thickness of even the largest vases to a few millimeters. Several pieces had been covered with varnish which on drying gave a brilliant enamel. Arrow heads are found in great numbers, another proof of the struggle for existence carried on by people who had to be ever on the alert to defend themselves against their unknown enemies. A number of irrigation canals bear witness to the industry of the inhabitants. The existence of these canals, wherever they could be of assistance for commerce or agriculture, conveys an idea of the progress realized by these people.

The difficulties attending excavations have necessarily influenced the number of human bones discovered. The works carried out at one place in Arizona produced some 300 skeletons, about 50 of which are complete. The stature is small. The bodies had been laid, dressed in their clothes, and bent double, in a chamber measuring 22 ft. in diameter.

In prehistoric times, distinct races occupied Central America. These races may originally have belonged to one source, but their separation dates from a considerable number of centuries and nothing in the facts we know permits an assertion or denial of the hypothesis. Many centuries, probably, before the coming of the Spaniards, the decadence of these peo-ples had begun. The causes of decadence are manifold. Among the most serious we must reckon the invasion of the Apaches. The Cliff Dwellers made a long but impotent resistance. They had to abandon their homes and wander farther south where their struggles were continued a long time with diminishing success. The destruction of the forests, a prolonged drought, the disappearance of the watercourses, changed the lands into arid deserts and sandy valleys, and the Dwellers had to leave the land where the struggle against nature became impossible.

Clifford, NATHAN (1803-1881), American statesman. Hebecame a lawyer in Maine, and was elected to the state legislature in 1830. In 1834 he became attorney general of the state, and in 1838 was elected to Congress where he served two terms. In 1846 he became attorney general of the U. S., and in 1848-49 was special envoy to Mexico. In 1858 he was nominated associate justice of the U. S. Supreme Court, which office he held until his death. He presided over the Hayes-Tilden electoral commission of 1877.

Commission of 1877. Clifford, WILLIAM KINGDON (1845-1879), English mathematician. In 1871 he was appointed professor of applied mathematics at University College, London. In mathematics his teaching and writings mark an epoch in the history of the science in England. He also wrote on philosophical subjects.

Climate, the character of the weather or atmospheric phenomena peculiar to every country as respects heat and cold, humidity and dryness, the direction and force of the prevailing winds, the alternation of the seasons, etc., especially as such conditions affect animal and vegetable life. In general, geographical latitude is the principal circumstance to be taken into view in considering the climate of a country, and thus the torrid, temperate, and frigid zones may each be said roughly to have a cli-mate of its own. The highest degree of heat is found in the equatorial regions, and the lowest, or the greatest degree of cold, at the poles. In the former the temperature continues practically the same all the year round, though there may be alternating rainy seasons and dry seasons. The variations in temperature are very considerable in the temperate zones, and increase as we approach the polar circles. The heat of the higher latitudes is, in July, greater than that of countries nearer the equator, and at Tornea, in Lapland, where the sun's rays are very oblique even in summer, the heat is sometimes equal to that of the torrid zone, because the sun is almost always above the horizon. But even in the equatorial regions, and still more in intermediate regions, the temperature is affected by local configuration and circumstances. In the deserts of Africa, for instance, owing to the exceptional radiating power of sandy plains and the absence of aqueous vapor in the atmosphere, the heat is excessive, while in the corresponding latitudes of South America the mountainous character of the country makes the climate more moderate. Altitude above the sea indeed has everywhere the same effect as removal to a greater distance from the equator, and thus in the Andes we may have a tropical climate at the sealevel and an arctic one on the mountain summits. The winds to which a country is most exposed by its situation have also a great in-fluence on the climate. In the northern hemisphere if north and east winds blow frequently in any region it will be colder, the latitude being the same, than another which is often swept by milder breezes from the south and west. The climate of Southern Europe, for instance, is decidedly affected by the warm south winds which blow from the hot deserts of Africa. The greater or lesser extent of coast line a country possesses in proportion to its area has a decided influence on the climate. The almost unvarying temperature of the ocean equalizes in some degree the periodic distribution of heat among the different seasons of the year, and the proximity of a great mass of water moderates, by its action on the atmosphere, the heat of summer and the cold of winter. Hence the more equable temperature of islands and coasts as compared with that of places far inland. The British Isles. Tasmania, and New Zealand enjoy a mild or insular climate as compared with, say, Central Russia or Central Asia. Thus it happens that London has a milder winter and a cooler summer than Paris, though the latter is nearly 30 farther south. Similarly, though Warsaw and Amsterdam are almost in the same latitude, the mean annual temperature of the former is 46.48°, while it reaches at the latter 53.4° F. The proximity of large masses of water involves also the presence of much aqueous vapor in the atmosphere, which may be coudensed in abundant rains so as to greatly influence the plant life of a country. Direction of mountain chains, set of ocean currents, nature of soil, are other modifying elements. In exhibiting graphically the chief climatic facts of a region various methods may be adopted. but in all the use of *isothermal lines* is one of the most instructive features. These are lines most instructive features. drawn on a map or chart connecting those places which have the same mean annual temperature or same mean summer and mean winter temperature. In this way we may divide the earth into zones of temperature which by no means coincide with the limits of the zones into which the earth is astronomically divided, and when compared with these on a map show interesting and instructive divergences. Geology teaches that vast changes have taken place in the climate of most if not of all countries, the causes of which are not fully understood.

**Climbing Perch**, a singular fish, remarkable for having the pharyngeal bones enlarged and modified into a series of cells and duplications so that they can retain sufficient water to keep the gills moist and enable the fish to live out of water for six days. The climbing perch of India proceeds long distances overland in search of water when the pools in which it has been living have dried up. It is also cred-

#### Climbing Perch.

ited with a power of climbing the rough stems of palm trees, but as to this latter point authorities disagree.

**Climbing Plants** are plants of weak stems which naturally seek support from their surroundings to rise from the ground. Some are twining plants, rising by winding themselves or their tendrils round the trunks of trees, etc. Such are the honeysuckle and scarlet runner. Others, like the ivy, attach themselves by small roots developed from the stem as they ascend. Some in climbing always twine spirally from right to left, others again always take the opposite direction.

**Clinton**, DEWITT (1769-1828), a famous American statesman and lawyer. He was educated at Columbia College, and in 1788 was admitted to the bar. In 1797 he was elected member of the Assembly. in 1798 member of the senate of the state of New York, and in 1801 member of the Senate of the U.S. For twelve years, with two short breaks, which amounted to three years, he occupied the position of mayor of New York. He was again member of the senate of New York from 1803 to 1811, and lieutenant governor of the state from 1811 to 1813. In 1812 he was defeated by Madison for president. In 1816 he was once more chosen governor of the state; in 1819 he was re-elected, and again in 1824 and 1826.

Clinton, GEORGE (1739-1812), American statesman. In 1768 he was elected to the New York assembly, and in 1775 was a dele-gate to the Continental Congress. In 1777 he was a deputy to the Provincial Congress which framed the state constitution. He was appointed a brigadier general in the Continental army in 1777. He was first governor of the state, serving from 1777 till 1795. In 1780 he thwarted an expedition led by Sir John Johnson, Brant, and Cornplanter, into the Mohawk Valley, and was instrumental in concluding treaties of peace with the Western Indians. In 1783 he accompanied Washington and Hamilton on a tour of the northern and western posts of the state. He helped to suppress Shay's rebellion in 1787. In 1791 he advocated the improvement of internal communication by navigation companies. In 1800 he served in the legislature, and in 1801 was again governor. In 1804 he was elected vice president of the U.S., which office he held until his death.

Clinton, SIR HENRY (1738-1795), British general. He arrived in Boston as major general. 1775. He was second in command in the movements that compelled the Americans to evacuate New York in September, 1775, and was left in command of that city in the summer of 1777. On October 6, he stormed forts Clinton and Montgomery, and was appointed com-mander in chief of His Majesty's forces in America, with the rank of lieutenant general. In June, 1778, he evacuated Philadelphia. and on his retreat through New Jersey fought with Washington at Monmouth Court House. He went to South Carolina in December, 1779. and captured Charleston May 12, 1780. In October, 1781, he set sail for Chesapeake Bay. with a large force, to aid Lord Cornwallis, but, at the entrance of the Chesapeake, he learned that Cornwallis had surrendered; upon hearing which he returned to New York. In June, 1782, he returned to England. He was elected to Parliament, and was afterward make governor of Limerick. In 1793 he was placed in command of Gibraltar, where he died.

**Clinton**, JAMES (1736-1812), American soldier, was the son of Charles Clinton. He was appointed an ensign in the second regiment of the Ulster county militia, in which he became a lieutenant colonel. During the Anglo-French War he distinguished himself at Fort Frontenac, and served in General Montgomery's expedition to Canada. He was made brigadier general in the Continental army in 1776, commanded Fort Clinton when it was attacked by Sir Henry Clinton, Oct. 6, 1777, and was the last man to leave the works. Although suffering from a severe bayonet wound he escaped by sliding down a precipice of 100

ft. to the creek. He took part in General Sullivan's expedition against the Iroquois of Western New Nork in 1779. Afterward he commanded the northern department, stationed at Albany.

**Clinton**, Worcester co., Mass., 45 mi. w. of Boston. Railroad, Boston & Fitchburg. The Nashua River supplies water power to a number of establishments, the principal products being ginghams and plaids, Brussels carpets, and cotton goods. Wirecloth. hollow ware, boots and shoes, and machinery are also manufactured. Pop. est. 1897, 10,000.

**Clinton**, Clinton co., Ia., on Mississippi River, 138 mi. w. of Chicago. Railroads: C. & N. W.; C. B. & Q.; C. M. & St. P.; B. C. R. & N. Industries: sawmills, two flouring mills, several iron foundries, chair, furniture, cracker, mattress, and wagon factories. The town was first settled in 1856. Pop. est. 1897, 24,000.

**Clinton,** Henry co., Mo., 85 mi. s.e. of Kansas City. Railroads: M. K. &. T.; K. C. Ft. S. & M., and K. C. O. & S. Industries: railroad shops, three flouring mills, two iron foundries, potteries, and a large ice plant. Clinton is an important center for the raising and shipping of poultry. Surrounding country agricultural and mineral, coal fields partly developed: four flowing artesian wells. The village was located in 1836; became a city in 1878. Pop. est. 1897, 7,200.

**Cll'o**, in Greek mythology, daughter of Zeus and Mnemosyne; the muse of history. Her attributes are a wreath of laurel upon her head, a trumpet in her right hand, and a roll of papyrus in her left.

**Clith ereo**, a town of England, Lancaster co., 28 mi. n.n.w. of Manchester. It is the seat of some large cotton spinning and weaving establishments, paper factories, foundries, and large print works. Pop. 10,815.

**Cli'tus,** the foster brother of Alexander the Great. He saved Alexander's life at the Granicus, but was afterward slain by him in a fit of intoxication, an act for which Alexander always showed the bitterest remorse.

**Clive**, ROBERT (1725-1774), English general and statesman, was b. in Shropshire. In 1751 Clive, who had already a reputation for skill and courage, marched on the large city of Arcot with 200 British troops and 300 Sepoys, and took it. In 1753 he sailed to England to recover his health. Two years later he was back in India, in governorship of St. David's from which he was soon summoned to command the expedition sent to Bengal. Clive was made governor of Calcutta. Here he was equally successful against the encroachments of the Dutch. He now visited England again. In 1761 he was raised to the Irish peerage with the title of Lord Clive, Baron of Plassey. After a time his health became poor, and in one of his babitual fits of melancholy he put an end to his life.

**Cloca'ca**, an underground conduit for drainage, of which the oldest known example is the great sewer at Rome, built some 2,500 years ago. A portion of it is still standing. It is about 13 ft. high and as many wide. The term is also applied to the excrementory cavity in birds, reptiles, many fishes, and lower mammalia, formed by the extremity of the intestinal canal.

Clock, an instrument for measuring time and indicating hours, minutes, and usually seconds, by means of hands moving on a dialplate, and differing from a watch mainly in having the movement of its machinery regulated by a pendulum, and in not being portable. The largest and most typical clocks also differ in having their machinery set in motion by means of a falling weight or weights, the watch wheel-work being moved by the force of an uncoiling spring; but many clocks also have a spring setting their works in motion. The use of an hour-teller was common even among the ancients, but their time-pieces were nothing else than sun-dials, hour-glasses, and clepsydræ. In the earlier half of our era we have accounts of several attempts at clock construction; that of Boethius in the sixth century, the clock sent by Harun al Rashid to Charlemagne in 809, that made by Pacificus, archdeacon of Verona, in the ninth century, and that of Pope Sylvester II in the tenth century. It is doubtful, however, if any of these was a wheel-and-weight clock, and it is probably to the monks that we owe the invention of clocks set in motion by wheels and weights. In the twelfth century clocks were made use of in the monasteries, which an-nounced the end of every hour by the sound of a bell put in motion by means of wheels. From this time forward the expression "the clock has struck," is often met with. The hand for marking the time is also made mention of. In the fourteenth century there are stronger traces of the present system of clockwork. Dante particularly mentions clocks. Richard, abbot of St. Albans in England, made a clock in 1326, such as had never been heard of till then. It not only indicated the course of the sun and moon, but also the ebb and flood tide. Large clocks on steeples likewise were first made use of in the fourteenth century. Watches are a much later invention, although they have likewise been said to have been invented as early as the fourteenth century. A celebrated clock, the construction of which is well known, was set up in Paris for Charles V in 1379, the maker being Henry de Vick, a German. It probably formed a model on which clocks were constructed for nearly 300 years, and until Huyghens applied the pendulum to clock-work as the regulating power, about 1657. The great advantage of the pendulum is that the beats or oscillations of a pendulum all occupy substantially the same time (the time depending on its length), hence its utility in imparting regularity to a timemeasurer. The mechanism by which comparative regularity was previously attained, though ingenious and simple, was far less perfect; and the first pendulum escapement, that is, the contrivance by which the pendulum was connected with the clock-work, was also less perfect than others subsequently intro-

## **Clodius Pulcher**

duced, especially Graham's dead-beat escapement invented in 1700. In a watch the balance-wheel and spring serve the same purpose as the pendulum, and the honor of being the inventor of the balance-spring was contested between Huyghens and the English philosopher, Dr. Hooke. Various improvephilosopher, Dr. Hooke. ments followed, such as the chronometer escapement, and the addition of a compensation adjustment, by which two metals having unequal rates of expansion and contraction under variations of temperature are combined in the pendulum or the balance-wheel, so that, each metal counteracting the other, the vibrations are isochronous under any change of temperature. This arrangement was perfected by Harrison in 1726, and is especially useful in navigation. The striking machinery of a clock, or that by which hours, quarters, etc., are sounded, is no necessary part of a clock, and forms indeed a separate portion of the works, usually driven by a separate falling weight, and coming into play at certain times. when there is a temporary connection between the two portions of the clock machinery. American methods of clock-making by machinery have revolutionized the clock trade and produced a world-wide market for the products of the Waterbury Clock Company and similar firms. In Liberia there is neither clock nor timepiece of any sort, the reckoning of time being guided entirely by the sun's movement and position.

**Clo' dius Pulcher**, PUBLIUS, a notorious public character of ancient Rome, son of Appius Claudius Pulcher. He served in the third Mithridatic war and filled different high posts in the provinces of the East. Returning to Rome, he became a popular demagogue, was elected tribune in 59 B. c., was the means of procuring Cicero's banishment, and continued to be a ringleader in all the seditions of the time till killed.

**Clois' ter,** an arched way or gallery, often forming part of certain portions of monastic and collegiate buildings, usually having a wall of the building on one side, and an open colonnade, or a series of windows with piers and columns adjoining an interior yard or court on the other side. Such galleries were originally intended as places of exercise and recreation, the persons using them being under cover. The term is also used as equivalent to convent or monastery.

**Clothes Moth**, the name common to several moths whose larvæ are destructive to woolen fabrics, feathers, furs, etc., upon which they feed, using at the same time the material for the construction of the cases in which they assume the chrysalis state.

**Clo'tho,** in Greek mythology, that one of the three Fates or Parcæ whose duty it was to put the wool for the thread of life round the spindle, while that of Lachasis was to spin it, and that of Atropos to cut it when the time had come.

**Cloud,** a collection of visible vapor or watery particles suspended in the atmosphere at some altitude. They differ from fogs only by their

## Cloud

height and less degree of transparency. The average height of clouds is calculated to be 24 mi., thin and light clouds being much higher than the highest mountains, while thick, heavy clouds often touch low mountains, steeples, and even trees. Clouds differ much in form and character, but are generally classed into three simple or primary forms, viz.: 1, The cirrus, so called from its resemblance to a lock

Cirrus

of hair, and consisting of fibers which diverge in all directions. Clouds of this description float at a general height, usually from 3 to 5 mi. above the earth's surface. 2. The cumulus or heap, a cloud which assumes the form of dense convex or conical heaps, resting on a flattish base, called also summer cloud. Under ordinary circumstances these clouds accompany fine weather, especially in the heat of summer. They attain their greatest size early

Cumulus.

in the afternoon and gradually decrease toward sunset. 3, The stratus, so named from its spreading out uniformly in a horizontal layer, which receives all its augmentations of volume from below. It belongs essentially to the night, and is frequently seen on calm summer evenings after sunset ascending from the lower to the higher grounds, and dispersing in the form of a cumulus at sunrise. These three primary forms of clouds are subdivided as follows: 1, The *cirro cumulus*, composed of a collection of clrri, and spreading itself fre-

# Cloud

quently over the sky in the form of beds of delicate snowflakes. 2, The cirro stratus or wane cloud, so called from its being generally seen slowly sinking, and in a state of transformation. When seen in the distance a collection of these clouds suggests the resemblance of a shoal of fish, and the sky, when thickly mottled with them, is called in popular language a mackerel sky. 2, The cumulo stratus or twain cloud, one of the grandest and most beautiful of clouds, and consisting of a collection of large, fleecy clouds overhanging a flat

Stratus.

stratum or base. 4, The nimbus, cumulo-cirrostratus, or rain cloud, recognizable, according to Mr. Howard, by its fibrous border and uniformly gray aspect. It is a dense cloud spreading out into a crown of cirrus and passing beneath into a shower. It presents one of the least attractive appearances among clouds, but it is only when the dark surface of this cloud forms its background that the splendid phenomenon of the rainbow is exhibited in perfection.

**Cloud** (klö), Sr., a town, France, department Seine-et-Oise, 6 mi. s.w. from Paris. It is celebrated for its château and its magnificent park. As the residence of the monarchs of France. St. Cloud is historically interesting. Louis XIV bought the old château and presented it to his brother, who enlarged and transformed it into a splendid palace, which became the residence of Henrietta, queen of Charles I of England, during her exile. It was chosen by Napoleon for his residence, was the summer residence of Napoleon III, and was greatly damaged in the Franco-German War. Pop. 5,163.

**Cloudberry** (or Mountain Bramble), a fruit found plentifully in the north of Asia, America, and Europe, and common in some of the more elevated moors of Britain. The plant is from 4 to 8 or 10 in. high, with a rather large handsome leaf, indented and serrated at the edges. The flowers are large and white, and the berries, which have a very fine flavor, are orange yellow in color, and about the size of a bramble berry.

Clove Bark (or Culil'awan Bark), is fur-

# Cloves

nished by a tree of the Molucca Islands. It is in pieces more or less long, almost flat, thick, fibrous, covered with a white epidermis of a reddish yellow inside, of a nutmeg and clover odor, and of an aromatic and sharp taste.

**Clover** (or Trefoil), a name of different species of plants. There are about 150 species. Some are weeds, but many species are valued as food for cattle. Common red clover, is a biennial, and sometimes. especially on chalky soils, a triennial plant. This is the kind most commonly cultivated, as it yields a larger product than any of the other sorts. White clover is a most valuable plant for pasturage over the whole of Europe, Central Asia, and North America, and has also been introduced into South America. The bee gathers much

A.-White Clover. B.-Red Clover.

of its honey from the flowers of this species. Alsike, hybrid, or Swedish clover, has been long cultivated in the south of Sweden, and for some time also in other countries; it is strongly recommended for cold, moist, stiff soils. It resembles the common red clover in duration, stature, and mode of growth. Perennial red or meadow clover much resembles the common red, but differs somewhat in habit, and the bright red flowers are larger and form a less compact head. Its produce is less in quantity, and not so nutritive, as that of the common red.

**Clover Weevil**, a kind of weevil, different species of which feed on the leaves and seeds of the clover, as also on tares and other leguminous plants.

**Cloves,** a very pungent aromatic spice, the dried flower buds, a native of the Molucca Islands, belonging to the myrtle tribe, now cultivated in Sumatra, Mauritius, Malacca, Jamaica, etc. The tree is a handsome evergreen from 15 to 30 ft. high, with large, elliptic, smooth leaves and numerous purplish

### Clovis

flowers on jointed stalks. Every part of the plant abounds in the volatile oil for which the flower buds are prized. The spice yields a very fragrant odor, and has a bitterish, pungent, and warm taste. It is sometimes em-

a.-branch with leaves, buds, and flowers; b.-bud.

ployed as a hot and stimulating medicine, but is more frequently used in culinary preparations.

**Clovis** (465-511), king of the Franks, succeeded his father Childeric in the year 481, as chief of the warlike tribe of Salian Franks, who inhabited Northern Gaul. In 486 he overthrew the Roman governor at Soissons and occupied the country between the Somme and the Loire. He d. at Paris, which he had made his capital.

Club, a select number of persons in the habit of meeting for the promotion of some common object, as social intercourse, literature, politics, etc. The coffee houses of the seventeenth and eighteenth centuries are the best representatives of what is meant by a modern club, while the clubs of that time were commonly nothing but a kind of restaurants or taverns where people resorted to take their meals. Among the earliest of the London clubs was the *Kit-cat Club*, among whose forty members were dukes, earls, and the leading authors of the day. Another club formed about the same time was the Beefsteak Club. Originally these two clubs had no pronounced political views, but in the end they began to occupy themselves with politics. Perhaps the most celebrated club of last century was that which was first called The Club par excellence, and numbered among its members Dr. Johnson, Sir Joshua Reynolds, Edmund Burke, Oliver Goldsmith, Edward Gibbon, and others. The most important London political clubs

#### Clytemnestra

of the present day are the Carlton Club, a sort of headquarters for the Conservative party, and the Reform Club, the building belonging to which stands next to that of the Carlton Club, the great club of the Liberal party. Clubs and club-life have reached their highest plane in our own country. Every important city numbers in its more important buildings the palatial quarters of some prominent club. New York, Chicago, Boston, Philadelphia, and San Francisco vie with each other in the sumptuous surroundings of their clubs. The Union League, Manhattan and Metropolitan clubs of New York, the Union League and Chicago clubs of Chicago, and a score of others rival in their luxurious appointments the most famous clubs of the Old World.

**Cluny** (klu-nē), a town of Eastern France, 11 mi. n.w. Macon, pop. 4,007. Here was a Benedictine abbey founded in 910, at one time the most celebrated in France, having 2,000 monastic communities directly under its sway in France, Italy, Spain, England, etc., the inmates of which formed the congregation of Cluniac monks. Most of it was destroyed in 1789, and the present town is to some extent built of its debris and occupies its site.

**Cluseret**, GUSTAVE PAUL (1823-1896), French soldier. In 1848, he became chief of a battalion of national guards and chevalier of the Legion of Honor. He served in Algeria and the Crimea, and in 1860 joined Garibaldi. In January, 1862, he entered the service of the U.S. In 1864 he edited a paper in New York City. He was for a short time minister of war under the Commune. He was arrested, but managed to escape both from the Communists and the police of the republic.

Clyde, Colin CAMPBELL, LORD (1792-1863). a famous British soldier, was b. in Glasgow. By the assistance of his mother's relations he was educated at the high school of Glasgow. and afterward at the military academy, Gosport. In 1808 he received an ensign's commission in the Ninth Regiment of Foot. He served in Spain under Sir John Moore and Wellington. In 1819-25 he was in the West Indies. In 1835 he attained the rank of lieutenant colonel. In 1842 he was in China, and on the termination of the Chinese War took active service in India. In 1854 he became major general with the command of the Highland Brigade in the Crimean War. On the outbreak of the Indian mutiny he was appointed to the chief command there. Land-ing at Calcutta on Aug. 29, 1857, he relieved Havelock and Outram at Lucknow, and crushed the rebellion entirely before the end of the year. He was created a peer with the title of Baron Clyde, and had an income of \$10,000 a year allotted him. In 1862 he was made field marshal. He was buried in Westminster Abbey.

**Clytemnestra**, in Greek mythology, daughter of King Tyndareus and Leda, and half sister of Helen. During the absence of Agamemnon in the war against Troy she bestowed her favors on Ægisthus, and, in connection with him, murdered Agamemnon on his return from Troy, and, together with her paramour, governed Mycenæ for seven years.

Coach, a general name for all covered carriages drawn by horses and intended for the rapid conveyance of passengers. The earliest carriages appear to have been all open. At Rome both covered and uncovered carriages were in use. After the fall of the Roman Empire they went out of use again, and during the feudal ages the custom was to ride on horseback, the use of carriages being considered effeminate. They do not appear to have become common till the fifteenth century, and even then were regarded exclusively as vehicles for women and invalids. Later on they became, especially in Germany, part of the appendages of royalty. They seem to have been introduced into England about the middle of the sixteenth century, but were for long confined to the aristocracy and the wealthy classes. Hackney coaches were first used in London in 1625. They were then only twenty in number, and were kept at the hotels, where they had to be applied for when wanted. In 1634 coaches waiting to be hired at a particular stand were introduced. Stage coaches were introduced into England about the same time as hackney coaches. The first stage coach in London appears to have run early in the seventeenth century, and before the end of the century they were started on three of the principal roads in England. Their speed was at first very moderate, about 3 or 4 miles an hour. They could only run in the summer, and even then their progress was often greatly hindered by floods and by the wretched state of the roads generally. Mail coaches next followed. The manufacture of elegant carriages is a proof of much wealth and mechanical skill in a place, many different workmen being employed in their construction, and both the materials and the workmanship requiring to be of the best.

**Coahuila** ( $k\hat{v}$ -å-wē'lå), a state of Mexico, on the frontier of the U. S., rich in woods and pastures, and having several silver mines. Area 50,890 sq. mi.; pop. 130,026.

Coal, a solid, opaque, inflammable substance, mainly consisting of carbon, found in the earth, largely employed as fuel, and formed from vast masses of vegetable matter deposited through the luxuriant growth of plants in former epochs of the earth's history. In the varieties of coal in common use the combined effects of pressure, heat, and chemical action upon the substance have left few traces of its vegetable origin; but in the sandstones, clays, and shales accompanying the coal, the plants to which it principally owes its origin are presented in a fossil state in great profusion, and frequently with their structure so distinctly retained, although replaced by mineral substances, as to enable the microscopist to determine their botanical affinities with existing species. The sigillaria and stigmaria, the lepidodendron, the calamite, and tree ferns are among the commoner forms of vegetable life in the rocks of the coal formation. Trees of considerable magnitude have also been brought

to light, having a recognizable relation to the modern araucaria. The animal remains found in the coal-measures indicate that some of the rocks have been deposited in fresh water. probably in lakes, while others are obviously of estuarine origin, or have been deposited at the mouths of rivers alternately occupied by fresh and salt water. The great system of strata in which coal is chiefly found is known as the Carboniferous. There are many varieties of coal, varying considerably in their composition, as anthracite, nearly pure carbon, and burning with little flame, much used for furnaces and malt kilns; bituminous (popularly so called) or "household coal"; and cannel or "gas coal," which burns readily like a candle, and is much used in gas making. All varieties agree in containing from 60 to over 90 per cent. of carbon, the other elements being chiefly oxygen and hydrogen, and frequently a small portion of nitrogen. Lignite or brown coal may contain only 50 per cent. carbon. For manufacturing purposes coals are generally considered to consist of two parts, the volatile or bituminous portion, which yields the gas used for lighting, and the substance, comparatively fixed, usually known as coke, which is obtained by heating the coals in ovens or other close arrangements. Coal was known to the ancients and to the Britons before the Roman invasion, and was used for fuel in England as early as 852 A.D. When coal was first used in the arts in London, it was objected to as injurious to health, and a proclamation was issued against its use, 1316. The first charter giving permis-sion to dig coal was granted by Henry III, 1239. In 1281 the Newcastle coal trade became so important that laws were passed for its regulation. The steam engine applied to the collieries about 1715 introduced into England a new era in mining, and trade in coal increased extensively. The coal beds of Great Britain occupy an area of less than 12,000 sq. mi. Coal deposits of the U. S. exceed in area, variety, and excellence those of any other country in the world. Coal was first utilized in the U.S. in revolutionary times for the manufacture of arms. In 1789 coal was shipped from Richmond, Va., to Philadelphia, New York, and Boston. Coal was first used in a grate by Judge Jesse Fell, Wilkesbarre, Pa., 1808. The area of American coal fields is about 200 000 coming the most internet internet. about 200,000 sq. mi., the most important of which is the Appalachian, covering about 60,-000 sq. mi., extending through the states from Pennsylvania to Alabama. The anthracite district of Pennsylvania is the most important. Coal was first discovered in America by Father Hennepin, near what is now Ottawa. Ill. The first coal mined in the U. S. (1813) was sold at Philadelphia for \$21 per ton. The first regular shipment of coal from the Pennsylvania mines was in 1820. The annual production from the Pennsylvania coal fields is valued at more than \$59,000,000. Of bituminous coal Ohio and Illinois are most productive. Germany, France, and Belgium produce coal less extensively than the U. S. and Great Britain. The coal beds of Russia have been little
worked. Immense coal fields are known to exist in China, Japan, Australia, and Canada.

**Coal Brass**, the iron pyrites found in coal measures, so named on account of its brassy appearance. Coal containing much pyrites is bad for iron smelting, and it is unpleasant for domestic use on account of the sulphurous acid which it gives off on burning. Coal brass is useful in the manufacture of copperas and in alkali works.

**Coal Cutting Machine**, any machine for cutting out coal in the pit, the chief objects they are intended to serve being the cheapening of the work, the saving of a large quantity of coal, which in the ordinary process of holing by hand labor with the pick is broken up into slack and dust, and the removal of the danger attending upon the employment of hand labor. The instruments of excavation in these machines are constructed on various principles, some having an action like that of an ordinary pick, others a horizontal cutting tool. There are usually arrangements for regulating the depth and force, and to a certain extent the direction, of the blow, and the precision obtained is fully equal to that of hand labor.

**Coal Fish**, a species of the cod genus, named from the color of its back. It grows to the length of 24 ft., and is found in great numbers about the Orkneys and the northern parts of Britain.

**Coal Gas,** the variety of carbureted hydrogen which produces common gaslight.

**Coal Tar** (or Gas Tar), a substance obtained in the distillation of coal for the manufacture of illuminating gas, a dark-colored more or less viscid mass, consisting principally of oily hydrocarbons. It passes over with the gas into the condensers along with ammonia liquor, but being heavier than the latter, it is easily separated from it when the whole is allowed to stand. It was formerly of comparatively little use; but in recent years a great number of valuable products have been derived from it by distillation, such as ammonia, naphtha, creosote, carbolic acid, and benzine, while it is also the source of the whole series of aniline colors, and other dyes, of alizarine, salicylic acid, etc.

**Coast Mountains** (Coast Range), a range or series of ranges extending along the west of California at no great distance from the Pacific coast, and rising to the height of 8,500 ft.

**Coatbridge,** a town in Scotland, Lanarkshire, 94 mi. e. of Glasgow. The district abounds in coal and ironstone. Pop. 17,500.

**Co'ati** (or Coati Mondi), a name of South American plantigrade carnivorous mammals, belonging to the Ursidæ or bears, but recalling rather the raccoon or civets, and having a long proboscis or snout. They feed on worms, insects, and the smaller quadrupeds, but chiefly on eggs and young birds.

**Co'balt**, a metal, of a grayish white color, very brittle, of a fine close grain, compact, but easily reducible to powder. It crystallizes in parallel bundles of needles. It is never found in a pure state. Its ores are arranged under the following species, viz., *arsenical cobalt*, of a white color, passing to steel gray; its texture is granular, and when heated it exhales the odor of garlic; gray cobalt, a compound of cobalt, arsenic, iron, and sulphur, of a white color, with a tinge of red; its structure is foliated, and its crystals have a cube for their primitive form; sulphide of cobalt, compact and massive in its structure; oxide of cobalt, brown or brownish black, generally friable and earthy; sulphate and arsenate of cobalt, both of a red color, the former soluble in water. The great use of cobalt is to give a permanent blue color to glass and enamels upon metals, porcelain, and earthenwares.

**Cob** bett, WILLIAM (1762-1835), English writer and politician, was the son of a farmer. In 1783 he went to London and obtained a situation as copying clerk to an attorney, but after nine months he enlisted into the Fiftyfourth Foot, and shortly after went with the regiment to Nova Scotia. Four years later he was promoted to sergeant major. He obtained his discharge, married, and proceeded to America. Under the signature of "Peter Porcupine," he wrote papers and pamphlets of a strongly anti-republican tendency. In 1800 he started first the Porcupine, then the Weekly Political Register. In 1824-7 appeared his History of the Reformation. On the passing of the Reform Bill in 1832 he was returned as member for Oldham. Cobbett is also the author of a Parliamentary History of England from the Conquest to 1803; Advice to Young Men and Women; Village Sermons, etc.

**Cobb.** HOWELL (1815-1868), American statesman, b. in Cherry Hill, Ga. In 1837 he was elected solicitor general of the western circuit of Georgia, and in 1843 was elected to Congress. In 1849 he was elected speaker. In 1851 he was elected governor of Georgia, serving until 1853. In 1855 he was again elected to Congress, and later was made secretary of the treasury, serving from 1857 to 1860. When the war came up he was appointed brigadier general, and subsequently major general, but took no part in military movements.

Cob' den, RICHARD (1804-1865), English politician, the "apostle of free trade." After receiving a very meager education he was taken as an apprentice into a warehouse in London. In 1830 he started a cotton manufactory in Manchester. His first political writing was a pamphlet on England, Ireland, and America. In this he gave clear utterance to the political views to which he continued through his life to adhere, advocating non-intervention in the disputes of other nations, and maintaining it to be the only proper object of the foreign policy of England to increase and strengthen her connections with foreign countries in the way of trade and peaceful intercourse. In 1841 he entered Parliament as member for Stockport. Next year he was chosen member for the West Riding of York, a constituency which he represented for ten years. In 1859 he was chosen member for Rochdale. During his later years he lived a good deal in retirement.

Cob'lentz, a fortified town of Germany.

### Cobourg

capital of Rhenish Prussia, on the Rhine in the angle between it and the Moselle, and connected by a pontoon bridge over the Rhine with the fortress of Ehrenbreitstein, this, along with its other fortifications, rendering it one of the strongest places in Germany, and capable of accommodating 100,000 men. Its industries embrace cigars, machinery, champagne wines, pianos, and it has an important trade in Rhine and Moselle wines. Pop. 31,669.

and Moselle wines. Pop. 31,669. Cobourg, a port of Canada, prov. Ontario, on Lake Ontario, 69 mi. e. by n. of Toronto. It is well built, has sundry manufactures, a good harbor, and an increasing trade. Pop. 4,957.

Cobra de Capello (that is, "snake of the hood"), the Portuguese name of the hooded or spectacled snake which is found in Southern Asia, a closely allied species called cobra, or asp, being found in Egypt. It is called spectacled snake from a singular marking on the back of the neck. So exceedingly poisonous is its bite, that in numerous instances death has followed within a few minutes. and under ordinary circumstances a few hours is the longest term where

Head of Cobra.

prompt measures have not been taken. In India thousands of natives lose their lives yearly through cobra bites. Its food consists of small reptiles, birds, frogs, fishes (being an excellent swimmer), etc. Its great enemy is the ichneumon.

**Co'burg**, a town, Germany, capital of the duchy of Saxe-Coburg-Gotha, 106 mi. e. by n. Frankfort-on-the-Main. The principal buildings are the palace of the Duke of Saxe-Coburg-Gotha, and on an eminence overhanging the town the ancient castle of the dukes of Coburg, in which are still shown the rooms occupied by Luther during his concealment here, with his bedstead and pulpit. Coburg has various manufactures, also extensive breweries. Pop. 16,210.

**Coca**, a South American plant. The leaf is a stimulating narcotic, and is chewed by the inhabitants of countries on the Pacific side of South America, mixed with finely powdered chalk. It has effects somewhat similar to those of opium. A small quantity of it enables a person to bear up against fatigue even when receiving less food than usual; and it prevents the difficulty of respiration experienced in climbing high mountains. Coca leaves depend for their influence on a crystallizable alkaloid called *cocaine*, which, besides having effects similar to the leaf, possesses valuable anæsthetic properties, and in recent times has been especially employed to prevent sufferings in operation on the eye, having also similar effects when applied to the tongue, larynr, ear, etc.

Coca; a.-flower; b.-fruit.

**Coc'culus**, a genus of East Indian menispermaceous plants, consisting of climbers with heart-shaped leaves and small flowers. The species are generally powerful bitter febrifuges. The fruit of the *Cocculus Indicus* 

Cocculus Indicus; a.-branch with leaves; b.panicle of female inflorescence; c.-a female flower; d.-the same with sepals removed; c.male flower; f.-fruit.

forms a considerable article of commerce, and is sometimes added to malt liquors to give bitterness.

**Coccus, a** genus of insects of the order Hemiptera, family Coccidæ, or scale insects. The males are elongated in their form, have large wings, and are destitute of any obvious means of suction; the females, on the contrary, are of a rounded or oval form, about an eighth of an inch in length, have no wings, but possess a beak or sucker, by which they suck up the juices of the plants on which they live. At a certain period of their life the females attach themselves to the plant or tree which they inhabit, and remain thereon immovable

### Cochabamba

during the rest of their existence. In this situation they are impregnated by the male; after which their body increases considerably, in many species losing its original form and assuming that of a gall, and, after depositing the eggs, drying up and forming a habitation for the young. Some of these insects are troublesome in gardens, plantations, and hothouses, while others are of great value. For example, kermes, cochineal, lac-lake, lac-dye, and gum-lac are either the perfect insects dried, or the secretions which they form. Kermes consist of the dried females of Coccus ilicis, found in great abundance upon a species of oak, a native of the Mediterranean basin, and gathered before the eggs are hatched. Cochineal consists of the bodies of the females of the Coccus cacti, a native of Mexico, which feeds on various species of cactus, particularly on one called nopal.

**Cochabam'ba** (koch-), a town in the interior of Bolivia, capital of the province of Cochabamba, situated in a fertile valley 8,435 ft. above the level of the sea, with good trade and considerable manufactures. Pop. 26,330.

Coch'in, a seaport, Hindustan, Malabar district. Madras presidency. Cochin was one of the first places in India visited by Europeans. In 1502 Vasco da Gama established a factory, and soon after Albuquerque built a fort. In 1663 the Dutch took the place, in 1795 the British. Pop. 15,698. Cochin-China, a country forming part of the

peninsula of Southeastern Asia, and generally regarded as comprising the whole of Anam and Lower or French Cochin-China. The latter belonged to Anam till, in 1863, a portion of it was finally ceded to France after a war occasioned by the persecution of French missionaries; another portion being declared French territory in 1867. The territory thus acquired covers 27,020 sq. mi.; pop. 4,600,000. In the low and wet grounds much rice is grown. In the more elevated districts are grown tobacco, sugar cane, maize, indigo, and betel. Among the other products are tea, gums, cocoanut oil, The climate is hot and unsuited silk, spices. for Europeans. Industrial arts are as yet limited among the natives. But they excel in the use of wood, of which their temples, pagodas, and tombs are built, being ornamented with elaborate carving. The principal export is rice, mainly to China; cotton and silk are also exported.

**Cochin-China**, a term applied to a variety of domestic fowl, imported from Cochin-China. It is a large ungainly bird, valuable chiefly owing to its fecundity, eggs being laid even during the winter.

**Cochineal** (koch'i-nēl), a dye-stuff consisting of the dried bodies of the females of a species of insect, *Corcus Cacti* a native of the warmer parts of America, particularly Mexico, and found living on a species of cactus called the cochineal fig. The insects are brushed softly off, and killed by being placed in ovens or dried in the sun, having then the appearance of small berries or seeds. A pound of cochineal contains about 70,000 of them. The

### Cockchafer

finest cochineal is prepared in Mexico, where it was first discovered. Cochineal produces crimson and scarlet colors, and is used in making carmine and lake.

Cochineal; a.-living on cactus; b.-male; c.-female.

**Cockatoo'**, the name of a number of climbing birds belonging to the family of the parrots, or regarded as forming a distinct family. They have a large, hard bill: a crest capable of being raised and lowered at the will of the bird, commonly white, but sometimes yellow, red, or blue: a tail somewhat longer than that of the parrot, and square or rounded long wings; and, for the most part. a white plumage; though in some genera the plumage is dark. They are found especially in the Eastern Archipelago, and Australia. They live on roots, fruits, grain, insects, etc., and usually congregate in flocks. These birds are easily tamed.

**Cockburn**, ALEXANDER (1802-1880), British jurist. He was successively solicitor general, attorney general, and chief justice, and in 1871 was one of the arbitrators of the Geneva claims.

**Cock' chafer**, a species of lamellicorn beetle remarkabe for the length of its life in the worm

Cockchafer (Meldontha rulgarts); a....full-grown larva; b...pupa; c. – perfect insect.

or larva state, as well as for the injury it does to vegetation after it has attained its perfect condition. The common cockchafer is hatched from an egg which the parent deposits in a hole about 6 in. deep, which she digs for the purpose. At the end of about three months the insect emerges as a small grub or maggot, and feeds on the roots of vegetables in the viconity. When full grown it is over an inch in length: it makes its way underground and commits great devastation on grass and corn crops. In the fourth year the insect appears as a perfect coleopterous insect-a beetle over an inch long, of a black color, with a whitish down. It usually emerges from the ground about the beginning of May, from which circumstance the name may bug or beetle has been given it. In its perfect state it is very destructive to the leaves of various trees.

**Cock Fighting,** an amusement practised in various countries, first perhaps among the Greeks and Romans. At Athens there were annual cock fights, and among the Romans quails and partridges were also used for this purpose. It was long a favorite sport with the British, and the training, dieting, and breeding of cocks for fighting was the subject of many treatises. It is a favorite sport in this country and Cuba.

**Cockle**, a name for the bivalve molluscs of the genus *Cardium*, common on the sandy shores of the ocean, much used as food. The general characteristics are: shells nearly equilateral and equivalvular; hinge with two small teeth. one on each side near the beak, and two larger remote lateral teeth, one on each side; prominent ribs running from the hinge to the edge of the valve.

**Cock of the Rock**, a South American bird of a rich orange color with a beautiful crest, belonging to the manakin family.

**Cock' roach**, a genus of insects belonging to the straight-winged order, characterized by an oval, elongated, depressed body, which is

#### Common Cockroach. a.-female; b.-male.

smooth on its superior surface. They have parchment-like elytra, and in the female the wings are imperfectly developed. They are nocturnal in their habits, exceedingly agile, and devour provisions of all kinds. Cockroaches, like other orthopterous insects, do not undergo a complete metamorphosis; the larvæ and nymphs resemble the perfect insect, except that they have merely rudiments of wings. The eggs are carried below the abdomen of the female for seven or eight days till she finally attaches them to some solid body by means of a gummy fluid. The species are numerous. The common kitchen cockroach was originally brought from Asia to Europe, and thence to America, where it is now common. The American cockroach grows to be 2 or 3 in. long.

**Cock's-foot** (Cock's-foot-grass), a perennial pasture grass of a coarse, harsh, wiry texture. but capable of growing on barren, sandy places, and yielding a valuable food for sheep very early in the spring. The name has been given to it because of the resemblance of its three-branched panicle to the foot of a fowl.

Co'coa, a name given to the ground kernels of the cacao or chocolate tree prepared to be made into a beverage. Cocoa is chocolate from which the oil has been extracted. One half of the cocoa bean is cocoa butter. Cocoa butter is used by confectioners in making In making cocoa the chocolate is candy. taken from the machine which grinds it. placed in little canvass bags, and put into a hydraulic press, where a pressure of 70 tons drives the oil out of the chocolate and leaves the cocoa in dry, oilless lumps which are broken with a mallet, and are taken away to be ground up for further operations. If the cocoa is wanted for drinking purposes it is ground into a flour-like substance and packed in tin boxes. If for eating or for confectioners, it is mixed with flavoring compounds in a mixing mill, after the sugar has been thoroughly incorporated with the cocoa by passing the whole mixture through rolls. Several the whole mixture through rolls. varieties of cocoa are mixed and blended during the process, and it is the success of this blending upon which the quality of the cocoa depends.

**Cocoa Butter** is a product of the cocoanut. After the milk has been extracted from the cocoanut, the white meats are broken into fine pieces and sent to the mill, where the rich oil is boiled and pressed out of them. A thousand nuts will yield about 25 gallons of oil. This oil is run into huge pipes holding 2,000 to 3,000 pounds each, where it hardens into a pure In this white substance not unlike tallow. form it is shipped to the factories. In the factory the oil is reduced to a rich yellow liquid in large tanks. These tanks are made double, and when the oil is inside it can be raised to a high temperature by the water in the jacket. A solution is put in to kill the fermenting germs of the oil. The oil next goes to the centrifugal machine, where it is The velocity of this remixed with water. volving bowl is about 4,000 revolutions per minute, and throws off the water and the germ-killing solution through one spout and the oil through another. The oil is carried to the storage tanks, where it is weighed. It then goes into tin vats partly filled with water. Here it is treated to a blast of cold air which granulates the oil until it looks like little lumps of pure white butter floating in butter-

#### Cocoanut

milk. It is skimmed off with large skimmers. leaving the water. It is then loaded into trucks and left in the storeroom for several days to develop acids. It is then put into an ordinary creamery churn and butter worker where the water is thoroughly squeezed out of If the butter is to be used for table purit. poses a little half-churned cream and butter color is put in. The greater part of the cocoanut butter is left white, in which condition it is almost tasteless and odorless. It is used in the kitchen in the place of cheap butter or lard. Cocoanut butter, by chemical analysis, is shown to have the same ingredients as real butter, with the exception of butyric acid, in the place of which it contains lauric acid.

**Co' coanut** (or Coco-nut), a woody fruit of an oval shape, from 3 or 4 to 6 or 8 in. in length, covered with a fibrous husk, and lined internally with a white, firm, and fieshy kernel. The tree which produces the cocoanut is a palm, from 40 to 60 ft. high. The trunk is straight

Cocoanut Palm (Cocos nuciferal, a.-portion of young spathe, with enclosed inflorescence; b.branch of spadix; c.-smailer portion enlarged, showing a female flower below, and male flower above; d.-cocoanut; c.-husk cut open, showing hard endocarp, at f opened to show the single seed.

and naked, and surmounted by a crown of feather-like leaves. The nuts hang from the summit of the tree in clusters of a dozen or more. The external rind of the nuts has a smooth surface. This encloses fibrous substance of considerable thickness, which surrounds the nut. The latter has a thick and hard shell, with three black scars at one end, through one of which the embryo of the future tree pushes its way. The kernel encloses a considerable quantity of sweet and watery liquid, of a whitish color, which has the name of *milk*. This palm is a native of Africa, the East and West Indies, and South America, and is now

### Cod-Liver Oll

grown almost everywhere in tropical countries. Food, clothing, and the means of shelter and protection, are all afforded by the cocoanut tree. The kernels are used as food in various modes of dressing, and yield, on pressure, an oil which is largely imported into various countries. When dried before the oil is expressed, they are known as *copra*. The fibrous coat of the nut is made into the well-known cocoanut matting; the coarse yarn obtained from it is called coir, which is also used for cordage. The hard shell of the nut is polished and made into a cup or other domestic utensil. The fronds are wrought into baskets, brooms, mats, sacks, and many other useful articles; the trunks are made into boats, or furnish timber for the construction of houses. By boring the tree a white, sweetish liquor called toddy exudes from the wound, and yields by distillation one of the varieties of the spirit called arrack. A kind of sugar called jaggery is also obtained from the juice by inspissation.

**Cocca Plum**, a fruit which is eaten in the West Indies. It is about the size of a plum. with a sweet and pleasant though somewhat austere pulp.

**Coccoon'**, the name given to the web or ball spun by caterpillars before passing into the chrysalis state. The valuable product thus obtained from the silkworm is well known.

**Cod**, a genus of well-known, soft-finned fish. is distributed throughout the temperate seas of Europe, Asia. and America. It feeds in water 25-50 fathoms deep. Its voracity in-clines it to take greedily almost any bait. The clines it to take greedily almost any bait. The genus is characterized by three dorsal and two anal fins, and a single barbel. The cod is prolific and spawns in February. The roe of a female forms more than half its weight. Roe is used for food, and in France, for bait in sardine fishing. Cod reaches maturity about the end of the third year, but second year cod are marketable. Ordinarily a cod weighs from 12 to 20 lbs., but some have been taken weighing from 50 to 70 lbs. The best months for cod fishing are October, November and December. The most noted cod fisheries in the world are off the coasts of Newfoundland. The London market is supplied from the coasts of Norfolk and Suffolk, where the cod is taken with hook and line and carried to market alive in well-boats. Salted and dried cod are exported to all parts of the world. From the swimming bladder of the cod is obtained isinglass, and from the liver. cod-liver oil. which is used in cases of rheumatism and pul-monary consumption. The Norwegians are said to feed cod heads with marine plants to cows to increase the quantity of milk. Dried cod bones furnish them with fuel. At Point Logan, in Wigtonshire, cod is cultivated in a great reservoir scooped out of solid rock. A barrier of stone through which the water has free egress, prevents the escape of the cod. The fish are fed on mussels and become very tame. Their flavor is superior to that of cod taken from the open sea.

**Cod-Liver Oil,** an oil extracted from the livers of different kinds of cod — the common

cod being specified in the pharmacopæia and allied species. The finest and palest oil is got from fresh and carefully cleaned liver, the oil being extracted either in the cold or by a gentie heat. The darker kinds are got at a higher temperature, and often from the livers in a putrefying state. Only the pale oils are used in medicine; the dark oils are too rank and acrid, and they are only used in dressing leather. Cod-liver oil is a somewhat complex substance, but the main ingredients appear to be olein and margarin. Acetic, butyric, and other acids are also present, and to these the oil may owe some of its odor. **Cod'rus**, according to Greek legend the last

**Cod<sup>7</sup> rus,** according to Greek legend the last king of Athens. Having learned that the enemies of his country would be victorious, according to the declaration of an oracle, if they did not kill the Athenian king, he voluntarily entered their camp, provoked a quarrel, and was slain. The grateful Athenians abolished the royal dignity, substituting that of archon, esteeming no one worthy to be the successor of Codrus.

Cody, WILLIAM F. (better known as "Buffalo Bill"), b. in Scott co., Iowa, 1845. He spent the early part of his life among the Indians on the Western frontier until the Civil War broke out, when he offered his services as a Union scout. He rendered valuable service during the war to several commanders. Cody was a member of a camp of U. S. troops which protected the laborers during the construction of the Union Pacific R. R., and took the contract to supply the entire force with fresh buffalo meat for a certain period, hence his soubriquet of "Buffalo Bill." Later he took to the stage, and finally collected a band of Indians, cowboys, rough riders, unbroken bronchos, and a small herd of buffalo, and commenced a series of exhibitions in the principal cities of America. The show is known as the "Wild West." He made a tour through the principal cities of Europe in 1802. He is at present managing this show with success.

**Coe**, GEORGE S., American financier, b. in Newport, R. I., in 1817. He began life as a bank clerk in 1834. In 1855 he became connected with the American Exchange National bank, first as vice-president and later as president. In 1858 he was instrumental in organizing the New York clearing house banks into an association.

**Coelentera'ta**, a sub-kingdom of animals, including those whose alimentary canal communicates freely with the general cavity of the body ("the somatic cavity "). The body is essentially composed of two layers of membranes, an outer layer and an inner layer. No circulatory organs exist, and in most there are no traces of a nervous system. Peculiar stinging organs or "thread-cells" are usually present, and in most cases there is a radiate or starlike arrangement of the organs, which is especially perceptible in the tentacles, which are in most instances placed round the mouth. Distinct reproductive organs exist in all, but multiplication also takes place by fission and budding. The Cœlenterata are divided into two great sections, the Actinozoa and the Hydrozoa, and include the medusas, corals. sea-anemones, etc. They are nearly all marine animals.

**Coffee** is the seed of an evergreen shrub which is cultivated in hot climates, and is a native of Abyssinia and of Arabia. This shrub is from 15 to 20 ft. in height. The leaves are green, glossy on the upper surface, and the flowers are white and sweet-scented. The fruit is of an oval shape, about the size of a cherry, and of a dark red color when ripe. Each of these contains two cells, and each cell a single seed, which is the coffee as we see it before it undergoes the process of roasting. Great attention is paid to the culture of coffee in Arabia. The trees are raised from seed sown in nurseries and afterward planted out in moist and shady situations, on

#### Coffee; branch with fruit.

sloping grounds or at the foot of mountains. Care is taken to conduct little rills of water to their roots, which at certain seasons require to be constantly surrounded with moisture. When the fruit has attained its maturity cloths are placed under the trees, and upon these the laborers shake it down. They afterward spread the berries on mats, and expose them to the sun to dry. The husk is then broken off by large and heavy rollers of wood or iron. When the coffee has been thus cleared of its husk it is again dried in the sun, and, lastly, winnowed with a large fan, for the purpose of clearing it from the pieces of husks with which it is intermingled. A pound of coffee is generally more than the produce of one tree; but a tree in great vigor will produce 3 or 4 lbs. The best coffee is imported from Mocha, on the Red Sea. It is packed in large bales, each containing a number of smaller bales, and when good appears fresh and of a greenish olive color. Next in quality to the Mocha coffee may perhaps be ranked that of

36

. ...

Southern India and that of Ceylon, which is strong and well flavored. Java and Central America also produce large quantities of excellent coffee. Brazilian coffee, though produced more abundantly than any other, stands at the bottom of the list as regards quality. Liberian coffee may also be mentioned. Of the best Mocha coffee grown in the province of Yemen little or none is said to reach the Western markets. Arabia itself, Syria, and Egypt consume fully two thirds, and the remainder is exclusively absorbed by Turkish or Armenian buyers. The only other coffee which holds a first rank in Eastern opinion is that of Abyssinia. Then comes the produce of India which those accustomed to the Yemenite variety are said to consider hardly drinkable. The Dutch were the first to extend the cultivation of coffee beyond the countries to which it is native. About 1690 some coffee seeds were brought to Java, where they were planted and produced fruit. By 1718 the Dutch planters of Surinam had entered on the cultivation of coffee with success, and ten years after, it was introduced from that colony by the English into Jamaica, and by the French into Martinique. It was not till 1774 that the planters of Brazil, now the greatest producers of coffee in the world, commenced its cultivation. Coffee as an article of diet is of but comparatively recent introduction. To the Greeks and Romans it was wholly unknown. From Arabia it passed to Egypt and Turkey, whence it was introduced into England. In Great Britain much less is drunk than on the Continent of Europe or in the U.S. and Canada. The excellence of coffee depends in a great measure on the skill and attention exercised in roasting it. If it be too little roasted it is devoid of flavor, and if too much it becomes acrid, and has a disagreeable, burned taste. Coffee is used in the form either of an infusion or decoction, of which the former is decidedly preferable, both as regards flavor and strength. Since the middle of the eighteenth century both the culture and consumption of coffee have continually increased. The principal supply of the U. S. is derived from Brazil, which furnishes 75 per cent. of the whole import. It is known in commerce as "Rio." Coffee acts as a nervous stimulant, a property which it owes mainly to the alkaloid caffeine.

Coffee comes to the roasting factory in coarse gunny sacks, and is dumped into bins. In the factory are rows of iron roasters, in the interior portions of each one of which is a hollow cylinder with a capacity of several hundred pounds and filled with innumerable little holes. Underneath it a strong fire is kept burning. When the raw coffee has been placed in the cylinder, a shaft begins to revolve at a low rate of speed, turning the cylinder and thoroughly mixing the coffee. Each variety of coffee requires a different time for roasting and thus necessitates very experienced workmen in this process. When the coffee berries have swelled up and become just brown enough, the fire is shut off and the cylinders are emptied

and recharged. When the coffee is cool it goes to the packing room where it is shoveled into barrels, bales, sacks, and paper packages, ready for shipment.

**Coffer-dam**, a temporary wooden enclosure formed in water in order to obtain a firm and dry foundation for bridges, piers, etc. It is usually formed of two or more rows of piles driven close together, with clay packed in between the rows.

**Coffin**, the chest or box in which a dead body is enclosed for burial. Coffins were used by the ancients mostly to receive the bodies of persons of distinction. Among the Romans it was latterly the almost universal custom to consume the bodies with fire, and deposit the ashes in urns. In Egypt coffins seem to have been used in ancient times universally. They were of stone, earthenware, glass, wood, etc. A sort of ancient coffin is known as a sarcophagus. Coffins among Christians were introduced with the custom of burying. Modern coffins are usually made of wood, and are sometimes enclosed in a leaden case. It has recently been proposed to employ coffins of wicker work.

**Cognac** (kon-yak), a town in France, dep. Charente and near the river Charente, 22 mi. w. Angoulême pleasantly situated on a hill, crowned by the remains of an old castle. It is famous for the brandy which bears its name. and which is exported to all parts of the world. Pop. 17,392.

**Cogno'vit**, in law, is a written confession given by the defendant that the action of the plaintiff is just, or that he has no available defense.

**Cohesion Figures**, a class of figures produced by the attraction of liquids for other liquids or solids with which they are in contact, and divided into surface, submersion, breath, and electric, cohesion figures. Thus a drop of an independent liquid, as oil or alcohol, will spread itself out on the surface of water always in a definite figure, but differing with each fluid dropped on the water. Breath figures are produced by putting a drop of the liquid to be examined on a slip of mica, and breathing on it, when each fluid takes a distinct characteristic shape. Electric cohesion figures are produced by electrifying drops of various liquids placed on a plate of glass.

liquids placed on a plate of glass. **Cohoes**, Albany co., N. Y., on Hudson River, at the mouth of the Mohawk River and Erie Canal. It has the Del. & Hud. Canal Co., the N. Y. C. & H. R. railroads. Industries: colton mills, knitting mills, tube works, rolling mills, ax factories, foundries, and machine shops. Pop. est. 1897, 25,000.

**Coimbatore**, a town of Hindustan, Madras presidency, capital of district to which it gives name. Pop. 46,383. The district has an area of 7,860 sq. mi. It is fertile, producing sugar. cotton, rice, and tobacco; and well watered by several rivers. Pop. 2,004,839.

**Colmbra** (ko-im 'brå), a city of Portugal, province of Beira. It contains an old and a new cathedral, a hospital, and a university which is the only one in the kingdom. Manufactures: linen. pottery, articles of horn. The

environs produce oil, wine, lemons, and oranges of excellent quality. Pop. 51,226.

Coining, the art of converting pieces of metal into current coins for the purposes of commerce, usually performed in a government establishment called a mint. It is one of the prerogatives of the supreme power in all states, and counterfeiting or otherwise tampering with the coin is severely punished. In the U.S. the Bureau of the Mint was established as a division of the Treasury Department in 1873. It has charge of the coinage for the government and makes assays of precious metals for private owners. The rolling machines are four in number. The rollers are adjustable, and the space between them is governed by the operator. About 200 ingots are run through per hour on each pair of rollers. When the rolling is completed the strip is about 6 ft. long. As it is impossible to roll perfectly true it is necessary to "draw" these strips, after being softened by annealing. The drawing benches resemble long tables. with a bench on either side, at one end of which is an iron box secured to the table. In this are fastened two perpendicular steel cylinders. These are at the same distance apart that the thickness of the strip is required to be. It is drawn between the cylinders, which reduces the whole to an equal thickness. These strips are now taken to the cut-ting machines, each of which will cut 225 planchets per minute. The press now used consists of a vertical steel punch. From a strip worth \$1,100 about \$800 of planchets will be cut. These are then removed to the adjusting room, where they are adjusted. After inspection they are weighed on very accurate scales. If a planchet is too heavy, but near the weight, it is filed off at the edges; if too heavy for filing, it is thrown aside with the light ones to be remelted. The planchets, after being adjusted, are taken to the coining and milling rooms, and are passed through the milling machine. The planchets are fed to this machine through an upright tube, and as they descend are caught upon the edge of a revolving wheel and carried about a quarter of a revolution, during which the edge is compressed and forced up. By this apparatus 560 half dimes can be milled in a minute; for large pieces the average is 120. The massive but delicate coining presses coin from 80 to 100 pieces a minute. These presses are attended by women. After being stamped the coins are taken to the coiner's room. The light and heavy coins are kept separate in coining, and when delivered to the treasurer they are mixed in such proportions as to give him full weight in every delivery. By law, the deviation from the standard weight, in delivering to him, must not exceed three pennyweights in 1,000 double eagles.

**Coir**, cocoanut fiber, fiber from the husk of the nut, from which are manufactured matting, bagging, ropes, and cables. Coir cordage, from lasting well in salt water, as also from its lightness, strength, and elasticity, is preferable in many respects to ropes of hemp. Mats and matting are now largely made of coir, which is also used in coarse brushes, for stuffing purposes, etc.

**Coke**, the carbonaceous residue of coal which has been heated in an oven or retort, or in any way by which little air is admitted, until all volatile matter has been expelled. The simvolatile matter has been expelled. plest method of producing coke is based on the preparation of wood charcoal, the coal being arranged in heaps, which are smothered with clay or coal dust, and then set on fire, sufficient air being admitted to keep the mass at the proper temperature for decomposition without After the volatile portions wasting the coke. are got rid of, the heap is allowed to cool, or is extinguished with water, and the coke is then ready. Methods of heating the coal in close or open ovens until the gaseous and fluid products are driven off are also commonly used. Gas coke is that which remains in the retorts after the gas has been given off. Good oven coke has an iron-gray color, sub-metallic luster, is hard, and somewhat vesicular; but gas coke has rather a slagged and cindery look, and is more porous. Coke contains about 90 per cent. of carbon, and is used where a strong heat is wanted without smoke and flame, and it is accordingly largely consumed in drying malt and similar purposes. It used to be burned regularly in locomotive engines, but raw coal is now commonly substituted. The largest quantities are consumed in smelting operations

**Coke**, SIR EDWARD (1551-1634), an eminent English lawyer. He was chosen recorder of the cities of Norwich and of Coventry, knight of the shire for his county, and, in spite of the rivalship of Bacon, attorney general. As such he conducted the prosecutions for the crown in all great state cases. In 1013 he became chief justice of the Court of King's Bench. In 1621 he was committed to the Tower, and soon after expelled from the privy council. In 1628 he was chosen member for Buckinghamshire. On the dissolution of the Parliament he retired to his seat in Buckinghamshire, where he died. His principal works are legal text books of the highest value.

**Colberg** (or Kolberg), a Prussian fortified seaport in Pomerania. Pop. 16,027.

**Colbert** (kol-bār), JEAN BAPTISTE (1619-1683), a celebrated French minister of finances. He was made intendant, and at length comptroller general of the finances. He instituted many reforms.

**Colburn,** ZERAH (1804-1840), "the calculating boy," b. in Vermont. Before his sixth year he began to manifest wonderful powers of arithmetical computation, and in public exhibitions astounded learned mathematicians by the rapidity and accuracy of his processes, but the faculty left him when he grew up. After acting as a teacher and itinerant preacher, he was latterly professor of languages at Norwich University, Vermont.

**Col' chester**, a borough of England, county Essex. It has a good coasting trade and employs a great number of small craft in the oyster fishery. It is a place of high antiquity. there being no place in the kingdom where so great a quantity and variety of Roman remains have been found as here. Pop. 34.559.

Colchicum (kol'chikum), a genus of plants, allied to the lilies. The meadow saffron is a bulbous-rooted, stem-less, perennial plant, which grows in various parts of Europe. From a small corm or bulb buried about 6 in. deep, and covered with a brittle brown skin, there rises in the early autumn a tuft of flowers having much the appearance of crocuses, flesh-colored, white, or even variegated. They soon wither, and the plant disappears till the succeeding spring, when some broad leaves are thrown up by each corm along with a triangular oblong seed-vessel. The plant is acrid and poisonous

Cold Cream, a cooling ointment prepared in various ways. A good variety may be made by heating four parts of olive oil with one of white wax. This ointment cools the skin, rendering it soft and pliable,

Colden, CADWALLADER (1688-1776), colonial physician, b. in Dunn, Scotland. In 1708 he came to this country and practised medicine in Philadelphia until 1715, when he visited Scotland, and returned to Philadelphia in 1716. In 1718 he removed to New York, and obtained a patent for land near Newburg. In 1719, he became the first surveyor general of the province, and master in chancery. He was appointed a member of the council in 1720, and was a Royalist, and an advocate of the taxation of the colonies. In 1760, he was made president of the council, and, in 1761, lieutenant governor, which office he held until his death.

Coldwater, Branch co., Mich., on Cold-water River, 87 mi. from Toledo. Railroad, L. S. & M. S. Industries: numerous mills and It is the site of the state public factories. school. Pop. est. 1897, 6.000.

Cole, THOMAS (1801-1848), landscape-painter. He was b. in England, but was taken quite young to America. Among his works are the Voyage of Life, Course of Empire, Hunter's Return, Views in the White Mountains, etc.

**Coleop'tera**, an order of insects, commonly known as *beetles*. They have four wings, of which the two superior are not suited to flight, but form a covering and protection to the two inferior, and are of a hard and horny or parch-ment-like nature. The inferior wings, when not in use, are folded transversely under the superior. The coleoptera undergo a perfect metamorphosis. The larva generally resembles a short thick worm with six legs and a scaly head and mouth.

**Coleraine** (kol-ran'), a town, Ireland, county of Londonderry, 47 mi. n.w. of Belfast. Its trade, chiefly in linen, agricultural produce, and provisions, is considerable. Pop. 6,845.

**Coleridge**, the name of an English family famous in literature and law. The most distinguished of its members were Hartley Coleridge (1796-1849), Henry Nelson Coleridge (1800-1843), and the poet Samuel Taylor Cole-ridge (1772-1834). The latter was b. at Ottery St. Mary, Devonshire, of which his father was vicar. From Christ's Church he went with a scholarship to Jesus College, Cambridge, where he remained for two years. In 1795 he was married to Miss Fricket of Bristol. In 1796 he took a cottage at Nether Stowey, in Somersetshire, where he wrote much of his best poetry. While residing at Nether Stowey he used to officiate in a Unitarian chapel at Taunton, and in 1798 received an invitation to take the charge of a congregation of this denomination at Shrewsbury. Later he made a trip to Germany, where he studied at the Uni-Southey at Keswick, while Wordsworth lived at Grasmere in the same neighborhood. From this fact, and a certain common vein in their poetry, arose the epithet of "Lake School" applied to their works. About 1804 Coleridge went to Malta to re-establish his health, seriously impaired by opium-eating. In 1806 he returned to England, and after ten years of somewhat desultory literary work as lecturer, contributor to periodicals, etc., Coleridge took refuge from the world in the house of a friend at Highgate, London. Here he passed the rest of his days.

Colfax, Schuyler (1823-1885), American statesman. b. in New York City. He entered Congress in 1854 and served until March, 1869. From Dec. 7, 1863, to March 4, 1869, he was speaker of the house. He was elected vice president of the U.S. in 1868.

Coligny (kol-in-yē), GASPARD DE (1517-1572), He was made admiral of French admiral. France in 1552 On the night of St. Bartholomew's, Coligny was basely slaughtered.

Colima (ko-lē' mā), a town of Mexico, capital of the state of same name, situated in a fertile plain encircled by hills above which rises the lofty volcano of Colima. Pop. about 25,736. On the coast about 30 mi. s.s.w. of the city is the port, Puerto de Colima, or Manzanillo. The state has an area of 2,272 mi.; pop. 73,026.

Col'lege, in a general sense, a body or society of persons invested with certain powers and rights, performing certain duties, or engaged in some common employment or pursuit. In the U.S. and England some societies of physicians are called colleges. The most physicians are called colleges. The most familiar application of the term college, however, is to a society of persons engaged in

# **College Fraternities**

the pursuits of literature, including the professors, lecturers, or other officers, and the students. As applied to an educational institution the name is somewhat loosely used. The higher class of colleges are those in which the students engage in study for the purpose of taking a degree in arts, medicine, or other subjects, and are connected with, or have more or less the character of, universities. The early history of these institutions is somewhat obscure; the probability is that they were originally founded in the various universities of the Middle Ages, with similar objects and from the same charitable motives. Hostels or boarding houses were provided (principally by the religious orders for the benefit of those of their own fraternity), in which the scholars lived under a certain superintendence, and the endowment of these hostels by charitable persons for the support of poor scholars completed the foundation of a college. Out of this has developed the modern college of which there are about 500 in the **U.** S.

College Fraternities, or "Greek letter" societies, as they are often called, are organizations of students in colleges and universities of the U.S. They receive their names from two or more letters of the Greek alphabet, as Delta Kappa Epsilon. Each of these letters is the beginning of a word of the secret motto of the fraternity. The purpose of such societies is literary and social. A fraternity is made up of several chapters in various colleges through-out the Union. Each fraternity has a general government and holds conventions either an-nually or bi-annually. There are also some local fraternities which have but one chapter. The number of chapters in various fraternities varies from four to seventy-five. There are several professional fraternities, as medical, law, and dental fraternities, etc. There are several similar organizations of young women known as sororities. The first fraternity formed was *Phi Beta Kappa*, now an honorary fra-ternity. This was founded at William and Mary's College, Va., in 1776. There are at present over a hundred college fraternities in the U.S. Among the earliest fraternities the U. S. Among the earliest fraternites founded after the *Phi Beta Kappa*, were *Alpha Delta Phi* in 1832, at Hamilton College, N. Y.; *Kappa Alpha* in 1835, at Union College, N. Y.; *Beta Theta Pi* at Miami College, O.; *Delta Kappa Epsilon* in 1844, at Yale; *Psi Upsilon* in 1833, at Union College, N. Y. College Point Oppose co. N. Y. on Long

**College Point,** Queens co., N. Y., on Long Island Sound, 3 mi. n. of Flushing. Railroad, Long Island. It has some manufactures, principally of india-rubber goods. Pop. est. 1897, 5,000.

**Collie**, a variety of dog especially common in Scotland, and from its intelligence of much use to shepherds. It is of medium size and varies much in coloring, black and white being common, and black with tan-colored legs, muzzle, etc., being highly esteemed. The head is somewhat fox-shaped, the ears erect, but with drooping points, the tail rather bushy, and with a strong curl. **Col'lier, JEREMY** (1650-1726), English divine and political writer. He obtained the rectory of Ampton in Suffolk in 1659. He is chiefly remembered now for his *Short View of the Immorality and Profaneness of the English Stage*—a work of some merit which is said to have effected a decided reform in the sentiments and language of the theater.

**Collier**, JOHN PAYNE (1789-1883), English Shakespearian critic. In 1831 his best work, the *History of English Dramatic Poetry*, was published. In 1842-44 he published an annotated edition of Shakespeare in 8 vols.; in 1844 Shakespeare's Library.

**Collimation,** LINE OF, in an astronomical instrument, such as a telescope or transit instrument, the straight line which passes through the center of the object glass and intersects at right angles a system of spider threads placed at the focus of the eye piece. The proper adjustment of the line of collimation of the instrument is necessary to accurate observation of the time at which movements of the heavenly bodies take place.

**Collins**, WILLIAM (1721-1759), English poet. While studying at Oxford he wrote his *Oriental Ecloques*. In 1746 he published his *Odes*.

#### Collie.

**Collins**, WILLIAM WILKIE (1824-1889), a noted British novelist. Among his best known works are Antonina, Basil, After Dark, The Woman in White, The New Magdalen, The Eril Genius, etc.

**Collo'dion**, a substance prepared by dissolving pyroxiline (gun cotton) in ether, or in a mixture of ether and alcohol, which forms a useful substitute for adhesive plaster in the case of slight wounds. When the fluid solution is applied to the cut or wound it immediately dries into a semitransparent, tenacious film, which adheres firmly to the part, and under it the wound or abrasion heals without inflammation. In a slightly modified form collodion is also employed as the basis of a photographic process called the collodion process.

Collyer, ROBERT, Unitarian clergyman, b. in

### Colmar

England, 1823. He attended a night school for two winters, and, at the age of fourteen, was apprenticed to a blacksmith. In 1850 hecame to this country and worked as a hammer maker in Shoemakertown, Pa., and preached on Sundays. In 1860 he organized Unity Church, of Chicago, of which he was the pastor until 1879, when he removed to New York to assume charge of the Church of the Messiah, which post he still (1897) holds.

**Col'mar** (or Kolmar), a city of Germany, in Upper Alsace, formerly in the French department of Haut Rhin, 39 mi. s.s.w. Strassburg. It has manufactures of printed goods, calicoes, silks, etc., besides cotton mills, tanneries, etc. It was united to France in 1697 by the Peace of Ryswick, and surrendered to Germany by the Treaty of Versailles, Feb, 26, 1871. Pop. 30,399.

**Coloca'sia**, a genus of plants, nat. order Arceæ, the leaves and tuber of which are acrid. The latter contain much starchy matter, and they are used as food in the south of Europe after the acrid matter is separated by washing or boiling.

**Cologne** (ko·lõn'), a city of Rhenish Prussia, on the left bank of the Rhine, forming, in connection with Deutz, a fortress of the first rank. The old fortifications, dating from the Middle Ages, are being, or have been recently, swept away, new works being constructed. There are many fine old buildings as well as excellent modern ones; the churches in particular are interesting. The most important edifice of all is the cathedral, begun in 1248, one of the finest and largest Gothic structures in Europe. The manufactures embrace sugar, tobacco, glue, carpets, leather, machinery, chemicals, pianos, and the celebrated eau de Cologne. The trade is very great. Pop. 161,401.

**Cologne Yellow**, a pigment consisting of 2 parts yellow chromate of lead, 1 of sulphate of lead, and 7 of sulphate of lime or gypsum. It is prepared by precipitating a mixture of nitrate of lead and nitrate of lime with sulphate of soda and chromate of potash.

Colom bia, REPUBLIC OF, formerly called New Granada, a republic of South America, consisting of nine departments or states of Antioquia, Bolivar, Boyaca, Cauca, Cundi-namarca, Magdalena, Panama (or Istmo), Santander, and Tolima. Pop. 3,907,524. The chief towns are Bogota, the capital, Medellin, and Panama. The territory of the republic includes the whole of the Isthmus of Panama, to the borders of Costa Rica, the Pacific coast south to Ecuador, and that of the Caribbean Sea east to Venezuela; but there is much disputed boundary territory in the inland regions toward the south and east. The area is estimated officially at 504,773 sq. mi. According to surface conformation the country may be divided into the elevated region of the Cordilleras in the west, and that of the low-lying lands in the east. The former occupies the greater portion of the country and presents a richly-diversified surface, being formed chiefly of three mountain chains which stretch north

and south in a nearly parallel direction, enclosing between them the valleys of the rivers Cauca and Magdalena. These, the two great navigable rivers of the country, flow northward, joining their waters about 120 mi. from their embouchure in the Caribbean Sea. In the central ridge is the culminating point of Colombia, the volcano of Tolima, 18,315 ft. high. The low lands of the east form a transitionary region between the plains of North Brazil and the llanos of the Orinoco region, the drainage being carried to the Amazon and Orinoco. The chief coast indentations are the Gulfs of Panama and Darien. The climate is naturally as varied as the surface of the country, but over a great part of the republic is very hot. At Cartagena on the Caribbean Sea, and on the Pacific coast, yellow fever is endemic at some places: while on the elevated country, as the plain of Bogota, 8,000 ft. above the sea, the climate is perfectly salubrious, and the temperature seems that of eternal spring. The flora is rich and luxuriant. A great part of the country is still covered with virgin forests, which yield excellent building wood, Peruvian bark, caoutchouc, vanilla, etc. The fauna includes the jaguar, puma, tapir, armadillo, sloth, various species of deer, and the gigantic condor. The mineral wealth is various and abundant. It comprises coal, gold, silver, emeralds, and salt. Industry is at a very low stage. Maize, bananas, and plantains are the chief articles of food. Tobacco and coffee are cultivated and exported. Sugar is also grown. Manufactures can scarcely be said to exist, Panama hats, mats, and coarse cotton cloths being almost the only articles that can be mentioned in this class. The chief ports are Barranquilla, Cartagena, Colon, and Panama. The possession of the Isthmus of Panama and the small line of railway (48 mi. long) which runs between Panama on the Pacific and Aspinwall on the Atlantic gives Colombia considerable commercial importance, which is likely to be increased by the canalization of the isthmus, if this is ever completed. The foreign trade is chiefly with Britain and the U.S. The exports are chiefly precious metals, hides, coffee, tobacco, etc.; the imports, manufactured goods. There are several short lines of railway. The money standard is the pese or dollar, nominal value \$1. dollar, nominal value \$1. By the consti-tution, as amended in 1886, the executive power is vested in a president elected for six years, the legislative power in a congress of two houses - the senate and the house of representatives. The former consists of 27 representatives, 3 from each department, and 6 members nominated by the president; the latter, of representatives elected for four years. one for every 50,000 inhabitants. The revenue is generally under the expenditure and the finances are in an unsatisfactory state. New Granada was discovered by Alonso de Ojeda in 1499: it was visited by Columbus on his fourth voyage, in 1502. The first Spanish settlement was made in 1510 at Santa Maria in the Gulf of Darien, and the whole country

# Colombo

was formed into a province under a captain general in 1547. New Granada declared its independence of Spain in 1811, and after eleven years of warfare succeeded with the help of Venezuela in effecting its liberation. Both states then united with Ecuador, also freed from the Spanish domination, to form the first republic of Colombia; but internal dissensions arising, the three states again separated in 1831, forming three independent republics, which have had a very troubled existence. In 1861 the states forming New Granada by agreement adopted a new constitution, the republic henceforth to be called the United States of Colombia. This title was retained till, by the new constitution adopted in 1886, the state ceased to be a federal republic and became a unitary republic with the name of Republic of Colombia. Its recent history has presented a series of civil broils.

**Colom'bo**, a seaport town, the capital of Ceylon, on the southwest coast, and about 70 mi. w. by s. of Kandy, with which it is connected by railway. The public buildings comprise the government offices, government house, supreme court, museum, etc. Through the construction of a breakwater and other works there is now excellent harbor accommodation; and numerous vessels call here. Pop. 126,825.

**Colon'**, (or Aspinwall) (the former is the official name), a free port of Colombia, on Manzanillo Island, on the north side of the Isthmus of Panama, at the Atlantic extremity of the interoceanic railway, and near that of the Panama Canal. Established in connection with the railway, it had an important transit trade before the canal was begun, and since then the place has been entirely transformed, a new town with wide and regular streets having been built on a tract of land reclaimed by the Canal Company. There is extensive harbor accommodation. Pop. 10,956.

**Colon' na**, an Italian family that had become important as early as the eighth century. Its fame during the Middle Ages eclipsed that of every other Roman family except the great rival house of the Orsini. The Colonna family is at present represented by several branches, the Colonna-Sciarra, Colonna-Stigliano, etc. It played an important part in the affairs of Europe, became allied to the greatest houses of Italy, Spain, and Germany, and has furnished many celebrated warriors, popes, and cardinals.

**Colon'na**, CAPE. the southern extremity of Attica, Greece. Its summit is crowned by the ruins of a temple of Athena 269 ft. above the sea, of which sixteen columns of white marble are still standing.

**Colon'na**, VITTORIA (1490-1547), the most renowned poetess of Italy, was the daughter of Fabrizio Colonna, high coustable of Naples. At the age of seventeen she was married to Ferdinand, Marquis of Pescara, who became one of the distinguished men of his age. All her poems were devoted to the memory of her husband. Her most celebrated work is the *Rime Spirituali*.

## Colony

Col'ony, a settlement formed in one country by the inhabitants of another. Colonies may either be formed in dependence on the mother country or in independence. In the latter case the name of the colony is retained only in a historical sense. Properly, perhaps, the term should be limited to a settlement which carries on a direct cultivation of the soil, as in the Dominion of Canada or Australia; such settlements as those of the British in Hindustan or Malta being the mere superposition on the natives of a ruling race which takes little or no part in the general industry of the countrv. Sometimes the ambition of extending territory and the desire of increasing wealth have been the chief impulses in colonization; but colonies may now be said to have become a necessity for the redundant population of European states. Among ancient nations the principal promoters of colonization were the Phœnicians, the Greeks, and the Romans; the greatest colonizers in modern times have been the English and the Spaniards, next to whom may be reckoned the Portuguese, the Dutch, and the French. The Germans have latterly contributed largely to the tide of emigration, particularly in the direction of America; but they have done little directly as colonizers. The Phoenician colonies were partly caused by political dissensions and redundant population, but were chiefly commercial, serving as entrepôts and ports of repair for Phœnician commerce along the coasts of Africa and Spain, in the latter of which they numbered, according to Strabo, more than two hundred. But it was in Africa that the most famous arose, Carthage, the greatest colonizing state of the ancient world. The Greek colonies, which were widely spread in Asia Minor and the islands of the Mediterranean, the coasts of Macedonia and Thrace, in South Italy and Sicily, were commonly independent, and frequently soon surpassed the mother states in power and importance. The colonies of Rome were chiefly military, and while the empire lasted were all in strict subordination to the central government. As the Roman power declined the remains of them amalgamated with the people among whom they were placed, thus forming in countries where they were sufficiently strong what are known as the Latin races, with languages (Spanish, Portuguese, French, and Italian) which are merely modi-Before fications of the old Roman tongue. America and the way by sea to the East Indies were discovered, the only colonies belonging to European states were those of the Genoese, Pisans, and Venetians in the Levant and the Black Sea, flourishing establishments on which the mercantile greatness of Italy in those days was largely built.

The *Portuguese* were the first great colonizers among modern states. In 1419 they discovered Madeira, the Azores, and the Cape Verd Islands; the Congo and the Cape of Good Hope followed; and before the century was out Vasco da Gama had landed at Calicut on the Malabar coast of India. The first Portuguese colonies were garrisons along the coast where they traded: Mozambique and Sofala on the east coast of Africa, Ormuz and Muscat in the Persian Gulf. Goa and Damao on the west coast of India. Colonies were established in Ceylon in 1505, in the Moluccas in 1510. Brazil was discovered in 1499, and this magnificent possession fell to Portugal, and was colonized about 1530. Bad government at home and the subjection of the country to Spain caused the loss of most of the Portuguese colonies. The Portuguese now possess several territories in Asia, at Goa, Damao, and Diu, India; Macao, China; and some is-lands in the Indian Archipelago. In Africa they possess the Cape Verd and other islands; settlements in Senegambia, Guinea, Mozambique, Sofala, Angola, Benguela, Mossamedes, formally amounting in area to about 700,000 sq. mi.; but Portuguese influence is really limited to a very small portion of this.

Soon after the Portuguese the Spaniards commenced the work of colonization. In 1492 Columbus, on board of a Spanish vessel, discovered the island of San Salvador. Hayti, or San Domingo, Porto Rico, Jamaica, and Cuba were soon colonized, and before the middle of the sixteenth century Mexico, Ecuador, Ven-ezuela, New Granada, Peru, and Chile were subdued, and Spain took the first rank among the colonizing powers of Europe. But the Spaniards never really attempted to develop the industrial resources of the subject coun-The pursuit of mining for gold or silver tries. occupied the colonists almost exclusively, and the enslaved natives were driven to work themselves to death in the mines. Cities were founded, at first along the coasts. for the sake of commerce and as military posts, afterward also in the interior, in particular in the vicinity of the mines, as Vera Cruz, Cumana, Porto Bello, Carthagena, Valencia, Caracas: Acapulco and Panama on the coast of the Pacific; Lima, Concepcion, and Buenos Ayres. The colonial intercourse with Spain was confined to the single port of Seville, afterward to that of Cadiz, from which two squadrons started annually-the galleons, about twelve in number, for Porto Bello; and the fleet, of fifteen large vessels, for Vera Cruz. When the power of Spain declined, the colonies soon took the opportunity to declare their independence, and thus were formed the republics of Mexico, Venezuela, Colombia, Ecuador, Peru, Bolivia, Chile, etc. Cuba, Porto Rico, the Philippine Islands, and a few other small places in India and Africa are now all that remain of the colonies of Spain.

The hate of Philip II, who prohibited Dutch vessels from the port of Lisbon, forced the Dutch to import directly from India or lose the large carrying trade they had acquired. Several companies were soon formed, and in 1602 they were united into one, the Dutch East India Company, with a monopoly of the East India trade and sovereign powers over all conquests and colonies in India. The Dutch now rapidly deprived the Portuguese of nearly all their East Indian territories. settled a colony at the Cape of Good Hope (1650), established a West India Company, made extensive con-

quests in Brazil (1623-60), which were soon lost, and more permanent ones on some of the smaller West India Islands, as San Eustatia, Curaçoa, Saba, etc. The growing power of the British and the loss of Holland's independence during the Napoleonic wars were heavy blows to the colonial power of the nation. But the Dutch still posses numer-ous colonies in the East Indies, among which the more important are Java, Sumatra, Dutch Borneo, the Molucca Islands, and part of New Guinea, also several small islands in the West Indies, and Surinam. No colonizing power of Europe has had a career of such uni-form prosperity as Great Britain. The English attempts at colonization began nearly at the same time with the Dutch. After many fruitless attempts to find a northeast or northwest passage to the East Indies, English vessels found their way round the Cape of Good Hope to the East Indies in 1591. The East India Company was established in 1600. English commerce with India, however, was not at first important, and they possessed only single factories on the continent up till the beginning of the eighteenth century. The ruin of the Mogul Empire in India after the death of Aurengzebe (1707) afforded the opportunity for the growth of British power, as the British and French were compelled to interfere in the contentions of the native princes and govern-The French appeared at first to maintain ors. the superiority; but the British in turn got the upper hand, and the victory of Clive at Plassey in 1756 laid the foundation of an exclusive British sovereignty in India. By the middle of the next century the British territory embraced, with the exception of a few dependent states, nearly the whole of India, and this vast territory was still under the government of the East India Company—a mercantile company, controlled indeed by Parliament, but exercising many of the most important functions of an independent sovereignty. On the suppres-sion of the Indian mutiny (1857-58) the government of India was transferred to the crown by act of Parliament in 1858.

The discoveries of the Cabots, following soon after the voyages of Columbus, gave the English crown a claim to North America, which though allowed to lie dormant for nearly a century, was never relinquished, and which, in the reign of Elizabeth, led to colonization on a large scale. Raleigh's settlement on Roanoke Island (North Carolina), in 1585, failed to become permanent, but in 1607 the colonists sent out by the London Company to Chesapeake Bay founded Jamestown, on the James River, in Virginia. The next great settlement was that of the Pilgrim Fathers, who landed Dec. 21, 1620, in Massachusetts Bay. The colonization of New Hampshire, Maine, New Jersey, Connecticut, Rhode Island soon followed. In the state of New York and the Hudson River territory the British found the Dutch already in possession, but in 1654 they seized the colony of New Amsterdam by force, changing its name to New York in honor of James, duke of York. Pennsylvania was

founded by William Penn, and colonized with Quakers in 1682; Maryland in 1631 by a party from Virginia; Carolina in 1670, and Georgia in 1732 by colonies from England. Colonies were early established in the West India Islands, including Barbadoes, half of St. Christopher's (1625), and soon after many smaller islands. Newfoundland was taken possession of in 1583, colonized in 1621 and 1633. Canada was surrendered to Britain at the peace of Paris, in 1763. In 1764 began the disputes between Britain and its North American colonies, which terminated with the acknowledgment of the independence of the U.S., Canada still remaining a British dependency.

Australia was discovered in the beginning of the seventeenth century. The first Australasian settlements of Britain were penal colonies. New South Wales, discovered in 1770, was established as a penal colony in 1788; Tasmania (Van Dieman's Land), discovered by Tasman in 1642, followed in 1803; West Australia, also first used as a penal settlement, became a free colony in 1829; Victoria (Port Philip) was colonized in 1835, and made an independent colony under its present name in 1851; South Australia was settled in 1836; New Zealand, discovered by Tasman in 1642, began to be used for whale fishery about 1790, was settled in 1839, and made a colony in 1840. In 1851 the discovery of the abundance of gold in Victoria ave a great impetus to the prosperity of the Australian colonies. In 1874 the Fiji Islands, and in 1884 part of New Guinea, were annexed as crown colonies. In South Africa Cape Colony. first settled by the Dutch in 1652, became an English colony in 1814. The latest annexations in this quarter are Griqualand West (1880), the Transkeian Territories (1875-84), Walfisch Bay (1884), and Bechuanaland (1885). Further north are the crown colonies-Lagos, the Niger Districts, the Gold Coast, Gambia, and Sierra Leone-all, except Lagos, which was acquired in 1861, ancient possessions of Britain. In Europe Great Britain has a few colonies acquired for military reasons-Gibraltar in 1704; Malta and Gozzo 1800, Heligoland 1807 (to Germany, 1890). It is estimated that the existing British colonies and dependencies embrace about one sixth of the land surface of the globe and nearly the same proportion of its population.

According to their government relations with the crown the colonies are arranged under three heads: 1, Crown colonies, in which the crown has the entire control of legislation, while the administration is carried on by public officers under the control of the home government. 2, Colonies possessing representative institutions but not responsible government, in which the crown has no more than a veto on legislation, but the home government retains the control of public officers. 3, Colonies possessing representative institutions and responsible government, in which the crown has only a veto on legislation, and the home government has no control over any officer except the governor. All colories are, however, disabled from such acts of independent sovereignty as the initiative in war, alliances, and diplomacy generally.

France was somewhat late in establishing colonies. Between 1627 and 1636 the West Indian islands of St. Christopher's, Guadeloupe, and Martinique were colonized by private persons. Champlain was the pioneer of the French in the exploration of the North American continent, and founded Quebec in 1608. Colbert purchased several West India Islands, as Martinique, Guadeloupe, St. Lucia, etc., and sent out colonists in 1664 to Cayenne. In 1670 the East India Company formed by Colbert founded Pondicherry, which became the capital of extensive possessions in the East Indies. At the beginning of the eighteenth century France had extensive settlements in Canada, Nova Scotia, and Newfoundland, the most flourishing of the West India Islands, and she seemed to have a prosperous career before her in India. Ere long, however, the rival interests of British and French colonists brought about a conflict which terminated in the loss of Canada and other North American possessions, as well as many of the West India Islands, while the dominion of India passed into the hands of the The chief colonial possessions of British. France at present are: in India, Pondicherry, and a few other small territories; Cochin-China, Tonquin, and the protectorates of Anam and Cambodia in Southeastern Asia; New Caledonia, the Loyalty and Marquesas Islands, etc., in Oceania; in Africa, Algeria, Tunis, Senegambia, island of Réunion, the protectorate of Madagascar, etc.; in America, Martinique, Gnadeloupe, St. Bartholomew, and Guyana. Algeria is now officially a French department.

Of recent years Germany has made an effort to take rank as a colonial power, and has acquired in Africa the territories of Damaraland and Luderitzland to the northward of Cape Colony, the Cameroons District, a considerable portion of territory formerly claimed by the sultan of Zanzibar, the Kilima-Njaro, the greater part of Somaliland, etc.; also in the Pacific a portion of New Guinea, now called Kaiser Wilhelm's Land, and the Bismarck Archipelago. Denmark's northern dependencies, Iceland, Greenland, and the Faroe Islands, though of considerable extent are of small value. In the West India Islands she has St. Thomas, settled in 1672; Santa Cruz, purchased from France in 1733; St. John; and some smaller islands.

**Col'ophon,** an ancient Ionian city of Asia Minor about 8 mi. n. of Ephesus, one of the places that claimed to be the birthplace of Homer. and the native city of Mimnermus, the elegiac poet, and of other eminent men.

**Colorado** (kol-o-rä'dō), one of the U. S. of America, situated in the central belt of states in the Rocky Mountains, and containing an area of 104,500 sq. mi. It is traversed from north to south by the main range of the Rocky Mountains, and forms a part of the region designated upon the early maps of the U. S. as the "Great American Desert." The plains east of the mountains constitute about one third of the total area. Among the elevated ranges are four large, natural parks the North, South, Middle, and San Luis—

•

which form distinct, picturesque, and beautiful features of the mountain system, and are watered by numerous streams and covered with verdure. The San Luis park, situated in the southwestern division, is the only one of the series that is well adapted to agriculture, and the only one which has been peopled to any considerable extent. It is traversed from north to south by the Rio Grande River, has six towns, a mixed population of Americans and Mexicans, the whole numbering about 6,000. Sixteen thousand sq. mi. are covered by forests, chiefly yellow and white pine and spruce. None of the harder woods, except a few clusters of scrub oaks, worthless for anything but fuel, exist in Colorado. Four fifths of the state has an elevation of 4,000 to 10,000 ft. above the sea. The lowest on the eastern border is 3,703 ft., and on the western, 4,435. The mountain parks are 8,000 to 9,500 ft. above tide water. The summit of the main range averages 11,000 ft. Seventy-two peaks from which the snow never disappears, rise to heights between 13,500 and 14,500 ft. The loftiest of these is the Sierra Blanca, a part of the chain enclosing the San Luis park, 14,483 ft. high. The geographical center of Colorado is at a point 3 mi. n.n.e. of Spinney Station, on the Colorado Midland Railway, in Park The principal rivers on the eastern county. slope of the great mountains are the South Platte and the Arkansas; on the western, the Grand and the Gunnison, each re-enforced by innumerable tributaries from the melting snows. None are navigable. Here and there are beautiful fresh-water lakes, swarming with flsh.

Climate.—The climate of Colorado is remarkably heathful. The air is dry, clear, and well adapted to the cure of diseases of the lungs and throat, The annual range of temperature is much less than in other sections of the country. In the various parts it is about  $60^\circ$  F. and the highest temperature does not exceed  $80^\circ$  nor the lowest  $20^\circ$  below. Health resorts are numerous in the mountain regions and there are also mineral and thermal springs. The mean temperature at Denver is  $50^\circ$ .

The mean temperature at Denver is 50°. Vegetation.—The soil is fruitful and the climate is well adapted to the growth of cereals. The state is almost a treeless region, although there are a few trees in the river bottoms; these are cottonwood, box elder, scrub oak, pine, and spruce. The sides of the mountain up to the snow line are covered with pines of various kinds, spruce, and fir. These woods furnish the supply of lumber needed. There is a large supply of native grass in Colorado and this furnishes pasture for the large herds of cattle and sheep. Vegetables of all kinds and many fruits are successfully grown. The soil of the greater part of the state is very fruitful where it can have sufficient moisture. Irrigation is used to a great extent, and in such regions wheat, maize, barley, oats, hay, and po-tatoes are staple products. The proverbial "Colorado potato bug" has proved very de-structive to many crops. Cattle and sheep structive to many crops. raising are important industries. The value of the crops in 1892 was, corn, \$1,109,000; wheat, \$1,452,000; oats, \$964,200.

Minerals .- The chief industry of the state is mining, and in its yield of gold and silver it is the leading state of the Union. Nearly every known mineral is found within the state. There are thousands of mines which produce lodes of silver and gold. There are also large deposits of lead ores, and the state produces about 45 per cent. of the entire lead output of the whole country. One mine has been known to yield since its discovery about \$160,000,000. Since 1880 Colorado has produced about \$480,-000,000 of gold and silver. One of the richest gold fields in the world has recently been opened up in the Cripple Creek district. In various parts of the state are iron mines of a good quality. There are large supplies of copper, zinc, cement, silica, gypsum, onyx, and several valuable clays. There are many veins of anthracite and bituminous coal and nearly every town and city in the state has coal

within close range. Manufactures.—In manufacturing Colorado ranks as the 28th state of the Union, producing annually about \$70,000,000 worth of goods of various kinds. At the present time there are about 700 manufacturing establishments employing about 22,000 hands. The principal manufacturing industries are in connection with the mineral products of the state: they are brass works, lead works, machine shops, foundries, iron works, building materials, tin. copper works, flouring mills, and furniture.

copper works, flouring mills, and furniture. Railroads.—There are at present about 4,500 mi. of railroads. The first railroad was built in 1870 extending n. from Denver 106 mi. and connecting with the Union Pacific at Chevenne. Six trunk lines reach Denver from the Missouri River, and another extends from Denver to Fort Worth, Texas, forming a connection with lines to Galveston and New Orleans. The principal system is that of the Denver & Rio Grande which extends to Santa Fć, N. M., having lateral branches extending to all the important towns in the southern, southwestern, and western divisions of the state. There are also connecting lines between Denver and Salt Lake City.

Education.—Colorado has a state university, agricultural college, school of mines, state normal school, all of which are sustained by legislative appropriations. Other institutions of learning are Colorado College, University of Denver, Westminster University of Colorado, Presbyterian College of the Southwest, Longmont College, St. John's College, Jesuit College, etc. Since the admission of the state into the Union, over \$15,000,000 has been expended in the extension of the common school system. There are thirty public libraries in the state, with about 65,000 volumes.

History.—About half of the present state of Colorado was acquired from France in the Louisiana purchase; the remainder was obtained from Mexico under the Treaty of Guadalupe Hidalgo. It was organized as a territory in 1801 and became a state in 1876, and is commonly known as the Centennial State. The

### Colorado

•

principal towns and cities are Denver, Aspen, Colorado Springs, Leadville, and Pueblo. Woman suffrage was adopted in the election of 1893 by a majority of over 4,000 votes. The new capitol building was completed in 1894 at a cost of \$2,250,000. In 1890 the population was 404,468 whites; 7,730 colored; 1,083 Indians, and 612 Chinese, making a total of 413,893. Since that time there has been a large increase in population owing to the discovery of the gold fields. In population the state ranks thirty-first in the Union.

Gorernors.—John L. Routt, 1876-79; Frederick W. Pitkin, 1879-83; James B. Grant, 1883-85; Benjamin H. Eaton, 1885-87; Alva Adams, 1887-89; Job A. Cooper, 1889-91; John L. Routt, 1891-93; Davis H. Waite, 1803-95; Albert W. McIntire, 1895-97; A. Adams, 1897.

**Colorado**, a name of two rivers of the U. S. — 1. The WESTERN COLORADO, (or Rio Colorado), formed by the junction of the Green and Grand rivers, in Utah. It flows s.w. and s. through Arizona, and between Arizona and Nevada and California, and after a total course, including Green River, of about 1,200 mi. falls into the Gulf of California. Among the most wonderful natural objects in North America is the Big Cañon of the Colorado. Here the river flows between walls of rock which are nearly vertical, and are in some places 6,000 ft. high. This cañon is more than 300 mi. long. 2, A river in Texas which rises in the n.w. part of the state, flows generally s.e., and after a course of about 900 mi. falls into the Gulf of Mexico at the town of Matagordo.

**Colorado**, Mitchell co., Tex., on Colorado River, 230 mi. w. of Fort Worth. Railroads: Texas & Pacific: and Colorado Valley. Industries: salt works, wool scouring mills, ice plant, and rolling works. Surrounding country agricultural and grazing. The town was first settled in 1876 and became a city in 1882. Pop. est., 1897, 1,800.

**Colorado Beetle**, an American species of beetle, nearly half an inch in length, almost oval, of a yellowish color marked with black spots and blotches, and on the elytra with ten black longitudinal stripes. The wings are of a blood-red color. It works great havoc among the potato crops.

**Colorado Springs,** El Paso co., Colo., 75 mi. s. of Denver. Railroads: D. & R. G.; C. R. I. & P.; Denver & Gulf; A. T. & S. F.; and Colorado Midland. It is a popular health resort and situated only ten miles from Pike's Peak. Colorado College is located there. The town was first settled in 1871. Pop. est., 1897, 20,000.

**Collos' sæ**, an ancient city of Asia Minor, in Phrygia, on the Lycus, a branch of the Mæander. It was the seat of one of the early churches of Asia to whom the apostle Paul wrote about 62 or 63 A. D.

**Colosse'um**, a name given to the Flavian Amphitheater in Rome, a large edifice for gladiatorial combats, fights of wild beasts, and similar sports. It was begun by Vespasian, and finished by Titus 80 A. D. The outline of the Colosseum is elliptic, the exterior length of the building being 620 and its breadth 513 ft.; it is pierced with eighty openings or vomitaria in the ground story, over which are superimposed three other stories, the whole rising perpendicularly to the height of 160 ft. Although two thirds of the original building have disappeared it is still a wonderful structure.

Colos'sus, in sculpture, a statue of enormous magnitude. The Asiatics, the Egyptians, and in particular the Greeks, have excelled in these works. The most celebrated Egyptian colossus was the vocal statue of Memnon, in the plain of Thebes, supposed to be identical with the most northerly of two existing colossi (60 ft. high) on the west bank of the Nile. Among the colossi of Greece the most cele-brated was the colossus of Rhodes, a brass statue of Apollo 70 cubits high, esteemed one of the wonders of the world, erected at the port of Rhodes by Chares, 290 or 288 B. c. It was thrown down by an earthquake about 224 B. C. The statue was in ruins for nearly nine centuries, when the Saracens, taking Rhodes, sold the metal, weighing 720,900 lbs., to a Jew, about 653. There is no authority for the popularly-received statement that it bestrode the harbor mouth, and that the Rhodian vessels could pass under its legs. Among the colossi of Phidias were the Olympian Zeus and the Athena of the Parthenon; the former 60 ft. high and the latter 40. The most famous of the Roman colossi were the Jupiter of the Capitol, the Apollo of the Palatine Library, and the statue of Nero, 112 or 120 ft. high, and from which the contiguous amphitheater derived its name of Colosseum. Recently rock-cut statues have been measured at Bamian on the road between Cabul and Balkh, the largest being 173 ft. high and the second 120 ft.

Among modern works of this nature is the colossus of San Carlo Borromete; at Arona, in the Milanese territory, 60 ft. in height; the Bavaria at Munich, 65 ft. high; the statue of Hermann or Arminius near Detmold, erected in 1875, 90 ft. in height to the point of the upraised sword, which itself is 24 ft. in length; the height of the figure to the point of the helmet being 55 ft.: the statue of Germania, erected in 1883 near Rüdesheim, a figure 34 ft. high, placed on an elaborately-sculptured pedestal over 81 ft. high; and Bartholdi's statue of Liberty presented to the U.S. by the French nation, and which measures 104 ft., or to the extremity of the torch in the hand of the figure 138 ft. It is erected at New York harbor on a pedestal 114 ft., is constructed for a light-house with one of the most powerful fixed lights in the world, and stands 317 ft. above mean tide.

**Color** is the name given to distinguish the various sensations that lights of various rates of vibration give to the eye. As is the case with many of the words that denote our sensations, the word *color* is also applied to the properties of bodies that cause them to emit the light that thus affects our senses. The molecular constitution of a body determines

the character and number of the light vibrations it returns to the eye, and so gives to each body its own characteristic color; hence the term color is used to denote that in respect of which bodies have a different appearance to the eye independently of their form.

Ordinary white light (the light which comes from an incandescent solid or liquid) when transmitted through triangular prisms of glass or other media differing in dispersive power from the atmosphere, is shown to consist of a number of colored lights, which, meeting the eye, together produce the sensation of white The colors thus shown are usually light. said to be seven-red, orange, yellow, green, blue, indigo, violet; although in reality there is an enormous, if not an infinite number of perfectly distinct colors in light. The seven colors are frequently called the primary colors, and other tints and shades are producible by mixing them; but in a stricter sense the primary colors are three in number, namely, red, green, and violet (or blue). These three colors or kinds of light cannot be resolved into any others. In the scientific sense of the word white and black are not considered colors, a white body reflecting and a black body absorbing all the rays of light without separating them, whereas the colors proper are due to separation of the rays of light by partial absorption and reflection or by refraction. If a body absorbs every other kind of light and reflects or transmits red light only, it will appear of a red color; if it absorbs every kind except blue rays, it will appear blue; and so on. If more than one kind of light be transmitted or reflected the object will appear of a color compounded of these different rays of light.

In art the term color is applied to that combination or modification of tints which produces a particular and desired effect in painting. The colors of the spectrum have to be distinguished from color used in reference to pigments. The pigments red, blue, and yellow, regarded in the arts as the primary colors, produce effects when mixed, very different from those produced by admixture of the corre-sponding spectrum colors. These three pigment colors form other colors thus: red and yellow make orange, yellow and blue make green, and red and blue make purple; but red, blue, and yellow cannot be produced by any combination of the other colors. *Local colors* are those which are natural to a particular object in a picture, and by which it is distinguished from other objects. Neutral colors, those in which the hue is broken by partaking of the reflected colors of the objects which surround them. Positive colors, those which are unbroken by such accidents as affect neutral Complementary colors, colors which objects. together make white; thus any of the primary colors is complementary to the other two. Subjective or accidental colors, the imaginary complementary colors seen after fixing the eye for a short time on a bright-colored object, and then turning it suddenly to a white or lightcolored surface.

Color Printing, the art of producing pic-

tures, designs, cards, etc., in various colors by means of lithography, printing from metal blocks, etc. The ordinary methods are: 1, The chromo-lithographic, in which a tracing of the original picture, or the like, is first made, and a copy transferred to as many stones as there are colors in the original, every color requiring a fresh stone. The drawing on each stone is made to fit in, or register, with the preceding one, and as the paper passes through the machine an additional color is added every time, and thus the picture is built up color upon color (each being allowed to dry before the next is put on) until it is completed. Some chromos or oleographs may have as many as 25 or 30 printings or colors. 2, Block or surface color printing is specially adapted for book illustrations or similar work where nicety of detail or rapidity of production is required. As in chromo-lithography various printings are necessary; but these. while producing similar effects, are reduced in number by a method of printing several tints of the same color at one operation. Each block, which is usually of zinc and prepared in the usual way, is capable of producing three or more gradations of the same color: the darkest shade from the normal surface. lighter shades being got from parts which have been bitten or corroded in an almost imperceptible degree-the deeper corrosions giving, of course, the lightest shade. When all the tints of one color are thus printed from one block and in one operation, a second block with gradations, in the same way, is used. registering as in chromo-lithography, and so on until the picture is finished.

**Coltsfoot**, a weed of the order Compositæ. the leaves of which were once much employed as a remedy for asthma and coughs. The name is given from the leaf somewhat resembling the foot of a colt, being broad and heartshaped; the flowers are yellow.

**Col' uber**, a genus of non-venomous serpents, which includes several North American snakes. To the same family belongs the common ringed snake which attains a length of 3 or 4 ft.

**Colum' ba,** Sr. (521-597), a native of Ireland. In 545 he founded the monastery of Derry. About 563 he landed in the island of Hy, now called Iona, and founded his church. About 565 he went on a mission of conversion among the northern Picts, and traversed the whole of Northern Scotland preaching. Shortly before his death he revisited Ireland.

**Columbia**, DISTRICT OF, a portion of the U.S. containing the national capital, is bounded on the w. by the Potomac River and on all other sides by Maryland. It contains the cities of Washington and Georgetown and has an area of 64 sq. mi. The seat of government was moved here from Philadelphia in 1900, and in 1814, the Capitol, White House, and executive buildings were burned by the British. The control of the government of the district is in charge of three commissioners appointed by the president. These have power to make appointments to all offices in the cities and district. Among institutions of note outside the

capital are, the Soldiers' Home, the Columbia Institute for the Deaf and Dumb, and the government hospital for the insane. Pop. est. 1890, 230,392. See *Washington*.

**Columbia**, Richland co., S. C., 130 mi. n.w. of Charleston on the Congagree River; the state capital. Railroads: Junc. Rich. & Danv., and others. Seat of the University of South Carolina, the Ursuline Institute (Catholic), a state insane asylum, etc. Center of a rich agricultural and forest district. Pop. est. 1897, 15,950.

**Columbia**, Lancaster co., Pa., on Susquehanna River, 12 mi. w. of Lancaster. Railroads: P. R. R.; Reading & Columbia; Columbia & Port Deposit, Frederick div. Industries: silk mills, several iron foundries, flour mill, iron mills, stove works, and lace mills. Surrounding country mineral and agricultural. The town was first settled in 1726 and is still a borough. Pop. est. 1897, 13,000.

**Columbia**, Maury co., Tenn., on Duck River, 45 mi. s. of Nashville. Railroads: N. C. & St. L.; L. & N.. and N. F. & Sheffield. Industries: cotton mills, two flouring mills, three lumber and planing mills, and a pump factory. Surrounding country is agricultural and mineral, and is in the blue grass region of Tenn. The town was first settled in 1807. Pop. est. 1897, 7,000.

**Columbia College**, a distinguished educational institution in New York, established in 1746, and giving a course of instruction in literature, divinity, science, medicine, law, and mining.

**Columbia River** (or Oregon), a river of the U. S. flowing into the Pacific Ocean, and rising at the base of the Rocky Mountains in British Columbia. It has a very winding course partly in British Columbia but mainly in the U. S., where it receives two large tributaries, Clark's River and Snake River. Latterly it turns abruptly to the west and forms the boundary between Washington and Oregon. It drains an area of 298,000 sq. mi., and has a length of about 1.400 mi.

**Columbian Exposition**, created by act of Congress of April 25, 1800, providing for celebrating the 400th anniversary of the discovery of America by Columbus. See *World's Colum*bian Exposition.

**Col'umbine**, the popular name of plants with five colored sepals and five spurred petals. The common columbine is a favorite garden flower, and owes its name to the fancied resemblance of the petals to the form of pigeons.

**Columbus**, Muscogee co., Ga., on left bank of Chattahoochee River, 100 mi. s.s.w. of Atlanta. Railroads: Central of Georgia; Georgia Midland & Gulf; and Southwestern. Principal industries are large cotton mills, iron works, plow, barrel, and bagging factories, and many smaller industries. The export trade in cotton is very large. Surrounding country agricultural. Pop. est. 1897, 18,000.

**Columbus**, Lowndes co., Miss., on Tombigbee River. Railroads: M. & O.; and the Southern Ry. Industries: cotton mills, flouring mills, iron foundry, manufacture of agricultural implements, and many small factories. Large quantities of coal in vicinity. Surrounding country agricultural and mineral. Pop. est. 1897, 10,000.

**Columbus,** Bartholomew co., Ind., on e. fork of White River, 41 mi. s. by e. of Indianapolis. Railroads: Jefferson, Madison & Indianapolis; C. C. C. & St. L.; P. C. & St. L. Principal industries: tanneries, lumber mills, woolen and starch works, furniture factories, and agricultural implements. Pop. est. 1897, 6,800.

**Columbus**, Franklin co., O., on Scioto River, 120 mi. n.e. of Cincinnati. Railroads: B. & O.; P. C. & St. L.; C. St. L. & P.; and eight others. It has a large inland trade in grain, wool, live stock, iron and coal, and important manufactures, principally iron and steel products, agricultural implements, and carriages. Lumber, leather, edge tools, and plows are also largely produced. It has a magnificent state capitol, State University of Ohio, Capital University, Ohio Agricultural and Mechanical College, and institutions for the blind, deaf, and dumb, and a large state penitentiary. Pop. est. 1897, 100,000.

Columbus, CHRISTOPHER (1436-1506), the discoverer of America, was b. in Genoese terin life developed a taste for geographical knowledge. In 1470 he married the daughter of Palestrello, a navigator. About this time he formed the opinion that undiscovered land lay west of Spain, and that it belonged to the continent of Asia. Aug. 3, 1492, by the aid of Isabella, queen of Spain, he was enabled to start on a voyage in search of a shorter route to India than the one around Africa. October 12 he landed on the island of Guanahani and named it San Salvador. He reached Cuba October 28, and Hayti December 6. Jan. 4, 1493 he returned to Spain. He made a second and third voyage, discovering a number of islands, and the main land of South America. Hoping to find the passage to India through Darien, he undertook a fourth voyage, May 9, 1502. In this expedition he was accompanied by his brother Bartolommeo and his son Her-He encountered every imaginable nando. disaster from storms and shipwreck, and returned to Spain, sick and exhausted, in 1504. After two years of illness, humiliations, and despondency, he d. at Valladolid. His remains were transported, according to his will, to the city of St. Domingo, but on the cession of Hispaniola to the French they were removed in January, 1796, to the cathedral of Havana in Cuba.

**Col'umn**, in architecture, a round pillar, a cylindrical solid body set upright and primarily intended to support some superincumbent weight. A column has as its most essential portion a long solid body, called a *shaft*, set vertically on a *stylobate*, or on a congèries of moldings which forms its *base*, the shaft being surmounted by a more or less bulky mass which forms its *capital*. In classical architecture columns have commonly to support an *entablature* consisting of three divisions, the *archi*-

#### Comanches

trave, frieze, and cornice, adorned with moldings, etc. Columns are distinguished by the names of the styles of architecture to which they belong; thus there are Hindu, Egyptian, Grecian, Roman, and Gothic columns. In classic architecture they are further distinguished by the name of the order to which they belong, as Doric, Ionic, Corinthian, Composite, or Tuscan columns. They may also be characterized by some peculiarity of position, of construction, of form, or of ornament, as attached, twisted, cabled, etc., columns. Columns are chiefly used in the construction or adornment of buildings. They have also been used, however, singly for various purposes, especially for monuments.

**Comanches** (kö-man'chēz), an American Indian tribe formerly roaming through Texas and part of Mexico. They were excellent horsemen, and extremely warlike, but their numbers are now insignificant. Some of them have been collected on a reservation in the western part of the Indian Territory.

**Comayagua** (kō-mā-vä'gūà), a town of Central America, in Houduras, the capital of department of the same name, situated on the southern border of the plateau of Comayagua, about midway between the two oceans; a poor place. Pop. 6.240.

**Comb**, an instrument with teeth, made of tortoise shell, ivory, horn, wood, bone, metal, or other material, used for dressing the hair, and by women for keeping the hair in its place when dressed. Combs have been used from the earliest times by rude as well as by eivilized races.

**Combaco' num**, a town of Hindustan, presidency of Madras, district of Tanjore. It was the ancient capital of the Chola dynasty, and is one of the most ancient and sacred towns in the presidency. It has a great many well endowed Hindu temples, a government college, courts, etc. Pop. 50,098.

Combustion, the operation of fire on inflammable substances, or the union of an inflammable substance with oxygen or some other supporter of combustion, attended with heat and in most instances with light. In consequence of the combination of the carbon in fuel with the oxygen of the air being the universal method of getting heat and light, and as when the action takes place the fuel is said to burn or undergo combustion, the latter term has been extended to those cases in which other bodies than carbon-for example, phosphorus, sulphur, metals, etc.-burn in the air or in other substances than air-for example, chlorine. Though the action between the gas and the more solid material, as coal, wood, charcoal, of whose combination combustion is the result, is mutual, the one having as much to do with the process as the other, yet the former, as oxygen, chlorine, iodine, and the compounds which they form with each other and with nitrogen, have received the name of supporters of combustion, while to the latter the term combustibles has been assigned.

Spontaneous Combustion is the ignition of a body by the internal development of heat

without the application of fire. It not unfrequently takes place among heaps of rags. wool, and cotton when lubricated with oil; hay and straw when damp or moistened with water; and coal in the bunkers of vessels. In the first case the oil rapidly combines with the oxygen of the air, this being accompanied with great heat; in the second case the heat is produced by a kind of fermentation; in the third by the pyrites of the coal rapidly absorbing and combining with the oxygen of the air. The term is also applied to the extraordinary alleged phenomenon of the human body being reduced to ashes without the direct application of fire. It is said to have occurred in the aged and persons that were fat and hard drinkers; but most chemists reject the theory altogether, maintaining that none of the instances adduced are well authenticated.

**Com'ets**, certain celestial bodies which appear at irregular intervals, moving through the heavens in paths which seem to correspond with parabolic curves, or in a few instances in elliptical orbits of great eccentricity. The former, after being visible from the earth for a shorter or longer time, disappear into space apparently never to return; the latter return to us periodically. Some comets are only visible by the aid of the telescope, while others can be seen by the naked eye. In the latter case they usually appear like stars accompanied with a train of light, sometimes short and sometimes extending over half the sky, mostly single and more or less curved, but sometimes forked. In a comet which appeared in 1744 the train was divided into several branches. The spreading out from the head like a fan. train is not stationary relatively to the head, but is subject to remarkable movements. The direction in which it points is always opposite to the sun, and as the comet passes its perihelion the train changes its apparent position with extraordinary velocity. The head of the comet is itself of different degrees of luminosity, there being usually a central core, called the nucleus, of greater brilliancy than the surrounding envelope, called the coma.

Comets were long regarded as supernatural objects, and usually as portents of impending calamity. Tycho Brahe was the first who expressed a rational opinion on the subject, coming to the conclusion that the comet of 1577 was a heavenly body at a greater distance from the earth than that of the moon. The general law of the motion of the bodies, as well as his own observations on the comet of 1680, led Newton to conclude that the orbits of the comets must, like those of the planets, be ellipses, having the sun in one focus, but far more eccentric: and having their aphelions, or greater distances from the sun, far remote in the regions of space. This idea was taken up by Halley, who collated the observations which had been made of all the twenty-four comets of which notice had been taken previous to 1680. The results were very interesting. With but few exceptions the comets had passed within less than the earth's shortest distance from the sun, some of them within less than

one third of it, and the average about one half. Out of the number, too, nearly two thirds had had their motions retrograde, or moved in the opposite direction to the planets. While Halley was engaged on these comparisons and deductions the comet of 1682 made its appearance, and he found that there was a wonderful resemblance between it and three other comets that he found recorded-the comets of 1456, of 1531, and of 1607. The times of the appearance of the comets had been at very nearly regular intervals, the average period being between seventy-five and seventy-six years. Their distances from the sun, when nearest to that luminary, had been nearly the same, being nearly six tenths of that of the earth, and not varying more than one sixtieth from each other. The inclination of their orbits to that of the earth had also been nearly the same, and their motions had all been retrograde. Putting these facts together Halley concluded the comets of 1456, 1531, 1607, and 1682 were reappearances of one and the same comet, which revolved in an elliptic

orbit round the sun, performing its circuit in a period varying from a little more than seventysix years to a little less than seventy-five; or having, as far as the observations had been carried, a variation of about fifteen months in the absolute duration of its year, measured according to that of the earth. For this variation in the time of its revolution Halley accounted upon the supposition that the form of its orbit had been altered by the attraction of the

remote planets Jupiter and Saturn as it passed near to them; and thence he concluded that the period of its next appearance would be lengthened, but that it would certainly re-appear in 1758 or early in 1759. As the time of its expected reappearance approached, Clairaut calculated that it would be retarded 100 days by the attraction of Saturn, and 518 by that of Jupiter, so that it would not come to the perihelion, or point of its orbit nearest the sun till April 13, 1759. It actually reached its perihelion on March 13, 1759, being thirty days earlier than had been calculated. Along the period of this comet and its perihelion distance the magnitude and form of its path were also calculated. Estimating the mean distance of the earth from the sun at 95,000,000 mi. (the number which was at that time considered the true one), the mean distance of the comet was calculated to be 1,705,250,000 mi.: its greatest distance from the sun, 3,355,400,000: its least distance 55,100,000; and the transverse or largest diameter of its orbit, 3,410.-500,000. This comet, therefore, is a body belonging to the solar system, and quite beyond the attraction of any body which does not be-long to that system. In 1835 it again returned, being first seen at Rome, August 5, and from that time continued to be observed till the end of the year in Europe, and through a great part of spring 1836 in the southern hemisphere.

The comet denominated Encke's comet, which has made repeated appearances, and first observed in 1818, and was identified with a comet observed in 1786, also with a comet discovered in 1795 by Miss Herschel in the constellation Cygnus, and with another seen in 1805. Its orbit is an ellipse of comparatively small dimensions, wholly within the orbit of Jupiter; its period is 1.260 days, or about  $3_{10}^{2}$  years. It has been frequently ob-served since. Another comet, the history of which is of the utmost importance in the latest theories regarding the connection of these bodies and the periodic showers of shooting stars, is one known as Biela's comet, discovered in 1826. It revolves about the sun in about 64 years, and was identified as the same comet which was observed in 1772 and in 1806. Its returns were noted in 1832, 1839, and 1845. In 1846 it divided into two, returned double in 1852, but has not since been seen, the supposition being that it has been dissipated, and that it was represented by a great shower of meteors that were seen in November, 1872.

Donati's Comet, 1858.

One of the most remarkable comets of recent times was that known as Donati's, discovered by Dr. Donati of Florence in 1858. The paths in which comets move are not, like those of planets, all nearly in the same plane as the orbit of the earth, but are inclined to that orbit at all angles. The orbits of the comets are at all possible angles; and the number increases with the angle, so that they approximate to an equal distribution in all directions round the sun as a center. A modern theory of the nature of comets is that these bodies were ejected millions of years ago from the interior of suns, or planets in a sunlike state. When a comet is viewed through a telescope of considerable power, there appears a dense nucleus in the center of the luminous and apparently vaporous matter of which the external parts are composed; and the opacity of this nucleus varies in different comets. On its first appearance, and again when it recedes, the luminous part of the comet is faint and does not extend far from the nucleus; but as it moves on toward the perihelion the brightness increases, and the luminous matter lengthens into a train, which, in some cases, has extended across a fourth of the entire circumference of the heavens. The most remarkable discovery of recent times regarding comets is the identity of the course of some of them with the orbit of certain showers of shooting stars. This was

first demonstrated by the Italian astronomer Schiaparelli, who proved the agreement between the orbit of the great comet of 1862 and that of the star shower seen annually about August 9, 10. It has since been demonstrated that every meteoric stream follows in the trail of some comet large or small, which wither exists now or has been dissipated, as Biela's comet was, leaving only its meteoric train to show where it once traveled; and that every comet is followed or preceded by a train of meteors, extending over a greater or less portion of the comet's orbit according to the length of time during which the comet has existed.

**Comma**, in punctuation, the point [, ] denoting the shortest pause in reading, and separating a sentence into divisions or members according to the construction. In music, a comma is the smallest enharmonic interval, being the difference between a major and a minor tone, and expressed by the ratio 80:81.

**Commentry** (kom-män-trē), a town of France, dep. of Allier, 8 mi. s.e. of Montluçon, in the midst of a vast coal field, to which the town owes its prosperity. Pop. 12,416.

**Commerce,** CHAMBER OF, a board chosen from among the merchants and traders of a city to protect the interests of commerce; to lay before the legislature the views of their members on matters affecting commerce; to furnish statistics as to the staple trade of the locality; and to attain by combination advantages which could not be reached by private enterprise, etc. These associations originated in France early in the eighteenth offutury. A system of international chambers of commerce for promoting relations with foreign countries has been largely adopted. Nearly all large cities in the U.S. have chambers of commerce. Some are incorporated.

**Commercial Law**, the law which regulates commercial affairs among the merchants of different countries, or among merchants generally. It is derived from the different maritime codes of mediaeval Europe, the imperial code of Rome, international law, and the custom of merchants. In this country the term is applied to that system of laws which refers to mercantile contracts, and is based upon the custom of merchants. The principal subjects embraced within it are the laws of shipping, including that of marine insurance; the law of negotiable bills of exchange and promissory notes; and the law of sales.

**Commercial Treaties**, treaties entered into between two countries for the purpose of improving and extending their commercial relations; each country engaging to abolish or to reduce to an agreed rate or otherwise modify the duties on articles of production and manufacture imported from the one country into the other. They are usually for a limited period but may be renewed and modified according to altering conditions. In the treaties the phrase, "most favored nation," implies concessions equal to the most favorable granted under any similar treaty.

Commines (ko-mēn), PHILIPPE DE (1445-

1509), French writer and statesman. His *Memoires*, published in 1523, were valuable as contributions to the history of his times.

**Committee of Public Safety**, a body elected by the French Convention (April 6, 1793) from among its own members, at first having very limited powers conferred upon it—that of supervising the executive and of accelerating its actions. Subsequently, however, its powers became extended; all the executive authority passed into its hands, and the ministers became merely its scribes.

**Common Council**, the council of a city or a corporate town, empowered to make by-laws for the government of its citizens. The common councils sometimes consist of two houses, chambers or courts, and sometimes form only one. In our American cities the city council is generally composed of two branches, called respectively, select and common. They are elected by the people.

Common Law, the unwritten law, the law that receives its binding force from immemorial usage and universal reception, in distinction from the written or statute law; sometimes from the civil or canon law: and occasionally from the lex mercatoria, or commercial and maritime jurisprudence. It consists of that body of rules, principles, and customs which have been received from former times, and by which courts have been guided in their judicial decisions. The evidence of this law is to be found in the reports of those decisions and the records of the courts. Some of these rules may have originated in edicts or statutes which are now lost, or in the terms and conditions of particular grants or charters; but it is quite certain that many of them originated in judicial decisions founded on natural justice and equity, or on local customs. It is contrasted with, 1, the statute law contained in acts of Congress; 2, equity, which is also an accretion of judicial decisions, but formed by a new tribunal, which first appeared when the common law had reached its full growth; and 3, the civil law inherited by modern Europe from the Roman Empire. Wherever statute from the Roman Empire. law, however, runs counter to common law, the latter is entirely overruled; but common law, on the other hand, asserts its pre-eminence where equity is opposed to it.

**Common Pleas,** in law, pleas brought by private persons against private persons, or by the government, when the cause of action is of a civil nature. In many states of the U. S. a court having jurisdiction generally in civil actions. In England the Court of Common Pleas is now merged in the High Court of Justice.

Commons, House or. See Parliament.

**Common Sense,** the philosophy of the socalled Scotch school of philosophy founded by Thos. Reid (1710-96), who aimed to establish a series of fundamental truths indisputable as primitive facts of consciousness. He taught that the general consent of mankind as to the existence of an external world, as to the difference between substance and qualities, between thought and the mind that thinks, is sufficient

to establish the reality of a permanent world apart from ourselves; and he maintains that sensations are not the objects of our perception, but signs which introduce us to the knowledge of real objects.

**Commune**, a small territorial district in France, being one of the subordinate divisions into which that country is parceled out; the name is also given to similar divisions in some other countries, as Belgium. In the country a commune sometimes embraces a number of villages, while some large cities are divided into a number of communes. In either case each commune is governed by an officer called a mayor.

Commune of Paris.-1, A revolutionary committee which took the place of the municipality of Paris in the French Revolution of 1789, and soon usurped the supreme authority in the state. Among its chiefs were some of the most violent of the demagogues, such as Hébert, Danton, and Robespierre. 2, The name adopted by the ultra-radical party in Paris brought once more into prominence by the events of the Franco-German War, more immediately by the siege of Paris (October, 1870, to January, 1871). They ruled over Paris for a brief period after the evacuation of the German troops, and had to be suppressed by troops collected by the National Assembly of The rising was entirely political and France. confined to Paris; it was based on no well-defined dogmas, only a fractional part of the communal government being communists in the economic sense, and these were soon thrust aside by their more violent and unscrupulous comrades.

**Com'munism**, the economic system, or theory, which upholds the absorption of all proprietary rights in a common interest, an equitable division of labor, and the formation of a common fund for the supply of all the wants of the community: the doctrine of a community of property, or the negation of individual rights in property. No communistic society has as yet been successful. Robert Owen made several experiments in modified communism, but they failed. St. Simon, Fourier, and Proudhon, have been the chief exponents of the system in France; and under the names of socialism, nihilism, etc., it seems to be working as a great, unseen force in several countries.

**Como**, capital of the province of Como, in the north of Italy (Lombardy), 24 mi. n.n.w. of Milan, in a delightful valley at the s.w. extremity of Lake Como. It has a splendid marble cathedral dating from the fourteenth century, the old church of S. Fedele of the tenth century, the townhall finished in 1215, the fine theater built in 1813. Here were born Pliny the elder and younger, and Volta, the natural philosopher. Pop. 25,560. The province of Como has an area of 1,049 sq. mi., and a pop. of 515,134.

a pop. of 515,134. **Como**, a lake in the north of Italy, at the foot of the Alps, fed and drained by the river Adda. It is celebrated for the beautiful scenery of its shores, which are covered with handsome villas, gardens, and vineyards, mountains raising behind to the height of 7,000 ft. Trout and other fish abound in the lake.

**Comorin'**, a cape forming the south extremity of Hindustan, and consisting of a low, sandy point.

sandy point. **Com'oro Islands,** a volcanic group in the Indian Ocean, between the northern extremity of Madagascar and the continent of Africa. They are four in number; Great Comoro, Mohilla, Johanna, and Mayotta. Area 758 sq. mi.; pop. 62,500.

**Compass**, an instrument used to indicate the magnetic meridian or the position of objects with respect to that meridian, and employed especially on ships, and by surveyors and travelers. Its origin is unknown, but it is supposed to have been brought from China to Europe about the middle of the thirteenth century. As now generally used it consists of three parts; namely, the box, the card or fly, and the needle-the latter being the really essential part, and consisting of a small magnet so suspended that it may be able to move freely in a horizontal direction. The box, which contains the card and needle, is, in the case of the common mariner's compass, a circular brass receptacle hung within a wooden one by two concentric rings called gimbals, so fixed by the cross centers to the box that the inner one, or compass-box, shall retain a horizontal position in all motions of the ship. The circular card is divided into thirty-two equal parts by lines drawn from the center to the circumference, called points or rhumbs; the intervals between the points are also divided into halves and quarters, and the whole circumference into equal parts or degrees, 360 of which complete the circle. The four principal are called cardinal points, viz., North, South, East, and West. The names of the rest are compounded of these. The needle is a small bar of magnetized steel. It is fixed on the under side of the card, and in the center is placed a conical socket, which is poised on an upright pointed pin fixed in the bottom of the box; so that the card, hanging on the pin, turns freely round its center, and one of the points, by the property of the needle, will always be directed toward the north pole. The needle, however, is liable to a certain deviation, owing to the magnetism of the ship itself, and this is especially strong in iron ships. To obviate this defect Sir W. Thomson has invented a compass having a number of needles arranged in a particular manner instead of one. In this compass quadrantal errors are corrected by means of two iron globes fixed on opposite sides of the binnacle; while the various components of the ship's magnetic force are neutralized by a series of bar magnets so arranged as to act as correctors. In the compass used by land surveyors and others the needle is not fixed to the card, but plays alone, the card being drawn on the bottom of the box

**Compasses** (or pair of compasses), a mathematical instrument used for the describing of

circles, measuring lines, etc. They consist simply of two pointed legs, movable on a joint or pivot, and are used for measuring and transferring distances. For describing circles the lower end of one of the legs is removed and its place supplied by a holder for a pencil or pen. Hair compasses are compasses having a spring tending to keep the legs apart, and a finely threaded screw by which the spring can be compressed or relaxed with the utmost nicety, and the distance of the legs regulated to a hair's breadth. Bow compasses are compasses having the two legs united by a bow passing through one of them, the distance between the legs being adjusted by means of a screw and nut. Proportional compasses are compasses used for reducing or enlarging drawings, having the legs crossing so as to present a pair on each side of a common pivot. By means of a slit in the legs, and the movable pivot, the relative distances between the points at the respective ends may be adjusted at pleasure in the required proportion.

**Compos**<sup>7</sup>**itze**, the largest known nat. order of plants, containing over 12,000 described species of herbs or shrubs distributed all over the world. The flowers are numerous and sessile, forming a close head on the dilated top of the receptacle, and surrounded by an involucre of whorled bracts. The flowers are monopetalous, and the order is divided into three natural groups from the form of the corolla: 1, *Tubulifora*, in which it is tubular, with five, rarely four, teeth; 2, *Labiatiflora*, in which it is divided into two lips; and 3. *Liguliflora*, in which it is slit or ligulate. The stamens are united into a tube. The style is two-cleft at the apex. The fruit is dry and seed-like. The head of numerous florets was called by the older botanists a compound flower, hence the name.

**Composite Order**, in architecture the last of the five orders: so called because the capital belonging to it is composed out of those of the other orders, borrowing a quarter-round from the Tuscan and Doric, a row of leaves from the Corinthian, and volutes from the Ionic. Its cornice has simple modillions or dentils. It is called also the *Roman* or the *Italic* order.

It is called also the Roman or the Itdic order. Composition of Forces and Motions, in mechanics, the union or assemblage of several forces or motions that are oblique to one another, into an equivalent force or motion in another direction. Thus two forces acting in the directions of the adjacent sides of a parallelogram, compose one force acting in the direction of the diagonal, and if the lengths of the adjacent sides represent also the magnitudes of the forces, the diagonal will represent the magnitude of the compound force.

**Compressed Air**, atmospheric air compressed by means of pumps, etc. As a means of transmitting power, compressed or condensed air received the attention of scientists as early as 1700 A.D. In that year, Dr. Papin, of Blois, the first man to apply a piston in a steam cylinder, the inventor of the digester and the steelyard safety valve, employed com-

pressed air to drive a piston in a cylinder which was intended to drive a pump. He used a fall of water to compress the air in a cylinder. His experiments were not success-About 100 years later, a Welsh engineer ful. used the power derived from a heavy fall of water to work a blowing cylinder from which the air was conveyed to a blast furnace, a mile and a half distant, The blast, however, was too feeble to do much work. About 1840, an English patent for the application of compressed air to working cranes, hoisting machines, and other machinery was granted. The air was compressed by an air pump, or compressor, and was conducted through pipes to the machinery. Compressed air frequently is called a "power." This is a misnomer, for the prime mover is the steam engine, turbine, or other form of water wheel, which operates the pump or compressor which compresses the The elastic air under pressure transmits air. the power used in compressing it when it is permitted to expand in a suitable device which will respond to the pressure exerted. In practise, the air is compressed by a pump or compressor, which, in its simplest form. is a piston working in a cylinder. The air is sucked in through suitable valves, with one stroke of the cylinder, compressed with the next stroke, and thus forced into a reservoir from which the service pipes lead.

Another method of using compressed air has been developed by the improvements made in automobile or horseless carriages. and motors for hauling street cars. The air. under enormous pressure, is stored in steel bottle-shaped reservoirs made seamless from a solid ingot of steel. These bottles are made to sustain a pressure of 2,000 lbs. or more to the sq. in. When charged with the compressed air, they are coupled, singly or in series, with the auxiliary reservoir on the motors, and a suitable reducing valve permits the air to fill the auxiliary reservoir until the working pressure of from 10 to 100 lbs. is secured. In practise, a small fire of coal, coke, gasoline, or kerosene, is maintained to heat the air just before it is expanded into the working cylinder. The heat not only gives the compressed air added efficiency, due to the expansion caused by heat, but it also removes the objection due to the snow and ice formed by the suddenly released air. In compressing the air, heat is formed; in suddenly expanding the air, the heat is absorbed so rapidly that ice and snow are formed. This has been an objectionable feature in the use of compressed air for transmitting power.

Compressed air is used for operating the automatic brakes which now are part of the equipment of every passenger car, locomotive, mail car, baggage car, and sleeping car in the U. S., and over half a million freight cars. In a few years, every freight car, and in fact every car of whatever description that is used on a railroad in the U. S. must under the federal law, be equipped with automatic air brakes. Compressed air also is used to operate rock drills, air motors in manufacturing establishments, air hoists of every description, passenger and freight elevators, clocks, to lift water, acids, and other liquids, as an agitator in preparing asphaltum for street paving, to paint broad surfaces, bridges, freight cars, warehouses, and buildings, to force plastic material through dies, holes, and pipes, to operate motors for hauling street cars, mine cars, and cars on railroads, to operate motocycles, automobiles, and all forms of horseness vehicles, to inflate "pneumatic" tires for bicycles and carriages, to drive the sand in a sand blast: to clean carpets, rugs, cars, etc., and for hundreds of other purposes.

George Westinghouse, Jr. invented the automatic air brake, which is standard on American railroads. He first made what was known as the "straight air" system, in which the brakes were set by direct pressure from the main reservoir. But this system was not automatic, and the engineer never was sure that all the brakes were set. Any leaks in the service pipes or elsewhere lowered the efficiency of the brake. The vacuum system was directly opposite to the direct air system. In it an imperfect vacuum was maintained, and atmospheric pressure did the work. The development of the air brake led to the invention and adoption of the "automatic air brake" system. The principal features of this system are the air pump, installed on the locomotive just in front of the cab; the main reservoir in which the compressed air is stored; the engineer's valve in the engine cab by which all the operations of the air brake are controlled; the train pipe, or principal service pipe which supplies the auxiliary air reservoirs under each car with compressed air; the triple valve which serves to feed the compressed air into the auxiliary reservoirs, and to supply the brake cylinder with air. It is this triple valve which makes the system automatic.

The air pump stands in front of the locomotive cab. It is strong, compact, and has two cylinders; a steam cylinder which drives the piston of the air cylinder. A valve, regulated by the pressure of the air in the main reservoir, throttles the steam to the air pump when the requisite pressure of air is secured. The air, compressed by the air pump, is led through a pipe to the main storage tank which generally is placed between the steam cylinder just back of the pilot. From this air tank, a pipe leads to the engineer's valve in the engine cab, within easy reach of the engine driver. This valve is a three-way valve. The air, generally, is compressed to a pressure of 90 lbs. to the sq. in., in the main reservoir. A certain movement of the handle of the engineer's valve opens the ports which permit the air to pass into the train pipe which runs from the locomotive under each car. This pipe is connected between the cars by a rubber hose, so that it is continuous. The engineer permits about 70 lbs. pressure of air to fill the car The air reservoirs through the train pipe. passes through the triple valve, which is so constructed that when the pressure of air in the car reservoir is the same as that in the train

pipe, the valve is balanced, and will respond to a decrease or increase of pressure from one side or the other. In this balanced, or normal condition, there is no connection between the car reservoir and the air brake cylinder. But when the engineer wishes to apply the brakes, he throws the handle of the engineer's valve to a certain position. That opens a port which permits the air in the train pipe to escape into the open air. This lowers the pressure in the train pipe, and the balanced valve, responding to the higher pressure in the car reservoir, slides back, and thus opens an aperture which permits the air in the car reservoir to reach the brake cylinder. The pressure of the air forces the piston of the brake cylinder forward, and this piston, through suitable levers, presses the brake shoes against the wheels and the brakes are set. Within the brake cylinder is When the engineer desires to a coiled spring. release the brakes, he feeds air from the main reservoir on the locomotive into the train pipe, thus increasing the pressure. This forces the balanced valve the other way, and thus opens an aperture which releases the air in the brake cylinder into the open air. The coiled spring reacting, forces the brake piston back to its normal condition, and thus releases the brakes.

A compressed air motor for hauling street cars is simply a reservoir in which compressed air is stored, and a driving mechanism, which in all its essential parts, is almost identical with a steam locomotive; that is, it has cylinders with pistons which are connected with the driving wheels. The air is compressed at a central station, and stored in a large tank. A pipe connection is made with the storage tank of the motor, and the tank is charged with air from the central reservoir. In practise, the air from the storage tank on the motor passes through a pipe to the working cylinders, and this pipe passes through water which is heated by a fire to  $300^{\circ}$  or more, and maintained at that temperature. This, it is estimated, gives an added efficiency of at least 5 per cent. to the compressed air and also prevents the valves and working gear from clogging because of the ice and snow which would form from cold air. Sometimes the reservoir on the motor is simply a cylindrical tank. But the later improvements make the reservoir a group or bundle of steel bottles, which are capable of withstanding pressures of 2,000 lbs. or more to the sq. in. A reducing valve lowers this storage pressure to a working pressure of from 50 to 150 lbs. Compressed air motors can be reversed, as steam locomotives are, and suitable valves permit the motorman to apply storage pressure direct to the working cylinders if necessary. At this time (1897) compressed air as a motive power is an experiment, although in several cities of the U.S. and Europe there are compressed air motors in daily operation. It is claimed that by heating the air before it enters the working cylinders, an efficiency of 92 per cent. is secured against 70 per cent. when not heated. Within a few years, the use of compressed air in lifting water has worked a revolution in water-works practises. It has come rapidly into use because of its simplicity as a means of raising water from deep wells, and because it increases the yield of wells that have begun to decrease in capacity. The conspicuous feature of the "air lift," as it is called, is that it takes all the water a well can supply, whereas a mechanical pump, it is estimated, sometimes gives less than 20 per cent. of the capacity of the well. A pipe for the compressed air is let down into a well, and forces the water up through another pipe which either encloses the compressed air pipe or is another pipe altogether. A system or group of wells can be operated from a central plant, where the air is compressed and led to the wells.

Rock drills are working cylinders mounted on tripods, the pistons of the cylinders have drills fastened to the end, and the air drives the pistons up and down, causing the drills to do work. A number of drills are supplied with air through pipes which lead back to the main air reservoir. The first work of any moment done by compressed air was in 1861, driving the Mont Cenis tunnel. The first successful application of compressed air to rock drills in America was made by Walter Shanly, in driving the Hoosac tunnel, 1868-1874. It was in that tunnel that nitroglycerine was first introduced in the U.S. The largest compressed-air plant in America is at Quinnsec Falls, in Michigan, on the Menominee River. The initial power is derived from the falls, which are 47 ft. in height. The plant consists of three pairs of Rand compressors, 32 in. diameter by 60 in. stroke, and one pair 36 in. diameter and 60 in. stroke, delivering 3,000 horse power through 31 mi. of pipe to the Chapin and Ludington iron mines at Iron Mountain for pumping, hoisting, and motive power engines above ground, and direct acting pumps and rock drills below ground. The power is carried through a 24 in. pipe with a loss of only one pound in pressure, with a working efficiency of 75 per cent. Data se-cured from contractors on the main drainage channel of the sanitary district of Chicago in excavating the drainage canal, shows that the cost of drilling with steam was 8.64 cents per cubic yard of rock; with compressed air, 6.30 cents per cubic yard of rock. Compressed air is coming into use in boiler shops, machine shops, foundries, railroad shops, etc. In the Topeka shops of the Atchison, Topeka & Santa Fé Railroad Co., five miles of air pipe are used in the shops and around the grounds. Some idea of the saving in labor secured by the use of compressed air in railroad shops can be found in the following illustrations: the stay bolt cutter will do the work of fifteen men; rotary grinder saves the work of six men; rotary saw, for sawing car roofs, saves the work of four men; pneumatic hammer saves the work of three men; pneumatic painting machine, one man does the work of ten painting by hand; device for cleaning coaches saves the work of ten men.

Following are some of the uses to which

#### Concentration

compressed air is put in railroad shops: elevating sand at engine house, elevating oil at oil house, hoisting heavy castings and tools, forcing couplings on air hose, operating cylinder boring bar, operating valve facing machine, filling cylinders of hydraulic presses, removing and applying driving tires, testing water pumps after repairs, drilling, tapping, and reaming with motors, cleaning boilers and machinery, punching jacket rivet holes, taking old paint off tin roofs, chipping, catting, and caulking, operating letter presses, jacking up cars and trucks, cleaning interior of cars and upholstered work, burning paint off coaches, painting cars, etc.

Compressed air is used on the vessels of the U. S. navy for the following purposes: to operate main engine auxiliaries, auxiliary, fire, bilge, and water service pumps, steering engine, boat cranes, turret-turning engines, hydraulic cylinders for working guns, ammunition hoists, ash hydro-pneumatic hoists, feed pumps, smoke hose for guns, whistle and siren, to send messages about the ship through pneumatic tubes, to clear a compartment of water when filled, to ventilate, heat, and cool the ship, and to operate the engine of the ordinary working launch. Compressed air also is used in dynamite guns.

**Com' stock Lode**, a large and extremely rich metallic lode in the western part of Nevada, on the eastern slope of the Virginia Mountains. To it belong the Big Bonanza and other mines, which have yielded gold and silver to the value of over \$300,000,000.

Comte (Kont), AUGUSTE (1708-1857), founder of the "positive" system of philosophy. He was educated at the Ecole Polytechnique, and embraced enthusiastically the socialist tenets of St. Simon. He was employed, in 1820, to draw up a formula of the doctrines professed by the St. Simonian school. This work did not, however, meet with the approbation of St. Simon. In 1826 Comte commenced a course of lectures on positive philosophy, but only four lectures were given when he became deranged in mind, and did not recover till the end of 1827. In 1830 he commenced the publication of his Cours de Philosophie Positire, which was completed in 1842, and was translated into English and condensed by Harriet Martineau. As a practical faith his system is now stationary. though as a philosophy of knowledge it is widely accepted.

**Co mus,** in the later Greek mythology, the god of revelry, feasting, and nocturnal entertainments, generally represented as a drunken youth.

**Concan**, a maritime subdivision of Hindustan, in the presidency of Bombay. It includes the town and island of Bombay. Area about 13,639 sq. mi.; pop. about 537,933.

**Concentration**, in chemistry, the act of increasing the strength of solutions. This is effected in different ways: by evaporating off the solvent, as is done in the separation of salt from sea water; by distilling off the more volatile liquid, as in the rectification of spirit of wine; by the use of low temperatures, as in the

purification of benzol; by difference of fusibility, as in Pattison's process for desilvering lead.

**Concepcion'**, a seaport of Chile, capital of a province of the same name, on the right bank of the Biobo, 71 mi. from its mouth, a well-built town, with a cathedral. Its port at Tal-cahuano, a small town on the Bay of Concepcion, about 8 mi. distant, is one of the best in Chile. Concepcion was founded in 1550, and has suffered much from earthquakes and attacks by the Araucanians. Pop. 25,120.

**Concertl'na**, a musical instrument invented by Professor Wheatstone, the principle of which is similar to that of the accordion. It is composed of a bellows, with two faces or ends, generally polygonal in shape, on which are placed the various stops or studs, by the action of which air is admitted to the free metallic reeds which produce the sounds.

**Conch** (kongk), a marine shell, especially a large spiral shell of a trumpet shape, and which may be blown as a trumpet, as is the practise in Hindustan and some of the Pacific Islands.

**Conchifera** (kon-kif'é-rā), Lamarck's name for that large class of acephalous mollusks which have shells consisting of two pieces, commonly known as oyster, mussel, etc.

**Conchol ogy**, the science of shells, that department of zoology which treats of the nature, formation, and classification of the shells with which the bodies of many mollusca are protected; or the word may be used also to include a knowledge of the animals themselves, in which case it is equivalent to *malacology*. In systems of conchology shells are usually divided into three orders, Univalves, Bivalves, and Multivalves, according to the number of pieces of which they are composed.

**Con' cord,** in music, the combination of two or more sounds pleasing to the ear. Concords are the octave, the fifth, third, and sixth. The first two are called *perfect*, because as concords they are not liable to any alteration by sharps or flats. The two last are called *imperfect*, as being alterable.

**Concord**, a town of Massachusetts, near the Concord River, 18 mi. n.w. of Boston. Here at Concord Bridge, April 19, 1775, the first shots of the American Revolution were fired and a monument on the bank of the river marks where two English soldiers fell. It is famous as the home of Ralph Waldo Emerson, Hawthorne, Thoreau, and Alcott. Pop. 5,100.

**Concord,** the capital of the state of New Hampshire, on the Merrimac River 59 min.w. of Boston. It was once called Rumford and here Benjamin Thompson, afterward Count Rumford, resided. It is one of the largest railway centers in New England. It has manufactures of carriages, hardware, cutlery, woolen fabrics, paper, etc. Pop. 17,004.

**Con'crete**, a composition used in building, consisting of hydraulic or other mortar mixed with gravel or stone chippings about the size of a nut. It is used extensively in building under water, for example, to form the bottom of a canal or sluice, or the foundation of any structures raised in the sea; and it is also frequently used to make a bed for asphalt pavements, or to form foundations for buildings of any kind. It is sometimes even used as the material with which the walls of houses are built, the concrete being firmly rammed into molds of the requisite shape, and then allowed to set.

**Concre'tions,** MORBID, in animal economy, hard substances that occasionally make their appearance in different parts of the body, as well in the solids as in those cavities destined to contain fluids. They are usually named according to the parts of the body in which they occur. Their composition is equally various, but the most common constituents are phosphates, urates, or other salts, in combination with mucus, albumen, fibrin, and other organic matter.

**Conde** (kõn-dē), town and fortress of France, dep. Nord, at the confluence of the Hayne and Scheldt. It gave their title to the Condé family. Pop. 3,382.

Condé, Louis de Bourbon, PRINCE of (the Great Condé) (1621-1687), a famous general. In 1641 he married a niece of Cardinal Richelieu. His defeat of the Spanish at Rocroi, in 1643, was followed, in 1645, by his defeat of Mercy at Nordlingen, and by his capture of Dunkirk in 1646, the year in which he inherited his father's title. During the troubles of the Froude he at first took the side of the court; but believing himself to be ill requited by Mazarin, he put himself at the head of the faction of the Petits Maîtres, and was im-prisoned for a year by Mazarin (1650). On his release he at once put himself at the head of a new Fronde, entered upon negotiations with Spain, and, his attack of Paris being indecisive, retired to the Netherlands, where he was appointed generalissimo of the Spanish armies. In this capacity he unsuccessfully besieged Arras in 1654; but he was more fortunate at Valenciennes in 1656, and at Cambrai in 1657. In 1658 he was defeated before Dunkirk by Turenne, but was restored to his rank in France after the peace of 1659. In 1668 he accomplished the reduction of Franche Comté in three weeks; and in 1674 he defeated the Prince of Orange at Senef. His successes over Montecuculi in Alsace in 1675 closed his military career. Four years after he retired to Chantilly, near Paris, and d. at Fontainebleau. Condé, Louis Joseph DE Bourbon, Prince

**Condé**, LOUIS JOSEPH DE BOURBON, PRINCE OF (1736-1818), b. at Chantilly; only son of the Duke of Bourbon and the Princess of Hesse-Rheinfels. He distinguished himself in the Seven Years' War.

Condensed Milk. See Milk.

**Con' denser**, a syringe by which air is compressed into a receiver. Also a vessel in which aqueous or other vapors are condensed by cooling into the liquid form.

**Con'dor**, a South American bird, one of the largest of the Vulturidæ or vulturine birds. In its essential features it resembles the common vultures, differing from them mainly in the large cartilaginous carbuncle which surmounts its beak, and in the large size of its

### Condorset

oval and longitudinal nostrils placed almost at the extremity of the cere. Despite the many stories of its gigantic proportions, Humboldt met with no specimens whose wings exceeded 9 ft. in expanse, though it has occasionally been known to attain an expanse of 14 ft. It is found in greatest numbers in the Andes chain, frequenting regions from 10,000 to 15,000 ft. above the level of the sea. They are generally to be seen in groups of three or four, and only descend to the plains under stress of hunger, when they will successfully attack sheep, goats, deer, and bullocks. They prefer carrion, however, and, when they have opportu-

### Condor.

nity, gorge themselves until they become incapable of rising from the ground, and so become a prey to the Indians. The king vulture is another bird of the same genus.

**Condorset** (kon-dor-sä), MARIE JEAN ANTOINE NICOLAS DE CARITAT, MARQUIS DE (1743-1794), an eminent French writer. The merit of his work gained for him in 1769 a seat in the Academy of Sciences, of which, after the publication of his *Eloges des Académiciens morts arant 1699* (1773), he was appointed perpetual secretary (1777). In 1777 his *Theory of Comets* gained the prize offered by the Academy of Berlin; he enriched the *Transactions* of many learned societies, and took an active part in the *Encyclopédie*.

**Condottieri** (kon-dot-tē-ā'rē), an Italian name given to the captains of those bands of mercenary soldiers who, in the fourteenth and fifteenth centuries, hired themselves out to carry on the petty wars of the Italian states. Montreal d'Albarno, a gentleman of Provence, was the first to give definite organization to a lawless band of this kind, and many of them attained a considerable size and power. For the most part these mercenarics were good soldiers and splendidly equipped, but rapacious and cruel to all but their own class.

**Con' ductor** (or Lightning Conductor), an instrument by means of which either the elec-

### Confucius

tricity of the clouds, the cause of lightning, is conducted without explosion into the earth, or the lightning itself is received and conducted quietly into the earth or water without injuring buildings, ships, etc. It was invented by Benjamin Franklin about 1752, and met with speedy general adoption. It usually consists of a stout iron rod with one or more points at the top, the lower end being metallically connected with thick strips of copper which are carried into the ground to a considerable depth and terminated, if possible, in water or in wet earth.

**Cone**, as used in geometry, generally means a right circular cone, which may be defined as the solid figure traced out when a right-angled triangle is made to revolve round one of the sides that contain the right angle.

**Cone**, in botany, a dry compound fruit, consisting of many open scales, each with two seeds at the base, as in the conifers; a strobilus.

**Concy Island,** a popular resort situated at the southwestern end of Long Island, in New York. It is historical as the place of Henry Hudson's landing in 1609. All parts of the island are reached by railroad lines from New York City, Jersey City, and Brooklyn. It was annexed to Brooklyn in 1894. During the summer months it is crowded with pleasure-seeking humanity from many parts of the country.

ing humanity from many parts of the country. Confederation of the Rhine, the league of Germanic states formed by Napoleon Bonaparte in 1806, and including Bavaria, Wurtemberg, Baden, Hesse-Darmstadt, the kingdom of Westphalia, etc.

**Confidential Communication,** in law a communication made by one person to another which the latter cannot be compelled to give in evidence as a witness. Generally all communications made between a client and his agent, between the agent and the counsel in a suit, or between the several parties to a suit. are treated as confidential. The privilege of confidentiality does not extend to disclosures made to a medical adviser, and in England it has been decided also that confessions made to a priest are not to be treated as confidential.

**Confisca' tion**, the act of condemning as forfeited, and adjudging to the public treasury, the goods of a criminal in part punishment of a crime.

Confu'clus (or Kong-fu-tse), that is, "the teacher, Kong" (B.c. 550-478), the famous Chinese sage; b. in the province of Shantung, then belonging in part to the small vassal kingdom of Lu. His father, Shuh-liang-heih, who was of royal descent, d. three years later, and the boy was reared in comparative poverty by his mother, Ching-tsai. At the age of seventeen he was made inspector of corn markets; at nineteen he married, and after about four years of domesticity, in which a son and two daughters were borne him, he commenced his career as a teacher. In 517 B.c. he was induced by two members of one of the principal houses in Lu, who had joined his band of disciples, to visit the capital with them, where he had interviews with Lao-tze, the founder of

Taouism. Though temporarily driven from Lu to Tsi by a revolution, he soon returned thither with an increased following, and at the age of fifty-two was made chief magistrate of the city of Chung-too. So striking a reformation was effected by him that he was chosen for higher posts, became minister of crime, and with the aid of two powerful disciples elevated the state of Lu to a leading position in the kingdom. Its marquis, however, soon after gave himself up to debauchery, and Confucius became a wanderer in many states for thirteen years. In 483 he returned to Lu, but would not take office. The deaths of his favorite disciples Yen Hwin and Tze-lu in 481 and 478 did much to further his own, which took place in the latter year. Confucius left no work detailing his moral and social system, but the five canonical books of Confucianism but the five canonical books of Confucianism are the Yih-king, the Shu-king, the Shi-king, the Le-king, and the Chun-tsien, with which are grouped the "Four Books," by disciples of Confucius, the Ta-hëo or Great Study, the Chung-Yung or Invariable Mean, the Tun-yu or Philosophical Dialogues, and the Hi-tse writ-ten by Meng-tse or Mencius. The teaching of Confusius has had and still has an imof Confucius has had, and still has, an im-mense influence in China, though he can hardly be said to have founded either a religion or a philosophy. All his teaching was devoted to practical morality and to the duties of man in this world in relation to his fellow men; in it was summed up the wisdom acquired by his own insight and experience, and that derived from the teaching of the sages of antiquity.

**Conger Eel** (kong'ger), a genus of marine eels characterized by a long dorsal fin beginning near the nape of the neck, immediately above the origin of the pectoral fins, and having the upper jaw longer than the lower. It is pale-

Conger Eel.

brown above, grayish-white below, with whitish dorsal and anal fins fringed with black. Its fiesh is eaten, but is somewhat coarse.

**Conglom' crate**, a term applied by geologists to rocks consisting mostly of water-worn pebbles cemented together by a matrix of siliceous, calcareous, or other cement, often called also *plum pudding stone*.

**Congo** (or Zaire), one of the great rivers of the world, in Southern Africa, having its embouchure in the South Atlantic. The mouth of the river was known to the Portuguese in 1485, but the lower part of its course was first explored by an English expedition under Captain Tuckey in 1816, which ascended it for about 172 mi. In 1867, however, Livingstone discovered a considerable river called the Chambezi, rising in the Chibalé Hills, and having followed it to Lake Bangweolo traced it thence as the Luapula to Lake Moero, and thence again as the Lualaba to Nyangwe. From this point its exploration was taken up in 1876-77 by Stanley, who proved its identity in 1870-77 by Stanley, who proved its identity with the Congo. It carries more water to the ocean than the Mississippi, its volume being next to that of the Amazon. Its total length is perhaps 3,000 mi. Its chief tributaries are the Aruwimi and the Mobangi from the right, and the Ikelemba and Kwa from the left, which latter represents the collected waters of immense rivers from the south, such as the Kassai, the Kwango, etc. It is navigable for about 110 mi. from its mouth, after which the navigation is interrupted by cataracts.

Congo Free State, a state recently founded on the river Congo, in Central South Africa, stretching by a kind of narrow neck of territory to the river's mouth, but expanding inland so as to cover an immense area, mainly lying south of the river. The obvious advantages of the Congo as a waterway in opening up the continent led to the formation at Brussels in 1878 of a Comité d Etudes du Haut Congo, under the patronage of Leopold II, having as its aim the internationalization and development of the Congo area. Under its auspices Stanley returned in 1879 (see preceding art.) to open up the river and form a free state under European auspices. He established a first station at Vivi, the limit of maritime navigation, 110 mi. above the mouth of the river, constructed roads past the Yellala and Livingstone cataracts, and hauled steamers up to the higher reaches of the Congo, where in 1882 the station of Leopoldville was formed on Stanley Pool. Of the 223 mi. between Vivi and Leopoldville only 88 are navigable water; but from the latter station to Stanley Falls the Congo itself is continuously navigable for 1,000 mi., to which its great affluents already explored add no fewer than 5,000 mi. of serviceable waterway. Above the Stanley Falls station (destroyed by Arab slave dealers in November, 1886) the river is again navigable for a distance of 385 mi. to Nyangwe, which is about 1,300 mi. from the Chambezi sources. The work having been thus initiated by Stanley, and the feasibility of the project made manifest, the association in 1884-85 entered into treaties with all the European powers and the U.S. for the recog-nition of its sovereign power. The boundaries of the new Congo Free State were settled at the same time, it being agreed that the basin of the Congo and its tributaries should be free to all nations, that no duties should be levied on imports, and that the slave trade should be suppressed. The central government is at

### Congress

Brussels, consisting of the king of Belgium as sovereign, and three departmental chiefs. Arrangements are being made for the construction of a railway past the falls obstructing navigation. A number of stations have been formed on the river, the chief of which is Boma, about 70 mi. from its mouth. The revenue at present largely consists of a subsidy from King Leopold. The exports forming the staple of present trade are palm oil, caoutchouc, ivory, orchilla, copal, groundnuts, camwood, wax, etc. Area estimated at 1,000,000 sq. mi.; pop. 27,000,000.

Congress, an assembly of the delegated representatives of sovereign states, for the purpose of considering matters of international interest. Even in America, though the term has now a different meaning, it had a similar origin, the first congress being that of the delegates from the various British colonies, who met Oct. 7, 1765, for the purpose of considering their griev-Previous to signing a treaty of peace, ances. a meeting of plenipotentiaries usually takes place, to which the name of a congress is sometimes applied, though it seems more properly to be reserved for those more important meetings at which extensive schemes of future policy are determined on. To this class belonged the famous Congress of Vienna in 1815; that of Carlsbad in 1819, for regulating the affairs of Germany; that of Paris at the end of the Russian War of 1854-56; and that at Berlin after the Russo-Turkish War of 1877-78. The word congress is often used interchangeably with conference. For U.S. Congress, see United States.

**Con'greve,** WILLIAM (1670-1729), English dramatist. His plays belong to the artificial school of comedy, which aimed rather at the production of a sustained flow of wit than at the precise delineation of character.

**Congreve,** SIR WILLIAM (1772-1828), English inventor of the Congreve rocket. He invented the rocket about 1804. It was first used in active service in the attack on Boulogne, 1806, and on Copenhagen, 1807. He took out patents also for the manufacture of gunpowder and of banknote paper, and wrote treatises on the mounting of naval ordnance and on the hydropneumatic lock. He died at Toulouse.

**Coni** (or Cu'neo), a town of North Italy, capital of the province of Coni. Formerly all merchandise passing from the seaport of Nice to Lombardy, Switzerland, and Germany went by this route, but the railway has confined its trade to Turin and neighboring towns. It has manufactures of silks and woolens. Pop. 12,413.

**Conic Sections,** three curves, the hyperbola, the parabola, and the ellipse, so called because they are formed by the intersection of the surface of a cone with planes that cut the cone in various directions. If the cutting plane be parallel to the axis the curve formed is the hyperbola (1); if parallel to the slope of the cone the curve is a parabola (2); if passing through both sides of the cone obliquely the section is an ellipse (3). A section perpendicular to the axis of the cone forms a circle (4), which may

### Connecticut

also be considered one of the conic sections. A perpendicular plane through the apex gives a triangle (5).

a triangle (5). **Conif** erse, the pines, firs, and their allies, a natural order of gymnospermous exogens, the essential character of which consists in the manner in which the ovules, not enclosed in an ovary, receive directly the action of the pollen without the intervention of a stigma. The ovules in these plants are borne on scales or modified leaves, which are spread out, not folded, and generally grouped in such a manner as to form a cone composed of a greater or smaller number of these leaves, of which only a portion may be fertile and bear ovules. The disposition of the ovules in relation to these scales permits of a division of the Coniferse into three distinct families or tribes.

**Conjev'eram, a** town of Hindustan, presidency of Madras, district of Chingleput. It possesses two famous pagodas dedicated to Vishnu and Siva, and the inhabitants are mostly Brahmans. Cottons are manufactured in the town. Pop. 37,275.

**Conjunc' tion,** in astronomy, the position of two of the heavenly bodies, as two planets, or the sun and a planet, when they have the same longitude (are in the same direction from the earth). When it is simply said that a planet is *in conjunction*, conjunction with the sun is to be understood. Superior conjunction and *inferior* conjunction are terms used of the planets whose orbits are nearer to the sun than that of the earth, according as the sun is between us and them, or they between us and the sun.

us and them, or they between us and the sun. Conkling, Roscoz (1829-1888), American statesman, b. in Albany, N. Y. In 1850 he became district attorney for Oneida county, and was made mayor of Utica in 1858. The same year he was chosen as a Republican to Congress and was re-elected in 1860, was defeated in 1862, but was re-elected in 1864. His first important speech was in support of the fourteenth amendment to the Constitution. He was re-elected in 1866, and in January, 1867, took his seat in the U.S. Senate, and was re-In 1881 he became elected in 1873 and in 1879. hostile to President Garfield's administration on a question of patronage, claiming, with his colleague, Thomas C. Platt, the right to con-trol federal appointments in his state. They finally resigned their seats in the Senate and appealed to the legislature of New York for a re-election as a vindication of their course, but they were unsuccessful, and Conkling resumed the practise of law in New York City. He de-clined the nomination of justice of the U.S. Supreme Court, offered by President Arthur, and practised law until his death.

**Connaught** (kon'ngt), the smallest of the four provinces of Ireland, situated between Leinster and the Atlantic; area 4,392,086 acres. It is divided into five counties—Galway, Mayo, Roscommon. Leitrim, and Sligo. Pop. 723,573.

**Connecticut** (kon-net'i-kut), a river, the west branch of which forms by treaty a part of the boundary between the U. S. and Canada. It rises on the north border of New Hampshire; forms the boundary between Vermont and New

Hampshire, passes through the west part of Massachusetts and the central part of Connecticut, and falls into Long Island Sound. It is navigable for vessels drawing from 8 to 10 ft. for about 300 mi. from its mouth, subsidiary canals, however, being required above Hartford; total length, 450 mi. It is famed for its shad fisheries.

**Connecticut**, one of the original thirteen states of the American Union; bounded by New York, Massachusetts, Rhode Island, and Long Island Sound; length, east to west, about 95 mi.; greatest breadth, north to south, about 72 mi.; area 4,990 sq. mi. The state lies on the south slope of the hilly regions of New England, with a general surface much diversified; there is, however, no land above 1,000 ft. in elevation. Besides the Connecticut, two other rivers flow from the north into Long Island Sound-the Housatonic and the Thames. The Connecticut is the largest river in New England, rising on the northern border of New Hampshire, 1,600 ft. above the sea, flowing s.s.w., separating Vermont and New Hampshire, crossing the western part of Massachu-setts, and central part of Connecticut, flowing s.s.e. below Middletown, and emptying into the Sound at Saybrook. Its length is more than 450 mi., with a width in Connecticut varying from 500 to 1,000 ft. It is navigable to Middletown (30 mi.) for vessels drawing 10 ft., and to Hartford (50 mi.) for those drawing 8 ft. The eastern part of the state is drained by the Thames, which is formed by the Yantic and Shetucket. It is navigable to Norwich. In the western part of the state is the Housa-To this place it is navigable for small tonic. vessels. Besides these large streams there are very many smaller ones, affording, in their rapid descent from the hills, an immense amount of water power. There are several well-defined ranges of hills. Of these the Housatonic hills are the most westerly, and extend along that river to the coast. The Green Mountain range, running south from Vermont, terminates near New Haven. The Blue Hills of Southington are a part of the Mount Tom range of Massachusetts, and lie between the Green Mountain range and the Connecticut River. On the eastern side of the river is a fourth range which the river crosses at Chatham. The mineral wealth of the state is considerable. Copper is found in the Sims-bury mines at Granby, and at Bristol. Iron Iron ore is found in great quantities in Salisbury, Kent, Sharon, Cornwall, and Canaan, and has been worked for 125 years. Limestone and marble of the very best quality are found at Canaan, Washington, and Milford. At Portland and Cromwell are the well-known immense quarries of freestone largely in demand for building. The excellent slate flagging from Bolton and Haddam is abundant in supply and in great demand. Granite, gneiss, hydraulic lime, tiling slate, clay, and sulphate of baryta are found in great quantities. There are are found in great quantities. There are over 100 mi, of deeply indented coast on the Sound (which measures 140 mi. by 24 mi.), af-fording excellent harbors. The chief of these

are Stonington, New London, Saybrook. New Haven, Bridgeport, and Fairfield. The harbor at New London is one of the best in the country, capacious, and never frozen over.

Climate. — The climate of the state, while very changeable, is very healthful,—the mortality being below the average of the other states. There is scarcely any spring season, but summer opens abruptly about May, and the cold weather begins in November. The winters with their keen n.w. winds, are severe, but the dryness of the air makes some compensation. The mean temperature of the year is  $48 \cdot F$ .

Vegetation.—Among the forest trees of Connecticut are pine, hemlock, white, yellow, and red oak, hickory, walnut, chestnut, butternut, tulip. beech, birch, ironwood, silver and red maple, ash, ełm, sassafras, wild cherry, red cedar, juniper, and a few shrubs and small trees. Wild fruits are grapes, beech, and sloe plums, crab apples, blackberries, cranberries, strawberries, etc. Among the agricultural products are corn, wheat, oats, barley, buckwheat, potatoes, tobacco, hay, clover seed, and grass seed.

Minerals.—The state ranks fourth in the production of granite. Iron ore has been mined for over 160 years. There are considerable quantities of copper, lead, nickel, and cobalt. Limestone and marble of the best quality are quarried.

Manufactures.—In manufacturing, the state ranks tenth in the Union. Manufacturing forms the leading industry of the state, and is of a greater variety than in any other state. The principal industries are rubber goods, hardware, clocks, paper, firearms, carriages, cotton goods, woolen and silk fabrics, machinery, hosiery, furniture, sewing machines, saddlery, pianos, tools, buttons, and pins. Excellent water power is furnished by the numerous rivers.

Education.—The value of school property is estimated at about \$6,000,000, which does not include several private schools. The institutions of higher learning are Yale University, founded in 1701; Trinity College; and Wesleyan University. There are 180 public libraries, with over 700,000 volumes. There is an agricultural college at Mansfield, established in 1881. The state institutions include the state prison, hospital for the insane, school for boys, blind asylum, two schools for deaf mutes, and a school for imbeciles.

History. — Connecticut was one of the original thirteen states and ratified the U. S. Constitution in 1788, being the fifth colony to do so. She took an active part in the War of 1812. The present constitution was adopted in 1818, doing away with slavery. During the Civil War the state took a very prominent part. The population in 1800 was 746,258, ranking twenty-ninth in the Union. The principal cities are Bridgeport, Danbury, Hartford (the capital). Meriden, New Britain, New Haven, Norwalk, Norwich, Stanford, and Waterbury. *Governors.*—Matthew Griswold, 1784; Samuel Huntington, 1786; Oliver Wolcott, 1796; Jonathan Trumbull, 1798; John Treadwell, 1809; Roger Griswold, 1811; John Cotton Smith, 1813; Oliver Wolcott, 1818; Gideon Jomlinson, 1827; John S. Peters, 1831; Henry W. Edwards, 1833; Samuel A. Foote, 1834: Henry W. Edwards, 1835; Wm. W. Ellsworth, 1838; Chauncey F. Cleveland, 1842; Roger S. Baldwin, 1844; Isaac Toucey, 1846; Clark Bissell, 1847; Joseph Trumbull, 1849; Thomas H. Seymour, 1850; C. H. Pond (acting), 1853; Henry Dutton, 1854; William T. Miner, 1855; Alexander H. Holley, 1857; Wm. A. Buckingham, 1858; Joseph R. Hawley, 1866; James E. English, 1876; Marshall Jewell, 1869; James E. English, 1876; Marshall Jewell, 1871; Chas. R. Ingersoll, 1873; Richard D. Hubbard, 1877; Chas. B. Andrews, 1879; Hobart B. Bigelow, 1881; Thomas M. Waller, 1883; Henry B. Harrison, 1883; Phineas C. Lounsbury, 1887; Morgan G. Bulkeley, 1880; Luzon B. Morris, 1893; O. Vincent Coffin, 1895-97; L. A. Cooke, 1897.

**Connellsville**, Fayette co., Pa., on Youghiogheny River, 54 mi. s.e. of Pittsburg. Railroads: B. & O.; P. & L. E. Industries: tin plate mill, lock and hardware factory, two machine and car shops, two fire brick works, railroad shops, planing mills and flour mill. Coal, coke, and natural gas in vicinity; the center of the Connellsville coke region. Surrounding country agricultural and mineral. The town was first settled in 1770 by Zachariah Connell and became a borough in 1806. Pop. est., 1897, 10,000

**Connersville**, Fayette co., Ind., on west fork of White River, 67 mi. n.w. of Cincinnati. Railroads: White Water Valley; C. H. & D.; and Ft. W. C. & L. Industries: furniture factory, three flouring mills, three iron foundries, and two planing mills. The town was settled in 1788 and became a city in 1872. Pop. est., 1897, 7,500.

Co'non, an Athenian who had the command of a fleet in 413 B. C. to prevent the Corinthians from relieving Syracuse, then at war with Athens, and who, after various services, succeeded Alcibiades in 406.

**Con' rad II**, king of Germany and emperor of the Romans, reigned from 1024 to 1039, and is regarded as the true founder of the Franconian or Salic line.

**Conrad III,** king of Germany and emperor of the Romans from 1138 to 1152, was the founder of the Suabian dynasty of Hohenstaufen.

**Consanguin' ity**, the relation of persons descended from the same ancestor. It is either lineal or collateral—lineal between father and son, grandfather and grandson, and all persons in the direct line of ancestry and descent, from one another; collateral between brothers. cousins, and other kinsmen descended from a common ancestor, but not from one another.

**Conscience,** that power or faculty, or combination of faculties, which decides on the rightness and wrongness of actions; otherwise called the *Moral Sense*. Whewell defines it as "the reason, employed about questions of

### Consignment

right and wrong, and accompanied with the sentiments of approbation and condemnation, which, by the nature of man, cling inextricebly to his apprehension of right or wrong." See *Ethics*.

**Conshohocken**, Montgomery co., Pa., on Schuylkill River, 13 mi. n. of Philadelphia. Railroads: Phila. & Reading; and Pennsylvania. Industries: iron foundry, cotton mills, flouring mill, and factories for the manufacture of surgical instruments, tubes, and fences. Surrounding country agricultural. The town was first settled in 1682 and was incorporated as a borough in 1850. Pop. est. 1897, 6,500.

**Conserv'atives**, in British politics, the party that substantially corresponds to what used to be the Tory party, taking the opposite side to the *Liberals*. The name came into use about the time of the passing of the Reform Act of 1832, and is often used as implying greater enlightenment or liberality than *Tory*.

Conserv' atory, a name given to a systematic school of musical instruction. Conservatories were originally benevolent establishments attached to hospitals, or other charitable or religious institutions. In Naples there were formerly three conservatories for boys; in Venice four for girls; the Neapolitan group being reduced in 1818 to a single establishment under the name Royal College of Music. In Milan a conservatory was established in 1808. In France the musical school established in connection with the Opera received its final organization in 1795 under the name of Con-servatoire de Musique. The Conservatorium, founded at Leipsic in 1842 under the auspices of Mendelssohn, is perhaps the most influential in Germany. Institutions of the same description exist in Warsaw, Prague, Munich, Berlin, and Vienna, and in many American cities.

**Conservatory**, in gardening, a term generally applied by gardeners to plant houses, in which the plants are raised in a bed or border without the use of pots, the building being frequently attached to a mansion. The principles of their construction are in all respects the same as for the greenhouse, with the single difference that the plants are in the free soil, and grow from the floor instead of being in pots placed on shelves or stages. The distinction, however, is often overlooked.

**Consign ment**, a mercantile term which means either the sending of goods to a factor or agent for sale, or the goods so sent. The term is chiefly used in relation to foreign trade. The receivers of consignments have usually to keep magazines and stores, for the use of which their consigners are charged. The profits of a consigning agency often compare favorably with the occasionally larger but much less safe profits of original ventures. The consigning trade is protected by special laws. In most countries a consigner can claim his goods and collect all outstanding debts for goods sold on his account by a consignee who has suspended payment.

### Console

Con sole, in ar-

chitecture, a pro-

jecting ornament or bracket having

for its contour gen-

erally a curve of contrary flexure.

It is employed to

support a cornice, bust, vase, or the

like, but is fre-

quently used merely as an ornament.

**Con** sonant, a letter so named as being sounded only in connection with a vowel, though some consonants have hardly any sound even when united with a vowel. serving merely to determine the manner of beginning or ending the vowel sounds; as in ap, pa, at, ta. In uttering a consonant there is greater or less contact of some parts of the organs of speech; in uttering a vowel there is a want of such contact, the vocal passage being open though variously modified.

**Conspir acy**, in law, an offense ranked as a misdemeanor, and punishable by imprisonment and hard labor. It is constituted by a combination between several persons to carry into effect any purpose injurious either to individuals, particular classes, or the community at large. When the conspiracy leads to any overt act of an unlawful kind, the offense becomes felony.

**Con' stable**, ARCHIBALD (1774-1827), Scottish bookseller and publisher He was the original publisher of the *Edinburgh Review*, the poems of Sir Walter Scott, the *Waverly Novels*, the Supplement to the Encyclopædia Britannica, and other valuable works.

**Constable**, JOHN (1776-1837), English landscape painter. In 1819 his *View on the River Stour* procured him admission as an associate of the Academy. From this period his reputation widely extended itself, both over Britain and the Continent. His careful studies of landscape in respect of tone were of great influence in art.

**Con'stance**, a town of Germany, in Baden. The town has various branches of industry and a considerable trade. It was once a flourishing imperial city with three times its present population. Pop. 16,235.

**Constance**, LAKE OF, a lake. Central Europe, forming a reservoir in the course of the Rhine; area 207 sq. mi. **Constan tia**, a small district in Cape Colony

**Constan' tia**, a small district in Cape Colony a few miles from Cape Town, celebrated for its wine, made from vines brought originally from Persia and the Rhine, esteemed the best liquor wine after Tokay, and owing its special properties largely to the soil.

**Con'stantine**, a town in Algeria, capital of a province of same name. Both within the town and in the vicinity Roman remains abound. The manufactures consist chiefly of woolen and linen goods: the trade is in corn, linen, and wax. Pop. 46,581. **Con'stantine**, CAIUS FLAVIUS VALERIUS

**Con'stantine**, CAIUS FLAVIUS VALERIUS AURELIUS CLAUDIUS (274-337), Roman emperor, surnamed the *Great*, son of the Emperor Constantine Chlorus. After the death of his father he was chosen emperor by the soldiery, in the year 306. In 325 Constantine became the sole head of the Roman Empire. His internal administration was marked by a wise spirit of reform. In 329 he laid the foundation of a new capital of the empire, at Byzantium, which was called after him Constantinople, and soon rivaled Rome herself. In 337 he was taken ill near Nicomedia, was baptized, and died after a reign of thirty-one years, leaving his empire between his three sons, Constantine, Constantius, and Constans.

Constantine, PAULOVITCH (1779-1831), grandprince of Russia, second son of Paul I. He distinguished himself in 1799 under Suwarroff, and at Austerlitz in 1805; and in 1812, 1813, and 1814 attended his brother, the Emperor Alexander, in all his campaigns. He was afterward employed in superintending the affairs of the new kingdom of Poland, and was successively made military governor and generalissimo of the Polish troops. On the decease of his brother in 1825 he was proclaimed emperor at St. Petersburg, in his absence, but as he adhered to a previous renunciation of his claim to the throne, his younger brother, Nicholas, became Alexander's successor. He died, execrated by the Poles as one of their most barbarous oppressors.

Constantino'ple ("city of Constantine"), a celebrated city of Turkey in Europe, capital of the Turkish Empire, situated on a promontory jutting into the Sea of Marmora, having the Golden Horn, an inlet of the latter, on the n. and the Bosporus on the e. The city proper is thus surrounded by water on all sides except the w., where is an ancient and lofty double wall of four mi. in length, stretching across the promontory. On the opposite side of the Golden Horn are Galata, Pera, and other suburbs, while on the Asiatic side of the Bosporus entrance is Scutari. Occupying the extreme point of the promontory on which the city stands is the Seraglio or palace of the sultan, which, with its buildings, pavilions, gardens, and groves, includes a large space. At the principal entrance is a large and lofty gate, called Bab Humayum, "the high door" or "sublime porte," from which has been derived the well-known diplomatic phrase. Of the 300 mosques, the most remarkable are the royal mosques, of which there are about 15, esteemed the finest in the world. First among these is the mosque of St. Sophia, the most ancient existing Christian church, converted into a mosque in 1453 on the capture of the city by the Turks. Another magnificent mosque is that of Soliman; after which are those of the Sultana Valide, built by the mother of Mohammed IV, and of Sultan Achmet, the most conspicuous object in the city when viewed from the Sea of Marmora. The streets are mostly extremely narrow, dark, dirty, and ill paved, and exceedingly crooked and tortuous, but there has been a certain opening up and improvement in the last twenty years owing to the construction of tramways and the railway to Adrianople, which runsalong

## Constellations

the shore of the Sea of Marmora and past the Seraglio to the entrance of the Golden Horn. The numerous covered and uncovered bazars are severally allotted to particular trades and merchandise. Constantinople has but one remarkable square, called the At-Meidan, occu-pying the site of the ancient *Hippodrome*. There are about 130 public baths in the city, mostly of marble, of plain exterior, but handsome and commodious within. The numerous cemeteries, mostly outside the western wall, have become vast forests, extending for miles round the city and its suburbs. The few manufactures are chiefly confined to articles in morocco leather, saddlery, tobacco pipes, fez caps, arms, perfumes, gold and silver embroideries, etc. The foreign commerce is considerable. The harbor, the Golden Horn, which more resembles a large river than a harbor, is deep, well sheltered, and capable of containing 1,200 large ships, which may load and unload alongside the quays. It is about 6 mi. long, and a little more than half a mile broad at the widest part. Among the imports are corn, timber, cotton stuffs, and other manufactured goods. The exports con-sist of silk, carpets, hides, wool, goats' hair, valonia, etc. The suburb Galata is the prin-cipal seat of foreign commerce. Here are situated the arsenals, the dock yard, the artillery barracks, etc., extending along the Bosporus for nearly 14 mi. It is an ancient place. Pera occupies the more elevated portion of the promontory of which Galata forms the mari-time part. Both it and Galata have now much of the appearance of a modern European town. Top Haneh is situate a little farther up the Bosporus than Galata, of which it forms a continuation. It has a government foundry and arsenal for cannon. Constantinople occupies the site of the ancient Byzantium, and was named after Constantine the Great, who rebuilt it about A.D. 330. It was taken in 1204 by the Crusaders, who retained it till 1201; and by the Turks under Mohammed II, May 29, 1453—an event which completed the extinction of the Byzantine Empire. Pop. 874,926.

Constella tions are the groups into which astronomers have divided the fixed stars, and which have received names for the convenience of description and reference. It is plain that the union of several stars into a constellation, to which the name of some animal, person, or inanimate object is given, must be entirely arbitrary, since the several points (the stars) may be united in a hundred different ways, just as imagination directs. The grouping adopted by the Egyptians was accordingly modified by the Greeks, though they re-tained the Ram, the Bull, the Dog, etc.; and the Greek constellations were again modified by the Romans, and again by the Ara-At various times, also, Christianity bians. has endeavored to supplant the pagan system, the Venerable Bede having given the names of the twelve apostles to the signs of the zodiac, and Judas Schillerius having, in 1627, applied Scripture names to all the constellations. Weigelius, a professor of Jena, even grouped the stars upon a heraldic basis, introducing the arms of all the princes of Europe among the constellations. The old constellations have, however, been for the most part retained. Ptolemy enumerated fortyeight constellations, which are still called the *Ptolemæan*. The different stars of a constellation are marked by Greek letters, a denoting those of the first magnitude,  $\beta$  those of the second, and so on. Stars of the sixth magnitude are the smallest visible to the naked eye. Several stars have also particular names.

**Constitution**, the fundamental law of a state, whether it be a written instrument of a certain date, or an aggregate of laws and usages which have been formed in the course of ages. The ideal constitution is that established by a free sovereign people for their own regulation, though the expediency of other forms at various stages of national development cannot but be recognized. The chief of these are: 1, Constitutions granted by the plenary power of absolute monarchs. 2, Those formed by contract between a ruler and his people, the contract being mutually binding. 3, Those formed by a compact between different of the set of a solute monarchs.

In regard to political principles, constitutions are: 1. Democratic, when the fundamental law guarantees to every citizen equal rights, protection, and participation, direct or indirect, in the government, such as the constitutions of the U.S. and of some cantons of Switzerland. 2, Aristocratic, when the constitution recognizes privileged classes, as the nobility and clergy, and intrusts the government entirely to them, or allows them a very disproportionate share in it. Such a constitution was that of Venice, and such at one time those of some Swiss cantons, for instance, Bern. 3, Of a mixed character. To this latter division belong some monarchical constitutions, which recognize the existence of a king whose power is modified by other branches of government of a more or less popular cast.

Con'sul, a name originally given to the two highest magistrates in the republic of Rome. After King Tarquinius Superbus had been expelled by the joint efforts of the patricians and plebeians (509 B.C.), two consuls were placed at the head of the senate. These officers were annually elected, at first only from the patricians; at a later period also from the plebeians. In order to be eligible to the consulship, the candidate was to be forty-five years of age, and must have passed through the inferior offices of quæstor, ædile, and prætor, and he was required by law to be in Rome at the time of the election. All these laws, however, were disregarded at various junctures in Roman history. The insignia of the consuls were a staff of ivory with an eagle at its head, a toga bordered with purple, which under the emperors was embroidered; an ornamental chair, and twelve *lictors*, who, with *fasces* and **axes**, pre-ceded them. In the beginning of the republic the authority of the consuls was almost as great as that of the preceding kings. They

## Consumption

could declare war, conclude peace, make alliances, and even order a citizen to be put to death; but their powers were gradually curtailed, especially by the establishment of the tribunes of the people, early in the fifth century. But they still stood at the head of the whole republic; all officers were under them, the tribunes of the people only excepted; they convoked the senate, proposed what they thought fit, and executed the laws. In times of emergency they received unlimited power, and could even sentence to death without trial, levy troops, and make war without the resolve of the people first obtained. Under the emperors the consular dignity sunk to a shadow, and became merely honorary. The last consul at Rome was Theodorus Paulinus (A. D. 536).

In France the name of consul was temporarily adopted for the chief magistrates after the revolution. The directorial government (third constitution) having been abolished by the revolution of the Eighteenth Brumaire, of the year VIII (Nov. 9, 1799), a provisional consular government, consisting of Bonaparte, Siéyès, and Roger Ducos, established the fourth constitution, proclaimed December 15, by which France was declared a republic under a government of consuls. Three elective consuls (Bonaparte, Cambacérès, Lebrun) had almost uncontrolled executive authority, while the legislative power was in the hands of the tribunate and the legislative assembly; a conservative senate was also elected. But as early as Aug. 2, 1802, Bonaparte was proclaimed first consul for life, and thus the constitution of France became again practically monarchical. On April 10, 1804, he was proclaimed emperor, and even the nominal consulate ended.

At present consuls are officials appointed by the government of one country to attend to its commercial interests in seaports or other towns of another country. The duties of a consul generally speaking are to promote the trade of the country he represents; to give advice and assistance when called upon to his fellow subjects; to uphold their lawful interests and privileges if any attempt be made to injure them; to transmit reports of trade to his own government, to authenticate certain documents, etc. They are generally of three ranks; consuls, general consuls, and vice consuls.

**Consumption,** in political economy, all use or expenditure of the products of industry or of things having an exchangeable value. It is usually characterized as productive or unproductive, according as it does or does not conduce to the efficiency of a producer and to further production. Thus wealth in the form of machinery is consumed productively by wear and tear in the processes of production; and, similarly, wealth expended in improving land is productively consumed; but the wealth expended in the maintenance of an operatic artist is, from the ordinary point of view, unproductively consumed. The classification, however, is not of a very definite kind, the distinction lying for the most part in the degree of directness and obviousness with which

.

the act of consumption is related to production. Hence in the case of the operatic artist it is sometimes urged that the recreative benefit conferred upon the community tends indirectly to increase efficiency in production, and that from this point of view the artist consumes productively. So the expenditure of wealth in war, or in preparations for war, usually classed as unproductive, may be really productive consumption, as tending to the assurance of the producer in the stability of the commercial conditions. The perfect characterization of an act of consumption as productive or unproductive involves the consideration of elements of a frequently incommensurable kind, and the rough, practical economic test has to be employed with some amount of reservation. Consumption is the end of all production: and as the demand of the consumer determines the employment of the various coefficients of production,-land, labor, and capital, - it is urged by many later economists that the scientific treatment of economics should proceed from consumption to production, instead of from production to consumption in accordance with the method of the older economists. Too much stress may be laid upon this method, but the consideration of economic problems from the standpoint of the consumer is of advantage, as giving the social need, rather than the producer's profit, the prior claim upon the attention.

**Contempt'**, an offense against the dignity, order, or authority of a court or legislative assembly. Contempts committed out of court may be punished by fine or imprisonment; contempts done before court are usually punished by commitment or flue. The power of vindicating their authority against contempt is incident to all superior courts.

**Content** and **Noncontent** are the words by which assent and dissent are expressed in the House of Lords. Aye and No are used in the House of Commons.

Continent'al System, a plan devised by Napoleon to exclude Britain from all intercourse with the continent of Europe. It began with the decree of Berlin of Nov. 21, 1806, by which the British Islands were declared to be in a state of blockade; all commerce, intercourse, and correspondence were prohibited; every Briton found in France, or a country occupied by French troops, was declared a prisoner of war; all property belonging to Britons, fair prize, and all trade in goods from Britain, or British colonies entirely prohibited. Britain replied by orders in council prohibiting trade with French ports, and de-claring all harbors of France and her allies subjected to the same restrictions as if they were closely blockaded. Further decrees on the part of France, of a still more stringent kind, declared all vessels of whatever flag. which had been searched by a British vessel or paid duty to Britain, denationalized, and directing the burning of all British goods, etc. These decrees caused great annoyance, and gave rise to much smuggling, till annulled at the fall of Napoleon, 1814.

#### Contour

**Contour** (kon'tör), an outline. In geodesy contours, or contour lines, are lines or levels carried along the surface of a country or district at a uniform height above the sea level, and then laid down on a map or plan, so that an approximately true outline of its contour is presented, the degree of accuracy depending on the number of lines or levels taken between the sea level and the highest point in the region.

**Con'traband**, in commerce, all goods and wares exported from or imported into any country against the laws of said country. There are, also, a number of articles termed *contraband of war* which neutrals may be prevented, by one belligerent, from carrying to another.

**Con' tract.** in law an agreement or covenant between two or more persons, in which each party binds himself to do or forbear some act, and each acquires a right to what the other promises. Contracts may be in express terms or implied from the acts of the parties; they may be verbal or written, and at common law both forms are binding; but by statute law a promise must be in writing. The law of contract occupies so large a space in all civilized systems of law that only a few of its more leading principles can be conveniently stated here. There is a general harmony in the jurisprudence of modern nations on this subject which is not to be found in other departments of law. The following definitions fully explain the character an 1 meaning of the term contract:-

1. When one person signifies to another his willingness to do or abstain from doing anything with a view to obtaining the assent of that other to such act or abstinence, he is said to make a proposal.

2. When the person to whom the proposal is made signifies his assent thereto, the proposal is said to be accepted. A proposal when accepted becomes a promise.

3. The person making the proposal is called the promiser, the person accepting the proposal the promisee.

4. When at the desire of the promiser the promisee or any other person has done or abstained from doing, or does or abstains from doing, or promises to do or abstain from doing something, such act or abstinence or promise is called the consideration for the promise.

5. Every promise and every set of promises forming the consideration for each other is an agreement.

6. Promises which form the cousideration or part of the consideration for each other are called reciprocal promises.

7. An agreement not enforceable by law is said to be void.

8. An agreement enforceable by law is a contract.

9. An agreement which is enforceable by law at the option of one or more of the parties thereto, but not at the option of the other or others, is a voidable contract.

10. A contract which ceases to be enforceable by law becomes void when it ceases to be enforceable.

#### Conway

Certain classes of persons are under peculiar disabilities in matters of contract, viz., infants, lunatics, and married women. 1, As a general rule at common law contracts made by an infant (a person under twenty-one years) are voidable unless they are in some way for his benefit, and in particular for "necessaries." The protection of infants has been extended by the court of chancery to "expectant heirs, as they are called, i. e., persons who borrow money on the credit of their expectations. 2, A married woman, being in the eye of the law merged in her husband, cannot bind herself by contract. 3, Contracts made by a lunatic are voidable, except where his state of mind was not known to the other contracting party. The principle is extended to corporations is ness. The general rule as to corporations is that they can only make binding contracts under their common seal, excepting in cases of "convenience almost amounting to neces-

sity." See Corporations. The contract must be founded on a consideration either of money or some act whereby an undoubted advantage accrues to the party sued. Lastly, the contract is voidable, if obtained by fraud, mistake, or compulsion.

**Contrac**'tions, abbreviations employed with the view of saving labor in writing, and also in former times with the view of saving parchment in extending MS. copies of works, deeds, etc. Contraction takes place in several modes, as by elision; writing a smaller letter above the word contracted; running two or more letters into one character; by symbols representing syllables or words, and by initial letters.

**Contral 'to,** in music, the highest voice of a male adult, or the lowest of a woman or a boy, called also the *Allo*, or when possessed by a man *Counter tenor*. It is next below the treble and above the tenor, its easy range being from tenor G to treble C.

**Co'nus**, a genus of gasteropodous mollusks, the type of the family Conidæ or cone shells, so named from the conical form of the shell. They are found in the southern and tropical seas.

**Convol'vulus,** a genus of plants, consisting of slender, twining herbs with milky juice, bell-shaped flowers, and five free stamens. Some species are commonly known as bindweeds; others are cultivated in gardens. Minor convolvulus, with its large flowers of violet blue, with white and yellow center, is a familiar species. Scammony is obtained from the root of the *Convolvilus Scammonia*, a native of Syria. Some species, like the sweet potato. have tuberous and fleshy roots capable of being used as food.

**Conway** (or Aberconway), a town of North Wales, in Carnarvonshire, about 13 mi. e.n.e. of Bangor. It is notable for its old castle built by Edward I, a suspension bridge built by Telford, and a tubular railway bridge by Stephenson. Pop. 7,246. The river Conway has a course of about 30 mi. through much romantic scenery.

Conway, HUGH, the nom de plume of Frederick John Fargus, (1847-1875), British novelist.

In 18"4 he wrote a dramatic story, *Called Back*, of which half a million copies were sold.

**Conway,** MONCURE DANIEL, an American clergyman, b. in Virginia, March 17, 1832, became at flist a Methodist, and about 1856 a Unitarian. He was a strong opponent of slavery. For many years (1863-1884) he preached or lectured at South Place chapel, London, and wrote on political, social and religious subjects in the liberal press.

**Cony** 'za, a genus of plants, natural order Compositæ, annual or perennial herbs, scattered over the warmer regions of the earth, a few being found in temperate countries. None possess properties of any value.

possess properties of any value. **Cooch Behar**' (or Kuch Behar'), a native state in India, in political relation with the government of Bengal. Area 1.307 sq. mi; pop. 602,624. The chief town, Cooch-Behar, contains some handsome public buildings and a splendid new palace of the Maharajah. Pop. 9.535.

**Cook**, ELIZA (1818-1889), British poetess. About 1840 she published a volume of domestic poems, and later established *Eliza Cook's Journal*. She was a favorite of the English middle class, and wrote verses such as *The Old Arm Chair*, etc.

**Cook, JAMES** (1728-1779), a famous British navigator, b. in Yorkshire. In 1755 he entered the royal navy, and four years later as sailing master of the Mercury performed valuable services in surveying the St. Lawrence River and the coast of Newfoundland. Some observations on a solar eclipse, communicated to the Royal Society, brought him into notice, and he was appointed commander of a scientific expedition to the Pacific, with the rank of lieuten-ant in the navy. During this expedition he successively visited Tahiti, New Zealand. discovered New South Wales, and returned by the Cape of Good Hope to Britain in 1771. In 1772 Captain Cook, now raised to the rank of a commander in the navy, commanded a second expedition to the Pacific and Southern Oceans, which resulted like the former in many interesting observations and discoveries. He re-turned to Britain in 1774. Two years later he again set out on an expedition to ascertain the possibility of a northwest passage. On this voyage he explored the western coast of North America, and discovered the Sandwich Islands, on one of which, Hawaii, he was killed by the natives.

**Cook**, JOSEPH, an American preacher, b. in Ticonderoga, N. Y., Jan. 26, 1838; graduated at Harvard in 1865. He became well known as a preacher and lecturer.

**Cookery**, the preparation of food so as to render it more palatable and more digestible. The art is of great importance, not only for comfort but also for health. Food is mainly prepared by submitting it to the action of fire. as by roasting, boiling, stewing, etc. These processes give each a different flavor to food, but result alike in rendering the tissues, both of animal and vegetable food, softer and much more easily dealt with by the digestive organs. The art of cookery was carried to considerable perfection among some of the ancient nations. as for instance the Egyptians, Persians, and Athenians. Extravagance and luxury at table were notable features of Roman life under the empire. Among moderns the Italians were the first to reach a high degree of art in this department. Their cooking, like that of the ancient Romans, is distinguished by a free use of oil. Italian cookery seems to have been transplanted by the princesses of the house of Medici to France, and was carried there to perhaps the highest degree of perfection; even yet the skill and resource which the French cook shows in dealing often with very slight materials is a highly creditable feature in the domestic economy of the nation.

**Cook's Inlet**, an inlet of the North Pacific Ocean, running into the Territory of Alaska for about 150 mi.; explored by Captain Cook in 1778.

**Cook's Islands**, a name of the Hervey Islands, given to them because discovered by Captain Cook.

**Cook's Strait**, the channel which separates the two principal islands of New Zealand, discovered by Captain Cook in 1770.

**Coolers**, WATER, vessels of porous, unglazed earthenware, in which a liquid can be kept cool by constantly exuding through the substance of the ware and evaporating from the outer surface of the vessel.

**Cooley**, THOMAS MCINTYRE, b. at Attica, N. Y., Jan. 6, 1824. He removed to Michigan and was admitted to the bar of that state in 1845. In 1859 he became professor, and subsequently dean of the faculty of the law department of the University of Michigan. In 1864 he was appointed to the state supreme bench, and in 1867 was elected chief justice. In 1890 he was placed at the head of the interstate commerce commission. Cooley is recognized as high authority on constitutional law. His work on torts is used as a text-book in many of the law schools. He is still a member of the faculty of the University of Michigan.

**Coom'assle**, a town, West Africa, capital of Ashantee, 130 mi. n. of Cape Coast Castle. It was taken and burned by Sir Garnet Wolseley, at the head of the English expedition sent against the Ashantees in 1874. Pop. about 50,000.

**Coombs**, LESLIE (1793-1881), American soldier. On June 2, 1813; he was made captain of spies in a regiment of Kentucky volunteers. In 1836 during the Texas struggle with Mexico, he raised a regiment of volunteers. In succession he became state auditor, and for several terms was elected to the legislature. When the war with Mexico began, he was active in raising volunteers in Kentucky. In 1860 he was chosen clerk of the Kentucky court of appeals. During the Civil War General Coombs was ardently devoted to the cause of the Union. He was a convincing sneaker.

of the Union. He was a convincing speaker. **Cooper**, SIR ASTLEY PATSON (1768-1841), English surgeon, was b. in Norfolk. He studied medicine in London, and attended the lectures of John Hunter. In 1794 he was ap-
pointed professor of anatomy at Surgeon's Hall, and in 1800 head surgeon of Guy's Hospital. In 1822 appeared his great work on *Dislocations and Fractures*. Shortly after he became president of the Royal College of Surgeons.

Cooper, JAMES FENIMORE (1789-1851), American novelist, b. at Burlington, N. J., studied at Yale College, and entered the American navy as a midshipman at the age of sixteen. In 1821 appeared the novel of *Precaution*, the first production of his pen. Though successful it gave no scope for his peculiar powers, and it was not till the production of the Spy and the *Pioneers* that he began to take a high place among contemporary novelists. After that came a steady flow of novels dealing with life on the sea and in the backwoods, most of which, like the Pilot, Red Rover, Waterwitch, Pathfinder, Deerslayer, and Last of the Mohicans, are familiar names to the novel-After visiting Europe and reading public. serving as consul for the U.S. at Lyons for three years, Cooper returned to America where he d. at Cooperstown, N. Y.

**Cooper**, MYLES (1735-1785), English clergyman. He graduated at Oxford in 1760. In 1762 he came to America as an assistant to President Johnson, of King's College. where he became professor of mental and moral philosophy. In the year following he became president.

Cooper, PETER (1791-1883), American inventor, manufacturer, and philanthropist, b. in New York City. In 1808 he was apprenticed to John Woodward, a carriagemaker, and while with him invented a machine for mortising the hubs of carriages, which proved of great value to his employer. His business ceased to be successful after the conclusion of peace with Great Britain, in 1815, and he attempted the trade of cabinetmaking, the grocery business, and the manufacture of glue; for the latter he leased a factory for twentyone years, and in addition to glue, made oil, prepared chalk, whiting, and isinglass. Subsequently he bought ten acres of land in Brooklyn, where the business has since continued. In 1828, he bought 3,000 acres of land in Baltimore, where he erected the Canton During the excitement over the iron works. building of the Baltimore & Ohio Railroad in 1830, he constructed from his own designs the first locomotive engine ever made in this country, the Tom Thumb, by which means the possibility of building railroads with little capital was demonstrated, and the Baltimore & Ohio Railroad was saved from bankruptcy. Soon after this he sold his iron works in Baltimore, and returning to New York built an iron factory, which he afterward turned into a rolling mill. In 1845 he removed his works to Trenton, N. J., and built three blast furnaces in Phillipsburg, the largest then known, bought the Andover iron mines, and built a railroad through the eight miles of country to bring the ore to his furnaces. He was president of the New York, Newfoundland & London Telegraph Company, the laying

of the Atlantic cable having been accomplished largely by his efforts and liberality. He bought the property at the intersection of Third and Fourth avenues, between Seventh and Eighth streets, and built here from his own plans the Cooper Union for the advancement of science and art. During the financial agitation in the U. S. following the crisis of 1873, he was active in the Greenback movement. In 1876, the National Independent party nominated him for president of the U.S.

**Cooperation**, a term in social economics, which, though of generic significance in the science of industry and trade. has a specific and technical sense, implying the association of any number of individuals or societies for mutual profit, whether in the purchase and distribution of commodities for consumption, or in the production of commodities, or in the borrowing and lending of capital among workmen.

The most powerful coöperative force in the industrial system is what economists have termed "the division of labor," but that is in reality also a union and graduation of labor toward productive ends, and has its counterpart in the multiform divisions of capital in its application to the maintenance and extension of industry.

Coöperation, as technically understood, occupies a middle position between the doctrines of the communists and socialists on the one hand, and the private property and freedom of individual labor and enterprise on the other. It takes its departure from communism at a very definite and significant point. While the latter would extinguish the motive of individual gain and possession in the sentiment of a universal happiness or good, and remodel all existing rights, laws, and arrangements of society on a basis deemed consonant to this end, coöperation seeks, in consistency with the fundamental institutes of society as hitherto developed, to ameliorate the social condition by a concurrence of increasing numbers of associates in a common interest.

The cooperative societies, springing from this idea, though attended with the most varied fortune, have greatly increased in number and in amount of business in recent years. The form, particular objects, and organic rules of these associations are by no means uniform. But they may be divided into three general classes: 1, Societies of consumption, the object of which is to buy and sell to members alone, or to members and non-members under differing conditions, the necessaries of life or the raw materials of their industry; 2, societies of production, the object of which is to sell the collective or individual work of the members: 3, societies of credit or banking. the object of which is to open accounts of credit with their members, and advance them loans for industrial purposes. There are numerous modifications of the principle, such as friendly societies, burial societies, societies of workmen which undertake the execution of work by contract. arrangements of private firms by which the workmen share in the

profits of the employers, and building societies. now rife in most large towns, the object of which is to enable members to become owners But the above three catof dwelling houses. egories define the distinguishing characteristics of the coöperative society proper. There are many cooperative societies in America. The Pillsbury flour mills of Minneapolis is the largest cooperative mill in this country. France, Germany, and England have numerous cooperation stores and factories. The Bon Marche in Paris is a coöperative store. In the U.S. cooperation has chiefly taken the form of building-loan associations for providing the members with houses of their own.

**Cooper's Creek** (or the Barcoo), called by the latter name chiefly in its upper course, the largest inland river of Australia, which rises in Queensland by two branches, the Thomson and Victoria (or Barcoo), and flows southwest to Lake Eyre.

**Co-ordinates,** in geometry, a term applied to lines, to which points under consideration are referred, and by means of which their position is determined. Co-ordinates either determine the position of a point in space or in a plane which is understood to contain all the figure under consideration. They determine position by straight lines only, or by a straight line and angles; in the latter case they are called *polar* co-ordinates. When co-ordinates are at right angles to each other they are called *rectangular* co-ordinates, and when they make any other angle with each other they are called *oblique* co-ordinates.

**Coorg** (or Kurg), a province in Southern Hindustan. Area 1,583 sq. mi.; pop. 173,055. The country has a healthy climate, and yields coffee, spices, timber, etc. The capital is Merkara.

**Coot**, a grallatorial bird of the rail family frequenting lakes and ponds. The common

Common Coot.

coot has a bald forehead, a black body, and lobated toes, and is about 15 in. in length. The nests, which are very large, strong, and compact, are composed of reeds and rank waterherbage, built sometimes near the water's edge, and sometimes on small islets at some distance from the shore. The coot of India, China, and Japan is said to be identical with that of Europe, but the North American coot is now recognized as a distinct species.

**Copaiba** (Copaiva) (ko-pā'ba, ko-pā-va), the name of a balsam and an oil. The balsam is a liquid resinous juice flowing from incisions made in the stem of a plant, and several other species of the genus, growing in Brazil, Peru, etc. It consists of several resins dissolved in a volatile oil. The resins are partly acid and partly neutral; the oil is clear, colorless, and has an aromatic odor.

, Co'pal is a gum-resin yielded by different trees in Africa, South America, India, and Australia, and differing considerably in its qualities according to its origin; but in general it is hard, shining, transparent, and citroncolored. When dissolved in alcohol or turpentine it makes a beautiful and very durable varnish. It resembles copal resin in color and odor.

**Copan'**, a ruined city of Central America, Honduras, on the Copan River, with some remarkable remains.

**Cope**, EDWARD DRINKER (1840-1897), American scientist. He graduated from the University of Pennsylvania and studied comparative anatomy in the Academy of Science, Philadelphia, the Smithsonian Institution, Washington, D. C., and in Europe. He was appointed professor in natural science in Haverford College in 1866, and afterward accepted that professorship in his alma mater. He was for a long time secretary and curator of the Academy of Natural Sciences, Philadelphia. He was a member of the Geological Society of France and the American Association for the Advancement of Science.

Copenha' gen, the capital of Denmark, on the Sound, the larger and older portion of it on the east side of the island of Zealand, a smaller portion on the north point of the island of Amager, with between them a branch of the sea forming the harbor. It has a citadel and several strong forts protecting it on the sea side: and is mostly well built, principally of brick. It has many buildings of interest. It has occasionally suffered much from fires and from hostile attacks, the most disastrous being the bombardment by the British from the 2d to the 5th of September, 1807. In 1801 the Danish fleet was here defeated by Sir Hyde Parker and The environs in some parts are very Nelson. Pop. 312,859. fine.

**Copep' oda**, an order of minute entomostracous fresh-water and marine crustacea, so named because their five pairs of feet are mostly used for swimming.

**Coper'nicus** (or Koppernigk), NICHOLA (1473-1543), a famous astronomer b. at Thorn, Poland. Having studied medicine at Cracow, he afterward devoted himself to mathematics and astronomy, and in 1500 taught mathematics at Rome with great success. Returning to his own country he was made a canon in the cathedral of Frauenburg, and began now to work out his new system of astronomy. Doubting that the motions of the heavenly bodies could be so confused and so complicated as the Ptolemaic system made them, he was induced to

38

consider the simpler hypothesis that the sun was the center round which the earth and the other planets revolve. Besides this fundamental truth Copernicus anticipated, for he can scarcely be said to have proved, many other of the principal facts of astronomical science, such as the motion of the earth round its axis, the immense distance of the stars which made their apparent position the same from any part of the earth's orbit, etc. The great work in which Copernicus explained his theory was completed in 1530, and published at Nuremberg in 1543. He was excommunicated by the pope on account of it.

**Co'ping,** the top or upper covering of a wall made to project and slope so as to carry the rain-water clear of the wall.

**Cop'ley,** JOHN SINGLETON (1737-1815), was b. in Boston, Mass., and d. in London, where he settled in 1776, and acquired a reputation as a historical painter. He was elected a member of the Royal Academy in 1779. His most celebrated picture is the *Death of Lord Chat*ham, now in the National Gallery.

Cop per, one of the most anciently known metals, deriving its name from Cyprus, large supplies having in Greek and Roman times come from that island. It is a metal of a pale red color tinged with yellow. Next to gold, silver, and platinum it is the most ductile and malleable of metals; it is more elastic than any metal except steel, and the most sonorous of all except aluminum. Its conducting power for heat and electricity is inferior only to that It has a distinct odor and a nauseof silver. ous metallic taste. It is not altered by water but tarnishes by exposure to the air, and becomes covered with a green carbonate. It occurs native in branched pieces, dendritic, in thin plates, and rarely in regular crystals, in the primitive and older secondary rocks. Blocks of native copper have sometimes been got weighing many tons. Its ores are numer-ous and abundant. Of these several contain sulphur and iron or other metal, such as copper-glance or vitreous copper. gray copper or Fahlerz, one of the most abundant and important ores, and copper pyrites or yellow cop-per, another abundant ore. The red oxide of copper forms crystals of a fine red color, and is used for coloring glass. There are two native carbonates, the blue and the green, the latter being the beautiful mineral malachite, the former also known as blue malachite. Blue vitriol is a sulphate, and is used for dyeing and preparing pigments, as are various other copper compounds. All the compounds of copper are poisonous. It is found in most European countries, in Australia and Japan, in Africa and in North and South America (especially in the vicinity of Lake Superior).

In extracting the metal from pyrites by the wet process, the ore is first roasted to get rid of the larger proportion of sulphur, then the calcined residue still containing sulphur is mixed with common salt, ground, and heated in ovens. The copper is thus converted into chloride, part of which volatizes, but is condensed along with arsenic and other substances, by passage through flues and water condensers. After some hours the calcined mixture is raked out of the ovens, cooled, and transferred to tanks, where it is exhausted by successive treatment with water. The solution, containing chloride of copper, sulphate and chloride of sodium, and iron salts, is next heated along with scrap-iron. Copper precipitates in the form of a ruddy, lustrous, tolerably compact mass, with a crystalline appearance, and mixed with metallic iron and oxide. The larger pieces of iron are picked out, the precipitate washed and drained, and then rendered compact by heating in a furnace. A slag containing the oxide of iron forms, and the copper, when judged sufficiently pure, is run into molds. Afterward this crude metal is refined and toughened in the usual way, and the slags are employed as in the Welsh process. Some of the alloys of copper, especially those containing tin and zinc, are of considerable importance, e. g., bronze, an alloy of copper with about 8 or 10 per cent. of tin; bell-metal composed of 80 parts of copper and 20 of tin; British bronze coinage, copper 95, tin 4, zinc 1. Copper is applied to a great many useful purposes. In sheets it is used for sheathing the bottoms of ships, covering roofs and domes, the constructing of boilers and stills of a large size. It is also used in electrotyping and engraving, for various household utensils and fittings; but its use for household utensils is by no means free from danger on account of the action of acids on it, which produces verdigris. About half the copper mined in the world is taken from the copper mines of the U.S. The proportion of pure copper to copper ore is largest in the American mines. Once about two thirds of the American copper mined was required for local consumption, and the balance was exported mostly to England, France, and Belgium. It is remarkable that although copper as money, except in small denominations, is no longer in general use, the consumption of this metal, once used for money chiefly, is more than eight times as great as it was forty years ago. This is in great measure explained by the enormous development of the telegraph and the use of copper for cartridges, and for electrical appliances. In 1896 the copper produced in this country amounted to 458.722,-560 pounds, and this, added to 19,000,000 pounds of copper mixed with nickel, makes a total of 477,722,560 pounds of copper mined in the U. S. Of this amount about 271,000,000 pounds were exported, and 206,000,000 pounds were consumed in this country.

١

The American product of copper in 1894 was 160,000 tons; 1895 it was 170,000 tons, and in 1896 it was in excess of 200,000 tons, or ten times more than the total American product of copper sixteen years ago, and nearly 40 per cent. more than the total copper product of the world sixteen years ago. The enormous increase in the demand for copper is, in part, due to the increased need of it for electrical appliances, for copper is used for telephones, electric cars, trolley wires, and cables. The development of trolley lines in other countries and of the tele-

phone service has greatly increased the home demand for American copper. There has been a large increase in the exports of copper utensils, too. While in 1895 10,000 tons of American copper were sent to England, the total amount for 1896 was 16,000 tons, an increase of more than 50 per cent.

The most productive copper districts of the U. S. are the north peninsula of Michigan, Montana, and Arizona. These three districts produce about nine tenths of all the copper mined in this country, but Colorado yields considerable, California some, and Utah is beginning to be a factor. The price of copper in the English market was just twice as much at the beginning of the Civil War as it is now, and Great Britain then produced 13,000 tons to 5,500 in the U. S. Now the English product is only 1,500 tons.

**Cop' peras**, sulphate of iron or green vitriol, a salt of a peculiar astringent taste and of a fine green color. When exposed to the air it assumes a brownish hue. It is much used in dyeing black and in making ink, and in medicine as a tonic. The copperas of commerce is usually made by the decomposition of iron pyrites.

**Copper Glance**, a copper ore of a lead or irongray color. It consists of 81 copper and 19 sulphur, and abounds in Cornwall and many European countries.

**Cop** permine River, a river, British North America, which falls, after a course of about 250 mi., into the Arctic Ocean.

250 mi., into the Arctic Ocean. **Copper-nickel** (or Kupfernickel), an ore of nickel, an alloy of nickel and arsenic, containing about 60 of the former and 40 of the latter, of a copper color, found in the mines of Westphalia.

**Copper-plate**, a polished plate of copper on which the lines of some drawing or design are engraved or etched to be printed from; also a print or impression from such a plate. **Copper Pyri'tes** (or yellow copper ore), a

**Copper Pyri'tes** (or yellow copper ore), a double sulphide of copper and iron composed in equal parts of copper, sulphur, and iron. It occurs mostly in primary and metamorphic rocks, and is the chief copper ore of England.

**Cop' rolites,** the term originally applied to the fossil excrements of extinct animals, chiefly lizards or sauroid fishes. They resemble oblong pebbles, and are found mostly in the Lias and Coal Measures. They consist chiefly of phosphates of calcium and magnesium, and the carbonates of the same metals, and organic matter, and as the fertilizing properties of these are well known, coprolites have been largely used as a manure. For this purpose they are reduced to powder and used as ground bones, or treated with sulphuric acid, so as to form superphosphate of lime.

**Cop' tis**, a small genus of plants, nat. order Ranunculaceæ, two species of which are found in Canada and the northern parts of the U.S.

**Cop' yright**, denotes the property which an author has in his literary works, or which any other person has acquired by purchase, and which consists of the exclusive right of publication; or the right which a designer, engraver,

## Coquimbo

painter, draughtsman, photographer, or sculptor has in his designs, engravings, paintings. etc. The copyright law of the U.S. gives the copyright of a work exclusively to the author for twenty-eight years with renewal to himself, his widow, or children for fourteen years more. In the case of encylopædias, reviews, magazines, and other periodical works, the copyright is vested in the proprietors as if they were the authors; but after twenty-eight years the copyright of all articles claimed by the authors reverts to them for the period of fourteen years still to elapse under the terms of this act. It is, of course, quite competent to the authors of such articles to reserve the right of publishing them in a separate form. Dramatic and musical compositions are subject to the same copyright as books. The exclusive right of performing dramatic and musical compositions not printed, or of causing them to be performed, belongs to the author or his assignees under the same rules of copyright as those relating to books. Lectures and public speeches are the property of the author and cannot be published without his consent, unless they are lectures delivered on any public endowment or foundation. Letters are the property of the writer, and the receiver has no right to publish them without the writer's consent. Anv person pirating a copyright work is liable to a special action, and all copies of pirated works become the property of the proprietor of the copyright. In European countries copyright is generally for the author's life, and a varying period thereafter-twenty, thirty, or even fifty As to Canadian copyright, an author vears. domiciled in Canada, or in any part of the British possessions, or being citizen of a state having an international copyright treaty with Great Britain, may secure copyright in Canada for twenty-eight years and renewal of it for fourteen years to himself or to his widow and children, but to no one else who may be in possession of the copyright.

A copyright may exist in a translation or in part of a work (as in notes or additional matter), with an exclusive right to the whole; but a *bona fide* abridgement of a book is not considered in America and England a violation of the original copyright. So a person may use fair quotation if by its application he makes it a part of his own work, but cannot take the whole or a large part of a work under the pretense of quotation.

International copyright is when nations make mutual arrangements as to copyright. In March, 1891, Congress passed an International Copyright act. By its terms the entire manufacturing of foreign copyrighted work must be performed in the U.S.

**Coquelin**, BENOIT-CONSTANT, French actor, b. in Boulogne, Jan. 23, 1841. Since 1884 he has been an associate of the *Theater Français*. M. Coquelin stands at the head of the dramatic profession in France, and has played with great success in England and the U.S.

**Coquimbo** (ko-kim'bō) (or La Serena), a town of Chile, capital of the province of Coquimbo. Pop. 13,000. Ровто Соquimbo. the

# Coquito

port of the above, from which it is distant 7 mi. to the s.w., has smelting works and a large export trade, chiefly in copper and the precious metals. Pop. 5,100. The province is rich in copper, silver, gold, and other metals, and is mountainous Pop. 165,474.

**Coquito** ( $k\bar{o}$ - $k\bar{e}$ -'t $\bar{o}$ ), a very beautiful palm of Chile, allied to the cocoanut, growing to the height of 40 or 50 ft., yielding a rich, sweet sap, which when boiled is called palm honey.

**Coral** is the name applied to the Zoophytes, having the property of secreting lime from the ocean and incorporating it among the tissues of their own bodies, as well as to their calcareous remains. There are two kinds of corals, the reef-building corals where the calcareous substance is deposited in the walls of the body, and the red coral of commerce in which the deposit is external. In composition coral consists chiefly of carbonate of calcium with vari-

A.-Branch of Dendrophyllia; B.-Part of a stock of red coral, with (a) fully extended polyp. and (b, b) two polyps, partly extended.

able quantities of salts. Coral reefs are composed of the calcareous remains of polyps, and are divided into fringed, barrier, and lagoon. The fringed reefs are often converted into barrier reefs. The coral of commerce and the arts is the production of various polyps and is of different colors and internal structure. The red, pink, and black are most highly prized. The red coral has a branching, shrublike form and is found in the Mediterranean. Coral fishing is carried on in various parts of the Mediterranean. The raw coral is wrought chiefly in Leghorn, Genoa, and Naples, whence it is sent to the East Indies, Germany, Russia, etc. The value of the coral brought yearly to Genoa amounts to nearly \$2,500,000. Coral is capable of taking a good polish.

**Coral Fishes**, a name given to several fishes of different genera. They are found in all tropical seas, especially about coral reefs, and are all brilliantly colored. The most important is the "emperor of Japan" which meas-

# Corday D'Armans

ures about 15 in. in length, and is the most esteemed of all the Indo-Pacific fishes.

**Coral Rag,** in geology, the highest member of the middle Oolitic series—a variety of limestone containing an abundance of petrified corals, occurring in some parts of England. **Coral Sea**, part of the Pacific on the north-

**Coral Sea**, part of the Pacific on the northeast of Australia between it and the Solomon Islands and the New Hebrides.

**Coral Tree**, the name of leguminous trees and shrubs, natives of Africa and America. with trifoliolate leaves and beautiful scarlet spikes of papilionaceous flowers. **Cor'bel**, in archi-

**Cor'bel**, in architecture, a piece of stone, wood, or iron projecting from the vertical face of a wall, to support some super incum bent mass. Corbels are of a great variety of forms, and are ornamented in many ways.

**Corbie Steps**, in architecture, steps into which the sides

of gables from the eaves to the apex are broken. They are common in old Scotch architecture, into which they were probably introduced from France.

Corbie Steps.

**Corcoran**, WM. WILSON (1798-1889), American banker and philanthropist. In 1828 he had charge of the real estate held by the U. S. Bank and the Bank of Columbia in the District of Columbia, and continued their agent until 1836. In 1835 he was married to Miss Louise A. Morris. It was in 1837 that he began his career as banker and broker in Washington. In 1854 he retired from the banking business and after gave much of his time to objects of benevolence.

**Corday D'Armans** (kor-dū-dür-män), MARIE ANNE CHARLOTTE (1768-1793), commonly called Charlotte Corday, was born in Normandy. Her lover, an officer in the garrison of Caeu. was accused by Marat as a conspirator against

the republic, and assassinated by villains hired for that purpose. This, as well as a deeprooted hatred against all oppressors, determined Charlotte Corday to free her country from Marat. Having obtained an interview with Marat at his own house, she plunged her dagger into his bosom, and gave herself up to the attendants who rushed in at his cries. When tried for the murder before the revolutionary tribunals, she was condemned to the guillotine and executed.

Cor'dova, an ancient Spanish city on the Guadalquivir, in Andalusia, capital of a province of same name. The cathedral is a splendid building, originally a mosque, erected in the eighth century by King Abderahman. The town is well supplied with schools, hospitals, and other institutions. It has always carried on considerable trade; and under the Moors the leather exclusively manufactured there (cordovan) was exported in all directions. Cordova, which was founded by the Romans, became the capital of Arabian Spain and the center of Arabian splendor and science under the caliphs of the West. At this time it is said to have had a rop. of 1,000,000. With the decay of the Moorish Empire it fell into the hands of Ferdinand III of Castile. Pop. 55,-614. The province includes the fertile and beautiful valley of the Guadalquivir and the mountains of Sierra Morena. Area 5,188 sq. mi.; pop. 420,728.

Cor'dova, a town of the Argentine Republic, capital of province of same name. It occupies a beautiful and well-sheltered site in the valley of the Primero, and has railways to Rosario and Tucuman. Pop. 67,200. The province has an area of 54,000 sq. mi., and a pop. of 377,200.

Cor'dovan, a fine leather which took its name from the city of Cordova, where it was manufactured in large quantities. Much is now made in Northern Africa and the Levant.

Corduroy', a thick cotton stuff corded or ribbed on the surface. Corduroy road, in the U. S., a road constructed with logs laid together over swamps or marshy places for carriages to pass over.

Corea. See Korea. Corelli, ARCANGELO (1653-1713), Italian musician. By his sonatas for the violin, and by his concerti, he may be considered the creator of a new species of harmony, especially for his own instrument, the violin.

Corentyn (kor'en-tin), a river of South America separating British and Dutch Guiana. It has a course of 300 mi., and is navigable 150 mi.

Cor'fu, a Greek island in the Mediterranean, the most northerly of the Ionian Islands. Area 427 sq. mi.; pop. 118,730. The surface rises at one point to the height of 3,000 ft.; the scenery is beautiful, the climate pleasant and healthy, the soil fertile. Oranges, citrons, grapes, honey, wax, oil, and salt are abundant. A Corinthian colony settled in the island in the eighth century B.C. The Venetians pos-sessed Corfu from 1386 to 1797, the British from 1815 to 1864. CORFU, the capital, is finely situated on a promontory, which terminates in a huge insulated rock, crowned by the citadel; the streets are Italian in style; chief edifices. the cathedral, government palace, and Ionian academy. There is a good harbor and con-siderable trade. Pop. 21,670.

Corian' der, an umbelliferous plant, native of Italy, and cultivated in other parts of Europe. The whole plant has an unpleasant smell, but the fruit, improperly called seed, is very agreeable and aromatic when dry. It is used as a carminative and aromatic in medicine, and as an ingredient in cookery and confectionery.

Corin' na, an ancient Greek poetess of Tanagra, in Bœotia, contemporary with Pindar (about 500 B. C.), whom she is said to have conquered five times at musical contests. Only a few fragments of her songs have come down to us.

Cor' inth, a once celebrated city upon the isthmus of the same name, which unites Peloponnesus with Northern Greece. It was renowned among the cities of Greece, commanded by its advantageous position a most important transit trade, and possessed all the splendor which wealth and luxury could create; while its citadel, the Acrocorinthus, nearly 2,000 ft. high, rendered it a strong for-tress. Only a few ruins remain to attest its ancient magnificence. It had two harbors, Lechæum on the west side of the isthmus, on what is now the Gulf of Corinth, or Lepanto, and Cenchreze, on the Gulf of Athens or Ægina. Near Corinth were held the Isthmian games. Besides being one of the most magnificent, it was also one of the most voluptuous cities of Greece. After many political vicissitudes Corinth became the head of the Achæan League, and was conquered and destroyed by the Roman consul Mummius, 146 B. C. Julius Cæsar, about a hundred years later, rebuilt it; but its commerce could not be restored, though it became a place of note and importance. St. Paul lived here a year and a half, and two of his epistles are addressed to the Corinthians, New Corinth is a village on the shore of the gulf, several miles n.w. from the site of ancient Corinth; it is the seat of an archbishop. Pop. 4,150.

Corinth, GULF of (or Gulf of Lepanto), a beautiful inlet of the Mediterranean, about 80 mi. long, between the Peloponnesus and Northern Greece, having the Isthmus of Corinth closing it in on the east.

Corinth, Isthmus or, the isthmus which connects the Morea (Peloponnesus) with Northern Greece, varying in width from 4 to 8 mi. A canal, begun in 1882 and about 4 mi. long, across the isthmus, enables vessels to sail from the Archipelago to the Adriatic without rounding Cape Matapan. Corinthian Order, that order of Grecian arch-

itecture of which the most characteristic features is the capital of the column, which is adorned with beautifully carved acanthus leaves, but varies considerably in minor details. The column is generally fluted, with a fillet between the flutings, and stands upon a base. The

entablature is variously decorated, especially the cornice; the frieze may be quite plain, or sculptured with foliage and animals. The Corinthian order was not very common in Greece before the time of Alexander the Great; among the Romans it was much employed.

**Coriola**'nus, the name given to an ancient Roman, Caius, or more properly, Cneius, Marcius. He was banished for seeking to deprive the plebeians of their hard-earned privileges, and in particular of the tribuneship; and seeking revenge, he took refuge among the Volsci, the bitterest enemies of Rome, and prevailed upon them to go to war with her. The Volscian army, after making itself master of the cities of Latium, was pitched in sight of Rome before troops could be raised for the defense. The Roman senate made unavailing overtures for peace, till at length the tears of Veturia his mother, and Volumnia his wife, when they appeared at the head of the Roman matrons, induced Coriolanus to withdraw his army from before Rome.

Cork, a city in the south of Ireland, capital of the county of Cork, situated on the river Lee. It is 15 mi. from the sea, and besides an upper harbor at the city itself, and quays extending over four miles in length, there is a lower harbor at Queenstown, 11 mi. below the The entrance, deep and narrow, is town. strongly fortified on each side. Cork is the third city in Ireland, and exports great quantities of grain, butter, bacon, hams, eggs, and live stock. The principal industries are tanning, distilling, brewing, and making of tweeds and friezes. There are also iron foundries and yards for the building of iron ships. The principal buildings are the Protestant and Roman Catholic cathedrals, exchange, customhouse, chamber of commerce, courthouse, Queen's college, etc. There is a naval dockyard at Haulbowline, an island within Cork harbor. Cork sends two members to Parliament. Pop. 75,345. The county is the most southerly and largest in Ireland, having an area of 2,885 sq. mi. The west part is mountainous, the north and east very fertile. The coast is indented with numerous bays and inlets, of which the more important are Bantry Bay, Kinsale and Cork harbors. The climate is remarkably mild, though moist. The county is watered by the Bandon, Lee, and Blackwater. Cattle, sheep, pigs, and quantities of butter are exported. The fisheries are important. The county has seven political divisions, each send-ing a member to Parliament. The county town is Cork; other towns are Queenstown, Fermoy, Youghal, Bandon, Mallow, and Kinsale. Pop. 438,432

**Cork** is the external bark of a species of oak which grows in Spain, Portugal, and other southern parts of Europe and in the north of Africa, and is distinguished by the great thickness and sponginess of its bark, and by the leaves being evergreen, oblong, somewhat oval, downy underneath, and waved. The outer bark falls off of itself if left alone, but for commercial purposes it is stripped off when judged sufficiently matured, this being when the tree has reached the age of from fifteen to thirty vears. The first stripping yields the coarsest kind of bark. In the course of eight or nine years, or even less, the same tree will yield another supply of cork of better quality, and the removal of this outer bark is said to be beneficial, the trees thus stripped reaching the age of 150 years or more. The bark is removed by a kind of ax, parallel cuts being carried round the tree transversely and united by others in a longitudinal direction, so as to produce oblong sheets of bark. These vary in thickness between three-fourths of an inch and three inches. Care must be taken not to cut into the inner bark, or the tree would be killed. The pieces of cork are flattened out by heat or by weights, and are slightly charred on the surface to close the pores. Cork is light, elastic. impervious to water, and by pressure can be greatly reduced in bulk, returning again to its original size. These qualities render it peculiarly serviceable for the stopping of vessels of different kinds, for floats, buoys, swimming belts or jackets, artificial limbs, etc.

The cork is sorted into four grades after which it is put into sheet-iron boxes and steamed. The cork is steamed so it will not take the temper out of the circular knives or punches which slice up the cork and make it into stoppers. The hollow punch which cuts into the cork twists around about 800 times a minute as it goes through the sheet, and the disk-shaped knife revolves 600 times a minute. The circular knife which slices the cork into strips, which are just as wide as the corks to be punched from it, is a disk of fine-tem-pered, thin steel about 28 in. in diameter. The revolving knife cuts the cork across the grain. the strips varying from 8 to 18 in. in length. and as wide as the cork is long. The punches or cutters are hollow cylinders made of the finest grade of tool steel and vary from an eighth of an inch to two and a half inches in diameter. The punch works horizontally and is held in place by a chuck on the end of the shaft. The shaft is drawn forward against the strip of cork which is held against a stop. A straight cork is made every time the shaft is drawn forward. As the punch returns to its original position the cork is forced out of it by a plunger and it rolls into a basket beneath. About 18,000 corks can be punched in a single day by one of these machines. The leavings from the strips of cork are granulated for insulating material and packing for ice-houses and refrigerators. The straight corks are taken to a tapering machine which is a large circular knife revolving in a horizontal position. The corks are fed into a device which carries them up against the knife. The cork is held in a slanting position and the knife cuts off shavings so as to give a bevel or taper to the cork. The corks are then selected into different grades and placed in packages for shipment.

Cork, FOSSIL, a kind of mineral, a species of asbestos.

Corliss, GEORGE HENRY (1817-1888), American inventor. The construction of stationary

# Cormorant

steam engines was revolutionized by his improvements. He invented many ingenious devices.

**Cor' morant**, the name of several large webfooted birds of the pelican family, or forming a family by themselves. They have a longish and strongly hooked bill, long neck, short wings, and rather long. rounded tail; all the toes are united by a web, and, though excellent swimmers, they are able to perch on trees: color generally black or dark. The common cormorant of Europe is larger than a goose, but with smaller wings. It occupies cliffs by the sea, feeds on fish, and is extremely voracious. It dives and swims with great power, and pursues its prey beneath the sur-

#### Cormorant.

face of the water, often to a great depth. Among the Chinese cormorants have long been trained to fish for man. At first a ring is placed on the lower part of the bird's neck to prevent it swallowing the prey, and in time it learns to deliver the fish to its master without such a precaution being necessary. Another British cormorant is the green cormorant or shag. It is smaller than the common cormorant. Both these species are found also on the eastern coasts of America, and there are various other American as well as Australian species.

**Corn** is the generic term for all kinds of grain used for making bread, and is applied specifically to the principal breadstuff; in England to wheat, in the U. S. generally to maize, and frequently in Scotland to oats.

**Corn**, INDLAN (or Maize), is the produce of Zeamays, a species of cereal. The stem, which is filled with a pithy, fibrous structure, is divided at irregular intervals by nodes, and its strength and solidity is increased by a siliceous outside covering. From the lowest, and sometimes also the second and third node, it sends out "brace" roots, and these help to support the plant, which sometimes grows to 10 ft. In height, the minimum being generally 3 ft. The ears — which are developed within the leaf-sheaf at the uodes, and consist of a "cob" with the grains disposed upon it in regular rows of from eight to twenty, and long "silk" threads attached to each embryo, which usually extend beyond the closely folded

tip of the mass of imbricated leaves ("husk") that wraps the whole - are from half an inch to 3 in. in diameter, and from 2 to 17 in. in length. The stem is topped by a "tassel," producing an abundance of light, dry, looselyattached pollen. It is held to be superior in nutriment to barley, buckwheat, and rye. By analysis it gives 77 per cent. of starch; 3 of zein, a principle analogous to gluten; 2.5 of albumen; 1.45 of sugar; .8 of extractive; 1.75 of gum; 1.5 of sulphate and phosphate of lime; 3 of lignin; and 9 of water. It is more generally used in America (North and South) than in the other continents -- in the U.S. the crop is over 2,000,000 bu., or about two thirds of all the grains grown; but in the Mediterranean countries, Germany, etc., it is also highly valued. The green ears of the sweet varieties are boiled and eaten from the kernel or served in milk. When coarsely ground corn forms the hominy, and finer ground it furnishes the mush or porridge. Pop-corn is a variety whose grains can be roasted and turned and shaken smartly over a brisk fire till they swell and burst, turning inside out; in this state they are coated with syrup and pressed into a ball, or the separate grains are simply sprinkled with salt. The deficiency of gluten in the meal of maize renders it ill adapted to bread-making: but johnny-cakes made from it are popular. Large quantities of starch are manufactured from corn, both for laundry purposes and for making puddings, custards, and blanc-mange; and the starch, by treatment with acid, is converted into glucose or The canning of green sweet grape sugar. corn is also an important industry in some states. By the Mexicans the small young shoots of thickly-sown crops are served at table like asparagus and as dessert. The stems of sugar corn when full grown yield by pressure a thin sweet juice, which unfermented gives a pleasant syrup and from 5 to 15 per cent. of sugar, fermented a beer called chica, and distilled an excellent spirit resembling brandy. In countries where corn does not ripen well it is sometimes sown to afford food for poultry, or to be mown as green fodder for cattle. Where it is cultivated for its grain the dried leaves are used as winter fodder. The stalks are used for thatch and for fuel, and for making baskets. The fibers of the culm and leaves afford a durable kind of yarn; and the husks are elastic, and can be applied to the stuffing of chairs, saddles, etc., and to the manufacture of good durable mattresses, which have become a profitable article of trade in Paris and Strasburg. The husks are also much used for packing oranges and lemons, and in South America for making cigarettes: and good paper has been manufactured from them. Hollowed corn-cobs make homely but serviceable pipe-heads for smoking tobacco. There are few plants of which the uses are more various than corn, and few which are of greater importance to man. Another species of maize, called Chile Maize or Valparaiso Corn, is distinguished by its serrated leaves. It is a smaller plant, a native of Chile, and has

## Cornaceæ

won a superstitious regard because its grains when roasted split in the form of a cross. The native country of corn is uncertain. In an ancient Chinese encyclopædia in the royal library at Paris is an excellent representation of the plant; so that while it was undoubtedly first introduced to Europe about the year 1520 by Columbus from America, there are good grounds for the conclusion that it was known and cultivated in the ancient world long before that time.

**Corna** ceæ, a natural order of polypetalous exogens, consisting of about 100 species, two of which are found in Britain, a lowly Alpine plant and the common dogwood or prickwood. Several plants of this order are of service as tonics and for the cure of ague.

**Corn Crake** (or Landrail), a species of bird of the order Grallæ or Waders, and of the family Rallidæ or rails. The crakes differ from the rails proper in having the bill shorter.

Corn Crake.

The name is expressive of its cry. It feeds on worms and insects. It is a bird of passage, frequenting the northern parts of Europe during summer, and the southern, including the Mediterranean coasts of Africa, in winter.

**Cor' nea**, one of the coats of the eye, a transparent membrane in the fore part of it.

**Corneilie** (kor-nā-yó), PIERRE (1606-1684), the father of French tragedy and classic comedy, was born at Rouen. In 1635 he entered the field of tragedy with Medea; but it was not till the appearance of his next work, the famous *Cid*, that Corneille's claim was recognized to a place among the great tragic poets. After the *Cid* appeared in rapid succession *Horace*, *Cianae*, his masterpiece according to Voltaire, and *Polycucte*, works which show Corneille's genius at its best.

**Cornel** (or Cornelian Tree), a species of dogwood, a tree or shrub of the order Cornaceæ, distinguished by the hardness of its wood, a native of Asia and the south of Europe. One of the finest, the round-leaved Cornel, is a large shrub, 5 to 10 ft. high, common from Virginia to Canada.

**Corne' lian** (or Carnelian), a gem of a lightred or flesh color. It consists of silica along with minute quantities of the oxides of iron, aluminum, and sometimes of other metals, and is used for seals, bracelets, necklaces, and other articles.

**Corne' lius,** PETER VON (1787-1867), German painter. In 1811 he went to Rome, where, in conjunction with Overbeck, Veit, and other associates, he may be said to have founded a new school of German art, and revived fresco painting in imitation of Michael Angelo and Raphael.

**Corne lius Nepos**, a Roman author of the first century B. C., the contemporary of Cicero and Catullus. The only extant work attributed to him is a collection of short biographies, probably an abridgment of a work written by Nepos. These biographies have long been a favorite school book, and popular editions of them are very numerous.

**Cornell**, ALONZO B., son of Ezra Cornell, was b. in Ithaca, N. Y., 1832. In 1879 he was elected governor of New York and served till Dec. 31, 1882.

**Cornell,** EZRA (1807-1874), American inventor and philanthropist, b. iu New York state. He realized a large fortune through his connection with the electric telegraph system, and devoted a greater part of it to the endowment of Cornell University, at Ithaca, N.Y.

**Cornell University**, at Ithaca in the state of New York, was established in 1867 with funds furnished from the income of 990,000 acres of public land allotted by Congress to the state for this purpose and with a foundation of \$500,000 presented by the Hon. Ezra Cornell, much augmented by subsequent donations. There are five general courses, including classics, literature and philosophy, science, engineering, architecture, agriculture, etc., all of which lead to a bachelor's degree.

**Cornet**, a wind instrument of former times, originally curvilinear or serpentine in form and increasing in diameter from the mouthpiece to the lower end. The modern cornopean is a kind of keyed bugle which has a very agreeable tone, and is much used in orchestras and military bands. Several forms of it are in use.

**Corning,** Steuben co., N. Y., on Chemung River. Railroads: Erie; Lackawanna; and Fall Brook. Industries: glass works, flouring mills, three iron foundries, lumber mills, novelty works, factories for the manufacture of agricultural implements, cabinets, etc. Surrounding country agricultural. Corning became a city in 1890. Pop. est. 1897, 12,000.

**Corn Laws**, a name commonly given to certain statutes passed to protect the agricultural interest in Britain. The first form of interference by legislative enactment with the corn trade in England, beginning soon after the Conquest, was the prohibition of exportation. an expedient in those times to prevent scarcity in a sudden emergency. The exportation of grain was prohibited in the reign of Edward III in 1360-61, Calais and other appointed ports being excepted. This provision was relaxed by a statute of Richard II in 1394, by which exportation was permitted from all ports not excepted by royal proclamation. In 1436, under

Henry VI, the exportation of grain was permitted without license whenever the price of wheat did not exceed 6s. 8d. per quarter, and barley 3s. 4d. At the restoration of Charles II duties were imposed both on exportation and importation, while the old principle of a standard price, beyond which exportation was prohibited, was retained. In 1804 if the price of corn was below 63s. a prohibitory duty of 24s. 3d. was laid on what was imported; if between 63s. and 66s., a duty of 2s. 6d.; and only when the price at home had risen as high as 66s. per quarter was the foreign grain allowed to pass at a nominal duty of 6d. With variations of more or less importance this sliding scale of prohibitory duties continued in force till 1846, when Sir Robert Peel, influenced by the corn-law repeal agitation, and more especially by the Anti-Corn-Law League, headed by Cobden and Bright, carried a measure repealing the duty on imported corn, except a nominal sum of 1s. per quarter, which also in 1869 was done away with, thus leaving the importation of corn entirely free.

**Corn Marigold** (*Chrysanthèmum segètum*), a common weed in British corn fields, of a rich orange color.

**Corn Moth**, a small moth, the larva of which is exceedingly destructive to corn sheaves in the field, and to stored grain, from eating into the grains. Salt, frequent turning, and many expedients are employed to destroy the eggs.

**Cornplanter**, a Seneca Indian chief, said to have been over a hundred years old at his death, in 1836. He was a bitter enemy of the whites; joined the French at the time of General Braddock's expedition, and took part in the Wyoming massacres.

**Cornucopiæ** ("horn of plenty"), a wreathed horn filled to overflowing with fruit, flowers, and grain; used as the symbol of plenty.

Corn wall, a maritime county of England, forming the southwestern extremity of the island. Area 1.350 sq. mi.; pop. 318,583. The chief wealth of the county is in its minerals, especially its mines of copper and tin, though the value of both has diminished. mines exceed 350 fathoms in depth. Several Besides tin and copper, silver, lead, zinc, iron, manganese, antimony, cobalt, and bismuth are found in comparatively small quantities. There are also valuable deposits of kaolin or china-clay. There are no manufactures, but the fisheries, particularly of pilchard and mackerel, are valuable. Cornwall, with the Scilly Isles, seems to have been the Cassiterides or Tin Islands of antiquity. The natives long maintained their independence against the Saxons, and their country was spoken of as West Wales. Their language also long continued to be Celtic. The chief towns are Bodmin (county town), Penzance, Truro, and Falmouth (with Penryn).

**Cornwall**, a port and manufacturing town of Canada, prov. Ontario, on the north side of the St. Lawrence, 67 mi. above Montreal. Pop. 6,805.

Corn' wallis, CHARLES, MARQUIS OF (1738-1806), British soldier, son of the first Earl

#### Corporation

Cornwallis. On the outbreak of the American war he sailed with his regiment, served with distinction under Howe and Clinton, and in 1780 was left in independent command in South Carolina with 1,000 men. He defeated General Gates at Camden, 1780, and fought General Greene at Guilford in 1781, but six months afterward was besieged in Yorktown and compelled to surrender Oct. 17, 1781. In 1786 Lord Cornwallis went out to India as commander in chief and governor general, invaded Mysore in 1791, and obliged Tippoo Sahib to surrender much territory. Having returned to Britain he was created a marquis (1794), appointed lord lieutenant of Ireland, and again in 1805 governor general of India.

**Corn Weevil**, a destructive insect which preys upon stored corn. It bores a hole and deposits its egg inside of the grain, which is afterward eaten to a husk by a grub.

**Coro**, a seaport town, Venezuela, at one time a flourishing place but now much decayed. Pop. 8,000.

**Corol' la**, in botany, the portion of the flower inside the calyx; the inner floral envelope. The corolla surrounds the parts of fructification and is composed of leaves called petals.

**Cor'ollary**, in mathematics, a collateral conclusion, following from a proposition demonstrated.

**Coroman'del Coast**, the east coast of the Indian Peninsula, Madras Presidency, or that portion of it between Palk's Strait and the river Pennar.

**Coromandel Wood**, the wood of a tree found in Ceylon. Its ground color is chocolate brown, with black stripes and marks; it is hard, turns well, and makes very handsome furniture.

**Coro' na** ("a crown"). 1, In astronomy, a halo, or luminous circle round one of the heav-

enly bodies; specifically the portion of the aureola observed during total eclipses of the sun, which lies outside the chromosphere or region

of colored prominences. 2, In botany, an appendage of the corolla in some flowers, coming as it were between the corolla and the stamens, well seen in the cup of the daffodil. 3, In architecture, the lower member of the projecting part of a cornice.

**Corot** (kö-rö). JEAN-BAPTISTE-CAMILLE (1796-1875). French artist, b. at Paris. He frequently painted figure subjects, including the large sacred pictures, the *Flight into Egypt* and the *Baptism of Christ;* but his most characteristic and successful work was in landscape. His woodland scenes, painted for the most part at dawn or twilight in a scheme of pale greens and silvery grays, show a singularly subtle feeling for this phase of nature, and are undoubtedly among the most important contributions of the century to landscape art.

**Corporation.** A corporation is an association of persons which the law treats in many respects as if it were itself a person. It has rights and duties of its own which are not the

# Corporation

rights and duties of the individual members thereof. Thus a corporation may own land, but the individual members of the corporation have no rights therein. A corporation may own money, but the corporators as individuals are under no obligation to pay the debt. If, however, an individual has not paid up his stock in full, he is liable for the amount unpaid. The rights and duties descend to the successive members of the corporation. This capacity of perpetual succession is regarded as the distinguishing feature of corporations as compared with other societies. One of the phrases most commonly met with in law books describes a corporation as a society with perpetual succession and a common seal. The latter point, however, is not conclusive of the cor-porate character. The legal attributes of a corporation have been worked out with great fullness and ingenuity in English law, but the conception has been taken full-grown from the The technical term in Roman law of Rome. law corresponding to our corporation is collegium; a more general term is universitas. collegium or corpus must have consistent of the cor-least three persons, who were said to be cor-porati—habere corpus. They could hold property and had a common chest. They in common and had a common chest. They might sue and be sued by their agent. There was a complete separation in law between the rights of the collegium as a body and those of its individual members. The collegium remained in existence although all its original members were changed. It was governed by its own by-laws, provided these were not con-trary to the common law. The power of form-ing collegia was restrained, and societies pretending to act as corporations were often suppressed. In all these points the collegia of Rome closely resemble the corporations of English law. There is a similar parallel be-tween the purposes for which the formation of such societies is authorized in English and Roman law. The Roman conception of a corporation was kept alive by ecclesiastical and municipal bodies. When English lawyers came to deal with such societies, the corporation law of Rome admitted of easy application. Accordingly, in no department of our law have we borrowed so copiously and so directly from the civil law. The corporations known to the earlier English law were mainly the municipal, the ecclesiastical, and the educational and eleemosynary. To all of these the same principles, borrowed from Roman jurisprudence, were applied. The different purposes of these institutions brought about in course of time differences in the rules of the law applicable to each. In particular, the great development of trading companies under special statutes has produced a new class of corporations, differing widely from those formerly known to the law.

Corporations are divided into two main classes, public and private. Public corporations are such as municipal corporations of states, counties, cities, villages, or incorporated official boards of officers, as a park board. Of private corporations there are four classes:

## Corporation

1. A corporation for the benefit of the members. In such a corporation there is no stock, no capital, and no pecuniary profit. Examples are social, artistic, scientific societies, religious and professional societies, clubs, etc.

2. Corporations for the pecuniary profit of individual members. The basis is a capital engaged in commercial enterprise. Shares of stock are held by stockholders. Such corporations are regulated in the U. S. by statutes, which designate the relations and privileges of the corporation. Such corporations are organized and chartered for a specific purpose, and cannot transact business other than that for which they are organized. Examples are railroads, telegraph and telephone companies, insurance and banking corporations. The profits are divided pro rata.

3. Corporations for mutual aid and relief. The first object is the element of personal membership and benefit; the division of profit is a secondary consideration. Examples: building and loan associations, co-operative societies, lodges of various kinds, etc. Such corporations are generally under state control. 4. Incorporated trusts. Such corporations

4. Incorporated trusts. Such corporations have a fund set apart for some purpose. This fund belongs to an abstract society, and is held by someone in trust, usually a board of trustees. Examples: colleges, hospitals, and charitable associations.

A corporation may be dissolved by the death of all its members, or of such number as leaves not enough to make new elections in the way the charter requires; by forfeiture of the charter through breach of its conditions: by surrender of the charter. In all such cases the lands of the corporation revert to their several donors; the creditors, however, if any, being entitled in the first place to insist on a sale and distribution of the property, whether in a sequestration or otherwise.

Corporations, as has been pointed out in the American Civil Rights Act of Congress, are liable to the ordinary laws and treaties of the country, but are not citizens in the sense of exercising a political or municipal franchise. The American law has also had occasion to emphasize the distinction between public corporations which may be affected by legislation, while the written constitution of the U. S. prohibits any interference with the rights of a private corporation. Further, the franchises of a corporation are treated as realizable assets for creditors. The amount of property which may be held by a corporation is frequently limited in the act or charter: and as regards charitable and religious purposes. a general law forbids the holding of more than \$50,000 worth.

The power of the majority to bind the society is one of the first principles of corporation law, even in cases where the corporation has a head. The binding majority is that of the number present at a corporate meeting duly summoned. Votes given for an illegal purpose or a disqualified person are considered as thrown away, and in an election votes must be given for some particular candidate—if they

# Corpuscular Theory of Light

are merely against a candidate, they are void. A corporation has power to make such regulations (by-laws) as are necessary for carrying out its purposes, and these are binding on its members and on persons within its local jurisdiction if it has any. Such by-laws must not be at variance with the law of the land, nor retrospective in their operation, nor unreasonable. They must further be in harmony with the objects of the society, and must not infringe or limit the powers and duties of its officers.

**Corpus' cular Theory of Light,** the older theory, which explained the phenomena of light by supposing that a luminous body emits excessively minute particles of matter, corpuscles as they were called, which striking the eye produce the sensation of light. Newton held the corpuscular theory, and supported it with great ingenuity. This theory has long been displaced by the undulatory theory.

**Correggio** (kor-re-j $\delta'$ ), ANTONIO ALLEGRI, (1494-1534), famous Italian painter, b. at Correggio near Modena. Correggio is unrivaled in chiarooscuro and in the grace and rounding of his figures. Among his best pictures are Night; the St. Jerome; the Marriage of St. Catharine; several Madonnas; the Penitent Magdalene; the altar pieces of St. Francis, St. George, and St. Sebastian.

**Correlation of Physical Forces**, a term introduced by Grove to denote what may more properly be called the convertibility of the various forms of energy. The energy, for instance, which a bullet in rapid motion possesses, is converted into heat when it strikes the target, the bullet being then warm to the touch. So heat may again be converted into kinetic energy, that is, the form of energy possessed by a moving body; for instance, through the intermediation of a steam engine. Heat is also directly converted into electricity, and electricity into heat. In connection with this doctrine that of the conservation of energy ought also to be studied.

**Corrèze** (kor-rez), an inland department, France, formed from part of the former province of Limousin, and deriving its name from the river Corrèze, by which it is traversed. Area 2.265 sq. mi.; pop. 328,119.

**Corrib**, Lough, a lake in Ireland, mostly in Galway county, area 68 sq. mi.

**Corrien tes,** a town, Argentine Republic, capital of the province of the same name. It is well placed to serve as an entrepôt of goods, between the upper parts of the Paraguay and the Parana, and the seaports on the La Plata. Pop. 14,200. Pop. of prov. 201,325; area 54,000 sq. mi.

sq. mi. **Corrosive Sublimate**, the bichloride of mercury, a white crystalline solid, an acrid poison of great virulence. The stomach pump and emetics are the surest preventives of its deleterious effects when accidentally swallowed; white of egg is also serviceable in counteracting its poisonous influence on the stomach. It is a powerful antiseptic.

Cor'rugated iron, sheet iron strengthened

by being bent into parallel furrows. It is largely used for roofing, and when dipped in melted zinc, to give it a thin coating, is commonly known as *galvanized iron*.

**Corry**, Erie co., Pa., 90 mi. s. of Buffalo. Railroads: Penna.; N. Y. L. E. & W.; N. Y. & P. Industries: iron mills, flouring mills, lumber, and sash and door factories. Natural gas, coal, and oil in vicinity. Surrounding country agricultural. Was first settled 75 years ago, but very thinly populated until the railroad was built. Pop. est. 1897, 7,000.

**Cor'sairs**, the Anglicized form of the term used in the south of Europe to denote those pirates who sailed from Algiers, Tunis, Tripoli, and the ports of Morocco.

Cor'sica, an island in the Mediterranean, forming the French department of the same name. Area 3,377 sq. mi.; pop. 288,596. There are fine forests containing pines, oaks, beeches, chestnuts, and cork trees, and the mountain scenery is splendid. In the plains and numerous valleys the soil is generally fertile; but agriculture is in a backward state. Mules, goats, horses, cattle, and sheep, and among wild animals the boar, the fox, and the deer. are common. There are good fisheries. The chief exports are wine, brandy, olive oil, chest-nuts, fruit, fish. The chief towns, Ajaccio and Bastia, are connected by railway. The island was first colonized by the Phœnicians, from whom it got the name of Cyrnos. The Romans afterward gave it that of Corsica. From the Romans it passed to the Goths, and from them to the Saracens, and in the fifteenth century to the Genoese. France had the rights of the Genoese ceded to her, after Paoli had virtually made Corsica independent, and entered on forcible possession of it in 1768. An insurrection in 1794, headed by General Paoli and assisted by the British, for a time restored the island to independence; but in 1796 it again fell under the dominion of France.

**Corsicana**, Navarre co., Tex., 54 mi. s. of Dallas. Railroads: Houston & Texas Central; and St. Louis Southwestern. Industries: two large oil mills, two cotton compresses. flouring mill, iron foundry, and numerous small factories. Coal, oil, and gas in vicinity. Surrounding country agricultural. The town was first settled in 1850 and became a city in 1875. Pop. est. 1897, 11,500,

**Cort**, HENRY (1740-1800), the inventor of the processes of puddling and rolling iron, b. at Lancaster.

**Cortes** (kor'tes), the legislative assembly of Spain and Portugal. See Spain.

**Cor'tez** (or Cortes), FERNANDO (or Hernan) (1485-1547), the conqueror of Mexico, was b. at Medellin, in Estremadura; d. near Seville. He went to the West Indies in 1504. He quitted Santiago de Cuba in 1518, with eleven vessels, about 700 Spaniards, eighteen horses, and ten small field pieces. He landed on the shore of the Gulf of Mexico, where he caused his vessels to be burned, in order that his soldiers might have no other resources than their own valor. After a desperate struggle, in which 100,000 natives are said to have perished, the city was taken, and soon after the whole-country was subjugated. In 1528 he returned to Spain; but two years after he was again sent out to Mexico, where he remained for ten years, discovering meanwhile the peninsula of California. He returned to Spain.

years, discovering meanwrite and provide the california. He returned to Spain. Cortland, Cortland co., N. Y., on Tioughnioga River, 37 mi. s. of Syracuse. Railroads: D. L. & W.; Lehigh Valley; and Erie & Central New York. Industries: wire mills, flouring mills, carriage, bicycle, skirt, chair, door, and window-screen factories, and several large wagon and sleigh factories. Surrounding country agricultural and mineral. The village was first settled in 1792, is the county seat of Cortland co. State normal and training school located here. Pop. est. 1897, 10,769.

**Corun' dum,** the earth alumina as found native in a crystalline state. In hardness it is next to the diamond. The amethyst, ruby, sapphire, and topaz are considered varieties of this mineral, which is found in India and China, and is most usually in the form of a sixsided prism or six-sided pyramid. It is nearly pure anhydrous alumina, and its specific gravity is nearly four times that of water. Its color is various—green, blue, or red inclining to gray, due to traces of iron, copper, etc. Emery is a variety of corundum.

**Corun'na**, a seaport of Spain in the province of the same name in Galicia. The harbor, which is well protected, is deep, spacious, and safe, and many improvements have been made. Cattle form the chief export. There is a government tobacco factory employing 3.000 women and girls. There is a lighthouse, 92 ft. high, called the Tower of Hercules, supposed to be of Roman construction. Pop. 37, 251. The province is hilly, and its inhabitants chiefly engaged in agriculture and fishing. Area 3,079 sq. mi.; pop. 613,881.

sq. mi.; pop. 613,381. **Cor' vidæ**, the crows, a family of conirostral birds, in which the bill is strong, of conical shape, more or less compressed, and the gape straight. The nostrils are covered with stiff bristle-like feathers directed forward. The family includes the common crow, rook, raven, magpie, jay, jackdaw, nut-cracker, Cornish chough, etc.

**Corwin**, THOMAS (1794-1865), American statesman, b. in Bourbon co., Ky. In 1844 he was elected to the U. S. Senate. He was appointed by President Fillmore secretary of the treasury in 1850, and after his service here returned to the practise of law iu Lebanon, O. In 1858 he was elected to Congress as a Republican, and was re-elected in 1860. President Lincoln appointed him minister to Mexico in 1861, but on the arrival of Maximilian he returned to Washington, and practised law.

**Cor'ymb**, in botany, that form of inflorescence in which the flowers, each on its own pedicel of different lengths, are so arranged along a common axis as to form a flat, broad mass of flowers with a convex or level top, as in the hawthorn and candytuft.

Cor' ypha, a genus of palms, including the fan palm, gebang palm, and taliput.

Coryphæ'na (Cor'yphene), a genus of fishes

of the mackerel family. The body is elongated, compressed, covered with small scales, and the dorsal fin extends the whole length of the back, or nearly so.

**Cos** (now called Stanchio or Stanko), an island in the Ægæan Sea, on the coast of Asia Minor. Area 95 sq. mi.; pop. 11,000.

Minor. Area 95 sq. mi; pop. 11,000. **Cosenza** (ko-sen'tså), a city of Southern Italy, capital of province of Cosenza or Calabria Citeriore, 150 mi. s.e. Naples; pop. 15,149. It has manufactures of silk, pottery, and cutlery; the environs are beautiful, and produce abundance of corn, fruit, oil, wine, and silk. **Cosmog'ony** (Greek, kosmos, world; and

gone, generation), a theory of the origin or formation of the universe. Such theories may be comprehended under three classes: 1, The first represents the world as eternal, in form as well as substance. 2, The matter of the world is eternal, but not its form. 3. The matter and form of the universe is ascribed to the direct agency of a spiritual cause; the world had a beginning, and shall have an end. Aristotle appears to have embraced the first theory; but the theory which considers the matter of the universe eternal, but not its form, was the prevailing one among the ancients, who starting from the principle that nothing could be made out of nothing, could not admit the creation of matter, yet did not believe that the world had been always in its present state. The prior state of the world, subject to a constant succession of uncertain movements which chance afterward made regular, they called chaos. The Phœnicians, Babylonians, and also Egyptians, seem to have adhered to this theory. One form of this theory is the atomic theory, as taught by Leucippus, Epicurus, and Lucretius. According to it atoms or indivisible particles existed from eternity, moving at hazard, and producing, by their constant meeting, a variety of substances. After having given rise to an immense variety of combinations they produced the present organization of bodies. The third theory of cosmogony makes God, or some deity, the creator of the world out of nothing. This is an ancient and widely spread theory, and is that taught in the book of Genesis. Anaxagoras was the first among the Greeks who taught that God created the universe from nothing. The Romans generally adopted this theory, notwithstanding the efforts of Lucretius to establish the doctrine of Epicurus.

**Cosmos,** order or harmony, and hence the universe as an orderly and beautiful system. In this sense it has been adopted by Humboldt as the title of his celebrated work, which describes the nature of the heavens as well as the physical phenomena of the earth.

**Cos' sacks**, tribes who inhabit the southern and eastern parts of Russia, paying no taxes, but performing instead the duty of soldiers. Writers are not agreed as to the origin of this people and of their name, but they are believed to be a mixed Caucasian and Tartar race. In personal appearance the Cossacks bear a close resemblance to the Russians. Originally their government formed a kind of democracy, at the head of which was a chief or hetman of their own choice; while under him was a long series of officers with jurisdictions of greater or less extent, partly civil and partly military, all so arranged as to be able on any emergency to furnish the largest military array on the shortest notice. The democratical part of the constitution has gradually disappeared under Russian domination. The title of chief hetman is now vested in the heir apparent to the throne, and all the subordinate hetmans and other officers are appointed by the crown. Care, however, has been taken not to interfere with any arrangements which foster the military spirit of the Each Cossack is liable to military Cossacks. service from the age of eighteen to fifty, and is obliged to furnish his own horse. They furnish the empire with one of the most valuable elements in its national army, forming a firstrate irregular cavalry, and rendering excellent service as scouts and skirmishers. In 1570 they built their principal "stanitza" and rendezvous, called Tcherkask, on the Don, not far above its mouth. As it was rendered un-healthy by the overflowing of the island on which it stood, New Tcherkask was founded in 1805 some miles from the old city, to which nearly all the inhabitants removed. This forms the capital of the country of the Don Cossacks, which constitutes a government of Russia, and has an area of 61,900 sq. mi. and a pop. of 1,474,133. It has a military organization of its own.

Costa Rica, the most southern state of the republics of Central America; area 23,000 sq. mi., including some disputed territories on the northern frontier. The country is intersected diagonally by the primary range or cordillera of the isthmus, which throws off numerous spurs on either side. The principal range contains several lofty eminences and volcanoes. Costa Rica is said to contain some rich gold mines; at present, however, they are not worked to any great extent. Silver and copper are also found. The country is extremely fertile. Coffee, rice, maize, etc., are raised on the table-land in the interior: and cacao, vanilla, sugar, cotton, tobacco, etc., are cultivated in the low coast regions. Coffee forms the most important product. The forests are valuable. The capital is San José, and the two established ports are Punta Arenas, on the Pacific side, and Porto Limon, on the Caribbean Sea. It has been an independent state since 1821, from 1824 to 1839 forming a part of the Central American Confederation, but subsequently separate. Pop. 243,205, mostly of Spanish descent.

**Coster,** LAURENS (1370-1440), whose name is connected with the origin of printing, was b. in Haarlem. According to a statement first found in Junius' Batavia (1588), he was the original inventor of movable types, and on this ground the Dutch have erected statues in his honor. But in 1870 a Dutchman, Van der Linde, professed to have demolished the claims of Haarlem to the invention of printing, and to have established that Holland, like other

countries, was indebted for it to the Mayence school. This conclusion has been rejected by J. H. Hessels, who, on carefully investigating the matter, thinks it highly probable that Coster was the inventor.

**Côte-d'Or**, an inland and eastern department of France, part of the old province of Burgundy, having Dijon as its capital. It is watered by the Seine, the Saône, and their affluents, and derives its name from the Côted'Or hills, which traverse it from n.e. to s.w. Area 3,382 sq. mi. The vineyards of the eastern slopes of the Côte-d'Or produce the celebrated wines of Upper Burgundy. Iron, coal, marble, etc., are found. Pop. 376,866.

**Côtes-du-Nord** (kot-dü-nor). a maritime department in the north of France, forming part of ancient Brittany; capital Brieuc. Area 2,659 sq. mi. The coast extends about 150 mi., and the herring, pilchard, and mackerel fishing is actively pursued. One of the main branches of industry is the rearing of cattle and horses. In manufacturing industries the principal branch is the spinning of flax and hemp, and the weaving of linen and sail cloth. Among the minerals are iron, lead, and granite. Pop. 618,652.

**Cotopax'i,** the most remarkable volcanic mountain of the Andes, in Ecuador, about 60 mi. n.e. of Chimborazo; altitude 19,500 ft. It is the most beautiful of the colossal summits of the Andes.

**Cotta**, JOHANN FRIEDRICH, BARON VON (1764– 1832), an eminent bookseller of Germany.

**Cotton,** the name given to the soft cellular hairs which encircle the seeds of plants of the

Cotton (Gossypium Barbadense). -a. -ripe capsule after dehiscence; b.-seed; c.-the same deprived of its hairs.-(From Bentley & Trimen.)

genus Gossypium, nat. ord. Malvaceæ. The genus is indigenous to both the Old and the New World, and the plants are now cultivated all over the world within the limits of  $30^{\circ}$  north and south of the equator. All the species are perennial shrubs, though in cultivation they are sometimes treated as if they were annuals.

They have alternate stalked and lobed leaves. large, yellow flowers, and a three or five celled capsule, which bursts open when ripe through the middle of the cell, liberating the numerous black seeds covered with the beautiful fila-mentous cotton. The North American cotton is produced by Gossypium barbadense, and two well marked varieties are cultivated, the longstaple cotton, which has a fine, soft, silky fiber nearly 2 in. long, and the short-staple cotton, which has a fiber little over 1 in. long adhering closely to the seed. The long-staple variety known as Sea Island cotton holds the first place in the market. It is grown in some of the southern states and on islands bordering the coast. The cotton grown in South America is obtained from G. peruviānum, called also kidney cotton. The indigenous Indian species is G. herbaceum, which yields a short-stapled cotton. It is grown throughout the Mediterranean region as well as in Asia. The mode of cultivation is usually as follows: The seeds are sown in the spring in drills of about a yard in width, the plant appearing above ground in The rows of about eight days afterward. young plants are then carefully weeded and hoed, a process which requires to be repeated at two or three subsequent periods. No hoeing takes place after the flowering has commenced, from which a period of seventy days generally elapses till the ripening of the seed. To prevent the luster of the cotton wool from being tarnished, the pods must not remain ungathered longer than eight days after coming to maturity. The cotton wool is collected by picking with the fingers the flakes from the pods. and then spreading out to dry, an operation which requires to be thoroughly per-formed. The cotton now comes to be separated from the seeds, a process formerly effected by manual labor, but which is now generally After being accomplished by machinery. cleansed from the seeds, the cotton wool is formed into bales, and is now ready for delivery to the manufacturer.

Cotton has been cultivated in India and the adjacent islands from time immemorial. It was known in Egypt in the sixth century before the Christian era, but was then probably imported from India. It was not till a comparatively late period that the nations of the West became acquainted with this useful commodity, and even then it appears only to have been used as an article of the greatest luxury. The introduction of the cotton shrub into Europe dates from the ninth century, and was first effected by the Spanish Moors, who planted it in the plains of Valencia. Cotton manufactories were shortly afterward established at Cordova, Granada, and Seville: and by the fourteenth century the cotton stuffs manufactured in the kingdom of Granada had come to be regarded as superior in quality to those of Syria. In China the cotton shrub was known at an early period, but it does not appear to have been turned to any account as an article of manufacture till the sixth century of the Christian era, nor was it extensively used for that purpose till nearly the middle of the fourteenth

century. In the New World the manufacture of cotton cloth appears to have been well un-derstood by the Mexicans and Peruvians long before the advent of Europeans. It was planted by the English colonists of Virginia in 1621, but only as an experiment, and the amount produced was long very small, the crop only amounting to about 2,000,000 lbs. in 1791. After this it rapidly increased, and in 1810 94,000,000 lbs. were exported. The quantity now produced is enormous, the crop of 1896 being estimated at 7,162,473 bales, averaging 440 lbs. each. The chief cotton-growing states are Mississippi, Georgia, Texas. Alabama. Arkansas, South Carolina, Louisiana, North Carolina, Tennessee, and Florida. The raw cotton exported in 1896 was 4,565,014 bales. In 1890 a process was discovered by which cotton can be manufactured from straw.

The cottons of commerce are usually distinguished by geographical names borrowed from the countries in which the article is produced, and under each of these divisions various qualities are recognized. The chief contributors to the European supply are the U. S., India. Egypt, and Brazil. There were in operation in the U. S. in 1894 16,811,000 spindles.

Cotton, ROUND BALING OF. As opposed to the packing of cotton in a square box and its compression in bulk, a new system of baling has been introduced which is a combination process and admits of obtaining by one operation, on the plantation where the cotton is ginned, the same result that now calls for two operations at a considerably greater expense. As is well known the present system involves the formation on the plantation of the "country" bale, which has a density of twelve lbs. to the cubic foot. After which it is transported to shipping centers and compressed to a density of 22 to 26 lbs. per cu. ft. for final shipment. In the old method, the cotton was compressed in bulk and between the fiber and in the fibers themselves, a certain amount of air was also compressed. The result being that in case of fire the increased supply of oxygen in the center of the bale tended to increase combustion so that a fire among cotton bales consisted of their smoldering inside and being impervious to a deluge of water. The only way to stamp out such a fire was by the use of heavy gases which would not sup-port combustion; this method being oftentimes called into service especially on ship board, where a fire in a cotton-laden vessel is always a menace. The fact of this air being present in the square bale also produced a certain tendency to re-expansion, and heavy iron bands were employed to maintain the original volume of the bale. With the method of rolling up cotton, which we are describing, a wide sheet of loose cotton fiber, technically known as a bat, is wound up on a spindle between heavy compression rolls, and as this cotton winds up on itself into a roll of constantly increasing diameter, the effect is produced of excluding air from between layers of cotton. The mechanism is so arranged that the increasing size of the bale pushes back one of the two

Digitized by Google

# **Cotton Famine**

rollers employed, giving a constantly in-creasing resistance to the increasing size of the bale. The machine in this way is automatic, furnishing its own pressure and being driven by belt power at an expenditure of energy no greater than was formerly used on the plantation on the old-time country bale of twelve lbs. density, and with this equipment just described a density of 38 to 40 lbs. is easily obtained, and curiously enough a bale is produced that has no tendency to re-expansion and needs no bands of any kind to hold it in shape. It has a density greater than some woods and is incombustible. Insurance inspectors have maintained bonfires around these bales and have demonstrated beyond a question that it is impossible to make such a bale support combustion. The air is expelled between each layer of cotton so that the center of the bale is without oxygen. Another feature of the round bale that makes it noticeable is the ease with which it is opened up and handled by the mills. The cotton unrolls in a strong tough sheet that is fed into the pickers which forms the first operation in cot-ton mill work. The bale while comparatively new on the market is coming rapidly to the front, and has demonstrated its place on the market and the fact that it is a distinct advance in the ease of handling the principal staple of the world.

**Cotton Famine**, the destitution in England caused by the outbreak of the American Civil War (1861-65) in the English cotton manufacturing districts, especially in Lancashire. The cotton supply failed on account of the blockade of the southern ports of the U. S., and in consequence the mill owners finally closed their mills entirely—nearly two millions of people being reduced to great distress.

**Cotton-seed Oil**, a valuable oil expressed from the seeds of the cotton plant, used as an adulterant or as a substitute for various other oils. The oil cake of cotton seed is a valuable cattle-freeding substance.

Cotton-spinning, a term employed to describe in the aggregate all the operations involved in transforming raw cotton into yarn. The word "spinning" has also a more limited signification, being used to denote the concluding process of the series. The following affords a general notion of the nature and order of the successive operations carried on in the manufacture of cotton yarn: 1, Mixing, the blending of different varieties of raw cotton, in order to secure economical production, uniform quality and color, and an even thread in any de-sired degree. 2, The willowing, scratching, or blowing, an operation which cleans the cotton and prepares it in the form of a continuous lap or rolled sheet for the next process. 3, Carding, an operation in which the material is treated in its individual fibers, which are taken from the lap, further cleansed, and laid in a position approximately parallel to each other, forming a thin film, which is afterward condensed into a sliver—a round, untwisted strand of cotton 4, *Drawiny*, the drawing out of several slivers to the dimensions of one so as to

# Cougar

render the new sliver more uniform in thickness, and to place the fibers more perfectly in parallel order. 5, Slubbing, the further drawing or attenuation of the sliver, and slightly twisting it in order to preserve its cohesion and rounded form. 6. Intermediate or second slubbing, a repetition of the former operation and further attenuation, not necessary in the production of coarse yarns. 7, Roving, a continuation of the preceding, its principal object being to sfill further attenuate the sliver, and give it a slight additional twist. 8, Spinning, which completes the extension and twisting of the yarn. This is accomplished either with the throstle or the mule. By means of the for-mer machine the yarn receives a hard twist, which renders it tough and strong. By means of the latter yarns of less strength are produced, such as warps of light fabrics and wefts of all kinds. Up to the middle of the last century the only method of spinning known was that by the hand-wheel, or the still more primitive distaff and spindle. In 1767 a poor weaver of the name of Hargreaves, residing at Stanhill, near Blackburn, in Lancashire, invented a machine for spinning cotton, which he named a spinning-jenny. It consisted at first of eight spindles, turned by a horizontal wheel, but was afterward greatly extended and improved, so as to have the vertical substituted for the horizontal wheel, and give motion to from 50 to 80 spindles. In 1769 Arkwright, originally a barber's apprentice, took out a patent for spinning by rollers. From the circumstances of the mill erected by Arkwright being driven by water-power, his machine received the name of the water-frame, and the thread spun on it that of water-twist. The next important invention in cotton-spinning was that of the *mule*, introduced by Samuel Crompton, of Bolton, in 1775, and so called from its combining the principle of the spinning-jenny of Hargreaves with the roller-spinning of Arkwright. Numerous improvements in cotton-spinning have been subsequently introduced up to the present day, but they are all, more or less, modifications of Arkwright's spinning-frame and Crompton's mule-jenny. Among the prin-cipal of these may be mentioned the *throatle*, an extension and simplification of the original spinning-frame, introduced about the year 1810. The first machines set up in the U.S. were at East Bridgewater, Mass., in 1786, by two Scotchmen. In 1812 Francis C. Lowell introduced the Cartwright power-loom at Lowell, Mass., which is now the largest cotton manufacturing center in America.

**Couch** (Quitch, or Quick) **Grass**, a perennial grass, which is propagated both by seed and by its creeping root-stock, and is one of the most common and troublesome weeds of agriculture.

**Cougar** (kö'gär), a voracious quadruped of the cat kind, inhabiting most parts of America. Its color is a uniform fawn, or reddish brown, without spots or markings of any kind. It may attain a length of 9 ft., inclusive of the tail. In habits it is stealthy and cowardly, and seldom or never attacks man. It is by some called the puma or red tiger, and is one of the most destructive of all the animals of America, particularly in the warmer climates, where it carries off fowls, dogs, cats, and other domestic animals.

**Coulomb** (kö-lon), CHARLES AUGUSTIN DE (1736-1806), French physicist. His fame rests chiefly on his discoveries in electricity and magnetism, and on his invention of the torsion balance.

**Council Bluffs**, Pottawattomie co., Ta., on Missouri River. 500 mi. s. w. of Chicago. Railroads: C. B. & Q.; C. R. I. & P.; Wabash; Northwestern; and C. M. & St. P. Industries: iron works, candy factory, and others. The town was first settled in 1840. The name is derived from a council held here with the Indians in 1804. Pop. est. 1897, 22,000.

Coun' terpoint, in music, a term equivalent to harmony, or the writing of a carefully planned accompanying part; or that branch of the art which, a musical thought being given, teaches the development of it, by extension or embellishment, by transposition, repetition, or imitation throughout the different parts. Counterpoint is divided into simple, florid, or figurate, and double. Simple counterpoint is a composition in two or more parts, the notes of each part being equal in value to those of the corresponding part or parts and concords. In florid counterpoint, two or more notes are written against each note of the subject, or canto-fermo, and discords are admissible. Double counterpoint is an inversion of the parts, so that the base may become the subject, and the subject the base, etc., thus producing new melodies and new harmonies.

**Coun'tersign**, a private signal, word, or phrase given to soldiers on guard, with orders to let no man pass unless he first give that sign; a military watchword.

**County**, originally a district of a country subject to a *count* or earl. It is now a civil district corresponding with shire in England and Scotland.

**Couple**, in dynamics, two equal and parallel forces acting in different directions, and applied to the same body. The distance between their lines of action is called the *arm* of the couple, and the product of one of the two equal forces by this arm is called the moment of the couple.

**Coupling,** in machinery, a contrivance for connecting one portion of a system of shafting with another, and of which there are various forms. A common form is the flange or plate coupling, which consists of two flanges separately fitted onto the two contiguous ends of the lengths of shaft to be connected, and firmly secured together by screws. The most useful kinds of couplings are those that are adjustable, or can be readily put on and off. The term is also applied to an organ register, by which two or more rows of keys can be connected by a mechanism, so that they can be played together.

**Coupon** (kö'pon), an interest-certificate printed at the bottom of transferable bonds. and so called because it is cut off or detached and given up when a payment is made. Also one of a series of tickets which binds the issuer to make certain payments, perform some service, or give value for certain amounts at different periods, in consideration of money received.

**Courbevole** (körb-vwä) a town of France, department Seine, on the left bank of the Seine, 5 mi. n.w. of Paris, well built, with large barracks. Pop. 17,597.

**Courcelles** (kor-sal'), a village of Alsace Lorraine, 4 mi. s.e. of Metz; scene of a German victory over the French under Bazaine. Aug. 14, 1870.

**Courland**, a government in Russia, area 10. 535 sq. mi. Pop. 693,300.

**Courser** (or Courier), a genus of grallatorial birds belonging to the plover tribe. They are found chiefly in Africa.

**Court Martial**, a court consisting of military or naval officers, for the trial of military or naval offenses. In the army of the U. S. there are general courts martial, before which only officers can be tried, and regimental and garrison courts martial. In the navy, summary courts martial are held for the trial of petty officers and persons of inferior rating, and general courts martial for the trial of the higher officers.

**Courtplaster** (so called because originally applied by ladies of the court as patches on the face), black, flesh-colored, or transparent silk varnished over with a solution of isinglass. which is often perfumed with benzoin, used for covering slight wounds.

**Courtral** (kör-trā), a fortified town, Belgium, province of West Flanders, 26 mi. s. of Bruges, on the Lys. Its manufactures are table linens, lace, cambrics, cotton goods, etc., and it has extensive bleaching and dyeing works. Pop. 31,319.

Cousin (köusan), VICTOR (1792-1867), French philosopher and writer, founder of the so-called Eclectic school of philosophy. He was educated at the Lycée Charlemagne. In 1815 he became deputy professor of philosophy at the Sorbonne. He had also an appointment at the Lycée Napoléon, or Collége Henri IV, and at the Ecole Normale. In 1817 he visited Germany. He lost his position as public teacher on political grounds in 1822, and did not resume teaching till 1828, when he shared with Guizot and Villemain an unexampled popularity, due partly to political feeling. In the cabinet of Thiers in 1840 he accepted the In office of minister of public instruction. and was created a peer of France. The revolution of 1848 brought his public career to a close The head and founder of the modern school of eclecticism in France, he borrowed from many sources. His eclecticism was based on the principle that every system, however erroneous, which has anywhere commanded assent, contains some elements of truth, by which its acceptance may be explained, and that it is the business of philosophical criticism to discover and combine these scattered elements of truth.

Cousins, SAMUEL (1801-1887), English en-

graver. He engraved plates after Lawrence, Landseer, Reynolds, Millais, Leslie, Eastlake, Ward, etc. He was elected a Royal Academician Engraver in 1855, and when this class was abolished he became an Academician proper.

Couthon (kö-ton), GEORGES (1756-1794), a French revolutionist. Some time after the Revolution he was chosen a member of the national assembly. On the downfall of Robespierre's party Couthon shared, along with him and St. Just, in the decree of arrest, and was guillotined.

Covenant, ip law an agreement between two or more parties in writing signed, sealed, and delivered, whereby they agree to do, or not to do, some specified act. In theology, the promises of God as revealed in the Scriptures, conditional on certain terms on the part of man, as obedience, repentance, faith, etc.

Covent Garden, a market place in London, England, which formerly consisted of the garden belonging to the abbot and monks of Westminster. In 1831 the present market buildings were erected by the Duke of Bedford, the proprietor of the ground.

Cov'entry, a city in England, county of Warwick, 85 mi. n. w. of London. Parliaments were convened here by the earlier monarchs of England, several of whom occasionally resided in the place. Pageants and processions were celebrated in old times with great magnificence, and a remnant of these still exists in the processional show in honor of Lady Godiva. Coventry is the center of the ribbon trade. Pop. 54,755.

Cov'erture, a legal term applied to the position of a woman during marriage, because she is under the cover or protection of her husband.

Covington, Kenton co., Ky., on Ohio River opposite Cincinnati, with which it is connected by a suspension bridge over the river. Surrounding country agricultural. Railroads: Kentucky Central, and Chesapeake & Ohio. Principal industries are cigar and tobacco factories, carriage and wagon works, distilleries, breweries, flour mills, etc. There are also several pork-packing houses, glass works, and silk manufactories. Pop. est. 1897, about 40,000.

**Cow**, the general term applied to the females of the genus Bos or ox, the most valuable to man of all the ruminating animals. Among the best breeds of dairy cows are the Devonshire, the Ayrshire, the short-horn, the polled Angus or Aberdeenshire, and the Alderney.

Cowberry, red whortleberry, a procumbent shrub of high moorlands in Europe. Asia, and North America, has evergreen, box-like leaves, and produces a red acid berry used for jellies and preserves.

Cow Bunting, an American bird belonging to the family Sturnidie, or starlings. It drops its eggs into the nests of other birds to be hatched by them, but has never been known to drop more than one egg into the same nest. It is migratory, spending its winters regularly in the lower parts of North and South Carolina and Georgia, and appearing in Pennsylvania

about the end of March. These birds often frequent corn and rice fields in company with the red-winged troopials, but are more commonly found accompanying the cattle, feed- -

ing on seeds. worms, etc. Cow'itch (or cowhage), the hairs of the pods of leguminous plants, genus Mucūna, natives of the East and West Indies. The pod is covered with a thick coating of short, stiff. brittle, brown hairs, the points of which are finely serrated. They easily penetrate the skin, and produce an intolerable itching. They are employed medicinally (being taken in honey or syrup) as a mechanical vermifuge.

Cowley (kau'li), ABRAHAM (1618-1667), an English poet of great celebrity in his day b. in London. He was educated at St. John's College, Oxford. He engaged actively in the royal cause, and when the queen was obliged to quit England, Cowley accompanied her. He was absent from his native country nearly ten years, and it was principally through him that the correspondence was maintained between the king and queen. He took a considerable interest in science, and was one of the founders of the Royal Society.

Cowloon' (or Kowloon), a peninsula at the mouth of the Canton River, directly opposite to the island of Hong-Kong, to which crown colony it belongs.

Cow Parsnip, an umbelliferous plant, one species of which, found in moist woods and meadows, grows to the height of 4 or 5 ft., and is used to feed pigs. Siberian cow parsnip is grown in gardens and shrubberies, reaching the height of 10 or 12 ft.

Cowpea (Cow-grass), a variety of clover cultivated in England and some parts of the U. S. for the same purpose as the common red.

Cowper (kö'per, or kou'per) WILLIAM (1731-1800), English poet. He was the son of a clergyman; lost his mother at the age of six, and was, when ten years of age, removed from a country school to that of Westminster, which he left at eighteen with a fair reputation for classical learning, and a horror of the school discipline, which he afterward expressed in his Tirocinium. He was then articled for three years to a solicitor, where he had for a fellow clerk Mr., afterward Lord, Thurlow. At the expiration of his apprenticeship he took chambers in the Middle Temple, and in 1754 was called to the bar. The interest of his family procured for him the post of clerk to the House of Lords; but having to appear for examination at the bar of the house, his nervousness was such that on the very day appointed for the examination he resigned the office, and soon after became insane. From December, 1763, to June, 1765, he remained under the care of Doctor Cotton at St. Albans. The skill and humanity of that gentleman restored him to health, and he retired to Huntingdon. In 1776 he commenced a poem on the *Progress of Error*, which he followed by three other poems, *Truth*, Table Talk, and Expostulation; these with some others were published in a volume in 1782. One of his friends, Lady Austen, suggested the Task, which, together with Tirocinium, 39 formed a second volume in 1785. The History of John Gilpin is also due to the suggestion of Lady Austen. The translation of Homer, begun in 1784, occupied him for the next six years, and was published in 1791. He removed during its progress, in 1786, from Olney to Weston. In the beginning of 1794 he was again attacked with madness. The revisal of his Homer, and the composition of some short pieces, occupied the latter years of his life.

**Cowpox,** the vaccine disease which appears on the teats of the cow, in the form of vesicles of a blue color, approaching to livid. These vesicles are elevated at the margin and depressed at the center; they are surrounded with inflammation and contain a limpid fluid. This fluid or virus is capable of communicating genuine cowpox to the human subject. and of protecting against smallpox either completely, or, at least, against the virulent form of the disease.

**Cowrie shell,** a small gasteropodous shell, used for coin in some parts of Africa and in many parts of Southern Asia. The beauty of the cowrie shells has procured them a place among ornaments, and they have been in demand among civilized and uncivilized nations time out of memory. The shells used as currency occur principally in the Philippine Islands. They vary in value in different localities. In India 6,000 to 7,000 are equal to a rupee, while in the interior of Africa 200 are worth 16 cents.

**Cow'slip**, a fragrant and pretty wild flower found in pastures and meadows. It has umbels of small, buff-yellow, scented flowers on short pedicels. Its flowers possess sedative properties, and have been used as an anodyne, a sort of wine being prepared from them.

**Cow trees**, a name of various trees having an abundance of milky juice, especially of a South American tree, which, when wounded, yields a rich milky nutritious juice in such abundance as to render it an important article of food. This fluid resembles in appearance and quality the milk of the cow. The tree is common in Venezuela, growing to the height of 100 ft. The leaves are leathery, about 1 ft. long and 3 or 4 inches broad.

Cox, DAVID (1783-1859), an English landscape painter, b. in Birmingham. His works are chiefly of English landscape, and in water colors, a department which constituted his peculiar walk. His pictures are now very highly valued.

Cox, SAMUEL SULLIVAN (1824-1889), statesman, b. in Zanesville, O. He removed to New York City in 1866, and two years later was elected to Congress from that city and served until 1882. In 1885 he was appointed minister to Turkey, resigned the following year, and in November, 1886, again became congressman.

**Coxey**, JACOB S., American labor agitator, b. in Pennsylvania in 1854. Early in life he speculated in sandstone quarries at Massilon. O., and later became a horse breeder and owned a stock farm in Kentucky. In politics he was formerly a Greenbacker, but became a Populist and was a delegate to the St. Louis convention in 1896. Coxey advocated the issue of \$500,000,000 in bonds by the Federal government to be expended in the construction of good roads, thus giving employment to men out of work. To promote this scheme he led an army of 336 men, known as the Commonweal army, to Washington in 1894. In Washington he attempted to conduct a demonstration on the steps of the capitol and in so doing, trespassed upon the grass. He was arrested and lodged in jail. He was a candidate for Congress in Ohio in 1896.

**Coyote** (koi-ot', koi-o'tā), the American prairie wolf, is intermediate in size between the fox and the ordinary wolf. It is the Ameri-

can representative of the old world jackal. It is 36 to 40 in. long with a tail of 16 to 18 in. The voice is a kind of snapping bark, whence the name of barking wolf.

**Crab**, a popular name for all the ten-footed, short-tailed crustaceans constituting the suborder Brachyura, order Decapoda, comprising many genera, distinguished from the lobster and other macrurous or long-tailed decapods by the shortness of their tail, which is folded under the body. The head and breast are united, forming the cephalothorax, and the whole is covered with a strong carapace. The

Great Crab.

mouth has several pairs of strong jaws, in addition to which the stomach has its internal surface studded with hard projections for the purpose of grinding the food. The stomach is popularly called the "sand-bag;" a little behind it is the heart, which propels a colorless lymph (the blood) to the gills ("dead man's fingers"). The liver is the soft, rich. yellow substance, usually called the fat of the crab.

They "molt" or throw off their calcareous covering periodically. The first pair of limbs are not used for locomotion, but are furnished with strong claws or pincers. Their eyes are compound, with hexagonal facets, and are pedunculated, elongated, and movable. Like most individuals of the class, they easily lose their claws, which are as readily renewed. They generally live on decaying animal matter, though others live on vegetable substances, as the racer crabs of the West Indies, which suck the juice of the sugar cane. Most inhabit the sea, others fresh water, some the land, only going to the sea to spawn. Of the crabs, several species are highly esteemed as an article of food, and the fishery constitutes an important trade on many coasts.

**Crabbe** (krab), GEORGE (1754-1832), an English poet. His poems are all characterized by homely truthfulness, simplicity, and pathos.

**Cracow'**, the old capital of Poland, in 1815– 46 capital of a republic of the same name now forming part of Austrian Galicia, is situated on the left bank of the Vistula, where it becomes navigable, and consists of Cracow proper, or the old city, and several suburbs. The cathedral, a fine old Gothic edifice, contains monuments of many Polish kings, of Kosciusko, etc. It has a library of 300,000 volumes. On a hill near the town stands the monument of Kosciusko, 120 ft. high. Pop. 72,472.

**Crambe**, a genus of cruciferous plants, natives of Europe and Asia. They are perennial herbs, with stout branched stems and broad leaves.

Cranberry, the fruit, a native of Northern

Cranberry. a.- flower: b.- fruit.

Asia, Europe, and North America. It is also called *Moss-berry* or *Moor-berry*, as it grows only on peat-bogs or swampy land, usually among masses of sphagnum. The berry, when ripe, is globose and dark red, and a little more than  $\frac{1}{2}$  in. in diameter. These berries form a sauce of exquisite flavor, and are used for tarts. The American cranberry, a native of U. S. and Canada, is the *O. macrocarpus*. It has larger berries than the European species, and is extensively cultivated in some localities.

Crane, the common name of birds of the

genus Grus, order Grallæ, or Gralatores. They are generally of considerable size, and remarkable for their long necks and stilt-like legs, which eminently fit them for living in marshes and situations subject to inundations, where they usually seek their food. This is partly of vegetable matter, but they also devour insects, worms, frogs, lizards, reptiles, small fish, and the spawn of various aquatic animals. They build their nests among bushes or upon tussocks in marshes, and lay but two eggs. Granes annually migrate to distant regions, and perform voyages astonishing for their great length. The common crane has the general plumage ash-gray, the throat black, the rump ornamented with long, stiff, and curled feathers, the head with bristly feathers:

Crane.

legs black; length about 4 ft. It inhabits Europe, Asia, and the north of Africa. The crowned crane has the general plumage bluish ash-gray, the tail and primary quills black, the wing coverts pure white: the head is crowned with a tuft of slender yellow feathers, which can be spread out at pleasure. It inhabits North and West Africa. The demoiselle crane is so called from the elegance of its form. It is ash-gray, and the head is adorned with two tufts of feathers formed by a prolongation of the ear coverts. Its habitat is Africa and the south of Europe. Among North American species are the whooping crane, a larger species than the common crane, and the brown or sandhill crane.

**Crane,** a machine for raising great weights and depositing them at some distance from their original place, for example, raising bales from the hold of a ship and depositing them on the quay. Cranes are generally constructed on the principle of the wheel and axle, cogwheel or wheel and pinion. A very efficient wheel and pinion crane much used on quays consists of a jib or transverse beam, inclined to the vertical at an angle of from 40° to 50°, which, by means of a collar, turns on a vertical shaft. The upper end of the jib carries a fixed pulley, and the lower end a cylinder, which is put in motion by a wheel and pinion. The weight is made fast to a rope or chain which passes over the pulley and is wound round the

#### Crank

cylinder. On turning the cylinder the weight is raised as far as necessary. The jib is then turned on its arbor till the weight is brought immediately over the spot where it is to be deposited, and the moving power is withdrawn so as to allow the weight to descend by its own gravity.

Crank, an iron axis with the end bent like an elbow, serving as a handle for communicating circular motion; as, the crank of a grindstone; or for changing circular into longitudinal motion, as in some saw mills, or longitudinal into a circular motion, as in a steam engine. The single crank can only be used at the end of an axis. The double crank is em-ployed when it is necessary that the axis should be extended on both sides of the point at which the reciprocating motion is applied. An exemplification of this arrangement is afforded by the machinery of steamboats. The bell crank so called from its being much used in bell-hanging, is for a totally different purpose to the others, being used merely to change the direction of motion, as from a horizontal to a vertical line.

Cran' mer, THOMAS (1489-1556), archbishop of Canterbury, and famous for the part he played in the English reformation during the reign of Henry VIII, was b. at Aslocton, Notts. In January, 1533, he was appointed archbishop of Canterbury. He zealously pro-moted the cause of the Reformation; and through his means the Bible was translated and read in churches, and monastic institutions were vigorously suppressed. Henry VIII appointed him by will one of the Council of Regency to Edward VI. The exclusion of the Princess Mary from the crown, by the will of her brother, was a measure in which Cranmer joined the partisans of Lady Jane Grey. With others who had been most active in Lady Jane's favor he was sent to the Tower on the accession of Mary. He was tried on charges of blasphemy, perjury, incontinence, and heresy, and was sentenced to be degraded and deprived of office. Shortly afterward he was burned at the stake.

Crape, a light transparent stuff, like gauze, made of raw silk, gummed and twisted on the mill, woven without crossing, and much used in mourning.

Cra'shaw, RICHARD (1613-1649), an English poet. He displayed considerable poetic genius in the treatment of religious subjects, and though his works are almost forgotten they are said to have furnished hints to both Milton and Pope.

Crassus, MARCUS LICINIUS (B.C. 115-53), the Roman triumvir, surnamed Dires (the rich), on account of his vast riches. He took part with Sulla in the civil war; and as prætor, in B.c. 71, he defeated Spartacus and the revolted slaves at Rhegium. In B. c. 70 he was elected consul, having Pompey as his colleague; and in B.C. 60 Cæsar, Pompey, and Crassus formed the first triumvirate. Five years later he again became consul, and obtaining Syria for his province he made war on the Parthians, but was defeated and slain.

#### Crawford

Crater, the orifice or mouth of a volcano. Craters may be central or lateral, and there may be several subsidiary ones, which may shift their places, or become merged by subsidence into others.

Crati'nus, an Athenian comic poet to whom the invention of satirical comedy is attributed; d. B. c. 422. Some fragments of his works remain.

Cravat', a neckcloth; an article of silk, muslin, or other material worn by men about the neck; so called from Fr. Crarate, a Croat. because this piece of dress was adopted in the seventeenth century from the Croats who entered the French service. Toward the end of the eighteenth and the beginning of the nineteenth century, the cravat attained an in-credible degree of extravagance, but common sense at last brought in the simpler style of neckties that has since prevailed

Crawfish (or Crayfish), a name of various crustaceous animals. the common crawfish, the river lobster, a macrurous, tenfooted crustacean, resembling the lobster in appearance and habits. It inhabits the fresh waters of the U S., Europe, and the north of Asia, and is common in some of the streams of England. It lurks under stones or in holes in the banks. Its

food consists of small mollusks or fishes, the larvæ of insects, and almost any sort of animal matter. Some of them by their burrowing habits injure mill-dams and the levees of the Mississippi.

**Crawfordsville**, Montgomery co., Ind., on Sugar Creek. Railroads: Big Four, Vandalia. and Monon. Industries: wire fence, flour mill, iron foundry, woolen mill, and other small factories. Surrounding country agricultural. The town was first settled in 1823, and became a city in 1865. Pop. est. 1897, 10,000.

Crawford, FRANCIS MARION, novelist, son of Thomas C., was b. in Tuscany, Aug. 2, 1853. He had his education at Concord, New Hampshire; Trinity College, Cambridge: Karlsruhe. and Heidelberg. At Rome he devoted himself to the study of Sanskrit, and during 1879-80 was engaged in press work at Allahabad, where he was admitted to the Catholic Church. He was selected by the government committee to write the national ode at the centennial of the American Constitution, Sept. 17, 1887. His first novel, Mr. Isaacs (1882), was a book of striking and quite unusual merit, and at once

found its author an audience. The rich romantic elements in certain of the aspects and contrasts of modern Oriental life was a distinct discovery to worked-out novelists. Its successors have been Dr. Claudius, and To Leevard (1883); A Roman Singer, and An American Politician (1884): Zoroaster (1885); The Story of a Lonely Parish, and Saracinesca (1886); Marzio's Crucifix, and Paul Patoff (1887); With the Immortals (1888): and Sant' Ilario (1889). Mr. Crawford possesses imagination, originality, and direct vigor, with a graceful and vivid style, and remarkable power of description.

Crawford, THOMAS (1814-1857), sculptor. His most famous works comprise Orpheus and Cerberus, Adam and Ere, Hebe and Ganymede, Mercury and Psyche, and Dancing Jenny. He performed important works for the National Government and state of Virginia.

Crawford, WILLIAM HARRIS (1772-1834), American statesman, b. in Nelson co., Va. He was admitted to the bar in 1798. In 1800 he was appointed with Horatio Marbury to revise the laws of Georgia. He was elected to the legislature in 1802, and in 1806 to the U.S. Senate. In 1813 he declined the office of secretary of war in President Madison's cabinet, and was appointed minister to France. He returned to this country in 1815, and was made secretary of the treasury, serving through both terms of Monroe's administration. He was made judge of the northern circuit of Georgia in 1827, which office he held until the time of his death.

**Cray ons,** colored pencils obtained from certain mineral substances in their natural state, but more commonly manufactured from a fine paste of chalk or pipe-clay colored with various pigments, and consolidated by means of gum, wax, etc. A kind of *crayon painting* is practised to some extent, the coloring matter in a soft state being rubbed on with the finger. Its chief advantages consist in the great facility of its execution, and the soft beauty and richness of coloring of effects so easily produced. The paper used has a specially granulated surface.

**Cream of Tartar** (or Potassium Bitartrate) exists in grapes, tamarinds, and other foods. It is prepared from the crystalline crust, deposited on the vessels in which grape juice has been fermented. The argol is dissolved by boiling with water, the mixture filtered, and the cream of tartar allowed to crystallize out. The commercial product usually contains a small percentage of calcium tartrate. It is frequently employed in medicine for its diuretic, cathartic, and refrigerant properties; as a mordant in dyeing wool; and as an ingredient in baking powder.

**Creasy** (kre'si), SIR EDWARD SHEPHERD (1812-1878), English historian. In 1840 he was appointed professor of history at the London University, and in 1860 was made chief justice of Ceylon, receiving at the same time the honor of knighthood. His principal works are: The Rise and Progress of the British Constitution, and The Fifteen Decisive Battles of the World.

Crécy (or Cressy), a small town of France,

in the department of Somme, 100 mi. n. of Paris; pop. 1,748. It is celebrated on account of a battle fought here, Aug. 26, 1346, between the English and French.

**Cred**<sup>7</sup>**it**, in economics, is the postponement agreed on by the parties of the payment of a debt to a future day. It implies confidence of the creditor in the debtor; and a "credit system " is one of general confidence of people in each other's honesty, solvency, and resources. By means of a credit system a comparatively small stock of money can be made to do duty for carrying on a number of different transactions; but it is indispensable for every good system of credit that money must be instantly available when required, and this principle applies to every species of transaction where postponed payment is concerned. Public credit is the confidence which men entertain in the ability and disposition of a nation to make good its engagements with its creditors; or the estimation in which individuals hold the public promises of payment, whether such The term promises are expressed or implied. is also applied to the general credit of individuals in a nation; when merchants and others are wealthy and punctual in fulfilling engagements; or when they transact business with honor and fidelity; or when transfers of property are made with ease. So we speak of the credit of a bank when general confidence is placed in its ability to redeem its notes, and the credit of a mercantile house rests on its supposed ability and probity, which induce men to trust to its engagements. When the public credit is questionable it raises the premium on loans.

**Credit**, LETTER OF, an order given by bankers or others at one place to enable a person to receive money from their agents at another place.

Credit Mobilier .-- In 1852 the French government sanctioned the statutes of a new bank under the name of the Société Générale de Crédit Mobilier. The Credit Mobilier proposed to give aid to the owners of morable property. The declared object of this bank is especially to promote industrial enterprises of all kinds, such as the construction of railways, sinking of mines, etc. It was allowed to acquire shares in public companies, and to pay the calls made upon it in respect of such shares, by its own obligations (or bonds); also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1854 it subscribed largely to the government loan on account of the Russian War, to the Grand Central Railway Company, to the General Omnibus Company of Paris, and to various other important undertakings. The dividend for this year was 12 per cent. In 1855 it loaned two sums to the government—the one of 250 and the other 375 million francs. Its operations were vast during this year, and the dividends declared amounted to 40 per cent. The public be-The public became alarmed so that, in 1856, the French government deemed it necessary to prohibit the carrying out of the proposed scheme.

This was a severe blow to the institution. In 1856 its dividends did not exceed 22 per cent.; in 1857 they were only 5 per cent. Several attempts had been made to resuscitate its credit, but failed. On Nov. 12, 1871, it was reorganized, the assets of the first society being reported at 48 million francs. In 1878 the capital was reduced from 80 millions to 32, and in 1879 raised again to 40 millions. Another reduction was made in 1884—30 million francs.

duction was made in 1884—30 million francs. The title "Crédit Mobilier of America" was adopted by a joint stock company organized in 1863, with a capital of \$2,500,000. In 1867 the charter having been purchased by a com-pany organized for the construction of the Union Pacific railroad, the stock was increased to \$37,500,000, and afterward rose to a great value, paying enormous dividends. In 1872 it became known that several members of Congress, as well as the vice president, were more or less secret stockholders. This caused a great political scandal, and led to a congressional investigation, which developed a huge attempt at bribery and corruption. An appeal was made to Congress for legislation to assist in the consummation of the work. In the course of debate it was charged that several leading advocates of the plan had been bribed by donations of large blocks of shares in return for their influence-among the culprits being the vice president of the U.S., and several senators and congressmen. As a result, resolutions of censure were passed in Congress in respect of one or more of its members, and one gentleman was sentenced to expulsion, but the sentence was never carried out. The scandal, after a time, died away, and the road proposed

was finally built and is now in operation. Creed, a summary of belief. The Nicene Creed was so called from being adopted as the creed of the church at the council of Nicæa or Nice, 325 A.D., though its terms The were subsequently somewhat altered. Apostles' Creed probably dates from the end of the fourth century; but there is no evidence of its having been accepted in its present form till the middle of the eighth. The Athanasian Creed was certainly not drawn up by St. Athanasius, as there is not sufficient evidence for its existence before the end of the eighth or beginning of the ninth century. In addition to these three creeds, the R. C. Church has the creed of Pius IV, put forth in 1564, and consisting of the Nicene Creed with additional articles adopted by the Council of Trent, to which is now added a profession of belief in the definitions of the Vatican Council. The Protestant Church adopts as "thoroughly to be received and believed" the three ancient creeds, which as part of her liturgy may be read in the Book of Common Prayer, but does not consider any of them to be inspired. The Thirty-nine Articles of the Book of Common Prayer form a confession of faith for the Anglican Church. The creed of the Church of Scotland, and other Presbyterian churches, is contained in the Confession of Faith, drawn up by the Westminster Assembly of Divines, and completed in 1646.

# Cremona

**Creedmoor,** a station on the Long Island railway, 11 mi. e. of the city of New York. It is much frequented by riflemen for target practise.

**Creeks**, American Indians formerly in Georgia and Alabama, but now planted in the Indian Territory. The number of warriors used to amount to about 6,000, but altogether the tribe does not now exceed 9,300. They have made considerable progress in agriculture, and raise horses, cattle, fowls, and hogs, and cultivate tobacco, rice, and corn.

**Creepers**, a family of birds which strongly resemble the woodpeckers in their habit of creeping on the stems of trees with the aid of

Common Creeper.

the strong quills which project from the tail feathers, and of securing their insect food by an exsertile tongue. The common creeper is European, but is represented by American species. It builds its nest usually in holes or crevices of trees. The wall creeper of Southern Europe searches for its insect food on rocks. The family is found in all parts of the world.

Cremation, the burning of the bodies of the dead, a practise which was frequent in ancient times instead of burial, and which has recently been advocated on hygienic grounds by many scientific men in Europe and America on account of the dangers to the living caused by the presence of graveyards and cemeteries. Various methods of cremation have been proposed; the great difficulty being to consume the body without permitting the escape of noxious exhalations, and without mingling the ashes with foreign substances. In Siemens's process, a modification of a plan of Sir Henry Thompson, this is successfully accomplished. Cremation societies have been instituted in every European country, and in many states of the Union.

**Cremo'na**, a city of Italy, capital of province of the same name, 47 mi. s.e. by e. Milan. The most remarkable edifice is the cathedral, begun in 1107, and completed about 1491. Close by, and connected with the cathedral, is the Torazzo, one of the loftiest and

most beautiful towers in Italy. Cremona has considerable manufactures of silk, wool, cotton, etc. It was at one time celebrated for its violins, especially those made by Antonius Stradivarius, Joseph Guarnerius, and members of the Amati family. Pop. 30,202. The province has an area of about 500 sq. mi. and a population of 300,000.

**Crenelle** (krè-nel), an embrasure in an embattled parapet or breastwork. The adjective *crenellated* is applied in architecture to a kind of embattled or indented molding of frequent occurrence in buildings of the Norman style.

**Cre'ole** is the name which was originally given to all the descendants of Spaniards born in America and the West Indies. It is now used in a wider sense to signify the descendants of Europeans of any nation born in South America and the West Indies, as well as in some other localities. *Creole dialects* are those jargons which have originated from the mixture of different languages in the West Indies, Southern U. S., etc., and spoken by the descendants of the slaves.

**Cre' osote**, a substance discovered by Reichenbach about 1813 in wood tar, from which it is separated by a tedious process. It is generally obtained, however, from the products of the destructive distillation of wood. In a pure state it is oily, heavy, colorless, has a sweetish burning taste and a strong smell of peat smoke or smoked meat. It is a powerful antiseptic. Wood treated with it is not subject to dry rot or other disease. It has been used in surgery and medicine with great success.

**Cres' cent**, an emblem representing the moon in her horned state. This emblem is of very high antiquity, being that of the Greek goddess Artemis or Diana. It is found on medals of many ancient cities, particularly of Byzantium, from whence it is supposed to have been borrowed by the Ottomans. Since their establishment in Europe it has been the universal emblem of their empire. The crescent has given name to a Turkish order of knighthood from the form of the badge, instituted by Selim, sultan of Turkey. in 1801.

Cress, the name of several species of plants, most of them of the nat. order Cruciferæ. Watercress is used as a <sup>\$</sup> salad, and is valued in medicine for its antiscorbutic qualihave a moderately pungent taste. It grows on the brinks of rivulets and in moist grounds.

**Crest**, in anc. armor, the plume or tuft of feathers, or the like, affixed to the top of the helmet. In her, the crest is a figure

Watercress.

originally intended to represent the ornament of the helmet, but is now generally placed upon a wreath, coronet, or cap of maintenance, above both helmet and shield. The crest is considered a greater criterion of nobility than the coat of arms itself, and it is now commonly a piece of the arms.

Commonly a piece of the arms. Creston, Union co., Ia., 114 mi. s.w. of Des Moines. Railroad, C. B. & Q. Industries: railroad repair shops, stock yards, etc. Surrounding country agricultural. Pop. est. 1897, 9,000.

**Creswick** (kres'ik), **THOMAS** (1811-1869), English landscape painter. His first pictures were admitted into the Academy exhibition when he was only in his seventeenth year, and his success was afterward continuous. Among his great works are England, London Road a Hundred Years Ago, and the Weald of Kent. **Creta**' ceous (or Chalk) System, in geology

**Creta** ceous (or Chalk) **System**, in geology the upper strata of the Secondary series, immediately below the Tertiary series, and superincumbent on the Oolite system. This group is common to Europe, and also to a part of Asia. It consists of chalk resting upon arenaceous and argillaceous deposits, which are also regarded as part of the system.

Crete (or Candia), one of the most important islands of the Turkish Empire, situated in the Mediterranean. Area 4,026 sq. mi. High mountains, covered with forests, run through the whole length of the island in several ranges. On the north side the island declines moderately to a fertile coast, provided with good harbors; on the south side steeply to a rocky shore, with few roadsteads; and it reaches its greatest height in Psiloriti (the ancient Ida), 7.670 ft. high, and always covered with snow. Numerous springs give fertility to most of the valleys, in which, and on the declivities of the mountains, is seen a luxuriant vegetation. The air is mild; the summer is cooled by the north winds; the winter is distinguished only by showers of rain. The island might therefore supply, as formerly, a much larger population than at present with grain, wine, and oil, wool, flax, silk. and cotton. fish, honey, game. cattle, fruits, and even with metal in abundance. But agriculture is at a very low stage, while education and the amenities of civilized life are almost entirely absent. The inhabitants (est. at 1,200,000 in ancient times, or 900,-000 in the time of the Venetians) now number about 275,000, of whom 234,000 are Christians, mostly of Greek descent. Manufactures, trade, and navigation are very insignificant. Most of the harbors are silted up. The capital, Candia, the seat of the Turkish governor, has 12,000 inhabitants; Retimo, 6.000; Canea, the most important place of trade, 8,000.

The early history of Candia is lost in the fables of Greek mythology, in which Saturn, Zeus, and Minos are spoken of as among its kings. At one time a republic, it became the seat of the Cilician pirates till conquered by the Romans, from whose hands it passed in 823 to the Saracens, and then to the Greeks again in 962. In 1204 the Byzantine sovereign sold it to the Venetians, who held it until the

### Creuse

second half of the seventeenth century, when the Turks conquered it after a desperate struggle and the siege of the capital for no less than twenty years. Insurrections against Turkish rule have more than once occurred, a formidable one fomented by Greece in 1868 was with difficulty suppressed after a tedious conflict. In 1877 another insurrection broke out, followed by a declaration of union with Greece in 1878. The inhabitants were pacified by the concession of self-government, etc., by Mukhtar Pasha; but religious difficulties gave rise to new troubles in 1884, when the Christian notables appealed to the sultan for a Christian governor, and succeeded in securing the reappointment of Photiades Pasha for a further term of five years. In 1897 a formidable insurrection took place and was supported by Greek troops. The powers of Europe interceded and blockaded the island with their fleets, while Turkey and Greece engaged in a brief but sanguinary conflict on their frontiers.

**Creuse** (kreaz), an inland department, France, comprising most part of the old province of Marche; area 2,150 sq. mi. It derives its name from the river Creuse, which rises in it, and traverses it diagonally in a northwest direction, afterward flowing on to join the Vienne. The surface is generally rugged, and the soil, which is thin and rests upon granitic rocks, is by no means fertile. Pop. 284,660.

**Crib'bage**, a favorite game at cards played with the whole pack. It may be played by two, three, or four persons; and when by two, five or six cards may be dealt to each. Five card cribbage played by two persons is the most scientific game. Sixty-one points make the game; there are no tricks and no trumps, the object being to make pairs, fifteens, sequences, or the go, or prevent the adversary from doing the same. Court cards and tens count as ten each, and all the rest count for the number of "pips" upon them. Every pair, that is, every couple of cards of the same value belonging to different suits (two aces, two fours, two kings, etc.), counts two; and when there are three or four similar cards, as many pairs are counted as there are different combinations of the cards taken two at a time. Every combination of cards, the united pips of which make up fifteen, counts two. A sequence con-sists of three or more cards of any suit following one another in rank, and counts one for When the player whose turn it is each card. to play cannot play a card without going beyond thirty-one, the other player scores one for having been the nearest to thirty-one. This is called scoring one for the "go." The remaining cards after thirty-one, or the next point to it, is made, are thrown up, and each player's cards are counted. When all the cards in a hand, either with or without the turn up card, are of one suit, or when all the cards in the crib, with the turn up card, are of one suit, it is called a flush, and counts one for each card. When the turn up card is a knave the dealer scores two ("two for his heels"). When a knave of the same suit with the turn up card is found in the hand of either player, the player

### Cricket

in whose hand it is scores one ("one for his nob").

**Crichton** (kri'ton), JAMES (1560-1585), surnamed the Admirable, a Scottish celebrity, son of Robert Crichton, lord advocate. He visited Paris, Genoa, Venice, Padua, etc., challenging all scholars to learned disputations, vanquishing doctors of the universities, and disarming the most famous swordsmen of the time in fencing. He was latterly tutor to a son of the Duke of Mantua, and is said to have been stabbed to the heart in a dastardly manner by his pupil.

**Cricket**, an insect of several species, the house cricket, the field cricket, and the mole-

Male cricket and eggs.

cricket. The house cricket is about an inch long, with antennæ of about an inch and a half, of a pale yellowish color mixed with brown. By the friction of the peculiarlyformed wing-covers the males produce that stridulous sound by which these insects are so

House cricket Gryllus domesticus; a.-full-grown larva; b.-pupa; c.-perfect insect.

well known, and which has become associated with ideas of cheerful domestic comfort. They live in holes and crevices near fire places or in other warm situations, whence they come out at night to feed on crumbs and other fragments of food. The field cricket makes a similar noise.

Cricket, the English national game played with bats, balls, and wickets on a piece of

#### Cricket

smooth greensward. It is played by two opposite sets or sides of players, generally numbering eleven each. Two *wickets* of three *stumps* each are pitched fronting each other at a distance of about 22 yds. apart, the stumps being upright rods stuck in the ground, and projecting 27 in. On the top of each set of stumps are placed two small pieces of wood called *bails*. After the rival sides, have tossed for the choice of either taking the bat or fielding, two men are sent to the wickets bat in hand. The opposite or fielding side are all simultaneously engaged; one (the bowler) being stationed behind one wicket for the purpose of bowling his ball against the opposite wicket, where his coadjutor (the wicket keeper) stands ready to catch the ball should it pass near him;

the other fielders are placed in such parts of the field as is judged most favorable for stop-ping the ball after it has been struck by the batsman or missed by the wicket keeper. It is the object of the batsman to prevent the ball delivered by the bowler reaching his wicket either by merely stopping it with his bat or by driving it away to a distant part of the field. Should the ball be driven any distance the two batsmen run across and exchange wickets, and continue to do so as long as there is no risk in being "run out," that is, of having the stumps struck by the ball while they are out of their position near the wickets. Each time the batsmen run between the wickets is counted as a "run," and is marked to the credit of the striker of the ball. If the batsman allows the ball to carry away a bail or a stump, if he knocks down any part

of his own wicket, if any part of his person stops a ball that would have otherwise reached his wicket, or if he strikes a ball so that it is caught by one of the opposite party before it reaches the ground, he is "out," that is, he gives up his bat to one of his own side; and so the game goes on until all the men on one side have played and been put out. This constitutes what is called an "innings." The other side now take the bat and try to defend their wickets and make runs as their rivals did. Generally after two innings each have been played by the contestants the game comes to an end, that side being the victors who can score the greatest number of runs.

score the greatest number of runs. Crilion (kré'yon), LOUIS DES BALBES DE BERTON DE (1541-1615), great French warrior of the sixteenth century. He distinguished himself in five successive reigns—those of Henry II, Francis II, Charles IX, Henry III, and, above all, in that of Henry IV.

Crime'a, THE, a peninsula of Southern Rus-sia, government of Taurida, to the mainland of which it is attached by the Isthmus of Perekop: area 10,000 sq. mi. Three fourths of the Crimea belongs to the region of steppes, but the other part, confined entirely to the south, and stretching along the coast from west to east, abounds in beautiful mountain scenery. Here the valleys looking southward are luxuriant with vines and olive and mulberry plantations, while the northern slope gives a large yield in cereals and fruits. The climate, however, is unequal, and in winter is severe. The chief stream is the Salghir. Others of celebrity are the Tchernaya and the The most important of the produc-Alma. tions, besides those already mentioned, are tobacco, of which a large quantity of excellent quality is produced, flax, and hemp. The forests are of limited extent. There are large numbers of fine-wooled sheep, and horned cattle and horses are reared in large numbers. Pop. est. at 450,000. The chief town and port The country was anciently is Sebastopol. associated with the Cimmerians, and in later times with various Greek settlements and minor kingdoms. After being for some time a dependency on Rome, it was overrun by successive bodies of barbarians, and in 1237 fell into the hands of the Mongols under Genghis Khan. About 1261 the Genoese were permitted to occupy and fortify Kaffa, and they rapidly extended their power in the formation of other settlements. They were expelled, however, in 1475 by Mahomet II, who made it a dependent khanate. In 1783 the Russians took possession of the country; and with the view of overawing the Turks the great naval arsenal of Sebastopol. occupying the most commanding position in the Black Sea, was begun by Catharine II in 1786. Its military resources were steadily developed up to the time of the Anglo-French campaign (see Crimean War) of 1854, when it fell into the hands of the Allies.

Crime'an War, the struggle between England, France, and Turkey, on the one hand and Russia on the other, to prevent the un-

due preponderance of Russia in the east of Europe, 1854 to 1856. The old plans for the extension of Russian power conceived by Catharine II and Potemkin were resuscitated by Nicholas I, who, believing that he had secured himself from interference on the part of Austria and Prussia, and that an Anglo-French alliance was impossible, prepared to carry them into action. Servia, Bosnia, Bulgaria, and the principalities of the Danube were to become protectorates, and Constantinople was to be provisionally occupied by Russian troops. The first markedly aggressive step-the demand by Russia for a protectorate over the Greek Church throughout the Turkish empire—brought matters to a crisis. An ulti-matum presented by Menschikoff in May, 1853 was rejected by the Porte; the Russians occupied the Danubian principalities; and war was declared by the Porte in October, 1853, by France and England in 1854, and by Sardinia in 1855. A French and English fleet entered the Baltic and captured Bomarsund and one of the Aland Islands, and in the south the allies landed at Varna, under Lord Raglan and Marshal St. Arnaud as commanders in chief. While the allies were making preparations Prussia and Austria demanded the evacuation of the Danubian principalities, and on evacuation being ordered by Nicholas "for strategic reasons." the principalities were provisionally occupied by the Austrians. It soon became obvious that the Crimea must be the seat of the war, and 50,000 French and English troops with 6,000 Turks were landed at Eupatoria (September, 1854). Five days later the battle of Alma was won by the allies (September 20), and the march continued toward the south side of Sebastopol. Soon after St. Arnaud d. and was succeeded by Canrobert. The siege of Sebastopol was commenced by a grand attack which proved a failure, and the Russians under Liprandi retaliated by attacking the English at Balaklava (October 25), but were defeated with heavy loss. It was at this battle that the famous, but useless, charge was made by the Light Brigade. A second attack at Inkerman was again repulsed by the allies, but the siege works made slow progress during the winter, in which the ill-supplied troops suffered great privations. The death of Nicholas and succession of Alexander II, in March, 1855, brought no change of policy. Canrobert resigned in favor of Pélissier; and shortly after an unsuccessful attack on those parts of the fortifications known as the Mala-khoff and Redan, Lord Raglan d., and was succeeded by Simpson. The bombardment was continued, and in September the French successfully stormed the Malakhoff, the simultaneous attack on the Redan by the British prov-ing a failure. The Russians, however, then withdrew from the city to the north forts and the allies took possession. The chief subsequent event was the capture of Kars, in Asia, by the Russians after a splendid defense by the Turks under General Williams. By this time, however, the allies had practical possession of the Crimea, and overtures of peace were gladly

accepted. A treaty was accordingly concluded at Paris on April 27, 1856, by which the independence of the Ottoman Empire was guaranteed.

**Crin'an Canal**, a canal in Argyleshire, Scotland. cutting off the peninsula of Cantyre from the mainland, and greatly shortening the route from Glasgow to Oban and other parts of the west coast: 9 mi. long. 12 ft. deep. admitting vessels of 200 tons.

Crinol' dea, the encrinites or sea-lilies, an order of Echinodermata. consisting of animals attached during the whole or a portion of their lives to the sea bottom by means of a calcareous jointed stem, from the top of which radiate feather-like flexible appendages, or arms, in the center of which is the mouth. Though comparatively few in number now, they lived in immense numbers in former ages, many carboniferous limestones being almost entirely made up of their calcareous columns and joints.

**Crin** oline, properly a kind of fabric made chiefly of horsehair, but afterward generally applied to a kind of petticoat supported by steel hoops, and intended to distend or give a certain set to the skirt of a lady's dress. A horsehair and cotton fabric used as a material for making ladies' bonnets is also called crinoline.

Cripple Creek, a mining town of Colorado, about 95 mi. s.w. of Denver. The first pay mineral was discovered in this locality by a surveyor named Lowe. He worked a claim unsuccessfully for ten years, when, in 1891, he took a partner, Robert Womack, and the lode sprang into success, being now owned by the Gold King Mining Co., and gave the impetus for the Cripple Creek of to-day. The present city of 9,000 inhabitants was five years ago the headquarters of a cattle company. The main locality of the mines first discovered is Poverty Gulch, and from this point prospecting has gone on until the territory now worked covers miles in extent, with an absolute certainty of the existence of gold in extensive adjacent regions yet unexplored. The output of the camp in gold and silver since its first pay mine began working has been as follows: 1891, \$200,000; 1892, \$600.000; 1893, \$2,500,000; 1894. \$4,000.000; 1895, \$8,100,000: 1896, \$10,000,000; and the present year (1897) bids fair to equal, if not surpass, the figures of 1896. The city of Cripple Creek is thoroughly enterprising, and its citizens have pushed forward in the face of a fire which nearly wiped out the place, until they have regained all that was lost, and now the city presents all the features of an Eastern business center, with fine schools and splendid residences, an imposing board of trade. large

and handsome churches, etc. **Crisp**, CHARLES F. (1845-1896). statesman, was b. in Sheffield, England, of American parents. After service in Confederate army he studied law: was solicitor general and judge in Georgia: member of Congress, and elected speaker fifty-second Congress.

Crittenden, JOHN J. (1787-1863), statesman, b. in Woodford co., Ky. He was a member of

# Croatia

the state legislature; of the U.S. Senate twice; governor of Kentucky; U.S. attorney general. By his influence the state of Kentucky maintained its adherence to the Union.

**Croa'tia**, a country which forms, along with Slavonia and the "Military Frontiers," a province or administrative division in the southwest of the Austrian dominions in the Hungarian portion of the monarchy, partly bounded by the Adriatic. Total area 16,411 sq. mi. The chief towns are Agram, Warasdin, and Karlstadt. Pop. 2,200,977.

**Crocid'olite**, an ornamental stone, a sort of fibrous quartz, now brought in considerable quantities from Cape Colony and made into articles of jewelry.

**Crocket,** in Gothic architecture, an ornament, usually in imitation of curved and bent foliage, but sometimes of animals, placed on

Crockets: A.-from choir of Notre Dame, Paris, circa 1160; B.-gable crocket, fourteenth century. (Le Duc.)

the angles of the sides of pinnacles, canopies, gables, etc. The name is also given to one of the terminal snags on a stag's horn.

**Crockett**, DAVID (1786-1836), American hunter and humorist. He was elected to Congress in 1827, and re-elected in 1829 and 1831. Subsequently he went to Texas, and took part in her contest of independence. He was one of the last six who defended the fort in the siege of Fort Alamo, in San Antonio de Bexar, and was captured and put to death by General Santa Anna.

Croc'odile, a genus, family, and order of saurian reptiles, comprising the largest living

Crocodile.

forms of reptiles. The characters of the order Crocodilia are as follows: The skin is covered with square bony plates; the tail is long and compressed laterally. The four feet are short,

# Croker

and there are five toes on each of the two fore feet, and four on each of the two hind feet, the latter more or less webbed; the limbs are feeble. The jaws are long and their gape of enormous width. The nostrils are at the extremity of the snout, and capable of being closed to prevent ingress of water. The heart is four-chambered. The alligators are all New World forms. The gavial proper is confined to the East Indies. The *Crocodilidæ*, to which family the crocodile belongs, have unequal teeth and no abdominal plates, and the cervical and dorsal plates are distinct for the most part. The crocodile of the Nile is the best-known member of the order; another species is met with in South Asia, Sunda, and the Moluccas. The crocodile is formidable from its great size and strength, but on shore its shortness of limb, great length of body, and difficulty of turning enable men and animals readily to escape pursuit. In the water it is active and formidable. It is exclusively carnivorous, and always prefers its food in a state of putrefaction. In Egypt it is no longer found except in the upper or more southern parts, where the heat is greatest and the population least numerous. Crocodiles are still common enough in the river Senegal, the Congo, Niger, etc. They grow sometimes to a length of 30 ft., and apparently live to a vast age.

**Crocol'sité**, a mineral, a native form of lead chromate, or red lead ore. In it chromium was first discovered.

**Crocus**, a genus of plants of the order Iridaceæ or Iris, forming one of the most common

ornaments of our gardens. Most of the species are natives of the south of Europe and the Levant; and three grow wild in Britain. They may be divided, according to their period of flowering, into *vernal* and *autumnal*.

Crossus, the last king of Lydia, son of Alyattes, whom he succeeded in 560 B.C., extending the empire from the northern and western coasts of Asia Minor to the Halys on the east and Mt. Taurus on the south, including the Greek colonies of the His riches, chiefly from mainland. obtained from mines and the gold dust of the river Pactolus, were greater than those of any king before him,

Spring Crocus.

so that his wealth became proverbial. Having entered upon war with Cyrus, he was taken prisoner in his capital, Sardis (B.C. 546). The date of his death is unknown, but he survived his captor, and is referred to in the reign of Cambyses.

Croker, JOHN WILSON (1780-1857), English writer and politician. He was one of the founders of the *Quarterly Review*, and one of its ablest contributors. His other writings include an edition of Boswell's Life of Johnson; Ulm and Trafalgar, and Talavera, two poems; Stories from the History of England, from which Sir Walter Scott derived his idea of Tales of a Grandfather; and editions of the Suffolk Papers, Lady Herry's Letters, Lord Herry's Memoirs, and Walpole's Letters.

**Croker**, THOMAS CROFTON (1798–1854), Irish collector of folk-lore. His best-known work is his Fairy Legends and Traditions of the South of Ireland.

Crom'arty, a seaport of Scotland.

**Crome**, JOHN (1769–1821), an English artist, son of a Norwich weaver. In 1805 he founded the Norwich Society of Artists. He excelled in depicting the scenery of his native county, and especially in his handling of trees; and his high place among British landscape painters is now universally acknowledged.

**Cromlech** (krom'lek), an ancient monument consisting of two or more columns of unhewn stone supporting a large tabular block so as to form a rectangular chamber, beneath the floor of which is sometimes found a cist inclosing a skeleton and relics. Sometimes the cromlech was encircled by a ring of standing-stones as in the case of the Standing-stones of Stennis, in Orkney; and sometimes it was itself buried beneath a large mound of earth.

**Crompton**, SAMUEL (1753-1827), inventor of the mule jenny. He early displayed a turn for mechanics, and when only twenty-one years of age invented his machine for spinning cotton, which was called a *mule*, from its combining the principles of Hargreaves' spinning-jenny and Arkwright's roller-frame, both invented a few years previously.

Crom' well, OLIVER (1599-1658), Lord Protector of the Commonwealth of England, Scotland, and Ireland, was b. at Huntingdon. He was educated at Sidney-Sussex College, Cambridge. He married Elizabeth, daughter of Sir James Bourchier. In 1628 he was member of Parliament. In 1631 he went with his family to a farm which he had taken at St. Ives; and in 1636 to Ely, where he had inherited a property worth nearly \$2,500 a year. In the summer of 1642 he was actively engaged in raising and drilling volunteers for the Parliamentary party. He served as captain and colonel in the earlier part of the struggle between Parliament and the king. On the occasion of the surrender of Charles by the Scottish army in 1646 Cromwell was one of the commissioners, and in the distribution of rewards for services received \$12,500 a year from the estates of the Marquis of Worcester. Affairs in Ireland demanding his presence, he was appointed lord lieutenant and commander in chief; and by making a terrible example of Drogheda, crushed the royalist party in that country within six months. Resigning the command to Ireton, he undertook at the request of the Parliament, a similar expedition against Scotland, where Charles II had been proclaimed king. He saved himself from almost inevitable disaster by the splendid victory at Dunbar (Sept. 3, 1650), and a year later put an end to the strug-

gle by his total defeat of the royalists at Worcester (Sept. 3, 1651). The Rump Parliament, as the remnant of the Long Parliament was called, had become worse than useless, and on April 20, 1653, Crom well, with 300 soldiers, dispersed that body. He then summoned a council of state, consisting mainly of his principal officers, which finally chose a Parliament of persons selected from the three kingdoms, nicknamed Barebone's Parliament. or the Little Parliament. Fifteen months after a new annual Parliament was chosen; but Cromwell soon prevailed on this body, who were totally incapable of governing, to place the charge of the com-monwealth in his hands. The chief power now devolving again upon the council of officers (Dec. 12, 1653), they declared Oliver Cromwell sole governor of the commonwealth under the name of Lord Protector, with an assistant council of twenty-one men. He refused the title of He died at Whitehall, in the sixtieth king.

year of his age. **Cromwell**, THOMAS (1490-1540), Earl of Esser. son of a blacksmith at Putney, in Surrey. He was made chief justice itinerant of the forests beyond Trent, knight of the Garter, and finally. in 1539, lord high chamberlain, and the following year Earl of Essex. He at length fell into disgrace with the king for the part he took in promoting his marriage with Anne of Cleves: and others of his political schemes failing, he was arrested on a charge of treason, and beheaded on Tower Hill.

**Cronstadt** (kron'ståt), a town of Austria, in Transylvania, after Hermannstadt, the principal seat of the industry and trade of the province, lying in a mountainous but well wooded and romantic district near its southeast corner. Pop. 29,584.

**Cronstadt**, a maritime fortress of Russia. about 20 mi. w. St. Petersburg, the most important naval station of the empire. It was founded by Peter the Great in 1710, and has spacious, regular streets with handsome houses and churches, very large marine establishments, a naval arsenal, a cannon foundry. building yards, docks, etc. Pop. 48,276.

**Cro'nus,** in ancient Greek mythology, a son of Uranus and Ge (Heaven and Earth), and youngest of the Titans. He received the government of the world after Uranus was deprived of it, and was in turn deposed by Zeus.

**Crook,** GEORGE (1828-1890), soldier; graduated at West Point in 1852. He was a captain at the outbreak of the Civil War, and he closed it a brevet major general. Thence he was transferred to Arizona, and thoroughly subdued the Piutes and Apaches. Major General Crook was in command of the department of the Missouri until his death.

**Croquet** (krô'kā), an open-air game played with balls, mallets, hoops, and pegs on a level area, which should be at least 30 yards long by 20 wide. The iron hoops (shaped like the letter U) are fixed with their two ends in the ground, arranged in a somewhat zigzag manner over the ground; they are usually ten in number. The posts or pegs (two in number) are placed at the near and far end of the field

## Crosby

respectively, marking the starting and turning points. The game may be played by any number of persons up to eight, either individually, or arranged in couples or in sides. The object of the players is to drive with their mallets the balls belonging to their own side through the hoops and against the posts in a certain order, and to prevent the balls of their opponents from completing the journey before their own by playing them against those of the enemy, and driving them as far as possible from the hoop or post to be played for; the player or players whose balls first complete the course

claiming the victory. Crosby, HowARD, Presbyterian clergyman; b. in New York, 1826. He was graduated at the New York University in 1844. In addition to contributions to periodicals, magazines, tracts, and lectures, he is the author of a number of theological works.

Cro'sier, the staff borne by some of the higher dignitaries of the Roman Catholic and other churches, and probably the oldest of the insignia of the Episcopal dignity. The original form of the staff resembled a shepherd's crook, but from the middle of the fourteenth century the archbishops began to carry, sometimes in addition to the pastoral crook, sometimes instead of it, a crosier terminating in a cross or double cross.

Cross, one straight body laid at any angle across another, or a symbol of similar shape. Among the ancients a piece of wood fastened across a tree or upright post formed a cross, on which were executed criminals of the worst class. It had, therefore, a place analogous to that of the modern gallows as an instrument of infamous punishment until it acquired honor from the crucifixion of Christ.

Cross' bill, a genus of birds of the finch family, deriving their name from a peculiarity of their bill, the mandibles of which are curved

as to cross each other, sometimes on one side and sometimes on the other. The form of the bill enables them to extract with ease the seeds of the pine, their usual food, from underneath

Crossbill.

the scales of the cones. They build and also breed at all seasons of the year, in December, as in March, April, or May. The common crossbill is found in the northern countries of Europe. It is from 6 to 61 in. in length. The male has a red plumage, the female is of a yellowish-green color. Two species of crossvellowish-green color.

billinhabit Canada and the Northern states, Cross'bow (or Arbalist), formerly a very common weapon for shooting, consisting of a

Crosse, An-

DREW (1784-A,-hand crossbow; B.-rolling-purchase crossbow. 1855), English

He applied electricphysician and scientist. ity in the production of crystals, discovered a process of purifying salt water by electricity, and also made some curious discoveries relative to the effects of positive and negative electricity on vegetation.

Cross-staff, an instrument used by surveyors consisting of a staff carrying a brass circle divided into four equal parts by two lines intersecting each other at right angles. At the extremity of each line perpendicular sights are fixed, the instrument being used in taking offsets.

Cross-trees, in ships, certain pieces of timber at the upper ends of the lower and top masts, athwart which they are laid, to sustain the frame of the tops in the one, and extend the top gallant shrouds on the other. Crotalaria, a genus of leguminous plants,

all natives of warm climates, but some of them long cultivated in hothouses.

Crotal'idæ, a family of serpents including some of the most dangerous, above all the rattlesnakes.

Cro'ton, a genus of herbaceous plants, shrubs, and trees, comprehending a great number of species, many of which possess important medical properties.

Cro'tona (Croto'na), in ancient geography, a Greek republic in Magna Gracia or South Italy, famous for its athlete, among whom the chief was Milo. It is still more celebrated as the city where Pythagoras taught between 540 and 530 B.C.

Crow, a genus of birds, type of the family Corvidæ. It includes the carrion crow, the hooded crow, the raven, the rook, and the jackdaw. The carrion crow, or simply the crow, is 18 or 19 in. in length, and about 36 between the tips of the wings. Its plumage is compact and glossy blue-black with some greenish reflections. Its favorite food is carrion of all kinds; but it also preys upon small quadrupeds, young birds, frogs, lizards, etc., and is a

confirmed robber of the nests of game birds and poultry. It is not gregarious, being generally met with either solitary or in pairs. It builds a large isolated nest, with from four to six eggs, generally of a bluish-green with blotches of brown. The carrion crow is easily tamed, and may be taught to articulate words.

Croton.

The American crow is similar to the foregoing, but is smaller and less robust, and is somewhat gregarious. The crow is common in all parts of the U. S., and is deemed a great nuisance by farmers from preying on their corn. The fish crow, another American crow, resembling the preceding but smaller, is abundant in the coast districts of the Southern states. Its favorite food is fish, but it also eats all kinds of garbage, mollusca, etc. The hooded, Royston, or gray-backed crow, is somewhat larger

#### A .- Crow; B.- Rook.

than the rook. Its head, wings, and tail are black, but less bright than in the rook; the rest of the body is a dull smoke-gray. Its food is similar to that of the carrion crow, and it builds a similar nest. The crow as a weather prophet is entitled to the highest distinction. When rain is approaching a whole community will rise from their nests or perches, wheel about for some time, and then return to their haunts.

**Crowberry** (or Crakeberry), a plant resembling the heaths, and bearing a jet-black berry, common in all the northern parts of Europe and Asia and North America. The berries, which have a slight acid taste and are sometimes eaten, afford a purple dye. The red crowberry which has a red fruit, grows in the neighborhood of the Straits of Magellan.

**Crow Blackbird**, the name of certain American birds, found in the Southern states, Mexico, and the West Indies, is 16 in. long, and of a glossy black plumage. The female is of a light-brown above and whitish beneath. The purple grackle, lesser or common crow blackbird, is similar in color to the preceding, but smaller. They reach the Middle states from the south in flocks in the latter part of March, and build in April in the tall pines or cedars. On their first arrival they feed upon insects, but afterward commit great ravages upon the young corn. In November they fly southward again.

**Crown Glass,** the hardest and most colorless kind of window glass, made almost entirely of sand and alkali and a little lime, and used in connection with fint glass for optical instruments in order to destroy the disagreeable effect of the aberration of colors.

fect of the aberration of colors. **Crown Wheel**, a wheel with cogs or teeth set at right angles to its plane, the wheel in certain watches that drives the balance.

**Croy' don**, a borough of England, in Surrey. 10 mi. s. of London, of which it is practically a suburb. The town, which is a favorite residence of merchants and business men, retired tradesmen, etc., is surrounded by fine villas, mansions, and pleasure grounds. It is a place of ancient origin, but from its recent rapid increase is almost entirely new. Of special interest are the remains of the ancient palace, long a residence of the archbishops of Canterbury. Pop. 102,697.

Cro'zet islands, a group of four uninhabited islands in the South Indian Ocean, between Kerguelen and Prince Edward Islands. They are all of volcanic origin, and the most easterly of them. East Island, has peaks exceeding 4,000 ft. The largest, Possession Island, is about 20 mi. long by 10 broad. Cru'cian Carp, a thick, broad fish, of a

**Cru'cian Carp**, a thick, broad fish, of a deep yellow color, differing from the common carp in having no barbules at its mouth, in-habiting lakes, ponds, and sluggish rivers in the north of Europe and Asia.

**Cru'cible**, a vessel employed to hold substances which are to be submitted to a high temperature without collecting the volatile products of the action. It is usually of a conical, circular, or triangular shape, closed at the bottom and open at the top, and is made

of various materials, such as fireclay, platinum, a mixture of fire clay and plumbago, porcelain, etc.

### Cruciferæ

**Crucif** eræ, a very extensive nat. order of dicotyledonous plants, consisting of herbs which all have flowers with six stamens, two of which are short, and four sepais and petals, the spreading limbs of which form a Maltese cross, whence their name. The fruit is a pod with a membranous placenta dividing it into two cells. The mustard, water-cress, turnip, cabbage, scurvy grass, radish, horse-radish, etc., belong to this family.

etc., belong to this family. **Cruden**, ALEXANDER (1701-1770), was b. at Aberdeen. His great work appeared in 1737, under the title of A Complete Concordance of the Holy Scriptures of the Old and New Testament.

**Cruikshank**, GEORGE (1792-1878), the greatest of English pictorial satirists after Hogarth, b. in London. The earliest of his drawings known is dated 1799, when he was only seven years of age, and when fifteen he was comparatively distinguished. He illustrated a number of popular books. Poorly paid for work by which others profited, he was latterly obliged to part with the vast collection of his works, and in 1866 \$250 a year was settled on him from the Royal Academy's Turner Annuities.

**Cruive** (kröv), a trap for fish, especially salmon, consisting of a sort of hedge of stakes on a tidal river or the sea beach. When the tide flows the fish swim over the wattles, but are left by the ebb.

Crusades, the wars carried on by the Christian nations of Western Europe, from the end of the eleventh till the latter half of the thirteenth century, for the conquest of Palestine. They were called Crusades, because the The anwarriors wore the sign of the cross. tagonism between the Christian and Mohammedan nations had been intensified by the possession of the Holy Land by the Turks and by their treatment of pilgrims to Jerusalem; and the first strenuous appeal was assured of response alike from the pious, the adventurous, and the greedy. The immediate cause of the first Crusade was the preaching of Peter of Amiens, or Peter the Hermit, who in 1093 had joined other pilgrims on a journey to On his return he gave Pope Jerusalem. Urban II a description of the unhappy situation of Christians in the East, and presented a petition for assistance from the Patriarch of Jerusalem. The statements of the pope at the councils of Piacenza and Clermont in 1095 produced a profound sensation throughout Europe, and in 1096 several armies set out in different divisions, most of which, being ignorant of military discipline and unprovided with necessaries, were destroyed before reaching Constantinople, which had been chosen for their place of meeting. A well-conducted regular army, however, of 80.000 men was headed by Godfrey of Bouillon; Hugh of Vermandois, brother to Philip, king of France; Baldwin, brother of Godfrey; Robert II of Flanders; Robert II of Normandy, brother of William II, king of England; Raymond of Toulouse: and other heroes. They traversed Germany, Hungary, and the Byzantine Empire, passed over into Asia Minor, conquered Nicæa in June, 1097, and shortly after, on July 4, fought the

first pitched battle at Dorylæum, being com-pletely victorious after a severe contest. They then marched through Asia Minor upon Antioch, which, with the exception of the citadei, fell into their hands by treachery in June, 1098. Surrounded in turn by a Turkish army, they were soon reduced to pitiable straits, but succeeded in routing their besiegers on June 28. After remaining nearly a year in the neighborhood of Antioch they commenced, in May, 1099, their march against Jerusalem, the siege Their of which they commenced in June. numbers were now reduced to little more than 20,000 men; but after a fierce struggle the town was taken by storm on July 15, and Godfrey of Bouillon was chosen king of Jerusalem, or, as he preferred to term himself, Protector of the Holy Sepulcher.

The eccond great and regularly-conducted Crusade was occasioned by the loss of Edessa, which the Saracens conquered in December. 1144. Fearing still graver losses, Pope Eugenius III, seconded by Bernard of Clairvaux, exhorted the German emperor Conrad III, and the king of France, Louis VII, to defend the cross. Both these monarchs obeyed, and in 1147 led large forces to the East, but returned without accomplishing anything in 1149.

The third Crusade was undertaken after the capture of Jerusalem by Saladin in 1187, the monarchs Frederick I (Barbarossa) of Germany, Philip Augustus of France, and Richard I (Cœur de Lion) of England, leading their armies in person. Richard and Philip Augustus met at Vezelai in June, 1190, and agreed to unite their forces at Messina in Sicily where they spent six months at the end of 1190 and beginning of 1191. Philip joined the other Crusaders before Acre on April 13, 1191; but Richard, whose fleet was separated by a storm, went to Cyprus, and, dispossessing Isaac Comnenus, made himself king. Jealousies arose between the monarchs, and within a few weeks after the fall of Acre the French king returned to Europe. Richard, now sole leader of the expedition, defeated Saladin and occupied Jaffa or Joppa; but having twice vainly set out with the design of besieging Jerusalem, he concluded (Sept. 2, 1192) a truce of three years and three months with Saladin, who agreed that pilgrims should be free to visit the Holy Sepulcher, and that the whole sea coast from Tyre to Jaffa (including the important fortress of Acre) should belong to the Crusaders.

The *jourth* Crusade was set on foot by Pope Innocent III, who commissioned Fulk of Neuilly to preach it in 1198. Among its chief promoters was Godfrey of Villehardouin, seneschal of Champagne; Baldwin, count of Flanders and Hainaut: Dandolo, the aged doge of Venice: and the Marquis of Montferrat, who was chosen leader. The Crusaders assembled at Venice in the spring of 1202, but were diverted from their original purpose first by the capture of the Dalmatan town of Zara, and then by the expedition which ended in the sack of Constantinople and the establishment of a Latin empire there (1204).

The fifth Crusade, undertaken by Andreas

of Hungary in 1217, and shared in by John of Brienne, to whom the title of King of Jerusalem was given, had little other result than the temporary occupation of the Nile delta.

The sixth Crusade, that of Frederick II, emperor of Germany, was undertaken at the instance of Popes Honorious III and Gregory IX. On arriving he entered into negotiations with the Sultan of Egypt, and without any fighting recovered for himself, as heir of John of Brienne, the kingdom of Judea, on the condition of tolerating in his kingdom the Mohammedan worship. He then concluded a useless truce of ten years, got himself crowned at Jerusalem, and returned in 1229.

The seventh and eighth Crusades were led by St. Louis of France (Louis IX) in person. Πe took Damietta in June, 1249, and marched up the Nile, but was compelled to retreat, and finally to surrender with his whole army. The finally to surrender with his whole army. second expedition of Louis was still more disastrous in its results than the first. He landed his army in 1270 on the northern coast of Africa; but he himself and a large number of his knights died before Tunis, and the majority of the French Crusaders returned home. A crusading army under Prince Edward of England (afterward Edward I), originally intended to co-operate with that of Louis, landed at Acre in 1271, but little was effected beyond a new truce for ten years (1272). For nineteen years longer the Christians in Palestine held with great difficulty the remnants of the Latin kingdom there. But Tyre and Berytus (Beyrout) were successively snatched from them, and finally the capture of Acre by the Sultan of Egypt in 1291 put an end to the kingdom founded by the Crusaders.

Despite their want of success, however, the Crusades were of considerable indirect value in that by these joint enterprises the European nations became more connected with each other, the class of citizens increased in influence, partly because the nobility suffered by extravagant contributions to the Crusades, and partly because a more intimate commercial intercourse greatly augmented the wealth of the cities, and a number of arts and sciences. till then unknown in Europe, were introduced.

**Crusta'cea**, one of the primary branches into which is divided the great group of Articulate or Annulose animals. The body is divided into head, thorax, and abdomen, of which the two former are united into a single mass, cephalothorax, covered with a shield or carapace, and the abdomen usually presents the appearance of a tail. In some—the sand hopper, wood louse, etc.—the head is partially distinct from the thorax. The Crustacea breathe by branchiæ or gills, or by membranous vesicles. or by the general surface; and the body is composed of a series of rings more or less distinct. They possess the faculty of reproducing lost parts in an eminent degree. The integument is chitinous and remains elastic in some, as the Isopods, throughout life. But in the majority it is calcified or transformed into a hard shell, prisms of carbonate of lime being deposited in

#### Crystallomancy

the outer layer. It consists of a great number of distinct pieces connected together by portions of the epidermic envelope, just as among the higher animals certain bones are connected together by cartilages. Several species, if not all, molt or cast these outer skeletons or shells in the progress of growth; this is the case with crabs, crayfish, etc. The general grouping of the Crustacea is sometimes based upon the successive metamorphoses which the higher Crustaceans undergo before reaching the adult form. Thus the first stage of the lobster embryo is that of a minute object with three pairs of limbs, known as the Nauplius form; in the second stage, the cephalo thorax is provided with anterior, posterior, and lateral spines; the final form being reached by a series of moltings.

Cry'olite (or Kryolite), a mineral, a native fluoride of aluminium and socium, found at Evigtok, in Greenland, whence it is exported. It is of a pale grayish-white or yellowish brown, occurs in masses of a foliated structure, and has a vitreous luster. It has been employed as a source of aluminum, and in the manufacture of a hard porcelanous glass of great beauty.

**Cryoph'orous**, an instrument for showing the diminution of temperature in water by its own evaporation. Wollaston's cryophorous consists of two glass globes united by a moderately wide glass tube. Water is poured in and boiled to expel the air, and while boiling the apparatus is hermetically sealed. When it is to be used the water is made to run into one of the globes, and the other is buried in a freezing mixture. The aqueous vapor in the globe being thus condensed, a vacuum is produced. fresh vapor rises from the water in the other globe, which is again condensed, and this proceeds continuously till the water remaining in the globe has been, by the evaporation.

cooled to the freezing-point. **Cryptog'amous Plants** (Cryptogamia). in botany, the division embracing the lower classes of plants having no evident flowers or in which the reproductive organs are obscure.

**Cryptog' raphy**, the art of writing in secret characters or cipher, or with sympathetic ink. The simplest method consists in choosing for every letter of the alphabet some sign, or another letter or group of letters.

**Crystal**, in chemistry and mineralogy. any body which, by the mutual attraction of its particles, has assumed the form of some one of the regular geometric solids, being bounded by a certain number of plane surfaces. The chemist procures crystals either by fusing the bodies by heat and then allowing them gradually to cool, or by dissolving them in a fluid and then abstracting the fluid by slow evaporation.

**Crys' talline Rocks**, rocks of a crystalline texture. such as granite, believed to have acquired this character by the action of heat and pressure.

**Crystal lomancy**, a mode of divining by means of a transparent body, as a precious stone, crystal globe, etc. The operator first muttered over it certain formulas of prayer. and then gave the crystal (a beryl was pre-

ferred) into the hands of a young man or virgin, who received an answer from the spirits within the crystal.

Cuba, the largest and most important of the West Indies, has a delightful climate, rich soil, and luxuriant tropical growth, and en-chanting natural scenery. Its coast line of 1,600 mi. furnishes no less than twenty-seven excellent harbors. This advantage, combined with its favored position at the entrance of the Gulf of Mexico, gives it a commercial value incomparable with the extent of its territory, which, including the Isles of Pines and some other small islands, aggregate about 43,825 sq. mi. The island measures from east to west 760 mi., and is traversed by a mountain range, the most elevated summit of which is 7,670 ft. From this central water-shed, short rivers flow north and south. One half of the island is covered with forests filled with a dense growth of underbrush, while the dry plains are a jungle of bushes and grass, which, during the rainy season, become impassable These natural conditions have been swamps. a great aid to the insurgents during the present revolution (1896-97). Havana, the capital, has an equable temperature, the mean average ranging from  $77^\circ$  to  $80^\circ$ . The foundation of this city dates from 1519, being the oldest city in America founded by Europeans. The cen-sus of 1887 showed a population of 200,408. The venerable cathedral, supposed to contain in an urn the bones of Columbus, is here, as well as the famous Moro Castle, in which so many political prisoners, including many Americans, have been incarcerated. For defense of the harbor newer fortifications have been erected on neighboring heights. At Havana and in other seaports yellow fever pre-vails during the summer. Santiago on the south, Matanzas on the north, and Puerto Principe inland, are the cities next in order of population. The principal products of Cuba are sugar,

tobacco, and coffee. Maize is indigenous; two crops are produced each year. Rice in small quantities is grown. Oranges and bananas have value as export articles, while mahogany and cedar woods come next in importance. Pineapples, melons, lemons, limes, figs, and strawberries are quite extensively cultivated. In Cuba the sugar planter is the prince of agriculture. The grinding season lasts twice as long as in Louisiana. The production of sugar is now about one million tons per annum, but it is estimated that the island is capable of yielding five times as much. The Spanish government has control of the tobacco trade and imposes restrictions that make the profits to the producer uncertain; for this reason those interested in the tobacco industry usually favor the revolution. The richest tobacco region in the world is the province Pinar del Coffee culture was introduced from Rio. Hayti (1748). Impetus was given to coffee culture by the superior methods brought in by French planters who fied from San Do-mingo (1798). Competition with Brazil long since crippled the coffee trade in Cuba. The

most important mineral product is bituminous coal, though copper, iron, and even gold and silver are found. The latest census gives the population of Cuba about 1,631,619, one third of whom are colored. The whole island excepting Havana was, for many years, neglected by the Spanish owners. Consequently whenever Europe was engaged in war with Spain. Cuban waters were the scenes of bloody combat. Havana was destroyed by the French 1534, and again in 1554. In 1624 it was captured by the Dutch but subsequently restored to Spain. Havana was captured by the English assisted by the colonies of New York, New Jersey, and Connecticut in 1762, but within a year was exchanged for Florida. When in 1808 the French deposed the reigning family in Spain, Cuba declared war against Napoleon. From 1810 Cuba was governed by a foreign captain general. His government combined with excessive taxation caused discontent, which became defiance in 1836 when Cuba was denied the benefits of the new constitution granted Spain. In 1844 and 1848 there were insurrections of the negroes, but these were soon quelled. The U.S. wishing to extend its slave territory (1848), offered to buy Cuba. The Ostend Manifesto issued in 1854 declared that if Spain would not sell Cuba, the U.S. should seize and annex the island. Before this, an attempt had been made (1850-1851) by Narcisso Lopez, assisted by adventurers from the U. S., to seize Cuba. The Cubans themselves repelled the intruders. During the ten years' war for Cuban independence which began in 1868 under the famous Maximo Gomez, Captain Fry of the Virginius with fifty-two other American prisoners, was shot (1873) at Santiago, condemned as pirates. This war was terminated 1878 by the treaty of Elzanjon with Martinez Campos, acting captain general. By this treaty personal rights were granted the Cubans and the early abolishment of slav-ery provided for. The promises were fair but the fulfillment false. Nothing was really changed; the government was mal-administered under softer names. Captain general became governor general, and the "law of vagrancy" took the place of the right of ban-ishment. Taxation without the consent of the Cubans still existed. Native Cubans were excluded from offices of influence. The whole island was still governed in the interests of The mother country had but one Spain. policy for Cuba: to raise the largest revenue possible, and give the people the smallest return. Export duties were laid on her products and tariff on her imports. The Cuban deputies in the Cortes at Madrid were without power or influence. Slavery was abolished in 1886, since which time Cuba has suffered from scarcity of labor, for in 1873 the Chinese government had stopped the emigration of its subjects to this island, and the negro population had been diminished by excessive infant mortality.

Cuban exiles continued to agitate for "Cuba libre," and in 1894 a revolutionary council was formed with Jose Marti as leader, and head-

quarters at New York. Arms were smuggled into Cuba, and secret preparations were going on at home and abroad. In January, 1895, a filibustering expedition, organized by Antonio Maceo and Jose Marti at Fernandina, Fla., was broken up on the eve of sailing. The formal declaration of war bears date Feb. 24, 1895. Maximo Gomez was given command of the revolutionary forces. The insurgents carried revolutionary forces. on guerrilla warfare, playing hide and seek with the Spanish forces in the mountains and swamps. A plot to exterminate the Spanish soldiery and to burn everything burnable came to light, and Callya, the governor general, proclaimed martial law in the threatened provinces. Raids were made upon the plantations, the crops ruined, and the laborers enticed away, but the Spanish troops operated without success, for the insurgents would disappear in the mountains and swamps at their approach. The rebels themselves were handicapped by the attitude of the autonomists who, while complaining bitterly against Spanish misrule, were unwilling to fight, limiting their demands Nearly all the negroes belong lionary party. Those holding to home-rule. to the revolutionary party. office and those of Spanish birth make up the royalist party. March, 1895, Maceo landed from Costa Rica and made his way through the eastern part of the island until he met a body of rebels who hailed his coming with joy. He and his brother Jose were made generals. In April of the same year Maximo Gomez and Jose Marti landed from San Domingo. Gomez was immediately made commander-in-The rebels now took fresh courage, chief. remembering their leaders' prowess in the former war. Marti, wishing to go to the U.S., set out May 19, but was led into ambush by a treacherous guide and killed almost in sight of camp. Governor general Callega had been relieved in April by field marshal Campos. The revolt went on with the advantage to the rebels that they were kept informed of the movements of the government troops. Campos divided the island into belts running military lines north and south, hoping thus to crowd the rebels off the island. On the contrary, he failed in the campaign of 1895, and went home to Spain to make way for the cruel, Gen. Valeriano Weyler, who arrived February, 1896. He found the insurgents near Havana, they having in their westward march laid waste the whole country. At the end of 1895 Spain had 200,-000 men in the field and the insurgents about 60,000. Weyler tried in vain to prevent concert of action between Gomez and Maceo (the lat-ter being in Pinar del Rio province), by throwing trochas, lines of fortified posts close together, across the island. Dec. 6, 1896, Maceo was killed, probably through the treachery The campaign of Dr. Zertucha of his staff. of 1897 is still going on and the insurgents have possession of nearly two thirds of the island. They have drawn up a form of government borrowed from American and Spanish models. The Spanish government has sent agents to treat with the rebels, but they are unwilling to consider anything short of independence.

**Cubic Niter** (or Chile Saltpeter), the nitrate of sodium found chiefly in the rainless district of Tarapacá in Chile, where it occurs for the most part mixed with other salts, sand, and clay. It crystallizes in obtuse-angled rhombohedra, not in cubes, and is used in considerable quantities both as a dressing for grass and mixed in artificial manures.

**Cuck' oo**, a scansorial or climbing bird, the type of the family Cuculidæ. The note from which it derives its name is a love call used only in the mating season. The greater number of species belonging to the genus are confined to summer countries, more especially India and Africa, though some are summer visitants of colder climates. The adult bird is ashy-gray, with a white breast barred across with narrow lines of grayish black; tail spotted and barred with white; bill black, touched at the gape with yellow; eyes and feet yellow. It appears in England about the middle of April, and in May begins to deposit its eggs in the nests of other species; giving the preference to those of the hedge sparrow, meadow pipit, or pied wagtail.

Cuckoo.

The young cuckoo ejects from the nest its young companions, and monopolizes the attentions of its foster parents, which feed it for about five weeks after it is fledged. The young birds do not leave the country until the end of August or even September; but the adult birds commence their flight southward in July or at latest early in August. Their food consists chiefly of cockchafers, moths, dragon flies, and caterpillars, though young cuckoos will sometimes eat berries. There appears to be a curious preponderance of male as compared with female birds, a low estimate putting the ratio at about five to one.

**Cuckoo Flower** (or Lady's smock), a common and pretty meadow plant, order Cruciferæ, with pale lilac or white flowers. It possesses antiscorbutic properties.

Cu'cumber, the fruit of *Cucamis satīrus*, or the plant itself, belonging to the Cucurbitaceæ or gourd order, and supposed to have been originally imported into Europe from the Levant. It is an annual with rough trailing stems, large angular leaves, and yellow male
and female flowers set in the axils of the leaf stalks.

**Cucumber Tree**, a fine forest tree, so named from the appearance of its fruit.

**Cucurbita ceæ**, the gourd order, consisting of large herbaceous plants, annual or perennial, with alternate leaves palmately veined and scabrous, and unisexual flowers. The corolla is monopetalous, regular, and with five lobes; the petals, usually either yellow, white, or green, and deeply veined; the fruit fleshy and succulent. The stems are scabrous, and the general habit is climbing or trailing, by means of tendrils. The order contains at least fifty-six genera and about 300 known species, and abounds in useful or remarkable plants, including the melon, gourd, cucumber, colocynth, bryony, etc. They are natives of both hemispheres, chiefly within the tropics. The annuals, however, are common in our gardens. **Cuddalore**' (or Kúdalúr), a maritime town

**Cuddalore**' (or Kúdalúr), a maritime town in Hindustan, presidency of Madras and district of South Arcot, 86 mi. s. of Madras. It was formerly a place of great strength and importance, and still carries on a large land trade with Madras in indigo, oils, and sugar. It also exports grain and rice. Pop. 43,545.

**Cud' dapah** (or Kadapa), a district and town, Hindustan, presidency Madras. The district, of which the area is 8,745 sq. mi., is traversed north to south by the Eastern Ghauts, and watered by the Pennar and its affluents. The forests contain much valuable timber, and the minerals include iron ore, lead, copper, diamonds, etc. Agriculture is in a flourishing condition, grain, cotton, and indigo being largely grown. Pop. 1,121,038. The town lies on a small river of same name, an affluent of the Pennar, 140 mi. n. w. Madras. It exports indigo and cotton. Pop. 18,982.

**Cuen'ca**, a town of Ecuador, next to Quito the most important in the country, with a cathedral and university. Pop. 30,000.

**Cufic,** a term derived from the town of Cufa or Kufa, in the pashalic of Bagdad, and applied to a certain class of Arabic written characters. The Cufic characters were the written characters of the Arabian alphabet in use from about the sixth century of the Christian era until about the eleventh. They are said to have been invented at Cufa, and were in use at the time of the composition of the Koran.

**Cullo den Moor,** a heath in Scotland, 4 mi. e. of Inverness, celebrated for the victory obtained April 27, 1746 by the Duke of Cumberland over Prince Charles Edward Stuart (the Pretender) and his adherents. The battle was the last fought on British soil, and the termination of the attempts of the Stuart family to recover the throne of England.

**Cullom,** SHELBY M., statesman b. in Wayne co., Ky. 1829; studied law and practised at Springfield, Ill. In 1876 he became governor of Ill. He was elected U. S. senator in 1883, which position he still holds.

**Cullum,** GEORGE W., engineer, b. in New York City, 1809, graduated at West Point in 1833 and entered the engineer corps. He built Fort Sumter and other Atlantic harbor defenses. Cu mæ, a very ancient city of Italy, in Campania, the oldest colony of the Greeks in Italy, founded about 1030 B.c. by colonists from Chalcis, in Eubea, and from Cyme in Asia Minor. It founded Naples, and in Sicily Zancle or Messina. In 420 B.c. Cumæ was taken by the Campanians, and came with them under the power of Rome (345 B.c.). It was destroyed A. D. 1207, and a few ruins only now exist.

**Cumana'**, a town of Venezuela. It is the oldest European city in the New World, having been founded in 1523. It lies near the mouth of the Gulf of Cariaco, and has a good roadstead in Cumana Bay, with a trade in cacao, sugar, tobacco, etc. Pop. 12,051.

**Cum' berland,** the extreme northwestern county of England. Area 970,161 acres. Carlisle is the county town; the other principal towns are the seaports Whitehaven, Workington, and Maryport; and the inland towns Penrith, Cockermouth, and Keswick. Pop. 266,-550.

**Cumberland**, Providence co., R. I.; a manufacturing town. Pop. 8,090.

**Cumberland**, Alleghany co., Md., on Potomac River, 150 mi. from Washington. Railroads: B. & O.; Pennsylvania; C. & P.; W. Va. C. & P.; and G. C. & C. Industries: railroad shops. four flouring mills, three iron foundries, three glass, three cement, steel shafting, and tin plate factories. Surrounding country agricultural and mineral. Fort Necessity was established by General Washington-destroyed by French in 1754, and Fort Cumberland garrisoned 1754-55. 1787 a survey of Cumberland was ordered, and in 1876 George Dent (fatherin-law of General Grant) made a plat of the town. In 1815 the town was incorporated, and in 1816 the first city council was elected. Pop. est. 1897, 15,300.

**Cumberland**, a river of the U. S. which runs through Kentucky and Tennessee into the Ohio, having a course of about 600 mi., navigable for steamboats to Nashville, nearly 200 mi.

**Cumberland Mountains**, in Tennessee part of a range of the Appalachian system; rarely exceeding 2,000 ft. in height.

**Cum in** (or Cum min), an umbelliferous plant which grows wild in Egypt and Syria, and is largely cultivated in Sicily and Malta. whence it is exported. The fruit, called cumin seeds, is of a light brown color, with an aromatic smell and caraway-like taste, and possesses stimulating and carminative properties.

Cumminsville, Hamilton co., O., near Ohio River, 5 mi. n. and part of city of Cincinnati by annexation. Railroads: C. H. & D.; Dayton Short Line: B. & O.; and three lines of Cincinnati street railway. Industries: two flouring mills, shoe, pearl button, harness. cigar, and other small factories. Surrounding country agricultural. The town was first settled in 1788; it was the scene of "Mad Anthony" Wayne's battles with the Indians. Pop. est. 1897, 15,000.

Cundinamarca, one of the departments of the Republic of Colombia. Area est, 79,810 sq. mi.; pop. 537,658.

## **Cuneiform Inscriptions**

Cune' iform inscriptions, the name applied to the wedge-shaped characters of the inscriptions on old Babylon and Persian monuments; sometimes also described as arrow-headed or nail-headed characters. They appear to have been originally of the nature of hieroglyphs, and to have been invented by the primitive Accadian inhabitants of Chaldea, from whom they were borrowed with considerable modification by the conquering Babylonians and Assyrians, who were Semites by race and spoke an entirely different language. The use of the character, however, ceased shortly after the reign of Alexander the Great; and after the lapse of nearly two thousand years it was doubted by many if the signs had ever had an intelligible meaning. They were even regarded by some as the work of a species of worm, by others as mere talismanic signs, astrological symbols, and the like. The first hints toward decipherment were given by Karstens Niebuhr late in the eighteenth century; and the labors of Grotefend, Rask, Bur-nouf, Lassen, Rawlinson, and other investigators slowly perfected the means of translation. Most of the inscriptions first discovered were in three different languages and as many varieties of cuneiform writing, the most promi-nent, and at the same time the simplest and latest, being the Persian cuneiform writing with about sixty letters. Next older in time and much more complex is what is designated the Assyrian or Babylonian system of writing, consisting of from 600 to 700 characters, partly alphabetic, partly syllabic, or representing sound groups. Lastly comes the Accadian inscriptions, the oldest of all, originally proceeding from a people who had reached a high state of civilization three thousand years before Christ, and whose language (allied to Turkish) ceased to be a living tongue about 1700 B.C. The most celebrated trilingual inscription is that at Behistun, cut upon the face of a rock 1,700 ft. high, and recording a portion of the history of Darius. The British Museum contains many thousands of inscribed clay tablets, cylinders, prisms, etc., the decipherment of which is in progress. See also Assyria.

Cu'pola, in architecture, a spherical vault on the top of an edifice; a dome or the round top of a dome. The Italian word *cupola* signifies a hemispherical roof which covers a circular building, like the Pantheon at Rome and the Round Temple of Vesta at Tivoli. The term is also applied distinctively to the concave interior as opposed to the dome forming its exterior.

**Cupping,** a surgical operation consisting in the application of the cupping-glass in cases where it is desirable to abstract blood from, or draw it to, a particular part. When blood is removed the operation is simply termed cupping; when no blood is abstracted, it is drgcupping. The cupping-glass, a cup-shaped glass vessel, is first held over the flame of a spirit lamp, by which means the included air is rarefied. In this state it is applied to the skin, and as the heated air cools it contracts and produces a partial vacuum, so that the skin and

# Curbroof

integuments are drawn up slightly into the glass and become swollen. If blood is to be drawn, a scarificator or spring-lancet is generally used.

ally used. Curaçoa (kö-rå-so'a), an island, Dutch West of Venezuela; 36 mi. long and 8 mi., broad; capital Willemstad, principal harbor Santa Anna. It is hilly, wild, and barren, with a hot, dry climate. Yellow fever visits it every sixth or seventh year. Fresh water is scarce, and serious droughts occur. The tamarind, cocoapalm, banana, and other useful trees are reared -among them three varieties of orange, from one of which the Curaçoa liquor is made. Sugar, tobacco, cochineal, and maize are also produced, but the staple exports are salt, and a valuable phosphate of lime used as a manure in its natural state, or made to yield valuable superphosphates. The islands of Curaçoa, Bonaire, Oruba (or Aruba), and Little Curaçoa, form a Dutch government, the residence of the governor being at Willemstad. From the sixteenth century Curaçoa was held in succession by the Spaniards, Dutch, and British, and finally ceded to Holland at the general peace in 1814. Pop. 25,421; including the dependencies, 44,734.

**Curaçoa** (or Curaçao), a liquor or cordial prepared from a peculiar kind of bitter oranges growing in Curaçoa, which have a persistent aromatic odor and taste. It is prepared from the yellow part of the rind, which is steeped in strong alcohol, the infusion being afterward distilled and rectified and mixed with syrup. For the true orange, the common bitter orange of Europe is often substituted, and the genuine deep-vellow color imitated by caramel. etc.

deep-yellow color imitated by caramel, etc. **Cu'rari** (Cu'rara, Urara, Woorali), the wellknown arrow poison of the Indians in Spanish Guiana and in Northern Brazil. It is the aqueous extract of a tree, the *Strych nos toxifera*, thickened with a mucilaginous matter; and its properties are such that if introduced into a scratch or puncture of the skin, so as to mix with the blood, it causes death by paralysis of the nerves of the respiratory organs. It may, however, be introduced in moderate doses into the alimentary canal without injury, and animals killed by it are wholesome as food. The active principle is called *curarin*.

**Curas' sow** (or Hocco), the name given to gallinaceous birds of the genus Crax, family Cracidæ; natives of the warm parts of America. The crested curassow, found in Guiana, Mexico, and Brazil, is a handsome bird, nearly as large as the turkey and more imposing in appearance, being of a dark violet color, with a purplish-green gloss above and on the breast: the abdomen is snow white, and the crest golden. Another species is the red curassow, also a native of South America, and about the size of a turkey. The cushew bird is called the galeated curassow.

**Curbroof**, in architecture, a roof in which the rafters, instead of continuing straight down from the ridge to the walls, are at a given height received on plates, which in their turn are supported by rafters less inclined to the horizon, so that this kind of roof presents a bent appearance, whence its name.

**Curb-sender**, an automatic signaling apparatus used in submarine telegraphy. The message is punched on a paper ribbon, which is then passed through the transmitting apparatus by clockwork. The name is due to the fact that when a current of one kind of electricity is sent by the instrument, another of the opposite kind is sent immediately after

#### Crested Curassow.

to curb the first, the effect of the second transmission being to make the indication produced by the first sharp and distinct, instead of slow and uncertain.

Cur'few, a practise originated in England by William the Conqueror, who directed that at the ringing of the bell at eight o'clock all fires and lights should be extinguished. The law was repealed by Henry I in 1100, but the bell continued to be rung in many districts to modern times, and probably may still be heard. Similar ordinances for keeping children off the streets have been passed in some of our American cities. The name was also given formerly to a domestic utensil for covering up a fire.

**Curlew**, a genus of birds belonging to the order Grallatores, or Waders, and of the same family as the snipe and woodcock. The genus

Common Curlew.

is characterized by a very long, slender, and arcuated bill, tall and partly naked legs, and a short somewhat rounded tail. The bill is more or less covered with a soft sensitive skin by

## Currants

which the bird is enabled to detect its food in the mud.

Curling, a favorite Scottish winter amuse-

ment on the ice, in which contending parties slide large smooth stones having somewhat the shape of a flattened hemisphere, weighing from 30 to 45 lbs, each, with an iron or wooden handle at the top, from one mark

Curling Stone. to another. The object of the player is to lay his stone as near to the mark as possible, to guard that of his partner which has been well laid before, or to strike off that of his antagonist.

**Curr'agh**, a plain or common in Ireland. Kildare county, the property of the crown and the site of the chief military encampment in Ireland, formed in 1855, and having accommodation for 12,000 troops.

Cur'ran, JOHN PHILPOT (1750-1817), Irish advocate and politician. His eloquence, wit. and ability made him the most popular advocate of his age and country.

Cur'rant, the name of two well-known skrubs, order Grossulariaceæ, cultivated in

gardens for their The red curfruit. rant. Ribes rubrum. the fruit of which is used principally for tarts and jellies, is a native of Southern Europe, Asia, and North America. The white currant is a cultivated variety of the red, and is used chiefly for dessert and for conversion into wine. The black currant, R. nigrum, a native to most parts of Europe, and found abundantly in Russia and Siberia, is used for tarts and puddings, and for a jelly recomfine mended in cases of sore throat.

**Currants,** a small kind of dried grape imported from the Levant, chiefly from the vicinity of Patras in the Morea, as also from Zante,

Cephalonia, and Ithaca, of which islands they are the staple produce. The plant is delicate and the crop precarious, and as the plantation must be six or seven years old before it bears, its cultivation requires a great outlay of capital. After being dried the currants are exported in large butts.

Currency, any medium of exchange by which the processes of trade are facilitated. Originally all exchanges may be supposed to have been made directly by barter, one commodity being exchanged against another according to the conveniences of the particular holders. In barter, however, it would obviously be often difficult to find two persons whose disposable goods suited each other's needs, and there would also arise difficulties in the way of estimating the terms of exchange between unlike things, and of subdividing many kinds of goods in the barter of objects of different value. To obviate these some special commodities in general esteem and demand would be chosen as a medium of exchange and common measure of value, the selection vary-ing with the conditions of social life. In the hunting state furs and skins have been employed by many nations; in the pastoral state sheep and cattle are the chief negotiable property. Articles of ornament, corn, nuts, olive oil, and other vegetable products, cotton cloth, straw mats, salt, cubes of gum, beeswax, etc., have all been at various times employed to facilitate exchange. These, however, while removing some of the difficulties attendant upon barter, would only partially solve others. It would be felt by degrees that any satisfactory medium must not only possess utility and value, but it must be portable, not easily destructible, homogeneous, readily divisible, stable in value, and cognizable without great difficulty. The metals would naturally commend themselves as best satisfying these requirements, and accordingly in all historic ages gold, silver, copper, tin, lead, and iron have been the most frequent materials of currency. The primitive method of circulating them appears to have consisted simply in buying and selling them against other commodities by a rough estimation of the weight or size of the portions of metal. Sometimes the metal was in its native state (e. g. rough copper or alluvial gold dust), at others in the form of bars or spikes, the first approximation to a coinage being probably rudely-shaped rings. The earliest money was stamped on one side only, and rather of the nature of stamped ingots than coins as we know them. The chief desiderata influencing the subsequent development of coinage were the prevention of counterfeiting, the prevention of any fraudulent subtraction of metal from the coin, the removal as far as possible of anything likely to occasion loss of metal in the wear and tear of usage, and the production of an artistic and historical monument of the state issuing the coin. Hence the elaboration of designs to cover the whole of a given portion of metal, and the nicer determination of quality, size, degree of relief, inscription, etc. While, however, metallic money of a guaranteed standard value was at an early period found to facilitate in a high degree the mechanism of exchange, it was speedily discovered that it was possible in large part to replace the standard gold, or silver, or copper coins by various forms of currency of a repre-sentative character. The standard money depended solely for its value in exchange upon the value of the material of which it was composed; its metallic value and its nominal value were coincident; the representative money derived its value from a theoretic convertibility at will into the standard coin. Thus in token coins the metallic value may be much less than the nominal value, which is defined by the fact that they can either by force of law, or custom be exchanged in a certain fixed ratio for standard coins. Gradually a series of devices came to be employed to further the interchange of commodities with the least friction and the least possible actual use of the coinage except as a standard and common denominator of value in terms of which exchanges were made. Even in home transactions, but especially in international transactions, the use of actual specie was found to involve a loss of interest and a risk of still more serious loss, and a paper currency based upon credit offered the readiest solution of the difficulty. In this way bank notes, bills of exchange, and checkswarrants or representative documents convertible, if desired, into standard coin-took their place alongside the metallic currency, partly displacing it, partly extending and supplementing it.

The requisites of circulation are that the monetary issues, whether of coin or paper, shall be from a recognized or official source, and that they admit of being freely returned when necessary, to the source from which they are issued. The certification of the fineness of the masses of metal circulating in a community, and the protection from adulteration and fraud, clearly falls among the neces-sary acts of police. It is still argued, as by Herbert Spencer in his Social Statics, that the coinage should be left to the ordinary competition of manufacturers and traders; but when this has occurred the currency has uniformly become debased, and it is generally held, in accordance with the maxims of civil and constitutional law, that the right of coining is a prerogative of the crown. Even in the case of state issues base money has been circulated. In the matter of state supervision two precautions are particularly necessary; that the standard coins shall be issued as nearly as possible of the standard weight, and that all coin worn below the least legal weight shall be withdrawn from circulation. The ground for these pre-cautions is to be found in the broad, general principle relating to the circulation of money. that bad money invariably drives good money out of circulation, the heaviest coins being selected for exporting, hoarding, melting, con-version into jewelry, gold leaf, etc. The law holds good not only with regard to coins in one kind of metal, but to all kind of money in the same circulation, the relatively cheaper me-dium of exchange being retained in circulation while the other disappears. Of the various systems of metallic currency, the first adopted was that known as the single-legal-tender system, in which the state issued certified coins in one metal only. It was found, however, that in such cases the people invariably circu-

## Currentometer

lated, for convenience, coins of other metals, and there naturally arose out of this the adoption of a double or multiple legal tender system, in which coins were issued in different metals at a fixed rate of exchange. To obviate difficulties arising from the possession of two or more metals as concurrent standards of value, with the constant tendency of one or other to become more valuable as metal than as currency, a third system, the composite-legal-tender, came into existence, in which coins of one metal were adopted as the standard of value, and token coins only issued in the other metals for the payment of small amounts. The double-legal-tender system is adhered to in the U.S.

The circulation of representative money differs from that of standard metallic money in that it only circulates within the district or country where it is legally or habitually cur-rent. In the payment of debts to foreign merchants the only money which can be exported is standard metallic money. Examples of this are to be found in the suspension of specie payments by the Bank of England between 1797 and 1819, and in the history of the French assignats at the time of the Revolution. The various methods on which the issue of paper money may be conducted are exceedingly numerous and a matter of interminable debate. The state may either constitute itself the sole issuer of representative money on the same lines as it constitutes itself the sole issuer of metallic money, or it may allow corporations, companies, or private individuals to issue representative money under legislative control.

The question as to the duty of a government in this respect has been much obscured by the want of a clear apprehension of the distinction between a real and a nominal currency. Another idea, that the issue of paper money ought to be wholly controlled by government, or ought to rest entirely upon government credit, places a high degree of faith in the trustworthiness of governments, and is held by many to misconceive the nature and objects of a paper currency.

**Currentom** eter (Current Gauge), an instrument for measuring the velocity of currents. It may be constructed in various ways, e. g., a simple tube which is bent and has its lower end open to the current, the ascension of water in the vertical part indicating the velocity of the current.

**Currents,** MARINE, masses of sea water flowing or moving forward in the manner of a great stream. They are phenomena of the highest importance, both on account of their influence upon the climate of many maritime regions—an influence often reaching far inland—and their practical relation to the art of navigation. These currents are very numerous, and taken together constitute an oceanic circulation the intricacy and irregularity of whose form is owing to the number and variety of the agencies at work. Among the theories which have been put forward to account for the existence of currents, the chief place belongs to the theory of a circuit maintained

## Currents

between equatorial and polar waters. According to this theory there is in either hemisphere an area within which the waters of the ocean are colder, and hence by many degrees denser, than within the belt of the tropics. The natural result is a tendency of the colder and heavier water to sink and to diffuse itself over the lower portion of the ocean bed, and a movement of the warmer and lighter water in the direction of the surface, over which it tends to become diffused. In other words, the colder waters will move beneath the surface in the direction of the equator, and the warmer waters will flow along the surface in the di-rection of either pole. Hence, in either half of the globe two great and opposite currentsa cold current flowing from the pole toward the equator, and a warm current flowing from the equator in the direction of the pole. This theory has been excellently illustrated by Dr. Carpenter's experiment, in which a trough of glass filled with water, and having a lump of ice at one end and a heated bar of iron at the other, exhibits a similar circulation of hot and cold currents. To this theory Sir C. Wyville Thomson opposed a theory of evaporation as the general cause of the movement, holding that in the Antarctic Ocean at least the return of moisture to the south to balance the cold indraught of water that comes from thence takes place in a large measure through the atmosphere. Another great general cause of currents is to be found in the axial rotation of the earth eastward, by which the movement of tropical waters toward the pole is deflected eastward, and becomes in the northern hemisphere a northeastwardly current and in the southern a southeastwardly one. Under the operation of the same laws the opposite currents from polar latitudes to the equator are deflected in southwesterly and northwesterly directions respectively. It is to such influences that we may in the main attribute the well-known differences between the climates of North America and Europe within correspondent parallels. Other causes, more local in their nature, must be looked for to explain the origin and direction of currents in particular cases. In the case of surface or drift currents, for instance, it is probable that these are largely caused by the action of winds. Thus it is to the constant drift of surface water to the westward under the influence of the tradewind that the equatorial currents of the Atlantic and Pacific are due. In the case of the Atlantic Ocean the westward-moving waters, encountering the eastward extension of the South American mainland, become of necessity divided into two streams, the one of which sets to the southward along the eastern coast of Brazil, while the other advances along the more northwardly portions of the South American continent, past the outlets of the Amazon and the Orinoco, and thence into the Caribbean Sea. From the latter land-enclosed basin its course is necessarily into the similarly shut in basin of the Mexican Gulf, whence it finally emerges through the narrow channel of Florida as the well-known Gulf Stream (which

see). In the case of the Pacific Ocean there exists no such unbroken land barrier to the westwardly progress of the equatorial waters. A portion of its equatorial stream, however, is deflected to the northward toward the coasts of Japan (where it forms the well-known Japan stream, setting to the northeastward, past the Kuriles, in the direction of the Aleutian Islands), while another portion turns southwardly in the direction of Australia and New Zealand. To the same action of the winds, operating in connection with the obstacles presented by the land, divergent and countercurrents are due. Thus in the Atlantic and the Pacific there flows between the two equatorial trade-wind currents a countercurrent in exactly the opposite direction, and there is a similar countercurrent in the Indian Ocean north of its sole trade-wind current. Currents called indraught currents are also caused by the flow of water to replace that taken away by currents due to causes already mentioned. An example of this is found on the west coast of Africa, where an indraught current replaces the water blown toward the coast of South America. In the case of inland seas evaporation determines the direction of the surface currents, the direction being inward, where, as in the Mediterranean, the evaporation exceeds the inflow of fresh water: and outward, as in the Baltic and the Black Sea, where there . is an opposite state of matters.

**Currying** is the art of dressing cowhides, calves' skins, sealskins, etc., principally for shoes, saddlery, or harness, after they have come from the tanner. In dressing leather for shoes the leather is first soaked in water until it is thoroughly wet; then the flesh side is shaved to a proper surface with a knife of peculiar construction, rectangular in form with two handles and a double edge. The leather is then thrown into the water again, scoured upon a stone till the white substance called bloom is forced out, then rubbed with a greasy substance and hung up to dry. When thoroughly dry it is grained with a toothed instrument on the flesh side and bruised on the grain or hair side for the purpose of softening the leather. A further process of paring and graining makes it ready for waxing or coloring, in which oil and lampblack are used on the flesh side. It is then sized, dried, and tallowed. In the process the leather is made smooth, lustrous, supple, and waterproof.

**Curso'res** (or Runner), an order of birds, which includes the ostrich, rhea, emu, cassowary, and apteryx. The birds of this order are distinguished by their remarkable velocity in running, the rudimentary character of their wings, which are too short to be of use for flight, and by the length and strength of their legs. The breast bone is destitute of the ridge or keel which it possesses in most birds, hence the name *Ratita* (*L. ratas*, a raft).

**Curtin,** ANDREW GREGG, b. in Bellefonte, Pa. April 22, 1815. He was elected governor of Pennsylvania in 1860. In 1863 he was reelected and in 1869 became minister to Russia. He sat in Congress from 1881 to 1887.

.

**Curtis,** GEORGE TICKNOR, b. in Waterton, Mass., 1812; graduated at Harvard in 1832. Four years later he was admitted to the bar. He was a member of the state legislature from 1840 to 1844, and then became U. S. commissioner. He removed to New York City in 1862. His writings on commercial and copyright law are very numerous.

**Curtis,** GEORGE WILLIAM (1824-1802), American author, b. in Providence, R. I.; in 1830 he joined the staff of the New York Tribune, and was one of the editors of *Putnam's* Monthly from 1852 to 1869. He commenced the "Editor's Easy Chair" papers in Harper's Monthly in 1853, and became principal leaderwriter for Harper's Weekly on its establishment in 1857. A novel, Trumps (1862), and most of his books appeared first in these journals. Until 1884 he was one of the most prominent and influential members of the Republican party.

Cu'rule Magistrates, in ancient Rome, the highest dignitaries of the state, distinguished from all others by enjoying the privilege of sitting on ivory chairs when engaged in their public functions. The curule magistrates were the consuls, prætors, censors, and chief ædiles, who, to distinguish them from the plebeian ædiles, were called curule.

**Cusco-bark** (Cuzco-bark), the bark of *Cinchōna pubescens*, which comes from Cuzco, in South America, and is exported from Arequipa. It contains a peculiar alkaloid called cuscocinchonine, or cusconine, which resembles cinchonine in its physical qualities, but differs from it in its chemical properties. When applied medicinally it excites warmth in the system, and is therefore recommended to be given in cold intermittents and low typhoid states of the system.

**Cuscus**, a genus of animals of the phalanger family, somewhat resembling the opossums, having a dense woolly fur, prehensile tails, and living on leaves; natives of the smaller Australian islands.

Cushing, CALEB (1800-1879), statesman, b. in Salisbury, Mass. After graduating at Har-vard in 1817, he was tutor of mathematics and natural philosophy there until 1819, was ad-mitted to the bar in 1822. In 1825-26 he served in the legislature. He was elected to Congress in 1835, serving until 1843. He was nominated by Tyler for secretary of the treasury, but was rejected by the senate. In 1843 he was made U.S. commissioner to China and negotiated a treaty which was ratified in 1845. He was elected to the legislature in 1846. In 1850 he was re-elected, and was made the first mayor of Newburyport. In 1852 he was appointed an associate justice of the Supreme Court of Massachusetts, and in 1853 was made U.S. attorney-general. In 1866 was appointed with two other jurists to revise and codify the laws of the U.S. In 1868 he was sent to the U.S. of Colombia, South America, on a diplomatic errand, and in 1870 engaged in preparing the protocol of the Treaty of Washington and afterward in the statement to be laid before the tribunal of arbitration in Geneva. In 1873

he was nominated as chief justice of the U.S. but was not confirmed by the senate, and in the same year he was made minister to Spain. In 1852 Harvard gave him the degree of LL.D. He was the author of *Reminiacences of Spain*, The Country, Its People, History, and Monuments; and Historical and Political Review of the Late Revolution in France. His wife published Letters Descriptive of Public Monuments, Scenery, and Manners in France and Spain.

**Cushion Capital**, a capital which has the appearance of a cushion pressed upon by the weight of its entablature, or, like the Norman capital, consisting of a cube rounded off at its lower extremities.

**Cushman**, CHARLOTTE S. (1816-1876), actress, was b. in Boston. She made her first appearance in opera in the Tremont Theater. As an actress she first appeared as Lady Macbeth in 1835. She was powerful in tragedy, great in Shakespearian characters. As a dramatic reader she developed remarkable ability.

**Cushman**, PAULINE, spy, born in New Orleans, La., 1833. At first she was a variety actress. When the war began she was employed by the U. S. government as a detective of Southern sympathizers in Louisville, Ky. For some time she posed in the Southern states as a Confederate sympathizer, but remained steadfast to her affiliations with the national government. Eventually she was captured as a Northern spy, court-martialed, and sentenced to be hanged. But when the Confederates left Shelbyville she was left behind, and became released by entrance of the Union army.

**Cusso**, a small Abyssinian tree, order Rosaceæ, yielding flowers which are imported into Europe and used as an anthelmintic.

**Custis**, GEORGE WASHINGTON PARKE (1781-1857), author, b. in Md. In early life he was married to Mary Lee Fitzhugh. He became a fluent speaker, wrote plays for his amusement, and finished several paintings of battles of the Revolution. He published *Recollections* of Washington.

Custer, GEN. GEORGE ARMSTRONG (1839-1876), soldier, b. in New Rumley, O. Graduated from U. S. Military Academy, 1861. He was sent from Washington with dispatches to General McDowell and took part in the first battle of Bull Run. Gen. Geo. B. McClellan was so impressed by his energy and bravery that he appointed him aid-de-camp. Captain Custer took the first colors captured by the Union army. June 29, 1863, he was appointed brigadier general of volunteers. He gained the rank of major, July 3, 1863. For gallantry at the battle of Winchester he was made brevet colonel, Sept. 19, 1864, and October 19 he was made major general of volunteers. He was made brigadier general, May 13, 1865. He served on the plains from 1866-1871. June, 1876, General Custer with his whole command was defeated and slain on the Little Big Horn (in a region almost unknown), by the confederate Sioux. The spot has become a national cemetery.

**Customhouse** is the house or office where

#### Customhouse

vessels are entered and cleared, and where the proper customs or duties are paid.

The system of customs duties is as old as the Roman Empire, and it is even claimed that it existed in ancient Greece. It was a feature of the Venetian government in medieval days, and the customhouse of Venice had its name wrought in nails upon its great swinging door. The noted "Zollverein" was a tariff union of North German sovereignties which existed from 1818 until it was merged into the German Empire after the Franco-Prussian War. In England, while there was no doubt that customs duties were collected prior to the Norman Conquest, their more modern use dates from the long conflict between the tion. To meet the claims made by the House of Commons to the exclusive right to vote all supplies, it used to be maintained that there were certain duties on exportation and importation to which the crown had acquired a right by custom; and the name thus acquired was retained after the power claimed by the lower branch of Parliament had been settled by permanent legislation. The first customhouse was erected in London in 1304.

Upon the organization of our government after the close of the Revolution, the system of customs duties then in operation in England was adopted with scarcely any modification, under the direction of Alexander Hamilton, the first secretary of the treasury. Among the especial features of the system was that of debentures, or drawbacks, which were certificates entitling an exporter of imported goods to a drawback of duties paid on their importation, and also to re-export them to foreign ports. Subsequently the object thereby accomplished was more directly facilitated by permitting the importer to "bond" his goods in government warehouses until he was able to pay the duties; and later on the practise was modified still more in favor of the importer by permitting him to take out of "bond" from time to time portions of the invoice of goods consigned to him, paying the proportionate amount of duties. This system of bonded warehouses, which is now a feature of the customs service in every civilized country of the world, was embodied in an act of Congress passed in 1840, during the incumbency of the treasury department by Robert J. Walker, and known as the Walker act. It is a peculiar fact that in the colossal bonded warehouses of Hamburg, Germany, vast quantities of American whisky lie in bond, while other holders of this species of goods send it, in bond, "round the Horn" to the Pacific Coast and back, the sea voyage improving the quality of the spirits. Under our present method a credit of three years is given to importers who desire to keep their goods in bond. Realizing the immense amount of our customs system, the early secretaries of the treasury, and especially Alexander Hamilton, Albert Gallatin, Wm. H. Crawford, Richard Rush, Levi Woodbury, and Thomas Corwin, united in a policy favorable to the importer, and in

that way materially contributed to build up our commerce to the commanding position it now enjoys.

The first customhouse was established in New York City in 1799 under an act of Congress passed the previous year, and the net revenue received by the government from customs duties in the first year was so small that it is related that the collector, who with his family lived over the custom house, used the receipts of his office to pay the men employed by him. At the present time the number of customhouses in the U.S. is 152. The ten which render the largest returns to the government are, in their order, New York, Boston, Philadelphia, San Francisco, Chicago, Baltimore, New Orleans, St. Louis, Detroit, and Tampa, Florida. The amounts of net revenue received by the government through these customhouses for the year 1896 are as follows:

New York	\$109,326,145.72
Boston	11,219,468.91
Philadelphia	13,109,655.12
San Francisco	5,526,535.34
Chicago	5,471,003.89
Baltimore	2,825,586.39
New Orleans	1,719,815.75
St. Louis	1,129,966.06
Detroit	792,535.36
Tampa, Fla	784,693.07

The customhouse in Tampa was established by an act of Congress Feb. 28, 1887, since which she has outstripped many of the leading cities of the country.

The net revenues received by the government through the customhouses of the country since the organization of the revenue system, are by decades as follows:

From	1791	to	1800	.\$	50,321,485.87
**	1801	to	1810		129,540,517.63
4.4	1811	to	1820		163,804,167.09
• •	1821	to	1830		198,523,207.69
44	1831	to	1840		204,703,913.92
44	1841	to	1850		243,666,681.78
* *	1851	to	1860		544,980,470.30
4.4	1861	to	1870		1,239,458,442.34
* *	1871	to	1880		1,663,973,043.74
"	1881	to	1890		1,992,600,748.76
**	1891	to	1896	•	1,059,116,311.87

Total.....\$7,390,688,990.99

NOTE.—In accordance with an act passed by Congress in 1842, the fiscal year since that time has begun on the first of July. Therefore the decade from 1841 to 1851 in the above list, embraces only nine and a half years.

**Cutch**, a state in the west of India, lying to the south of Sind, under British protection; area 6,500 sq. mi. During the rainy season it is wholly insulated by water, the vast salt morass of the Rann separating it on the north and east from Sind and the Guicowar's Dominions. Its southern side is formed by the Gulf of Cutch, and on the west it has the Arabian Sea. The country is subject to violent volcanic action. The date is the only fruit which thrives, and the principal exports are cotton and horses. Pop. 512,084.

**Cutch Gunda** va, a division of Beloochistan, in the northeast; area 10,000 sq. mi.; pop. 100,000.

Cutlery, a term applied to all cutting instruments made of steel. The finer articles, such as the best scissors, penknives, razors, and lancets are made of cast steel. Table knives, plane irons, and chisels of a very superior kind are made of shear steel, while common steel is wrought up into ordinary cutlery. One of the commonest articles of cutlery, a common razor, is made as follows: The workman, being furnished with a bar of cast steel, forges his blade from it. After being brought into true shape by filing, the blade is exposed to a cherry-red heat, and instantly quenched in cold water. The blade is then tempered by first brightening one side and then heating it over a fire free from flame and smoke, until the bright surface acquires a straw color (or it may be tempered differently). It is again quenched, and is then ready for being ground and polished.

**Cuttack**, a town of Hindustan, in Orissa, 230 mi. s.s.w. Calcutta. It is known mainly for its beautiful filigree work in gold and silver. Pop. 51,000. The district of Cuttack has an area of 3,517 sq. mi. It is well watered, and rice, pulse, sugar, spices, dye stuffs, etc., are grown along the coast, which is low and marshy, and wheat and maize in the hilly regions. On the coast salt is extensively manufactured. Pop. 1,738,165.

**Cutter**, a small vessel, furnished with one mast, and a straight running bowsprit which

may be run in upon deck. It differs from the sloop in having no stay to support its jib.

Cûvler (küv-yā), GEOROES LÉOPOLD ÜHRÉTIEN FRÉDÉRIC DAGOBERT, BARON (1769-1832), a distinguished modern naturalist, was b. at Montbéliard, then belonging to the duchy of Würtemberg. His lectures on natural history, distinguished not less for the elegance of their style than for profound knowledge and elevated speculation, were attended by all the accomplished society of Paris. In January, 1800, he was appointed to the Collége de France. Under Napoleon, who fully recognized his merits, Cuvier held important offices in the department of public instruction. In 1819 he was received among the forty members of the French Academy.

Cuzco, an ancient city in Peru, capital of a department of the same name, is situated in a wide valley about 11,300 ft. above sea level, between the Apurimac and Urubamba. The ruins of the fortress built by the Incas, a stupendous specimen of cyclopean architecture, are still to be seen, as well as other massive specimens of ancient Peruvian architecture. The inhabitants manufacture sugar, soap, cotton, woolen goods, etc. There is a university, a cathedral, etc. Cuzco is the most ancient of the Peruvian cities, and was at one time the capital of the empire of the Incas. In 1534 it was taken by Pizarro. Pop. 18,730. Area of the department 95,547 sq. mi.; pop. 238,445.

Cy'anite (or Kyanite), a mineral of the garnet family found both massive and in regular crystals. Its prevailing color is blue, but of varying shades. Found only in primitive rocks.

Cyan' ogen, a compound radical composed of one atom of carbon and one of nitrogen. It is a gas of a strong and peculiar odor, re-sembling that of crushed peach leaves, and burning with a rich purple flame. It is unrespirable and highly poisonous. It unites with oxygen, hydrogen, and most non-metallic elements, and also with the metals, forming cyanides. Combined with hydrogen it forms prussic acid.

Cyanom'eter ("measurer of blue") is the name of an instrument invented by Saussure for ascertaining the intensity of color in the sky. It consists of a circular piece of metal or pasteboard, with a band divided by radii into fifty-one portions, each of which is painted with a shade of blue, beginning with the deepest, not distinguishable from black, and decreasing gradually to the lightest, not distin-guishable from white. The observer holds this up between himself and the sky, turning it gradually round till he finds the tint of the instrument exactly corresponding to the tint of the sky.

**Cyan'otype Process**, a photographic pic-re obtained by the use of a cyanide. This ture obtained by the use of a cyanide. process is in very common use by architects and engineers for copying plans, producing an image with white lines upon a blue ground. Sensitive paper is made by brushing it over with a solution of ferric oxalate; it is then exposed under the positive and treated with a solution of potassium ferricyanide, by which the image is developed. The color of the ground is deepened by subsequent washing with solution of potassium bisulphate.

Cybele (sib'o-lē), originally a goddess of the Phrygians, like Isis, the symbol of the moon, latterly introduced among the Greeks and Ro-Her worship was celebrated with a viomans. lent noise of instruments and rambling through fields and woods, and her priests were eunuchs in memory of Atys.

## Cyclometer

Cycada'ceæ (or Cycads), a nat. order of gymnospermous plants, resembling palms in their general appearance, and, as a rule, increasing by a single terminal bud. The leaves are large and pinnate, and usually rolled up when in bud like a crozier. The microscopic structure of the wood, as well as the general structure of their cones, allies them with the confers.

Cycladés (sik'la-dēz) (or kyklades), the principal group of islands in the Grecian Archipelago now belonging to the kingdom of Greece, so named from lying round the sacred island of Delos in a circle. The largest islands of the group are Andros, Paros, Myconos, Tenos, Naxos, Melos, and Thera or Santorin. They are of volcanic formation and generally mountainous. Some are very fertile, producing wine. olive oil, and silk; others almost sterile. The inhabitants are excellent sailors. Pop. 132,020.

Cycling. See *Bicycle*. Cycloid Fishes, an order of fishes according to the arrangement of Agassiz, having smooth, round, or oval scales, as the salmon and her-ring. The scales are formed of concentric layers, not covered with enamel and not spinous on the margins; they are generally imbricated. but are sometimes placed side by side without

overlapping. Cyclom'eter, a machine attached to a wheel. especially to that of the bicycle, to measure and record the distance traveled. This machine is a modification of and an improvement upon the odometer, which is known to have been used in the time of the Emperor Commodus. It is spoken of by Capitolinus in his Life of the Emperor Pertinax; also carvings of this instrument were made on the ducal palace of Urbino in the fifteenth century. Distances were measured in France by this instrument in 1550, and descriptions of this machine appeared in 1604 and 1612. An English artist, named Butterfield, invented an odometer at the end of the seventeenth century, and various improve-ments were made in France and other countries during the eighteenth century. Among the oldest inventions patented in the U.S. is an odometer (or road measurer), cyclometer for use on a coach. This was invented by W. A. Turner and patented in 1833. The registering mechanism was similar to that used to-day on gas meters, and it was placed in the body of the coach and operated from the wheel through a series of shafts, wheels, and universal joints. Since that time about two hundred patents have been granted in the U.S. for odometers or cyclometers. Most of them have been similar to Turner's but placed near the wheels and operated direct. Others have been operated by electricity, which necessitated carrying a bat-With the revival of the bicycle the name tery. was changed from odometer to cyclometer. and numerous new designs were brought out. Among the best of these was Stanton's bicycle log, an English instrument which was clamped to the axle of the front wheel and operated by a weight on the inside. The next step was to allow the cyclometer to hang loosely on the axle and operate it by the latter by means of a

worm wheel or pin. The Ritchie cyclometer was operated by a magnet which revolved with the axle and moved a small needle within the This allowed the case to be hermetically case. sealed against dust and oil and yet avoided the uncertain action due to jarring and centrifugal force of a weight. The Hoyt cyclometer, 1886, was attached to the under side of the pedal and operated by a cam attached to the crank. About 1890 shortly after the advent of the modern safety bicycle, the cyclometers were attached to the front fork and operated by a pin or projection attached to the wheel. The dials resembled a watch, the distance being designated by hands or by figures appearing through small openings on the dial. With these instruments the figures occupied only a small part of the space taken up by the dial so that the latter was larger and projected farther from the bicycle than necessary and was frequently broken. In 1895 the form was changed from a round dial to a cylinder or barrel. This form is light, compact, while the figures are large and easily read and has proved to be very popular. Accuracy is an important point in any measuring instrument, but when a soft or yielding tire is used it becomes impossible to register the distance traveled with absolute accuracy. The number of revolutions of the wheel in going a mile will be more or less as the tire is soft or hard, this being especially the case with pneumatic tires. For instance the front wheel of a standard bicycle is 28 in. in diameter, and if the tire were incompressible would revolve 720 times in going one mile. Ĩf the tire is very soft and compresses ‡ in., that is, if the diameter is equivalent to 274 in., it will revolve 733 times per mile. Some cyclometers, for standard sized wheels, register a mile for every 728 revolutions which corresponds to a compression of about 3 in., which seems to be a fair average. The wheel will then advance 87 in. in one revolution and may be tested as follows: Place the bicycle on a smooth floor with a rider in the saddle; mark the tire and the floor under the center of the wheel; then carefully push the bicycle ahead in a straight line until the mark on the tire again comes under the center of the wheel; mark the floor again opposite the mark on the tire. If the distance between the two marks on the floor is 87 in., the cyclometer will register correctly.

The manufacture of cyclometers requires the best material, the finest machinery, and as much care as a watch. One of the largest factories in the U.S. employs 140 people on this work exclusively. Most of these are women.

**Cyclone** (sī'klon), a circular or rotatory storm or system of winds, varying from 50 to 500 mi. in diameter, revolving round a center, which advances at a rate that may be as high as 40 mi. an hour, and toward which the winds tend. Cyclones of greatest violence occur within the tropics, and they revolve in opposite directions in the two hemispheres—in the southern with, and in the northern against, the hands of a watch — in consequence of which, and the progression of the center, the strength of the storm in the northern hemisphere is greater on the south of the line of progression and smaller on the north, than it would be if the center were stationary, the case being reversed in the southern hemisphere. An *anticyclone* is a storm of opposite character, the general tendency of the winds in it being away from the center, while it also shifts within comparatively small limits. Cyclones are preceded by a singular calm and a great fall of the barometer.

**Cyclo' plan Works,** in ancient architecture, masonry constructed with huge blocks of stone unhewn and uncemented, found in Greece, Sicily, Asia Minor, etc.

**Cy** clops, in Greek myths, a fabled race of one-eyed giants, the sons of Urănus and Gē (Heaven and Earth), slain by Apollo. They were often represented as a numerous race living in Sicily and rearing cattle and sheep. Of such is the Cyclops of the Odyssey. Later traditions describe them as the servants of Vulcan working under Ætna, and engaged in forging armor and thunder bolts. Cyclops is likewise the generic name of a certain minute Crustacean, order Branchiopoda, having but one eye, situated in the middle of its forehead.

**Cydnus** (sid'nus), a river in Cilicia, rising in the Taurus Mountains, anciently celebrated for the clearness and coolness of its waters.

**Cyl'Inder**, a geometrical solid which, in popular language, may be described as a long, round, solid body, terminating in two flat, circular surfaces which are equal and parallel. In steam engines, the cylinder is the chamber in which the force of the steam is exerted on the piston.

**Cylin' drical Lens**, a lens whose surfaces are cylindrical, instead of spherical, which is usually the case. A convex cylindrical lens brings the image of a source of light to a focus in a line instead of in a point. They are usually cylindrical on one side and flat on the other.

Cy'ma, in architecture, a wavy molding the profile of which is made up of a curve of contrary flexure, either concave at top and convex at bottom or the reverse.

**Cyme** (sim), in botany, a mode of inflorescence in which the principal axis terminates in a flower, and a number of secondary axes rise from the primary, each of these terminating in a flower, while from these secondary axes others may arise terminating in the same way, and soon giving a flat-topped or rounded mass.

**Cymrl** (kim ri), a branch of the Celtic family of nations which appears to have succeeded the Gaels in the great migration of the Celts westward, and to have driven the Gaelic branch to the west (into Ireland and the Isle of Man) and to the north (into the Highlands of Scotland), while they themselves occupied the southern parts of Britain. At a later period they were themselves driven out of the Lowlands of Britain by the invasions of the Angles, Saxons, and Jutes, and compelled to take refuge in the mountainous regions of Wales, Cornwall, and the northwest of England. Wales may now be regarded as the chief seat of the Cymri. **Cynewulf** (kin'e-wulf), an Anglo-Saxon or early English poet, whose name we only know from its being given in runes in the poems attributed to him.

**Cynics** (sin'iks), a sect of philosophers among the ancient Greeks, founded by Antisthenes, a scholar of Socrates, at Athens, about 380 B.c. Their philosophy was a one-sided development of the Socratic teaching by Antisthenes and his followers, who looked only to the severer aspect of their master's doctrines, and valued themselves on their contempt of arts, sciences, riches, and all the social civilization of life.

Cy'nips, the gall-fly, a genus of hymenopterous insects remarkable for their extremely minute head and large, elevated thorax. The females are provided with an ovipositor by which they make holes where they deposit their eggs in different parts of plants, thus producing those excressences which are known as galls.

**Cynosceph'aise** ("dogs' heads"), a range of hills in Thessaly, memorable for two battles fought there in ancient times. The first was B.C. 364, between the Thebans and Alexander of Pheræ, and the second B.C. 197, in which the last Philip of Macedon was defeated by the Roman consul Flaminius.

Cy'press, a genus of coniferous trees. The common European cypress is a dark-colored evergreen with extremely small leaves, entirely covering the branches. It has a quadrangular, or, where the top branches diminish in length, pyramidal shape. Cypress trees, though of a somewhat somber and gloomy appearance, may be used with great effect in shrubberies and gardens. They are much valued also on account of their wood, which is hard, compact, and very durable, of a reddish color and a pleasant smell. It was used at funerals and as an emblem of mourning by the ancients. Its timber is valuable, and under water is almost imperishable. In parts of the U.S. this cypress constitutes forests hundreds of miles in extent.

**Cypripe' dium** (Lady's Slipper), a genus of plants of the nat. order Orchidaceæ. These species are natives of the U. S.

**Cyp'ris, a** genus of minute fresh-water crustaceans popularly known as water fleas. They have the body enclosed in a delicate shell and swim by means of cilia. The Cypris is common in stagnant pools, and is very often found in a fossil state.

Cy prus, an island lying on the south of Asia Minor, and the most easterly in the Mediterranean. Its greatest length is 145 mi. maximum breadth about 60 mi.; area 3,678 sq. mi. The chief features of its surface are two mountain ranges, both stretching east and west, the one running close to the northern shore, and extending through the long northeastern horn or prolongation of the island; the other and more massive occupying a great part of the south of the island, and rising in Troödos to 6,590 feet. Between them is the bare and mostly uncultivated plain called Messaria. There is a deficiency of water. The climate is in general healthy. The mountains are

covered with forests of excellent timber (now under government supervision), and the island is esteemed one of the richest and most fertile in the Levant. Agriculture, however, is in a very backward state, and locusts sometimes cause great damage. Wheat, barley, cotton, tobacco, olives, raisins, and carobs are the most important vegetable products. The wine is famous, especially that known as com-Silkworms are reared, and a coarse mandery. kind of silk is woven. Salt in large quantities is produced. The minerals are valuable: the copper mines were of great importance in ancient times (the name copper is derived from that of this island), and are again being worked. Large numbers of sheep and goats are reared on the extensive pasture lands of the island. The principal towns are Lefkosia or Nicosia. the capital, the only considerable inland town, and the scaports Larnaca and Limassol. The chief exports are carobs, wine, and cotton, with cheese, raisins, cocoons, wool, etc.

After belonging successively to the Phonicians, Greeks, Egypt. Persia, and again to Egypt, Cyprus in 57 B.C. became a Roman province, and passed as such to the eastern division of the empire. In 1191 it was bestowed by Richard of England (who had conquered it when engaged in the third Crusade) on Guy de Lusignan, and after his line was extinct it fell into the hands of the Venetians (1489), with whom it remained till it was conquered by the Turks in 1571 and annexed to the Ottoman Empire. In 1878 it was ceded to Britain by the convention of Constantinople concluded between England and Turkey, its reversion to Turkey being provided if Russia should give up Batoum and Kars. Britain was also bound to pay a subsidy to Turkey annually amounting to about \$465,000, but this is not paid directly, being retained as an offset against British claims on Turkey. The island has be come much more prosperous under British administration, and roads, harbor works, etc., have been constructed, trees planted, and schools opened. The head of the government is the chief commissioner, and there is a legislative council of twelve elected and six official members, nine of the former being Greeks, the others Mohammedans. Pop. 186,000, of whom three fourths belong to the Greek Church.

**Cyr** (sēr). ST., a French village in the department of the Seine-and-Oise, famous for the seminary for the education of ladies of rank which Louis XIV founded here. During the revolution this institution was done away with, and the buildings finally converted into a military school by Napoleon (1803). Pop. of the commune, 2,870.

**Cyrenaica** (si-re-nā'i-ka), once a powerful Greek state in the north of Africa (corresponding partly with the modern Barca), west of Egypt, comprising five cities (Pentapolist among which was Cyrene, a Spartan colony, founded in 631 B.C. Latterly it came into the hands of the Ptolemies, and in B.C. 95 the Romans obtained it. The Arab invasion ruined it (647). Cyrenaica is at present a vast but as yet imperfectly explored field of antiquities. **Cyrene** (si- $r\bar{e}$ ' $n\bar{e}$ ), in ancient times a celebrated city in Africa, about 10 mi. from the north coast, founded by Battus, and a body of Dorian colonists. B. C. 631. Numerous interesting remains have been discovered here. The town now occupying the site of the ancient Cyrene is a miserable place in the vilayet of Barca.

**Cyrillian Letters,** characters used in one of the modes of writing the Slavonic language. In Poland, Bohemia, and Lusatia, Roman or German letters are used; but among Russians, Bulgars, and all the Slavonic nations belonging to the Greek Church, the Cyrillic alphabet, a modification of the Greek one, is in use. Besides these there is the Glagolitic alphabet, in which the oldest literature of the Slavonic church is written.

Cy'rus, king of Persia, a celebrated conqueror. According to Herodotus he was the son of Cambyses, a distinguished Persian, and of Mandane, daughter of the Median king Astyages. His grandfather, made apprehensive by a prophecy that his grandson was to dethrone him, gave orders that Cyrus should be destroyed after his birth. But the boy was preserved by the kindness of a herdsman, and at length sent to his parents in Persia. Here Cyrus soon gathered a formidable army, conquered his grandfather (B. c. 559), and thus became king of Media and Persia. He was slain in battle with a Scythian nation in B. c. 529.

**Cyrus**, called the *Younger*, to distinguish him from Cyrus the founder of the Medo-Persian monarchy, was the second son of Darius Nothus or Ochus. Having formed a conspiracy against his elder brother, Artaxerxes Mnemon, Cyrus was condemned to death, but released at the request of his mother, Parysates, and made governor of Asia Minor. Here he secretly gathered an army, an important part of which consisted in 13,000 Greek auxiliaries, and marched eastward. His brother with a large army met him in the plains of Cunaxa (B.C. 401), and in the battle which followed, although the troops of Cyrus were victorious, Cyrus himself was slain.

## Czernowitz

**Cystop'teris,** bladder fern, a genus of polypodiaceous delicate flaccid ferns.

Cyt'isus, a genus of plants belonging to the natural order Leguminosæ, sub-order Papilionaceæ. The members of the genus are shrubs or small trees, sometimes spiny, with leaves composed of three leaflets, and with yellow, purple, or white flowers. They belong to Europe. Asia, and North Africa, and are very ornamental plants.

**Cyz'icus**, a peninsula of Asia Minor, 60 mi. s.w. of Constantinople. It was once an island, and the site of an ancient town of the same name.

**Czar** (zür or tsör), a title of the Autocrat of all the Russias, not improbably a corruption of the Roman title Cæsar. It was first adopted in 1579 by Ivan II. The feminine of czar is *czarina*, meaning the empress of Russia.

**Czechs** (chols), the most westerly branch of the great Slavonic family of races. The Czechs have their headquarters in Bohemia, where they arrived in the fifth century. The origin of the name is unknown. The total number of the Czechs is about 6,000,000, nearly all of whom live in the Austrian Empire. The Czechs proper, in Bohemia, number about 2,700,000. They speak a Slavonic dialect of great antiquity and of high scientific cultiva-The Czech language is distinguished as tion. highly inflectional, with great facility for forming derivatives, frequentatives, inceptives, and diminutives of all kinds. Like the Greek it has a dual number, and its manifold declensions, tenses, and participial formations, with their subtle shades of distinction, give the language a complex grammatical structure. The alphabet consists of forty-two letters, expressing a great variety of sounds. In musical value the Czech comes next to Italian.

**Czegled** (tseg'lād), a market town, Hungary, 39 mi. s. e. of Budapest, in a district yielding grain and wine. Pop. 24,872.

**Czernowitz** (cher-nö'vits), a city of Austria, chief town of Bukowina, 138 mi. s. e. of Lemberg. It has manufactures of clocks, silverplate, carriages, toys, etc. Pop. 45,600, a considerable proportion being Jews.

**D**, the fourth letter in the alphabet, representing a dental sound formed by placing the tip of the tongue against the root of the upper teeth, and then forcing up vocalized breath, or voice, into the mouth, the soft palate being raised to prevent its escape through the nose. T is formed in the same way, except that it is uttered with breath merely and not with voice. As a numeral, D represents 500.

**Dab**, a fish belonging to the family of flatfishes, comprising also the soles, turbots, halibuts, plaice, and flounder, the last two being included in the same genus with the dab. It is of a pale brownish color spotted with white on the side which it usually keeps uppermost, and

Dab.

white on the underside, and has rougher scales than the other members of the same genus. It is preferred to the flounder for the table.

**Dacca**, a district of Hindustan in Bengal, at the head of the Bay of Bengal: area, 2,797 sq. mi. It is one of the richest districts in India, and produces such quantities of rice as to be called the granary of Bengal. Dacca was at one time celebrated for its hand-woven muslins, which are still hardly to be equaled in their combination of durability and delicacy. Dacca, its capital, is about 150 mi. n.e. of Calcutta. Dacca, being free from violent heats, is one of the healthiest stations in Bengal. Pop. 82,321.

**Dace**, a small river fish of the family Cyprinidæ, and resembling the roach but longer and thinner. It is a gregarious fish swimming

Dace.

in shoals and inhabiting chiefly deep, clear streams with a gentle current. It seldom exceeds a pound in weight.

Da'cla, in ancient times, a region north of the Danube, inhabited by the Daci, or Getæ, afterward a Roman province. It was con-

## Daguerreotype Process

quered by the emperor Trajan in 101 A.D., but in 274 A.D., in the reign of Aurelian, had to be abandoned by the Roman colonists.

**Da'do**, in classical architecture, the middle part of a pedestal, that is to say, the solid rectangular part between the plinth and the cornice; also called the *die*. In the interior of houses it is applied to a skirting of wood several feet high round the lower part of the walls. or an imitation of this by paper or painting.

or an imitation of this by paper or painting. Dæ'dalus, a mythical Greek sculptor, the scene of most of whose labors is placed in Crete. He is said to have lived three years before the Trojan War. He built the famous labyrinth in Crete.

**Daff'odil**, the popular name of a European plant which is one of the earliest ornaments of gardens, being a favorite object of cultivation.

**Daghestan**, a province of Russia, in the Caucasus. Area 11,332 sq. mi.; pop. 609,380. Its fertile and tolerably cultivated valleys produce good crops of grain. and also silk, cotton, flax, tobacco, etc.; capital, Derbend.

Dag' obert 1 (600-638), surnamed the Great, one of the Merwing kings of France. He succeeded his father, Hhlotar II. in 628; warred successfully against Gascons, Bretons, Saxons, and Slavonians; reformed the Frankish laws: d. at Epinay, and was buried at St. Denis. He was an able but a cruel and licentious king.

Da'gon (probably from the Hebrew dag, a fish), the god of the Philistines, whose image is generally believed to have been in the form of a triton, or merman, with the upper part human and the extremities, from the waist downward, in the shape of the tail of a fish.

**Daguerre** (dä-går), LOUIS JACQUES MANDE (1789-1851), the inventor of the first photographic process. He was a scene-painter at Paris, and as early as 1814 had his attention directed by Nicéphore Niepce to the subject of photographic pictures on metal. In 1829 they made a formal agreement to work out the invention together, but it was not till after 1833, that Daguerre succeeded in perfecting the process since called *daguerreotype*. The new process excited the greatest interest. Daguerre was made an officer of the Legion of Honor, and an annuity of 6,000 francs was settled on him.

Daguerreotype Process (dager'ro-tip), the original photographic process, consisting in sensitizing a silver plate with the vapor of iodine, and then placing it in a camera obscura previously focused, and afterward developing the picture by vapor of mercury. It is then fixed by immersion in hyposulphate of sodium. After thorough washing and drying the picture is covered with glass to prevent its being rubbed off. Daguerreotype has now been superseded by the collodion and other processes.

## Dahlgren

Dahlgren, JOHN ADOLPH (1809-1870), American naval officer and artillerist; he entered the navy in 1826, passed midshipman in 1832, and afterward served in the coast survey. In 1843 he went to the Mediterranean on a cruise. On his return, in 1845, he was assigned to ordnance duty in Washington. In 1857 he equipped the *Plymouth*, and visited the coast of Europe from Portugal to Holland. Subsequently he cruised in the West Indies, and on his return to Washington, resumed command of the ordnance department, of which he was made chief in July, 1862. At the beginning of the Civil War he had charge of the defenses of Washington on the left, and in 1863, he was made rear admiral, and was placed in command of the South Atlantic blockading squadron. In 1866 he had command of the South Pacific squadron, and in 1868 again took charge of the bureau of ordnance in Washington. ľn 1869 he was appointed commandant of the Washington navy yard. His works on ordnance have been used as text-books by the government.

**Dahlgren** (däl'gren) **Guns**, an improved kind of cannon invented by Admiral Dahlgren of the U. S. navy. The chief peculiarity consists in their having less metal between the muzzle and the trunnions than ordinary cannon.

Dah'lia (so called after the Swedish botanist Dahl), a genus of plants belonging to the nat. order Compositæ, sub-order Corymbiferæ,

Dahlia. A.-single; B.-double varieties.

natives of Mexico. By cultivation an immense number of varieties have been produced. The flowers are large and beautiful, sporting into innumerable varieties. It does not stand frost, and has to be taken up during winter.

**Dahlmann** (däl-mån), FRIEDRICH CHRISTOPH, (1784-1860), a distinguished historian of Germany. He was professor at Göttingen and

#### Dalbergia

afterward at Bonn, and distinguished himself as an advocate of liberal measures in politics.

Daho' mey, a kingdom of West Africa; area 3,960 sq. mi.; pop. 250,000. The country yields cotton, sugar, tobacco, indigo, palmoil, ivory, india-rubber, yams, melons, oranges, limes, pineapples, and other fruits, and beans, peas, maize, millet, and Guinea-corn in abundance. A plentiful supply of cattle is to be found over all the country. Wild animals are numerous, including the lion, tiger, elephant, hyena, the boa, and other reptiles. The inhabitants are a tall, well-made, and warlike, but savage race, of pure negro blood, belonging to a branch of the Ewe family, partly employed in agriculture, and practising a rude form of fetish-worship made up of ridiculous ceremonials and extensive human sacrifices. All the females in the state belong nominally to the king, and at a grand yearly festival there is a general distribution of wives. The only considerable town is Abomey, or Agbome, the capital, situated 95 mi. inland from its small port of Whydah. It is surrounded by mud-built walls and by a ditch four miles in circumference, but only contains some 20,000 inhabitants. In October, 1885, at the request of the king, Dahomey was placed under the protectorate of Portugal. In 1890 King Benhawzin and the French fell out about Porto Novo and Kotonu, which the latter claimed. A short war resulted in the submission of the king, who agreed to waive all claim to the territory in question on the receipt of an annual payment of \$4,000. Peace lasted only two years, when the French were forced to march against the king, who fled. In 1894 he sur-rendered, and was sent to Senegal with the chiefs who had sided with him. The French annexed the districts of Whydah, Savi, Godomey, Abomey-Kalavy, and Avrekete, and proclaimed the rest of the country a French protectorate. Later on, in 1894, Guthili was elected king, and in January, 1895, obtained French recognition.

**Dairy**, the department of a farm which is concerned with the production of milk and its manufacture into butter and cheese. As a rule the soil and climate of a country, and the nearness of suitable markets, determine in a great measure the choice between tillage and dairy husbandry. For milk dairies, cows that yield abundantly are selected, while for butter and cheese dairies the rich quality of the milk is the principal point. In the U.S. the cattle of Ayrshire and Jersey hold the first place for dairy purposes; the first on account of the large yield which they give on comparatively poor feeding, the second for the richness of their milk.

**Daisy**, the name of a plant which is very familiar, and a great favorite. It never ceases to flower, and is nearly naturalized in New England. In the days of chivalry it was the emblem of fidelity in love. Its name is literally, day's eye, because it opens and closes its flower with the daylight.

Dalber'gia, a genus of fine tropical forest trees and climbing shrubs, some species of

which yield excellent timber. The blackwood, or East India rosewood, is a magnificent tree, furnishing one of the most valuable furniture woods.

**Dalecar'lia** (or Dalarne), a tract in Sweden. The name, meaning "valley-land," is kept alive in the minds of the inhabitants by the noble struggles which the Dalecarlians, its inhabitants, made to establish and maintain the independence of the country.

**Dalhousie**, JAMES ANDREW BROWN RAMSEY, tenth Earl and first Marquis of (1812-1860), British statesman. After filling the offices of vice-president (1843) and president of the board of trade (1844), he was appointed governor general of India (1847). He greatly extended the British Empire in India, annexing the Punjab, Oude, Berar, and other native states, as well as Pegu, in Burmah.

well as Pegu, in Burmah. Dallas, Dallas co., Tex., on Trinity River. Surrounding country agricultural. Railroads: Houston & Texas Central; Gulf, Colorado & Santa Fé; Trunk; Texas Pacific; M. K. & T.; Midland. Industries: saddles, harness, and collars, cotton gins, cotton mill, flouring mills, four iron foundries, paper mills, galvanized iron and copper cornices, traveling goods, candy and cigar factories, shirt, hat, and tinware manufactures. The town was first settled in 1840 and became a city in 1856. Pop. est. 1897, 63,600.

**Dallas**, GEORGE MIFFLIN (1792-1864), statesman, b. in Philadelphia. He graduated at Princeton, in 1810. He went to Russia as private secretary to Albert Gallatin, one of the commissioners to negotiate a treaty with Great Britain through the Russian emperor. In 1817 he was made deputy attorney general of Philadelphia, of which he was elected mayor in 1828. This office he resigned to become U. S. district attorney. In 1831 he was sent to the U. S. Senate. In 1837-39 he was minister to Russia, and on his return practised law in Philadelphia. In 1844 he was elected vice-president by the Democratic party. In 1856 he was made minister to England. He returned to Philadelphia in 1861.

**Dalles** (dalz), the name given to various rapids and cataracts in the U.S. *The Great Dalles of the Columbia* are about 200 mi. from its mouth, where the river is compressed by lofty basaltic rocks into a roaring torrent about 58 yds. in width; the *Dalles of the St. Louis* are a series of cataracts, near Duluth, Minn.

are a series of cataracts, near Duluth, Minn. Daima'tia, a province of Austria, with the title of kingdom, the most southern portion of the Austrian dominions. Area 4,940 sq. mi; pop. 527,426. The inland parts of Dalmatia are diversified by undulatory ground, hills, and high mountains; there are some rich valleys, but the country is considered unproductive. The interior is occupied by a neglected population, and agriculture is in a backward state. Apples, pears, peaches, apricots, oranges, pomegranates, etc. are among the fruits: the wines are strong, sweet, and full-bodied. On the coast, fish, especially the tunny and the sardine, abound. The trade of the country is mostly confined to the coast towns, where the population is mainly of Italian extraction. Chief of these are Zara (the capital), Sebenico, Cattaro, Spalato, and Ragusa. Among the numerous islands sprinkled along the coast many are valuable for their productions, such as timber. wine, oil, cheese, honey, salt, and asphalt. After passing successively through the hands of Hungarian and Venetian rulers, and of the first Napoleon, Dalmatia finally, in 1814, fell under Austrian rule.

**Dalmat'ic** (or dalmatica). an ecclesiastical vestment worn by the deacon at mass, so called because it was an imitation of Dalmatian costume. It is worn also by bishops under the chasuble. It is a long robe with large full sleeves with black or red longitudinal stripes and partially unclosed sides.

**Dairymple**, JOHN (1648-1707), first earl of Stair, an able Scottish lawyer and statesman. It was through him that the massacre of Glencoe was perpetrated in 1692.

**Daiton**, JOHN (1766-1844), an English chemist and natural philosopher. In 1808 he announced his atomic theory of chemical action. the discovery of which spread his fame over Europe.

Daly, AUGUSTIN, playwright, b. in Plymouth, N. C., July 20, 1838; acted as dramatic editor of New York newspapers, and in 1869 began his career as a theatrical manager. He has produced many adaptations from French and German authors and a few original plays.

Dam, a bank, or construction of stone, earth, or wood across a stream for the purpose of keeping back the current to give it increased head, for holding back supplies of water, for flooding lands, or for rendering the stream above the dam navigable by increased depth. Its material and construction will depend on its situation and the amount of pressure it has to bear. For streams which are broad and deep strong materials are required, usually stone masonry bound in hydraulic cement and The common a strong framework of timber. forms of a dam are either a straight line crossing the stream transversely, or one or two straight lines traversing it diagonally, or an arc with its convex side toward the current.

Dam'ages, in law, pecuniary compensation paid to a person for loss or injury sustained by him through the fault of another. It is not necessary that the act should have been a fraudulent one; it is enough that it be illegal. unwarrantable, or malicious. If, however, a person has suffered a loss through fraud or delict on the part of another, that person has not only a claim to ordinary damages, but may also claim remote or consequential damages. and may estimate the amount of the loss he has sustained not at its real value, but at the imaginary value which he himself may put upon it, subject, however, to the modification of a judge or a jury. In other cases the damages cover only the loss sustained estimated at its real value, together with the expenses incurred in obtaining damages.

**Daman** (da-mān'), a seaport, Hindustan, 100 mi. n. from Bombay. It belongs to the Portuguese, who conquered it in 1531, and made it

a permanent settlement in 1558. The settlement, which is governed under Goa, has an area of 82 sq. mi.; pop. 49,084.

**Dam'araland**, a German protectorate in South Africa, extending along the Atlantic coast from Cape Frio to Walfisch Bay, and inland to  $20^{\circ}$  e. long. Area about 100,000 sq. mi., including a large amount of barren lands.

Damas' cus, a celebrated city, capital of the Turkish vilayet of Syria, supposed to be the most ancient city in the world. It is beautifully situated on a plain which is covered with gardens and orchards and watered by the Barrada. The appearance of the city, as it first opens on the view, has been rapturously spoken of by all travelers; but the streets are narrow. crooked, and in parts dilapidated, and, except in the wealthy Moslem quarter, the houses are low, with flat arched doors and accumulations of filth before the entrance. Within, however, there is often a singular contrast, in courts paved with marble and ornamented with trees and spouting fountains, the rooms adorned with arabesques and filled with splendid fur-niture. Among the chief buildings are the Great Mosque and the Citadel. The bazaars are a notable feature of Damascus. They are simply streets or lanes covered in with high wood work and lined with shops, stalls, cafes, etc. In the midst of the bazaars stands the Great Khan, it and thirty inferior khans being used as exchanges or market-places by the merchants. One of the most important and busiest streets is "Straight Street," mentioned in connection with the conversion of the apostle Paul. Damascus is an important emporium of trade in European manufactures; it is also a place of considerable manufacturing industry in silk, damasks, cotton, and other fabrics, tobacco, glass, soap, etc. Saddles, fine cabinet work, and elegant jewelry are well made; but the manufacture of the famous Damascus blades no longer exists. It is one of the holy Moslem cities, and continues to be the most thoroughly Oriental in all its features of any city in existence. Of its origin nothing certain is known; but it is of great antiquity, being mentioned as a place apparently of importance in Gen. 14:15. After passing successively under the power of Israelites, Persians, Greeks, and Romans, it fell at last in 1516 into the hands of the Turks. Pop. 198,600.

**Damascus-steel**, a kind of steel originally made in Damascus and the East, greatly valued in the making of swords for its hardness of edge and flexibility. It is a laminated metal of pure iron and steel of peculiar quality, carbon being present in excess of ordinary proportions, produced by careful heating, laborious forging, doubling, and twisting.

**Dam'ask**, the name given to textile fabrics of various materials, ornamented with raised figures of flowers, landscapes, and other forms, being the richest species of ornamental weaving, tapestry excepted. Damask is very commonly made in linen for table napery.

**Damaskeen'ing**, the ornamenting of iron and steel with designs produced by inlaying or incrusting with another metal, as gold, silver, etc., by etching and the like. •

**Damien, FATHER JOSEPH DE VEUSTER (1840-**1889), Roman Catholic missionary, b. at Tremeloo, Belgium, d. on Molokai Island, Hawaiian group. He entered holy orders at the age of nineteen, and devoted his life to the cause of the church. Having been sent on a mission to Honolulu he learned of the terrible condition of the lepers banished to Molokai Island, and decided to devote his life to the amelioration of their condition. He went to live among them in 1873, combining in his own person the offices of physician, teacher, carpenter, magistrate, and friend. In 1885 he contracted the fatal contagion, but continued his work until his death.

Damiet'ta, a town of Egypt, on one of the principal branches of the Nile, about 6 mi. from its mouth. It contains some fine mosques, bazaars, and marble baths. Alexandria has long diverted the great stream of commerce from Damietta, but the latter has still a considerable trade with the interior in fish and rice. Pop. 34,046.

**Dammar Resin**, a gum or resin of several kinds produced by different trees. The East Indian or cat's eye resin is got from a tree of the East Indian islands, and is used for making varnishes for coach builders, painters, etc.

Branch of Dammar Pine.

In its native localities it is burned as incense, also used for caulking ships. Sal dammar is produced by the sal tree of India, rock dammar by Hopea odorata and other species of trees; both yield good varnishes.

Damon and Pythias, two illustrious Syracusans, celebrated as models of constant friendship. Pythias had been unjustly condemned to death by Dionysius the younger, tyrant of Sicily; but, having to leave Syracuse to arrange his affairs, his friend Damon was taken as a pledge that Pythias should return on the day fixed. Pythias, however, being unexpectedly detained, had great difficulty in reaching Syracuse in time to save Damon being executed in his place; and Dionysius was so affected by this proof of their friendship that he pardoned Pythias. The Knights of Pythias, a fraternal order established in the U. S., has this pleasant incident for its basis. Its growth has been remarkably rapid, and lodges are in existence in every state of the Union.

**Damps**, noxious exhalations issuing from the earth, and deleterious or fatal to animal life. Damps exist in wells which continue long covered and not used, and in mines and coal-pits; and sometimes they issue from the old lavas of volcanoes. These damps are distinguished by miners under the names of *choke-damp*, consisting chiefly of carbonic acid gas, which instantly suffocates; and *fire-damp*, consisting chiefly of light carbureted hydrogen, so called from its tendency to explode.

**Dam'son**, a variety of the common plum. The fruit is rather small and oval, and its numerous sub-varieties are of different colors: black, bluish, dark purple, yellow, etc. The damson, as its name imports, is from Damascus.

**Dan** (Hebrew meaning "judgment"), one of the sons of Jacob by his concubine Bilhah. At the time of the exodus the Danites numbered 62,700 adult males, being then the second tribe in point of numbers. Samson was a member of this tribe.

**Dana**, CHARLES ANDERSON, editor, was b. in Hinsdale N. H., Aug. 8, 1819. After association with the N. Y. *Tribune* for fourteen years as one of the proprietors and managing editor, in 1863 was appointed assistant secretary of war. Since 1868 Mr. Dana has been editor of the N. Y. *Sun.* Perhaps more than any other journalist his personality is identified with his newspaper.

**Da'na**, JAMES DWIGHT, naturalist, b. 1813, and since 1855 a professor at Yale College. He has written System of Mineralogy; Manual of Mineralogy; Coral Reefs and Islands; Manual of Geology; Text-book of Geology; and many reports and papers.

**Dana**, RICHARD HENRY (1787-1879), writer, b. at Cambridge, Mass.; educated at Harvard; published several collections of poems and two novels. His son Richard Henry (1815-1882), was the author of the well-known work, *Two Years Before the Mast*, the result of his own experiences during a voyage recommended to him on account of his health.

**Dan'ae**, in Greek mythology, daughter of Acrisius, king of Argos. She was shut up by her father in a brazen tower, but Zeus, inflamed with passion for her, transformed himself into a golden shower, and descended through the apertures of the roof into her embraces. Set adrift on the waves by her father, she reached safely one of the Cyclades, where her child, Perseus, was brought up.

**Dan bury**, a town of Fairfield co., Conn., situated on the Still River, a tributary of the Housatonic, about 53 mi. n. n. e. of New York, with which it is connected by rail. There is a monument, erected in 1854, to the memory of General Wooster, who was mortally wounded in 1777, when the town was burned by the English under General Tryon, and another, of more recent date, to commemorate the other citizens who perished on the same occasion. The principal industry is the manufacture of hats, which was introduced in 1780, and is carried on by ten separate companies; shirts are also largely produced, and sewing machines are constructed. Pop. 16,960.

Dancing, a form of exercise or amusement in which one or more persons make a series of more or less graceful movements with measured steps in accord with music. In its earliest forms among simple races, it is a mode of outward expression for strong emotions of joy and sorrow, love and rage, and even for the most solemn and impassioned religious feelings; in more civilized strata of human society it becomes a mere frivolous amusement with no high signification whatever. Dancing corresponds to a universal primitive instinct in man. It is still practised by the South Sea Islanders, the forest Indians of Brazil, the Zulus, the negroes of Central Africa, and the native Australians, exactly as it was in the earlier stages of every civilized modern race. Many of the rude courting dances of modern savages, like the native Australian corro-boree, are themselves refinements of more ancient dances, in the survivals of which we can guess at their original grossness and obscenity. Ferocious war-dances were constantly practised by savage warriors, as the North American Indian braves, who worked themselves up into frantic mechanical intoxication capable of carrying them irresistibly on to victory. The Zulu war dance is still a noble exercise for warriors, like the Pyrrhic dance of the ancient Spartans; and the dancing and spinning dervishes in the East, who work themselves into spasms of physical excitement, are still highly esteemed for devoutness and piety. Into savage dancing, moreover, the idea of magic always enters. Thus the Mandan Indians dance Buffalo to bring game when supplies of food are low, the rain doctors of central Africa dance mystic dances to bring down rain, and the wives of Gold Coast negroes dance a battle dance to give their absent husbands courage in the battle. Everywhere in ancient religions is dancing one of the chief acts of worship. In ancient times it was generally an expression of religious, patriotic, or military feeling, as in the case of the dance of David before the ark, the choric dances, or the Pyrrhic dance of the Greeks. The Romans, however, like the Orientals, had their dancing done by hired slaves. This solemn character of the dance, has declined with the progress of refinement and civilization, and it is now nothing more than an elegant social amusement and an agreeable spectacle at public entertainments. France took the lead in inventing modern dances. Among some of the early dances which were paramount in France were the graceful minuet, the favorite for a century; the quadrille; the Ecossaise, first introduced in 1760; the galop, a death blow to the "poetry of motion." introduced from Germany: the coli-

lon, fashionable under Charles X; the polka, first danced at Odéon in 1840 by a dancingmaster from Prague; the polka tremblante, or schottisch, also of Bohemian origin, first brought out in Paris in 1844; the lancers, introduced by Laborde in 1836; and the walk, originally Bavarian, and which, now considerably modified from its original form, promises to maintain its supremacy. The French provide the world with fashions, and society everywhere has followed their lead. Characteristic of particular races or merely of classes of people are such forms of the dance as the Scotch reel, Highland fling and strathspey, the Irish jig, the negro break-downs, sailors' horn-pipes, step-dances, the can-can, morris-dances, and the like.

**Dandeli'on,** a plant indigenous to Europe, but now also common in this country. The leaves are all radical, and runcinate, or jagged on the margin. The stems are hollow and have one large, bright-yellow flower and a tapering, milky, perennial root, which acts as an aperient and tonic. The whole plant is full of a milky and bitter juice. The seed of the plant is furnished with a white pappus, and is transported far and wide by the wind.

**Dandle Dinmondt Terrier**, a peculiar breed of the Scotch terrier, so called from the border farmer of that name who figures in Scott's novel, *Guy Mannering*. This breed is known by its short legs, wiry and abundant hair, and large ears. It is very courageous when fully grown. It is usually either of a light-brown or a bluish-gray color, termed respectively the "mustard" and the "pepper" variety.

"mustard" and the "pepper" variety. Danenhower, JOHN WILSON (1849-1887), American Arctic explorer, graduated at the U. S. naval academy in 1870, and in 1879 sailed from San Francisco as second in command of the Jeannette under Lieut. George W. DeLong. The steamer was lost in the ice, but the explorers escaped, and returned home in 1882.

**Dan'iel,** the prophet, a contemporary of Ezekiel, was b. of a distinguished Hebrew family. In his youth, B. c. 605, he was carried captive to Babylon, and educated in the Babylonish court for the service of King Nebuchadnezzar. Thrown into the lions' den for conscientiously refusing to obey the king he was miraculously preserved, and finally made prime minister in the court of the Persian king, Darius.

**Dan'iell**, JOHN FREDERICK (1790-1845), English physicist. In 1820 he published an account of a new hygrometer which he had invented. Soon afterward his valuable works, *Meteorological Essays* and the essay on *Artificial Climate*, appeared. In 1831 he was appointed professor of chemistry in King's College, London, and made further important discoveries, chief among which is his apparatus for maintaining a powerful and continuous current of electricity in galvanic batteries.

**Daniell's Battery**, a galvanic battery the cells of which were originally constructed in the following way: A tall, cylindrical copper vessel was nearly filled with saturated solution of sulphate of copper. A rod of amalgamated zinc was enclosed in a skin or bladder, which

was filled with dilute sulphuric acid, and was suspended in the copper cylinder. When the zinc rod was connected by a wire with the copper vessel, which itself forms one of the plates of the battery, the current passes, ac-cording to common phraseology, from the copper through the wire to the zinc. Instead of the bladder or skin, porous earthenware pots are now employed to contain the dilute sulphuric acid in which the zinc is immersed. In improved modifications of Daniell's battery the most important change is that of substituting for the dilute sulphuric acid that surrounds the zinc, solution of sulphate of zinc, and in this case the zinc is not amalgamated. By doing away with the sulphuric acid local waste of the zinc is to a great extent prevented, and the solution of sulphate of zinc is used instead of pure water on account of the very high resistance of water impregnated with salts.

**Dannemo'ra**, a village on a lake of the same name, 24 mi. n.n.e. of Upsala, in Sweden, celebrated for its iron mines, the second richest in Sweden, which have been worked uninterruptedly for upward of three centuries, and produce the finest iron in the world.

**Dante** (a contraction of *Durante*), ALIGHIERI (dån' tā å-lē-gē-ā' rē) (1265-1321), the great Italian poet, was b. in Florence of a family belonging to the lower nobility. His education was confided to the learned Brunetto Latini. He seems to have been quite a boy, no more than nine years of age, when he first saw Beatrice Portinari, and the love she awakened in him he has described in that record of his early years, the Vita Nuova, as well as in his later great work, the Divina Commedia. Dante married Gemma dei Donati in 1828, by whom he had seven children. At this time the Guelfic party in Florence became divided into the rival factions of Bianchi and Neri (Whites and Blacks), the latter being an extreme papal party, while the former leaned to reconciliation with the Ghibellines. Dante's sympathies were with the Bianchi, and being a prior of the trades and a leading citizen in Florence he went on an embassy to Rome to influence the pope on behalf of the Bianchi. In Dante's absence his enemies obtained a decree of ban-ishment against him. The poet remained an exile to the end of his life; and his history, first lost by the indifference of contemporaries and then hallowed by the legends of later generations, becomes semimythical. During this period he is said to have visited many cities, Arezzo, Bologna, Sienna, etc., and even Paris. In 1320 we find him staying at Ravenna with his friend Guido da Polenta. He was buried at Ravenna, where his bones still lie. His great poem, the Dirina Commedia (Dirine Comedy), written in great part, if not altogether, during his exile, is divided into three parts, entitled *Hell*, *Purgatory*, and *Paradise*. The poet dreams that he has wandered into a dusky forest, when the shade of Vergil appears and offers to conduct him through hell and purgatory. Further the pagan poet may not go, but Beatrice herself shall lead him through

paradise. The journey through hell is first described, and the imaginative power with which the distorted characters of the guilty and the punishments laid upon them, are brought before us; the impressive pathos of these short histories - often compressed in Dante's severe style into a couple of lines -of Pope and Ghibelline, Italian lord and lady; the passionate depth of characterization, the subtle insight and intense faith, make up a whole which for significance and completeness has, perhaps, no rival in the work of any one man. From hell the poet, still in the company of Vergil, ascends to purgatory, where the scenes are still mostly of the same kind though the punishments are only temporary. In the earthly paradise Dante beholds Beatrice in a scene of surpassing magnificence, ascends with her into the celestial paradise, and after roaming over seven spheres reaches the eighth, where he beholds "the glorious company, which surrounds the triumphant Redeemer.' In the ninth Dante feels himself in presence of the divine essence, and sees the souls of the blessed on thrones in a circle of infinite magnitude. The Deity himself, in the tenth, he cannot see for excess of light. There are many notable translations of Dante's great poem in many languages.

**Danton** (dan-ton), GEORGE JACQUES (1759-1794), one of the figures in the French Revolution. He was foremost in organizing and conducting the attack on the Tuileries, Aug. 10, 1792. He voted for the capital punishment of all returning aristocrats, and along with Robespierre brought Hébert and the worshipers of the goddess Reason to the scaffold. Robespierre succeeded in having Danton denounced and thrown into prison, 1794. Afterward he was condemned by the revolutionary tribunal as an accomplice in a conspiracy for the restoration of monarchy, and executed.

**Dantzig** (or Danzig) (dånt'zik), a fortified town and port, Prussia, capital of the province of West Prussia, 253 mi. n.e. Berlin, on the Vistula, about 3 mi. above its mouth. It is one of the most important seaports in the Prussian monarchy. Among the principal buildings are the Dom or Cathedral, begun in 1343, the church of St. Catherine, the exchange, the arsenal, observatory, three monasteries, two synagogues, two theaters, etc. The industries are, shipbuilding, artillery, and beer. The prosperity of the town is founded chiefly on its transit trade, particularly in wheat from Poland. There is also a considerable trade in amber. The proper port of Dantzig is Neufahrwasser, at the mouth of the Vistula. After being alternately possessed by the Teutonic knights and the Poles, Dantzig, on the partition of Poland, fell to the lot of Prussia. Pop. 120,338.

**Dan'ube**, a celebrated river of Europe, originates in two small streams rising in the Schwarzwald, or Black Forest, in Baden, and uniting at Donaueschingen. The direct distance from source to mouth of the Danube is about 1,000 mi. and its total length, including windings, about 1,670 mi. From its source the

Danube flows in a northeasterly direction to Ulm, in Würtenberg, where it becomes navigable for vessels of 100 tons; then to Ratisbon in Bavaria, where it becomes navigable for steam-Here it turns in a southeasterly direction, ers. entering Austria at Passau, passing Vienna and Budapest, above which latter town it suddenly turns due south, holding this direction till it is joined by the Drave, after which it runs s.s.e. and enters Servia at Belgrade. Continuing its general course eastward it forms for a long distance the boundary line between Roumania and Bulgaria. At Silistria it once more turns northward, and flowing between Roumania and Bessarabia falls into the Black Sea by three different outlets. The Danube may be estimated as admitting of about 2,500 mi. of steam navigation.

**Dan'vers**, a town in the county of Essex, in Massachusetts, 15 mi. n.n.e. of Boston, with which it is connected by rail. The principal industry is the manufacture of boots and shoes. The most interesting building is the Peabody Institute, with its library and art collections, founded in 1852 by George Peabody, the philanthropist, who was b. at Danvers in 1795. Pop. 7,446.

vers in 1795. Pop. 7,446. **Danville**, a city of Illinois, the county seat of Vermilion co., 125 mi. s. of Chicago. Situated in a rich and populous district, in the vicinity of an extensive coal-field, and well supplied with building materials and water, it forms a manufacturing center with foundries, wagon works, locomotive works, and various other industrial establishments. The railroad communications are extensive, there being seven branches of road centering here under the control of three main systems. Pop. 11.-491.

**Danville**, the county seat of Boyle co., Ky. It is an educational center of some note, being the seat of two colleges. A deaf and dumb asylum is also located here. The principal industry of the surrounding country is agriculture.

**Danville**, Pittsylvania co., Va., on Dan River, 140 mi. s.w. of Richmond. Railroads: Southern Ry., Danville & Western, and Atlantic & Danville. Industries: six cotton mills, fiour mill, two iron foundries, knitting mills, twelve tobacco factories. Surrounding country agricultural and mineral. Danville was base of supplies for confederacy in 1861-65. The town was first settled in 1798. Under Virginia law every town is a city when it reaches 5,000 inhabitants. In 1890 Neapolis on n. side of river was annexed. Pop. est. 1897, 22,000.

**Danville,** Montour co., Pa., on n. branch of Susquehanna River, 154 mi. n.w. of Philadelphia. Railroads: Pennsylvania branch of S. H. & W., P. & R., and D. L. & W. Industries: steel and iron, flour mill, four iron foundries, silk mill, suspender, overall, and stocking factories. Surrounding country agricultural and mineral. The town was first settled in 1774. Pop. est. 1897, 8,000.

Daph' nia, the water flea, a genus of minute crustaceans belonging to the division Branch-

Digitized by Google

. . . . . .

iopoda. The best-known species is the "branch horned" water flea, which is a favorite microscopic object. The head is prolonged into a snout, and is provided with a single, central, compound eye; it is also furnished with antennæ, which act as oars, propelling it through the water by a series of short springs or jerks. These animals are very abundant in many ponds and ditches; and as they assume a red color in summer impart the appearance of blood to the water.

Dar' danelles (-nelz; anc. Hellespont), a narrow channel which connects the Sea of Marmora with the Grecian Archipelago, and at this particular point separates Europe from Asia. It is about 40 mi. in length, and varies in breadth from 1 to 4 mi. A rapid current often much increased by winds runs southward. On the Asiatic side the country is fine and fertile, rising gradually upward from the sea to the range of Mount Ida; the European side is steep and rugged, but densely peopled and highly cultivated. On both shores there are numerous forts and batteries. Two castles on the opposite shores occupy the sites of ancient Sestos and Abydos, and recall the story of Hero and Leander. By treaty made in 1841 between the five great powers and Tur-key, confirmed by the Peace of Paris in 1856, it is settled that no foreign man-of-war shall pass the strait without the express permission of the Turkish government.

**Dare**, VIRGINIA, first English child b. in new world, b. at Roanoke, 1587. She was a granddaughter of Gov. John White.

**Darfur'** (or DARFOOR'), a considerable region of Central Africa, forming a large oasis in the s.e. corner of the Great Desert. Area 198,000 sq. mi.; pop. 1,420,000. The inhabitants are Mohammedans and negroes, and semi-barbarous. Their occupation is chiefly agriculture, and cattle form their principal wealth. It exports slaves, ivory, ostrich feathers, gum, copper, etc., and receives in exchange sugar, cotton cloth, hardware, firearms, etc.

Da'rien, GULF OF, a gulf of the Caribbean Sea, at the n. extremity of South America, between the Isthmus of Panama and the mainland.

**Darlen**, ISTHMUS OF, often used as synonymous with the Isthmus of Panama, but more strictly applied to the neck of land between the Gulf of Darien and the Pacific.

**Darien Scheme**, a celebrated financial project, conceived and set afloat by William Paterson, a Scotsman, toward the close of the seventeenth century. Paterson was a man of bold conceptions, and possessed of a wide knowledge of commerce and finance. He was the first projector of the Bank of England, but was disappointed of his just recompense. His next scheme was one of magnificent proportions. He proposed to form an emporium on each side of the Isthmus of Darien or Panama for the trade of the opposite continents. The settlement thus formed would become the entrepôt for an immense exchange between the manufactures of Europe and the produce of South America and Asia. Scotland subscribed \$2,000,000, a full half of all the cash in the kingdom. Little more than the half, however, was paid up. In 1698 five large vessels laden with stores, etc., and with 1,200 intending colonists, sailed for the Isthmus of Darien. The settlement was formed in a suitable position, and the colonists fortified a secure and capacious harbor; but nothing else had been rightly calculated, and at the end of eight months the survivors were compelled by disease and famine to abandon their settlement and return to Europe. Two of the ships were lost on the way home, and only about thirty, including Paterson, reached Scotland.

Darl'us, the name of several Persian kings. 1, DARIUS I, fourth king of Persia, son of Hystaspes, a prince of the royal family of the Achæmenidæ, attained the throne in B. c. 521. He reduced, after a two years' siege, the re-volted city of Babylon, and led an expedition of 700,000 men against the Scythians on the Danube. He sent an army under Mardonius to invade Greece. But the ships of Mardonius were destroyed by a storm in doubling Mount Athos (492 B C.), and his army was cut to pieces by the Thracians. Darius, however, which was met on the plains of Marathon by an Athenian army 10,000 strong, under Miltiades, and completely defeated (490 B.c.). Darius had determined on a third expedition when he d. B.C. 485. 2, DARIUS II, surnamed Nothos, or the Bastard, by the Greeks, an illegitimate son of Artaxerxes I. He ascended the throne in 423, and d. in 404. His son Cyrus is familiar to us through Xenophon's Anabasis. 3, DARIUS III, surnamed Codomannus, great grandson of Darius II, was the twelfth and last king of Persia. He ascended the throne B.C. 336, when the kingdom had been weakened by luxury and the tyranny of the satraps under his predecessors, and could not resist the attacks of Alexander of Macedon; and the army which was sent against him by Darius was totally routed on the banks of the Granicus, in Asia Minor. Darius then hastened with 400,000 soldiers to meet Alexander in the mountainous region of Cilicia, and was a second time totally defeated near the Issus, B.C. 333. Two years afterward, all proposals for peace having been rejected by Alexander, Darius collected a second army, and meeting the Macedonian forces between Arbela and Gaugamela was again routed (331 B.C.). Alex-ander captured Susa the capital, and Per-sepolis, and reduced all Persia. Meanwhile Darius was collecting another army at Echatana in Media, when a traitorous conspiracy was formed against him by which he lost his life in 330 B.C. Alexander married his daughter Statira.

**Darjeel'ing** (or Darjiling), a district of India, in the extreme north of the lieutenantgovernorship of Bengal, division of Cooch-Behar. Area 1,164 sq. mi.; pop. 223,114. Tea, coffee, cinchona, and cotton are cultivated more or less, and the cultivation of the teaplant and the making of tea is now the staple industry. DARJEELING, the chief town in the district, is a sanatory station for the British troops.

**Dar' laston**, a town of England, county of Stafford. It has extensive coal and iron mines. Pop. 14.422.

**Darley**, FELIX OCTAVIUS CARR (1822–1888), artist, b. in Philadelphia. While a clerk in a mercantile house in Philadelphia, he produced some humorous sketches, which were so highly praised that he devoted himself to the pursuit of art by making drawings for engravers. In 1848 he went to New York City. His illustrations for books became innumerable. Some of his sketches were reduced, to appear on government bonds and bank-notes.

**Darling** (from a governor of New South Wales), a name of several applications in Australia. The *Darling Ricer*, a river rising in the n.e. of New South Wales, flows in a southwesterly direction till it joins the Murray. *Darling District* is a pastoral district, about 50,000 sq. mi. in extent, in the s.w. of New South Wales, and watered by the Darling and the Murray. The *Darling Downs* are a rich table-land west of Brisbane in Queensland. It is well watered, and measures about 6,000 sq. mi. The *Darling Range* is a range of granite mountains in Western Australia, running in a northerly direction parallel with the coast from Point D'Entrecasteaux for 250 mi.

Darling, GRACE (1815-1842), a celebrated English heroine; b. in the Longstone Lighthouse, of which her father was keeper. In 1838 the steamer Forfarshire, with forty-one passengers on board besides her crew, became disabled off the Farne Islands during a storm, and was thrown on a rock where she broke in two, part of the crew and passengers being left clinging to the wreck. Next morning William Darling descried them from Longstone, about a mile distant, but he shrank from attempting to reach the wreck through a boiling sea in a boat. His daughter Grace, however, implored him to make the attempt and let her ac-company him. At last he consented, and father and daughter each taking an oar, they reached the wreck and succeeded in rescuing nine sufferers. The news of the heroic deed soon spread, and the brave girl received testimonials from all quarters. A purse of \$3,500 was publicly subscribed and presented to her. Four years afterward she died of consumption.

**Dar' lington**, a municipal borough of England, county and 17½ mi. s. of Durham, well built, chiefly of brick. The woolen manufacture is carried on to a considerable extent, and there are large iron works, and works manufacturing steel, locomotive engines, iron bridges, etc. Pop. 38,000.

**Darmstadt** (dårm ståt), a town in Germany, capital of the grand-duchy of Hesse, 15 mi. s. Frankfort. Among the remarkable buildings are the old palace, the Catholic church, and the Rathhaus or townhall built in 1580. Darmstadt has some iron foundries, breweries, etc., but depends more upon the residence of the court than upon either trade or manufactures. Pop. 56,399.

**Dar'nel**, the popular name of a species of

poisonous grass. It appears to be the tares of Scripture. Its properties are said to be narcotic and stupefying, but recent researches have cast some doubt on its reported deleterious qualities. It is met with in corn fields, and is now naturalized in North America.

Darn'ley, HENRY STUART, LORD (1541-1567), son of the Earl of Lennox and Lady Margaret Douglas, a niece of Henry VIII, and by her first marriage queen of James IV. In 1565 he was married to Mary Queen of Scots. It was an unfortunate match. Mary affected, however, to be reconciled to him, but could not long conceal her contempt for the handsome imbecile. After the birth of a son, subsequently James VI, Darnley was seized at Glasgow with smallpox, from which he had barely recovered when Mary visited him, and had him conveyed to an isolated house called Kirk of Field, close to the Edinburgh city walls. This dwelling, which belonged to a retainer of Bothwell's, the rapidly rising favorite, was blown into the air with gunpowder. The dead bodies of the king and his page were found in a field at a distance of 80 yards from the house.

Darrah, MRS. LYDIA, heroine. She was a Quaker and resided in Philadelphia. When the British Army was there the adjutant general hired one of her rooms for private con-On Dec. 2, 1777, some particular ferences. and emphatic directions were given that excited her curiosity. She listened at the door of the meeting room, and heard an order read that the British soldiery should march out of camp on December 4 to attack the Americans then quartered 8 mi. distant. On the following morning she walked several miles on the snowy ground, and approached the American camp. Here she met Colonel Craig, and gave him the information. When the British movement was made, they found the army of Washington prepared to meet them at all points, and the enterprise miscarried.

**Darters** (or Snake Birds), a genus of webfooted birds of the pelican tribe, found near the eastern coasts of the tropical parts of

Darter.

America, and on the western coast of tropical Africa, as well as in Australia. The birds perch on trees by the sides of lakes, lagoons, and rivers, and after hovering over the water suddenly dart at their finny prey with unerring aim. From the serpent-like form of their head and neck, the head being scarcely thicker than the neck, they are called snake birds.

**Dart' ford**, a town, England, Kent, 15 mi. s.e. of London. On the river are numerous paper, corn, and oil mills, a large foundry, and an extensive gunpowder manufactory, etc. Dartford was the first place in Britain where a paper mill was erected. Wat Tyler was a native of this place, and the insurrection known by his name broke out at Dartford (1377). Pop. 11,062.

**Dartmoor',** an extensive upland tract in England, in the western part of Devonshire, and belonging to the duchy of Cornwall; area 150.000 acres. Cattle and sheep are fed on the coarse grass during the summer months. Several of the rugged granite hills are of considerable height. Dartmoor prison, built in 1809 as a state-prison, is now a convict depôt.

**Dartmouth College.**—This institution is the outgrowth of an Indian school which was opened in 1754. A few years later English students were admitted, and in 1765, £1,000 was raised in England and placed in charge of trustees. It was named after the Earl of Dartmouth. The present site was chosen in 1769 and the first students were graduated in 1771. A suit for the control of the college was instituted between the state and the college, and decided in 1819 in favor of the trustees. Daniel Webster was attorney for the college. There is a medical department, school of science and art, college of agriculture and mechanical arts, and civil engineering school. The income is \$75,000; students, 560; professors, 48: books, 75,000.

**Darwen**, OVER, a borough of Lancashire, England, 3<sup>1</sup>/<sub>2</sub> mi. s. of Blackburn. Until about the middle of this century Over Darwen was an insignificant village; now it is a populous and thriving town. The staple manufacture is cotton; other manufactures are paper, iron castings, earthenware, etc. Pop. 34,192.

**Dar' win**, CHARLES ROBERT (1809-1882), a noted English naturalist. He early devoted himself to the study of natural history, and in 1831 he was appointed naturalist to the surveying voyage of H.M.S. *Beagle*, commanded by Captain Fitzroy. Darwin came home with rich stores of knowledge, part of which he soon gave to the public in various works. In 1839 he married his cousin, Emma Wedgwood, and henceforth spent the life of a quiet country gentleman, engrossed in scientific pursuits—experimenting, observing, recording, reflecting, and generalizing. In 1859 his name attained its great celebrity by the publication of *The Origin of Species by Means of Natural Selection.* This work, scouted and derided though it was at first in certain quarters, may be said to have worked nothing less than a

revolution in biological science. In it for the first time was given a full exposition of the theory of evolution as applied to plants and animals, the origin of species being explained on the hypothesis of natural selection. The rest of his works are largely based on the material he had accumulated for the elaboration of this great theory. The principal are a treatise on the Fertilization of Orchids (1862); Domesticated Animals and Cultivated Plants; or The Principle of Variation, etc., under Domestication (1967); Descent of Man and Variation in Relation to Sex (1871); The Expression of the Emotions in Man and Animals (1872); Morements and Habits of Climbing Plants (2d. ed. 1875); Insectivorous Plants (1875); Cross and Self Fertilization (1876): The Power of Movement in Plants (1880); The Formation of Vegetable Mold (1881), the last containing a vast amount of information in regard to the common earthworm. Mr. Darwin was buried in Westminster Abbey.

Dar' winism, the views, especially regarding the origin and development of animals and plants, expressed in detail and advocated with much earnestness in the works of Charles What has come to be known as "the Darwin. Darwinian theory" is the position that all forms of living organism, including man, have been derived or evolved through heredity, from certain primitive states or conditions of existence, during the struggle for existence of individual organisms, which results, through natural selection, in the survival of those least exposed, or, in the words of the distinguished author, "the survival of the fittest." Mr. Darwin especially advocated, as distinct from other writers on biology and evolution, these ideas: the inherent susceptibility and tendency to variation according to conditions of environment; the preservation and perfection of organs best suited to the needs of the individual in its struggle for existence; the per-petuation of the more favorably organized beings, and the destruction of those less fitted to survive; the operations of natural selection, in which sexual selection is an important factor, and the general proposition that at any given time any given organism represents the result of the foregoing factors, acting in opposition to the hereditary tendency to adhere to the type, or "breed true." See *Evolution*. **Dass**, PETER (1647-1708). Norwegian poet,

**Dass**, PETER (1647-1708), Norwegian poet, of Scottish extraction He is known as the "father of Norwegian poetry," and his principal poem, *The Trumpet of Northland*, is one of the most favorite national poems.

**Das'yure** (dasyu'rus), the brush-tailed opossums, a genus of plantigrade marsupials found in Australia and Tasmania, and so named in contrast to the opossums of this country which have naked tails somewhat like rats. The ursine dasyure of Tasmania is about the size of a badger, but of a sturdier form, of a dull black color, carnivorous, and of a savage temper. Formerly it was most destructive to flocks and poultry yards, but is now in the inhabited districts nearly extirpated. The various species of the genus have much the same nature and habits as the European polecat. Date

Tasmania Devil.

Date, the fruit of the date palm or the tree itself. The fruit is used extensively as an article of food by the natives of Northern Africa and of some countries of Asia. It consists of an external pericarp, separable into three portions, and covering a seed which is hard and horny in consequence of the nature of the albumen in which the embryo plant is buried. Next to the cocoanut tree the date is unquestionably the most interesting and use-ful of the palm tribe. Its stem shoots up to the height of 50 or 60 ft. without branch or division, and of nearly the same thickness throughout its length. From the summit it throws out a magnificent crown of large feather-shaped leaves, and a number of spadices, each of which in the female plant bears a bunch of from 180 to 200 dates, each bunch weighing from 20 to 25 lbs. The fruit is eaten fresh or dried. Cakes of dates pounded and kneaded together are the food of the Arabs who traverse the deserts. A liquor resembling wine is made from dates by fermentation. Persia, Palestine, Arabia, and the north of Africa are best adapted for the culture of the date tree, and its fruit is in these countries an important article of food.

**Date plum,** the name given to several species of *Diospyros*, a genus of trees of the ebony family. The European date plum is the *D*.

a-Bunch of dates; b.-Portion of leaf.

Lotus, a low-growing tree, native of the south of Europe. It produces a small fruit, the supposed lotus of the ancients. The American date plum, or persimmon, attains a height of 50 or 60 ft.; the fruit is nearly round, about an inch in diameter, is very austere, but edible after being frosted. The Chinese date plum is cultivated for the sake of its fruit, which is about the size of a small apple, and is made into a preserve.

Dath olite, the siliceous borate of lime, a mineral of a white color of various shades found in Scotland and on the Continent; also near Lake Superior, where it is used in the manufacture of boracic acid.

**Daudet** (dö-dā), ALPHONSE, French novelist, b. at Nimes 1840. He settled in Paris in 1857, and wrote poems, essays, plays, etc., without much success, till he discovered his powers as a novelist, when he speedily rose to the highest rank. His elder brother, ERNEST DAUDET, b. 1837, has also distinguished himself as a novelist and one of the best known political writers of the French republican party.

**Dau' phin**, the title of the eldest son of the king of France prior to the revolution of 1630, said to be derived from the dolphin, the crest of the lords of Dauphiny. The name was assumed toward the middle of the ninth century by the lord of Dauphiny, which province was bequeathed by Humbert II to the king of France in 1349, on condition that the heir of the throne should bear the title of Dauphin of Viennois.

**Dauw** (da'u) (or Peechi) (Equus Burchell), a species of Zebra which inhabits the plains of Southern Africa, particularly to the n. of the Orange River. Its general color is a pale brown, with grayish-white on the abdomen and inner parts of the limbs. Its head, neck. and body, and the upper parts of its limbs are striped like the zebra, but the stripes are not so dark in color.

Dav'enant, SIR WILLIAM (1605-1688), English poet and dramatist. He flourished under Charles II. His works consist of dramasmasques, addresses, and the epic Gondibert, which was never fluished, but he is remembered chiefly by the travesty of Shakespeare's Tempest, made in conjunction with Dryden. He was buried in Westminster Abbey.

**Davenport,** Scott co., Iowa, on the Mississippi River, 182 mi. w. from Chicago. Railroads: C. R. I. & P.; C. B. & Q.; B. C. R. & N.; C. M. & St. P.; Rock Island & Peoria. The lumber industry employs a great many men. and there are four flouring mills, woolen mill, iron foundry, packing company, and other factories. The surrounding country is agricultural. The town was first settled in 1835 by Col. Geo. Davenport and Antonio LeClair. and became a city in 1830. Pop. est. 1897, 36,000.

Davenport, EDWARD LOOMIS (1814-1877), b. in Boston, Mass., actor. He was a judicious and finished performer, who never rose to particular distinction. "St. Marc," in a play of his own: "Hamlet," "Sir Giles Overreach." and "William," in Black Eyed Susan, were

among his best performances. His wife, Fanny Elizabeth Vining, b. in 1819, was associated with him in his starring engagements.

**Davenport,** FANNY, daughter of the foregoing, b. in London, England, April 10, 1850, went on the stage as a child, and became a star. She married in 1879 an actor named Edwin H. Price.

David, king of Israel, the youngest son of Jesse, a citizen of Bethlehem, and descended through Boaz from the ancient princes of Judah. The life of David is recorded in the first and second books of Samuel and the first book of Chronicles. The book of *Psalms*, a large portion of which has been attributed to him, also contains frequent allusions to incidents in his life. He reigned from 1055 B. c. to 1015 B. c. according to the usual chronology, but recent investigations put the dates of David's reign from 30 to 50 years later. Under David the empire of the Israelites rose to the height of its power, and his reign has always been looked on by the Jews as the golden age of their nation's history.

**David**, JACQUES LOUIS (1748-1825), founder of the modern French school of painting. He went to Rome in 1774, and passed several years there painting several important pictures. A second visit produced the *Horatii*, one of his masterpieces. In 1787 he produced *The Death of Socrates*, in 1788 *Paris and Helen*, and in 1789 *Brutus*. He was appointed first painter to Napoleon about 1804; and after the second restoration of Louis XVIII he was included in the decree which banished all regicides from France, when he retired to Brussels.

**David**, PIERRE JEAN (1789-1856), a French sculptor, born at Angers. In 1831 he began the magnificent sculptures of the Pantheon, his most important work, which he finished in 1837. He executed a great number of medallions, busts, and statues of celebrated persons of all countries.

**David,** SAINT, patron of Wales, archbishop of Caerleon, and afterward of Menevia, now St. David's, where he d. about 601. He was celebrated for his piety, and many legends are told of his miraculous powers.

told of his miraculous powers. **Davis,** DAVID (1815-1886), jurist, b. in Cecil co., Md. He studied law in Massachusetts and Connecticut, and removed to Illinois in 1835. In 1844 he was a member of the state legislature, and from 1848 was circuit judge. In October, 1862, President Lincoln appointed him associate justice of the Supreme Court. Judge Davis was nominated by the labor reformers for president in 1872. In March, 1877, he took his seat in the U. S. Senate.

**Davis,** HENRY WINTER (1817-1865), statesman, was b. in Annapolis, Md. As member of Congress was a brilliant orator. Although representing a slave state he was unfaltering in fidelity to the Union and a strenuous advocate of emancipation, and as early as 1865 favored negro suffrage.

Davis, JEFFERSON (1808-1889), president of the Confederate States of America during the Civil War; b. in Kentucky. He was trained at

West Point Military Academy, and from 1828 to 1835 saw a good deal of service on the frontier. At the latter date he became a cotton planter in the state of Mississippi. He was elected to Congress in 1845, but at the commencement of the Mexican War he left Congress and engaged actively in the contest. He entered the Senate in 1847, and held various posts in the government, upholding the policy of the slave states and the doctrine of slave rights. On the outbreak of the Civil War he was chosen president of the Southern states, was taken prisoner after the fall of Richmond, imprisoned for two years in Fortress Monroe, and set at liberty by the general amnesty of 1868.

Davis, JEFFERSON C. (1829-1879), soldier, b. in Clark co., Ind. He fought in the Mexican War and received a commission in the regular army. In April, 1861, he was at Fort Sunter, and later commanded a division in Tennessee. He was with Sherman's army in the march to the sea, and in 1865 received a major general's brevet and became colonel of the Twenty-third Infantry.

Davis, JOHN CHANDLER BANCROFT, jurist, b. in Worcester, Mass., in 1822; acted as agent for the U. S. before the Geneva court of arbitration. In 1869 and again in 1873, he was assistant secretary of state. He was next minister to Berlin (1872-1877), then judge of the Court of Claims (1877-1882), and reporter of the U. S. Supreme Court.

**Davis,** NoAH, b. in Haverhill, N. H., in 1818. In July, 1870, he became U. S. district attorney for the southern district of New York, and in 1872 was again elected to the State Supreme Court of which he became presiding justice in 1874. He retired from the bench in 1887.

**Davis's Strait**, a narrow sea which separates Greenland from Baffin's Land, and unites Baffin's Bay with the Atlantic Ocean.

fin's Bay with the Atlantic Ocean. **Davitt**, MICHAEL, b. in 1846 in county Mayo, Ireland. In 1870 he was sentenced to fifteen years' imprisonment for treason-felony, but was released in 1878. The next year he founded, in conjunction with Charles S. Parnell, the Irish land league. He made a tour of the U. S. on behalf of that organization in 1880; and on his return to England was again arrested on his old sentence, and held in prison for fifteen months. While he was in prison, he was elected a member of Parliament, but was not permitted to take his seat.

**Davos** (då-vös'), an elevated valley of Switzerland, canton Grisons, containing several villages; a winter resort of persons suffering from chest diseases.

**Davout** (or Davoust) (dä-vö), LOUIS NICOLAS, duke of Auerstädt and prince of Eckmühl, marshal and peer of France (1770–1823). He went with Bonaparte to Egypt in 1708, and commanded the cavalry of the army of Italy in 1800. He shared the glory of Eylau, Eckmühl, and Wagram; was made governor of Hamburg; took part in the Russian campaign of 1812, and was wounded at Borodino. During the Hundred Days (1815) he was Napoleon's minister of war, and after Waterloo, was appointed by the provisional government general-in-chief of the French armies.

Da'vy, Sir HUMPHRY (1778-1829), a distinguished English chemist. He was appointed professor of chemistry in the Royal Institution at the age of twenty-four. In 1803 he was chosen a member of the Royal Society. His discoveries with the galvanic battery, his decomposition of the earths and alkalies and ascertaining their metallic bases, his demonstration of the simple nature of the oxymuriatic acid, etc., obtained him an extensive reputation. The numerous accidents arising from fire-damp in mines led him to enter upon a series of experiments on the nature of the explosive gas, the result of which was the invention of his safety lamp.

**Da'vyum** (after Sir H. Davy), a metal of the platinum group discovered in 1877. It is a hard, silvery metal, slightly ductile, extremely infusible.

**Dawes**, HENRY L., U. S. Senator from Massachusetts, was b. in Cummington, Mass., Oct. 30, 1816. He graduated at Yale College and studied law. After serving as member of House for seven consecutive terms, in 1874. elected U. S. Senator; re-elected 1881 and 1887.

**Dawson,** HENRY (1811-1878), English landscape painter. Among the best of his pictures are Wooden Walls of Old England, London from Greenwich Hill, Houses of Parliament, The Rainbow, Rainbow at Sea, The Pool Below London Bridge.

**Dawson,** SIR JOHN WILLIAM, b. 1820 at Picton, Nova Scotia; Canadian geologist. He was educated at Picton and Edinburgh University. He accompanied Sir Charles Lyell when examining the geology of Nova Scotia in 1842. In 1850 he became superintendent of education for Nova Scotia, and in 1855 principal and professor of natural history in M'Gill College, Montreal, in which position, as well as in that of vice-chancellor, and, latterly, principal of the university, his services in the cause of education have been very marked. He became a member of the Royal Society in 1862.

Day, either the interval of time during which the sun is continuously above the horizon, or the time occupied by a revolution of the earth on its axis, embracing this interval, as well as the interval of darkness. The day in the latter sense may be measured in more than one way. If we measure it by the apparent movement of the stars, caused by the rotation of the earth on its axis, we must call day the period between the time when a star is on the meridian and when it again returns to the meridian; this is a sidereal day. It is uniformly equal to 23 hours, 56 minutes, 4,098 seconds. But more important than this is the solar day, or the interval between two passages of the sun across the meridian of any place. The latter is about four minutes longer than the former, owing to the revolution of the earth round the sun, and it is not of uniform length, owing to the varying speed at which the earth moves in its orbit and to the obliquity

of the ecliptic. For convenience an average of the solar day is taken, and this gives us the mean solar or civil day of twenty-four hours, the difference between which and the actual solar day at any time is the equation of time. The length of the days and nights at any place varies with the latitude and season of the year, owing to the inclination of the earth's axis. In the first place, the days and nights are equal all over the world on the 21st of March and the 21st of September, which dates are called the *vernal* (spring) and *autumnal equinozes*. Again. the days and nights are always of equal length at the equator, which, for this reason, is some-With these times called the equinoctial line. exceptions, we find the difference between the duration of the day and the night varying more and more as we recede from the equator.

The Babylonians began the day at sunrising: the Jews at sunsetting; the Egyptians and Romans at midnight, as do most modern peoples. The civil day in most countries is divided into two portions of twelve hours each. The abbreviations P.M. and A.M. (the first signifying post meridiem, Latin for afternoon; the latter ante meridiem, forenoon) are requisite, in consequence of this division of the day. The Italians in some places reckon the day from sunset to sunset, and enumerate the hours up to twentyfour; the Chinese divide it into twelve parts of two hours each. For astronomical purposes the day is divided into twenty-four hours instead of two parts of twelve hours. Formerly it began at noon, but since Jan. 1, 1885, the day of twenty-four hours begins at midnight at Greenwich observatory; and this reckoning is now generally adopted for astronomical purposes elsewhere than at Greenwich. The poses elsewhere than at Greenwich. The Greenwich day practically determines the date for all the world. At mid-day at Greenwich the date (day of the week and month) is everywhere the same, though there are all possible differences in naming the hour of the day. But mid-day at Greenwich is the only instant at which we ever have the same date all over the world. The meridian of midnight, which is then at 180° e. or w., goes on revolving, gradually bringing a new date to every place to the west of that line, but obviously not bringing that new date to the places immediately to the east of that line till twenty-four hours after. From this it follows that whereas places on the one side of the globe never have a different date except when midnight lies between them. places on the opposite side of the globe, and on different sides of the meridian of 180° e. or w.. never have the same date except when midnight lies between them.

Day, THOMAS (1748-1789), an ingenious writer, of a benevolent, independent, but eccentric spirit, was b. at London. He wrote in prose and verse, on various subjects, but the *History of Sanford and Merton*, a popular book for boys, is the only work by which his name is perpetuated.

**Dayfly**, the popular name of those neuropterous insects which belong to the genus *Ephemera*. They are so called because, though they may exist in the larval and pupal

state for several years, in their perfect form they exist only from a few hours to a few days, taking no food, but only propagating their species and then dying.

Day-illy, the popular name for a genus of lilies, natives of temperate Asia and Eastern Europe, two species of which are grown in

Yellow Day-lily.

They have long radical leaves, and gardens. a branched, few-flowered scape, with large handsome blossoms, the segments of which

Dayton, WILLIAM LEWIS (1807-1864), states-man, b. in N. J. He graduated at Princeton in 1825; studied law and began practise in Trenton, N. J., in 1830. He was appointed to the U.S. Senate in 1842 to fill a vacancy, and was re-elected in 1845. In 1856 he was nominated for vice president on the ticket with John C. Fremont. In 1857 he became at-torney general of N. J., and in 1861 was appointed minister to France, which office he held until his death.

Days of Grace are days allowed for the payment of a promissory note or bill of exchange after it becomes due.

Dayton, county seat Montgomery co., O., on the great Miami River, 60 mi. n.e. of Cincinnati. Railroads: P. C. C. St. L. (Pa.); C. H. & D.; C. C. C. & St. L. (Big Four); and Erie. Industries: car works, three factories for the manufacture of agricultural implements, sewing machine, bicycle, refrigerator, pump, linseed oil, and paint factories. Natural gas is pumped from Indiana and the Mercer co. fields. Surrounding country agricultural. First settled in 1796 and became a city in 1805. Dayton celebrated its 100th anniversary in 1896. Three lines of electric cars run to the National Soldiers' Home which is three miles from the center of the city, and embraces over 600 acres of natural and beautiful grounds. Dayton has seven banks, a clearing house, and a number of building and loan associations. Pop. est. 1897, 83,000,

# Deaf and Dumb

Dead-letter, a letter which lies for a certain period uncalled for at the post-office, or one which cannot be delivered from defect of address, and which is sent to the general postoffice to be opened and returned to the writer. Dead-letter office, a department of the general post-office where dead-letters are examined and disposed of.

Dead-nettle, the common name of a species of plants. There are several species found in the U.S. and England as the white dead-nettle, the red, and the yellow.

Dead Reckoning, the calculation of a ship's place at sea without any observation of the heavenly bodies. It is obtained by keeping an account of the distance which the ship has run by the log, and of her course steered by the compass, and by rectifying these data by

White Dead-nettle.

the usual allowance for drift, leeway, etc.,

Dead Sea, called in Scripture "Salt Sea," "Sea of the Plains," and "East Sea," a celebrated lake in Asiatio Turkey, near the south extremity of Palestine, in the pashalio of Damascus. The north extremity is 25 mi. e. of Jerusalem and 10 mi. s.e. of Jericho; length about 46 mi.; breadth at the widest part, 9 to 10; average, about 84 mi. The basin in which the Dead Sea reposes forms the south termination of the great depression through which the Jordan flows, that river entering it at its north extremity. It receives several other tributaries, but has no outlet. The surface is tributaries, but has no outlet. 1,312 ft. below the level of the Mediterranean. It lies deeply imbedded between lofty cliffs of naked limestone, its shores presenting a scene of indescribable desolation and solitude, encompassed by desert sands, and bleak, stony, salt hills. Sulphur and rock salt, lava and pumice abound along its shores. The water is nauseous to the taste and smell, and so buoyant that the human body will not sink in it. At about a third of its length from the north end it attains a maximum depth of 1,308 ft. The southern portion is a mere lagoon, 12 ft. deep in the middle and 3 at the edges.

Deaf and Dumb (or Deaf-mutes), persons both deaf and dumb, the dumbness resulting from deafness which has either existed from birth or from a very early period of life. Such persons are unable to speak simply because they have not the guidance of the sense of hearing to enable them to imitate sounds. Among the causes assigned for congenital deafness are consanguineous marriages, hereditary transmission, scrofula, certain local or climatic conditions, ill health of the mother

during pregnancy, etc. Acquired or accidental deafness, which occurs at all ages, is frequently due to such diseases as smallpox, measles, typhus, paralysis, hydrocephalus, and other cerebral affections, but more particularly to scarlet fever, which is somewhat apt to leave the patient deaf owing to the inflammatory state of the throat extending to the internal ear, and thus causing suppuration and destruction of the extremely delicate parts of the auditory apparatus. In the greater proportion of deaf-mutes no defect is visible, or can be detected by anatomical examination, and no applications yet discovered appear to be useful. The necessity of communication, and the want of words, oblige the deaf-mute to observe and imitate the actions and expressions which accompany various states of mind and of feeling, to indicate objects by their appearance and use, and persons by some peculiar mark, and to describe their actions by direct imitation. In this way he and his friends are led to form a dialect of that universal language of attitude, gesture, and expression which becomes a substitute for words in the hands of the pantomimic actor, and which adds force and clearness to the finest effusions of the orator; in other words, the natural sign language. This language, in its elements, is to be found among all nations, and has ever been the medium of communication between voyagers and the natives of newly discovered countries. It is employed by many savage tribes to supply the paucity of expression in their language and to communicate with other tribes. Among some of the Indians it exists as a highly-organized language. Such a means of communication is after all very imperfect, however, and various more perfect systems have been devised to enable deaf-mutes to communicate with one another and with the rest of mankind, and thus to gain such an education as people in general possess. In 1648 John Bulwer published the earliest work in English on the instruction of the deaf and dumb. In 1743 the practicability of instructing deaf-mutes was first publicly demonstrated in France by Pereira, a Spaniard, before the Academy of Sciences, which gave its testimony to the success of the About the same time the Abbé de method. l'Epée, who devoted his life and fortune to this subject, introduced a system for the instruction of the deaf and dumb, which was taught with great success in the Royal Parisian Institution, and afterward still further developed by his pupil and successor, the Abbé Sicard. In 1779 a public institution for the education of deaf-mutes was established at Leipsic, through the labors of Samuel Hein-icke, the great upholder of the vocal or articulatory system, which is still retained at Vienna and throughout Germany. The first public institution in Great Britain for the gratuitous education of the deaf and dumb was founded at Bermondsey in 1792. From this establishment originated the London Asylum in Kent Road, which was opened in 1807. American institutions have munificent state

endowments and are admirably managed. Deaf-mutes are "the wards of the commonwealth" and every state in the Union provides for its own, either by establishing schools or by appropriations to schools already estab-lished in other states. The Asylum at Hart-ford, Conn., was founded in 1817. This was the first school for the instruction of deafmutes opened in this country. In 1819 this institution received a grant of government land which now yields a fund of over \$300,000. The second school was opened in New York City in 1818. Since that time many institutions have sprung up in other states. The Clarke Iustitute at Northampton, Mass., for instructing deaf-mutes was organized in 1867. It differed from other American institutions in that pupils were received at the legal school age, instead of later, and instructed by articulation and lip-reading, a method borrowed from the Germans. At a conference of instructors in Washington a resolution was passed recommending the use of articulation and lip-reading in connection with the manual method in all the schools in the U.S. The two systems are now combined in nearly all the schools throughout the country. The U. S. has a Na-tional College located at Washington. The American Annals of the Deaf and Dumb has been published since 1847, and conventions of instructors have been held since 1850. The two chief methods of conveying instruction to the deaf and dumb are by means of the manual alphabet, and by training them to

Two-handed alphabet.

watch the lips of the teacher during articula-There are two kinds of manual alphation. bet: the double-handed alphabet, where the letters are expressed by the disposition of the fingers of both hands; and the single-handed, in which the letters are formed with the fingers of one hand. Particular gestures which are attached to each word as its distinctive sign are largely used, as are also real objects and models, pictures, etc. The method of teaching by articulation, the pupil learning to recognize words, and in time to utter them, by closely watching the motions of the lips and tongue in speech, and by being instructed through diagrams as to the different positions of the vocal organs, is now receiving much attention, and has given excellent results, cases being known where persons have conversed with the deaf and dumb and remained ignorant that those to whom they were speaking were afflicted in this way. It is by no means a novel system, but of late it has vastly increased in favor with authorities. A new mode of teaching articulation has recently been brought into notice, consisting in the use of the system of visible speech. The characters of the alphabet on which this system is founded are intended to reveal to the eye the position of the vocal organs in the formation of any sound which the human mouth can utter. Its practical value as a means of instruction with all classes of the deaf and dumb has not as yet been sufficiently tested.

**Deal**, the division of a piece of timber made by sawing; a board or plank. The name deal is chieffy applied to boards of fir above 7 in. in width and of various lengths exceeding 6 ft. If 7 in. or less wide they are called battens, and when under 6 ft. long they are called battens, and when under 6 ft. long they are called dealends. The usual thickness is 3 in., and width 9 in. The standard size, to which other sizes may be reduced, is  $1\frac{1}{2}$  in. thick, 11 in. broad, and 12 ft. long. Whole deal is deal which is  $1\frac{1}{2}$ in. thick; stit deal, half that thickness.

**Deal-fish**, so called from its excessively compressed body, a denizen of the northern ocean and an occasional visitor to the coasts of Iceland, Norway, and Britain; measures from 4 to 8 ft. in length, is of a silvery color with minute scales, and has the dorsal fin extended along the whole length of the back. It is also known by the Scandinavian name Vaagmaer.

**Deane**, SILAS (1737-1789), b. in Greton, Conn., diplomatist. He graduated at Yale in 1758. In 1768 he was elected to the legislature, and in 1774 to the Continental Congress. He bought the first vessel for the American navy. In 1779 he was discharged from Congress. He died in England.

**Dean Forest,** England, county of Gloucester. It formerly comprised the greater part of the county w. of the Severn, but is now reduced to about 22,000 acres, nearly one half of which is enclosed, and was formerly appropriated for the growth of navy timber, but is now mainly covered with coppices. This district is crown property, and the inhabitants enjoy many ancient privileges. It contains a population of nearly 25,000.

# Debenture

Dearborn, HENRY (1751-1829), soldier. He served in Colonel Stark's regiment, took part in the battle of Bunker Hill, and accompanied Arnold to Quebec, where he was captured. He was released on parole in 1776, and exchanged in 1777. He served in General Gates's army; took part in the battle of Monmouth; served in Sullivan's expedition against the Indians in 1779; was with the army in N. J. in 1780; and accompanied General Washington to Yorktown. After the war Washington appointed him marshal of the district of Maine. In 1793, he was elected to Congress, and served two terms. He was secretary of war from 1801 till 1809, when he was made collector of the port of Boston. In 1812 he was made senior major general of the U. S. army. In 1813 he went with his army to Canada and captured York and took Fort George. In 1813 he was placed in command of the military district of New York City. From 1822 till 1824 was minister to Portugal.

**Death's-head Moth,** one of the largest species of lepidopterous insects. The markings upon the back of the thorax very closely resemble a skull, or death's-head. It measures from 4 to 5 inches in expanse. It emits

Death's-head Moth and Caterpiliar.

peculiar sounds, somewhat resembling the squeaking of a mouse, but how these are produced naturalists have not been able satisfactorily to explain. It attacks bee-hives, pillages the honey, and disperses the inhabitants.

**Deathwatch**, a coleopterous insect that inhabits the woodwork of houses. In calling to one another they make a peculiar ticking sound, which superstition has interpreted as a forerunner of death.

**Deben' ture**, a declaratory deed given by a public company in acknowledgment of borrowed money. It gives the holder the first claim for dividends, while the capital sum lent is usually assured on the security of the whole undertaking. With the deed, coupons or war-

#### Deborah

rants for the payment of interest at specified dates are generally issued.

**Deb'orah**, a Hebrew seer or prophetess who lived in the time of the judges; by the aid of Barak delivered the northern tribes from the oppression of Jabin, and secured a peace of 40 years' duration.

**Debra Tabor**, a town in Abyssinia, about 35 mi. e. of Lake Dembea, the residence of the Abyssinian sovereign.

**Debreczin** (de-bret'sin), a town of Hungary, on the edge of the great central plain, 113 mi. e. of Budapest. Its houses are mostly of a single story; the streets broad and unpaved. Among the principal edifices are the Protestant church and college. Chief manufactures are coarse woolens, leather, soap, tobacco pipes, casks, etc., and a large trade is done in cattle. Pop. 56,940.

Debt, National. See National Debt.

**Decalogue** (dek'a-log) (Gr. deka, ten, and logos a word), the ten commandments, which according to Exodus 20 and Deuteronomy 5 were given by God to Moses on two tables. The Jews call them the ten words. Jews and Christians have divided the ten commandments differently; and in some Catholic catechisms the second commandment has been united with the first, and the tenth has been divided into two.

**De Candolle** (dé'kän-dol), AUGUSTIN PYRAME (1778-1841), one of the most illustrious of modern botanists, whose natural system of classification, with some modifications, is the one still generally used, was b. at Geneva. In 1808 he obtained the chair of botany in the faculty of medicine at the University of Montpellier. In 1816 he went to Geneva, where a chair of natural history was expressly created for him, and where he continued for many years to extend the boundaries of his favorite science by his lectures and publications.

**Decap'oda.** 1. The highest order of crustaceans, so called from having five pairs of legs. They are subdivided into the short-tailed decapods or crabs; long-tailed, including the shrimp, lobster, prawn, crayfish, etc.; and Anomura, of which the hermit-crab is an example. 2, One of the two divisions of the dibranchiate cuttlefishes. They have two arms longer than the other eight, and bear the suctorial discs only at the extremities.

**Decatur**, Macon co., Ill., on Sangamon River. Railroads: Illinois Central; Wabash; and three other lines. Industries: flour mills, furniture, linseed oil and cotton factories, farming implements, carriage and iron works. There are coal mines in the vicinity. Pop. est. 1897, 18,-000.

**Decatur**, STEPHEN (1779-1820), b. in Sinnepuxent, Md.; naval officer. In 1790 he became a lieutenant, and in 1801 sailed in the *Essex* to Tripoli. In 1803, he was given command of the *Enterprise*. In 1812, while commander of the frigate United States, he encountered the British frigate Macedonian, and captured her. On his way to sea through Long Island Sound, in 1813, Decatur's vessel was blockaded by the British fleet, and he was driven into New Lon-

## Declination

don. In 1815, he was sent with a squadron of nine vessels to the Mediterranean, where he captured an Algerine frigate. On June 28, he captured a second vessel, and anchoring his squadron in the harbor of Algiers, compelled the dey to negotiate a treaty. He then entered Tunis and Tripoli, forced the release of the American prisoners, and obtained satisfaction for past offenses. Returning to the U. S., he was made a naval commissioner. His death was caused by a wound received in a duel with Commodore Barron, near Bladensburg, D. C.

Dec' can, a term locally limited to the territory of Hindustan lying between the Nerbudda and the Kistna, but generally understood to include the whole country south of the Vindhya Mountains, thus comprising the presidency of Madras and part of Bombay, Hyderabad, Mysore, Travancore, and other native states.

**Decem** ber, the twelfth month of our year. from the Latin *decem*, ten, because in the Roman year instituted by Romulus it constituted the tenth month, the year beginning with March. In December the sun enters the tropic of Capricorn, and passes the winter solstice.

**Decem' virs**, the ten magistrates who had absolute authority in ancient Rome (B.C. 451-449).

**Decid' uous** is a term applied in botany to various organs of plants, particularly leaves, to indicate their annual fall. A tree of which the leaves fall annually is called a deciduous tree, and the same term is applied to the leaves themselves. The term is also applied in zoology to parts which fall off at a certain stage of an animal's existence, as the hair, horns, and teeth of certain animals.

Declaration of Independence, the solemn declaration of the Congress of the U.S.A., on July 4, 1776, by which they formally renounced their subjection to the government of Britain. (For text see U. S.) Declaration of Paris, an instrument signed at the Congress of Paris. 1856, and subsequently accepted by the chief powers. It declared: 1, privateering to be abolished; 2, a neutral flag covers enemy's goods. with the exception of contraband of war; 3. neutral goods, except contraband of war, are not liable to capture under an enemy's flag: and 4, blockades, in order to be binding, must be effective. Declaration of War, the formal notice which, by the usage of nations, belligerents are expected to give before commencing hostilities.

**Declination**, in astronomy, the distance of a heavenly body from the celestial equator (equinoctial), measured on a great circle passing through the pole and also through the body. It is said to be north or south according as the body is north or south of the equator. Great circles passing through the poles, and cutting the equator at right angles, are called *circles of declination*. Twenty-four circles of declination, dividing the equator into twenty-four arcs of  $15^{\circ}$  each, are called hour circles or horary eircles. Declination of the compass or needle.

## Declinometer

or magnetic declination, is the variation of the magnetic needle from the true meridian of a place. This is different at different places, and at the same place at different times.

Declinom' eter, an instrument for determining the magnetic declination, and for observing its variations. In magnetic observatories there are permanent instruments of this kind, and they are now commonly made self-registering. Such instruments register the small hourly and annual variations in declination, and also the variations due to magnetic storms.

**Decomposition**, Chemical, is the separation of the constituents of a body from one another. Roughly speaking—for it is a difference of degree rather than of kind-decomposition is Artificial deeither artificial or spontaneous. composition is produced in bodies by the action of heat, light, electricity, or chemical re-agents; spontaneous, in bodies which quickly undergo change in ordinary circumstances, unless special precautions are taken to preserve them. The bodies of the mineral, and the definite crystallized principles of the organic world, belong to the first; organized matter, such as animal and vegetable tissues, organic fluids, such as blood, milk, bile, and the complex non-crystallized bodies, albumen, gelatin, emulsine, etc., belong to the second.

Dec'orated Style, in architecture, the second style of pointed (Gothic) architecture, in use in Great Britain from the end of the thirteenth to the beginning of the fifteenth century. when it passed into the Perpendicular. It is distinguished from the Early English, from which it was

developed, by the more Column, Fourteenth flowing or wavy lines of its Century.

tracery, especially of its windows, by the more graceful combinations of its foliage, by the

greater richness of the decorations of the capitals of its columns, and of the moldings of its doorways and niches, finials, etc., and generally by a style of ornamentation more profuse and naturalistic. though perhaps somewhat florid. The most distinctive ornament of the style is the ball flower, which 🚚 is usually inserted in a hollow molding. The decorated style has been divided into two periods; viz.,

Window, Oxfordshire, 1300.

the Early or Geometrical Decorated period, in which geometrical figures are largely introduced in the ornamentation; and the Decorated style proper, in which the peculiar characteristics of the style are exhibited. To this latter period belong some of the finest monuments of British architecture.

Decoration Day. The custom of decorating the graves of fallen soldiers originated in the South, where, for several years after the late Civil War, it was observed with reverence and devotion, and with befitting public exercises. The practise was also followed privately in the North for some years after the close of the war; but in 1868 General Logan then commanding the Grand Army of the Republic, by the following official order, made the observance a national one, declaring it to be his "purpose to inaugurate this observance with the hope that it may be kept up from year to year:"

"The 30th of May, 1868, is designated for the purpose of strewing with flowers or otherwise decorating the graves of comrades who died in defense of their country during the late Rebellion, and whose bodies now lie buried in almost every city, village, hamlet, and churchyard in the land. In this observance no form of ceremony is prescribed, but posts and comrades will in their own way arrange such fitting services and testimonials of respect as cirumstances will permit. "JOHN A. LOGAN,

" Commander-in-Chief G. A. R."

Since the issuance of this order the observance of the day thus set apart has constantly increased throughout the country. At first the occasion was called *Memorial Day*, but Decoration Day is now the appellation gener-ally adopted. Originally different days were observed by different states, notwithstanding the day fixed in General Logan's order; but the 30th of May has now been universally settled upon, and in most of the states, North as well as South, it is made a legal holiday. Of all national observances connected with public events in American history, this appropriate and beautiful custom appears to have taken the deepest hold in the popular heart.

Decoy', a place into which wild fowls are decoyed in order to be caught. A decoy pond is kept only in a secluded situation. Several channels or pipes of a curved form, covered with light, hooped network, lead from the pond in various directions. The wild fowl are enticed to enter the wide mouth of the channel by tamed ducks, also called decoys, trained for the purpose, or by grain scattered on the water. When they have got well into the covered channel they are surprised by the decoyman and his dog, and driven up into the funnel net, at the far end where they are easily caught. The details differ in different cases. but this is the general principle of the contrivance.

Decrepita tion, the act of flying asunder with a crackling noise, on being heated, or the crackling noise, attended with the flying asunder of their parts, made by several salts and

42

minerals when heated. It is caused by the unequal sudden expansion of their substance by the heat, or by the expansion and volatilization of water held mechanically within.

**Dedham,** Norfolk co., Mass., on the Charles River. Railroads: N. Y. N. H. & H. and N. Y. & N. E. Industries: broom, woolen, suspender manufactories, cocoa and chocolate establishments, and piano Works. Pop. est. 1897, 7,500.

Dee, the name of several British rivers. 1, A river of Scotland, partly in Kincardineshire, but chiefly in Aberdeenshire, one of the most finely wooded and one of the best salmon rivers in Britain. 2, A river of North Wales and Cheshire; rises in Lake Bala, Merionethshire; flows to the Irish Sea, 20 mi. below Chester. 3, A river of Scotland, county of Kirkcudbright, rises in Loch Dee, flows s.e. and s., and falls into Kirkcudbright Bay.

Dee, JOHN (1527-1608), English mathematician, alchemist, and astrologer. In the reign of Mary he was imprisoned on suspicion of practising the "black art;" but was in favor with Elizabeth, who is said to have employed him on secret political missions, and paid him a fixed salary. In 1581 he visited several of the Continental courts, pretending to raise spirits. In 1595 he obtained from the queen the wardenship of Manchester College.

Deed, in law, a writing containing some contract or agreement, and the evidence of its execution made between parties legally capable of entering into a contract or agreement; particularly an instrument on paper or parchment, conveying real estate to a purchaser or donee. It is either an *indenture* or a *deed-poll*; the former made between two or more persons in different interests, the latter made by a single person, or by two or more persons having similar interests.

Deer, a general name for the ungulate or hoofed ruminating animals constituting the family Cervidæ, of which the typical genus is *Cervus*, the stag or red deer. The distinguishing characteristics of the genus are, that the members of it have solid, branching horns which they shed every year, and eight cutting teeth in the lower jaw and none in the upper. The horns or antiers always exist on the head of the male, and sometimes on that of the female. The forms of the horns are various; sometimes they spread into broad palms which send out sharp snags around their outer edges; sometimes they divide very fantastically into branches, some of which project over the forehead, while others are reared upward in the air; or they may be so reclined backward that the animal seems almost forced to carry its head in a stiff, erect posture. They are used as defensive and offensive weapons, and grow with great rapidity. There are many species of deer, as the red deer or stag, the fallow deer, the roebuck, the reindeer, the moose, the elk, the axis, rusa, muntjac, wapiti, etc. Deer are pretty widely distributed over the world, though there are none in Australia and few in Africa, where the antelopes take their place. The reindeer alone has been domesticated.

Deering, Cumberland co., Me., on Casco Bay. Railroads: Maine Central; Grand Trunk; Portland & Rochester. Industries: lumber and manufactures. Pop. est. 1897, 6,200.

Deer mouse, the common name of the animals belonging to the genus *Meriones*, an American genus of rodent animals allied to the mice and the jerboas of the Old World. The deer mouse of Canada is a pretty little animal of the size of a mouse, with very long hind-legs and tail, and very short fore legs.

**Default'**, in law, signifies generally any neglect or omission to do something which ought to be done. Its special application is to the non-appearance of a defendant in court when duly summoned on an appointed day. If he fail to appear judgment may be demanded and given against him by default.

**Defend** ant, in law, the party against whom a complaint, demand, or charge is brought: one who is summoned into court, and defends. denies, or opposes the demand or charge, and maintains his own right. The term is applied even if the party admits the claim.

**Defiance**, Defiance co., O., on Maumee River and Wabash & Erie Canal. Railroads: Baltimore & Ohio, and Wabash lines. Industries: lumber mills and woolen factories. In grain-growing district. Pop. est. 1897, 8,000.

Definition, a brief and precise description of a thing by its properties; an explanation of the signification of a word or term, or of what a word is understood to express. Logicians distinguish definitions into nominal and real. A nominal definition explains the meaning of a term by some equivalent word or expression supposed to be better known. A real definition explains the nature of the thing. A real definition is again accidental, or a description of the accidents, as causes, properties, effects, etc., or essential, which explains the constituent parts of the essence or nature of the thing. An essential definition is, moreover, metaphys ical or logical, defining "by the genus and dif-" as it is called, as, for example, "a ference. plant is an organized being, destitute of sensation," where the part first of the definition states the genus, and the latter the difference: or *physical*, when it distinguishes the physical parts of the essence; thus, a plant is distinguished by the leaves, stalk, root, etc. A strictly accurate definition can be given of only a few objects. The most simple things are the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined.

**Defoe** (dē-fo'), DANIEL (1661-1731), an English writer of great ingenuity and fertility, was b. in London. In 1701 appeared his satire in verse, *The True-born Englishman*, in favor of William III. In 1716 he published his largest poem, entitled *Jure Divino*, a satire on the doctrine of divine right. In 1707 he was in Scotland. In 1719 appeared the most popular of all his performances, *The Life and Surpring Adventure of Robinson Crusse*. After the accession of George I he was employed by government in some underhand work connected with the obnoxious Jacobite press, and was a prolific

contributor to periodical and ephemeral literature.

Degree', in geometry or trigonometry, the 360th part of the circumference of any circle, the circumference of every circle being supposed to be divided into 360 equal parts, called degrees. A degree of latitude is the 360th part of the earth's circumference north or south of the equator, measured on a great circle at right angles to the equator, and a degree of longitude is the same part of the surface east or west of any given meridian, measured on a circle parallel to the equator. Degrees are marked by a small  $\circ$  near the top of the last figure of the number which expresses them; thus,  $45^{\circ}$  is 45 degrees. The degree is subdivided into sixty equal parts called minutes; and the minute is again subdivided into sixty equal parts called seconds. Thus,  $45^{-12'}$  20'' means 45 degrees, 12 minutes, and 20 seconds. The magnitude or quantity of angles is estimated in degrees and parts of a degree, because equal angles at the center of a circle are subtended by equal arcs, and equal angles at the centers of different circles are subtended by similar arcs; or arcs containing the same number of degrees and parts of a degree. An angle is said to be so many degrees as are contained in the arc of any circle intercepted between the lines which contain the angle, the angular point being the center of the circle. Thus we say an angle of  $90^{\circ}$ , or of  $45^{\circ}$  24'. It is also usual to say that a star is elevated so many degrees above the horizon, or declines so many degrees from the equator, or such a town is situated in so many degrees of latitude or longitude. The length of a degree depends upon the radius of the circle of the circumference of which it is a part, the length being greater the greater the length of the radius. Hence the length of a degree of longitude is greatest at the equator, and diminishes continually toward the poles, at which it = 0. Under the equator a degree of longitude contains 60 geographical, and 691 statute miles. The degrees of latitude are found to increase in length from the equator to the poles, owing to the figure of the earth. Numerous measurements have been made in order to determine accurately the length of degrees of latitude and longitude at different parts of the earth's surface and thus settle its dimensions and magnitude. When the French determined to establish their system of measures and weights based upon the meter, they settled that this basis was to be the ten-millionth part of the distance from the equator to the pole, which distance had to be found by accurate measurement. Ten degrees of latitude were accordingly measured, from Dunkirk to Formentera, one of the Balearic Islands. Similar measurements having been made in Britain, the length of a total arc of twenty degrees has been found. Many measurements have also been made elsewhere. The term is also applied to the divisions, spaces, or intervals marked on a mathematical, meteorological, or other instrument, as a thermometer or barometer.

Degree, in universities, a mark of distinc-

tion conferred on students, members, or distinguished strangers, as a testimony of their proficiency in the arts or sciences, or as a mark of respect, the former known as ordinary, the latter as honorary degrees. The degrees are bachelor, master, and doctor, and are conferred in arts, science, medicine, divinity, and music.

**De Haas,** MAURICE FREDERICK HENDRICK (1832-), painter, b. in Rotterdam, Holland. He studied at the Academy of Fine Arts; in 1857 was made artist of the Holland navy, and in 1859 became located in New York City. His best known American work is *Farragut Passing the Forts*. He became an academician of the national academy in 1867, and was one of the original members of the American society of painters in water colors.

De ism, a philosophical system which, as opposed to Atheism, recognizes a great first cause: as opposed to Pantheism, a Supreme Being distinct from nature or the universe; while as opposed to Theism, it looks upon God as wholly apart from the concerns of this world. It thus implies a disbelief in revelation, scepticism as regards the value of miraculous evidence, and an assumption that the light of nature and reason are the only guides in dootrine and practise. It is thus a phase of Rationalism. In the last century there were a series of writers who are spoken of distinctively as the English deists. They include Collins, Toland, Tindal, etc.

De Kaib, JOHN (1721-1780), baron, a general in the American army of the Revolution, b. in Alsace. He was a brigadier in the French service, and in 1777 accompanied Lafayette to America. Congress appointed him a major general, and he served in New Jersey and Maryland, was second in command under General Gates, and was mortally wounded at Camden.

**De Koven**, REGINALD, American composer, b. 1859 at Middletown, Conn. He studied at Stuttgart and Paris, and later attended Oxford University, where he graduated in 1879. He devoted himself to composition, and produced several popular operas and songs, among which are Margery Daw. O Promise Me, Winter's Lullaby, and Ask What Thou Wilt. His operas are, Robia Hood, Don Quirote, The Fencing Master, Rob Roy, and The Mandarin. He is at present musical critic of the New York World.

**Delago'a Bay,** in Southeast Africa, a large sheet of water separated from the Indian Ocean by the peninsula and island of Inyack. The bay stretches north and south upward of 40 mi., with a breadth of from 16 to 20 mi., and forms the southern extremity of the Portuguese settlement of Mozambique. It is available for vessels of large tonnage, though the presence of shoals, banks, and flats renders the navigation of the bay somewhat intricate. The port and Portuguese settlement of Lourengo Marques is becoming a place of considerable trade since the opening of gold mines in the Transvaal. A railway running toward the Transvaal has been opened for a distance of over 50 mi.

De Lancey, JAMES (1703-1760), colonial chief justice, b. in New York City. In 1731 he became second judge of the supreme court. In 1730 he framed the Montgomery charter of the city. In 1733 he succeeded to the chief judgeship, which he retained throughout life. In 1753, he became lieutenant governor of New York, and in 1754 presided over the first Congress convened in the country, held to conciliate the Indians. In May, 1755, he granted the charter of Columbia College. When Governor Hardy arrived in September, 1755, the lieutenant governor resumed his functions on the bench. Two years later Governor Hardy sailed in command of an expedition against Louisburg, leaving Judge De Lancey again governor of the province.

**Delano,** COLUMBUS (1809-), statesman, b. in Shoreham, Vt., removed to Ohio in 1817, practised law, and was elected to Congress in 1844 and again in 1864 and 1866. In November, 1870, he became secretary of the interior, and held office until October, 1875.

**De la Ramee**, LOUISA, known to the literary world as "Ouida," was b. in England in 1840. Her novels, though full of incident, are disfigured by extravagance of language.

Delaroche (dé-la-rosh), Hippolyte (familiarly styled Paul) (1797-1856), probably the greatest painter of the French school. He studied landscape painting for a short time, but applied himself afterward to historical painting, and rapidly rose to eminence. His subjects are principally taken from French and English history. Among others may be men-tioned: St. Vincent de Paul Preaching Before Louis XIII on behalf of Deserted Children; Joan of Arc Interrogated in Prison by Cardinal Beaufort; A Scene of the St. Bartholomew Massacre; The Children of Edward IV in the Tower; etc. His merits consist in correct drawing, appropriate expression, harmonious color, and great distinctness and perspicuity in treatment, rendering the story of his pictures at once intelligible.

**Delaware**, a river of the U. S. which rises in Catskill Mountains in New York, separates Pennsylvania from New York and New Jersey, and New Jersey from Delaware, and loses itself in Delaware Bay. It has a course of about 300 mi., and is navigable for large vessels to Philadelphia, and for smaller craft to the head of tide water at Trenton (155 mi.).

**Delaware**, one of the original thirteen states, and, next to Rhode Island, the smallest state in the Union. named after Lord Delaware, one of the early governors of Virginia. It is bounded north by Pennsylvania, east by the Delaware River and Bay and by the ocean, south and west by Maryland; area 2.050 sq. mi. It is divided into three counties, Kent, Newcastle, and Sussex, and has nearly the form of a right-augled triangle (hence its popular name "the diamond state"). Its rivers are small and unimportant, and most of them flow into the Delaware Bay or River. The Delaware and

Chesapeake Canal connects the two great bays. and makes an easy water transit for produce between Philadelphia and Baltimore. Save in a small hilly section in the north, nearly all the surface is low and level, and in the extreme south there is much swampy land; while the most southern two fifths of the area is in great part a sandy region. The hill district in the north presents a stony surface overlying azoic rocks, such as gneiss and granite, with patches of serpentine and limestone. A strip of highly fertile red clay lies south of the hill country: and next southward occurs a productive and fossiliferous greensand formation, succeeded by a somewhat sandy belt, less fertile than the greensand, although the greater part of its extent is by no means unproductive. The coast region has many salt marshes, some of them dyked, and thus rendered tillable; and farther inland is a considerable body of extremely rich alluvial soil. The western border of the state is generally well wooded, and in some places flat and marshy. In the north kaolin and iron ore are found, and bog ore or limonite occurs to some extent in other parts.

Climate.—The climate is mild and healthful except in the southern part, where the swamps occasion some fevers. The range of temperature in winter is from 30 to 38 degrees, and in summer from 69 to 74. The average rainfall is about 49 in.

Vegetation.—Fruit growing is the principal agricultural industry. Great quantities of peaches, apples, and small fruit are raised and sold in Philadelphia and New York. The cereals are wheat, corn, rye, oats, barley, buckwheat, flax, hops, tobacco, peas, beans, clover seed, and flax seed. In the swampy districts there are great forests of cypress and other evergreen trees, and in the semi-tropical regions are large quantities of bog oak, hackmatack, etc.

Manufactures.—In manufacturing Delaware ranks thirty-fifth in the Union. Among the manufactories are cotton, paper, and carriages. Iron shipbuilding is also carried on in the state. There are rolling mills, woolen factories and flouring mills. There are several railroads. having a total mileage of 350 mi.

Education.—There are two colleges in the state, Delaware College at Newark, and Wesleyan Female College at Wilmington. The public school education is thorough throughout the state. The state provides for the purchase of free text-books. The state institutions are a state hospital for the insane, industrial school for boys and girls, deaf, dumb, and blind institutions, etc.

History. – Delaware was one of the original thirteen states of the Union. It was first settled by Swedes and Finns in 1638; in 1655 it passed into the hands of the Dutch; in 1664 it passed with New York into the hands of the English; in 1682 Wm. Penn became proprietor of the Delaware counties. Delaware was a slave state until the Civil War, but took no part in the secession movement. The principal cities are Wilmington, Dover (the capital), and New Castle. The pop. of the state is about 170,000. The popular name is the Blue Hen State.

Governors.—Joshua Clayton, 1796-98; Gunning Bedford, 1706-97; Daniel Rogers, 1797-98; Richard Bassett, 1798-1801; James Sykes, 1801-02; David Hall, 1802-05; Nathaniel Mitchell, 1805-08; George Truett, 1808-11; Joseph Haslett, 1811-14; Daniel -Rodney, 1814-17; John Clarke, 1817-20; Jacob Stout, 1820-21; John Collins, 1821-22; Caleb Rodney, 1822-23; Joseph Haslett, 1823-24; Samuel Paynter, 1824-27; Charles Polk, 1827-30; David Hazzard, 1830-33; Caleb P. Bennett, 1833-36; Charles Polk, 1836-37; Cornelius P. Comegys, 1837-40; Wm. B. Cooper, 1840-44; Thomas Stockton, 1844-46; Joseph Maul, 1846; Wm. Temple, 1846-47; Wm. Thorp, 1847-51; Wm. H. Ross, 1851-55; Peter F. Cansey, 1853-59; Wm. Burton, 1859-63; Wm. Cannon, 1863-67; Gove Saulsbury, 1867-71; James Ponder, 1871-75; John P. Cochran, 1875-79; John W. Hall, 1870-83; Chas. C. Stockley, 1888-87; Benjamin T. Biggs, 1887-01; R. J. Reynolds, 1801-05; J. H. Marvil (d. April 8), 1805; W. P. Watson, 1805-97; E. W. Tunnell, 1897.

Delaware, Delaware co., O. Railroads: Columbus, Hocking Valley & Toledo, and C. C. C. & St. L. Industries: chair, castiron, furniture factories, woolen mills, and carriage shops. Seat of Ohio Wesleyan University. Pop. est. 1897, 8,500.

**Delaware Bay**, an estuary or arm of the sea between the states of Delaware and New Jersey. At the entrance, near Cape Henlopen, is situated the Delaware Breakwater, which affords vessels a shelter within the cape. It was erected by the Federal government, and cost about \$3,000.000.

Delaware Indians, a tribe belonging to the Algonquin family, originally known as living on the Delaware River, and called by themselves *Lenni Lenape*. They had to leave their original settlements about the middle of last century, going farther west, and latterly they were removed to the Indian Territory. Their numbers are now insignificant.

**Delft** (formerly Delf), a town, Holland, 8 mi. n. w. Rotterdam, intersected in all directions by canals. Among its buildings are the townhall, the Prinsen-hof, the scene of the assassination of William the Silent, now a military barrack; the old Reformed church, containing the monuments of Admiral Tromp, the naturalist Leeuwenhoek, etc.; the new church, containing monuments to William I, Hugo Grotius, and the burial vaults of the present royal family. Pop. 27, 131. **Delhi** (del'i), a city of Hindustan, in the

Delhi (del'1), a city of Hindustan, in the Punjab, anciently capital of the Patan and Mogul empires, about 954 mi. n.w. Calcutta. It was at one time the largest city in Hindustan. A vast tract, covered with the ruins of palaces, pavilions, baths, gardens, mausoleums, etc., marks the extent of the ancient metropolis. The present city abuts on the right bank of the Jumna, and is surrounded on three sides by a lofty stone wall. The palace or residence of the Great Mogul, built by Shah Jehan, commenced in 1631, and now known as "the fort," is situated in the east of the city, and abuts directly on the river. It is surrounded on three sides by an embattled wall of reddish sandstone nearly 60 ft. high, with round towers at intervals, and a gateway on the west and south. Since the mutiny of 1857 a great portion has been demolished in order to make room for military barracks. One of the most remarkable objects in the city is the Jamma Musjid or Great Mosque, a magnificent structure in the Byzantine-Arabic style, built by the Emperor Shah Jehan in the seventeenth century. Among modern buildings are the government college, founded in 1792, the Residency, and a Protestant church. Pop. 193,580.

Delir' ium Tre' mens, an affection of the brain which arises from the inordinate and protracted use of ardent spirits. It is therefore almost peculiar to drunkards. The principal symptoms of this disease, as its name imports, are delirium and trembling. The delirium is a constant symptom, but the tremor is not always present, or, if present, is not always perceptible. Frequently the sufferer thinks he sees the most frightful, grotesque, or extraordinary objects, and may thus be put into a state of extreme terror. It is properly a disease of the nervous system.

**Della Robbia**, LUCA (1400-1482), Italian sculptor. He was distinguished for his work both in marble and bronze, and also for his reliefs in terra-cotta coated with enamel, a kind of work named after him.

**Deforme** (de-form), MARION, a celebrated French beauty who reigned under Louis XIII. The date of her birth is stated at 1611, 1612, and 1615. Her beauty and wit soon made her house the rendezvous of all that was gailant and brilliant in Paris. She espoused the side of the Frondeurs, and Mazarin was about to have her arrested when her sudden death terminated her short career of thirty-nine years.

De'los, an island of great renown among the ancient Greeks, fabled to be the birthplace of Apollo. It was a center of his worship, and the site of a famous oracle. It is the central and smallest island of the Cyclades, in the Ægean Sea, a rugged mass of granite about 12 sq. mi. in extent.

sq. mi. in extent. **De Long,** GEORGE WASHINGTON (1844-1881), Arctic explorer; b. in New York City; d. in Siberia, Russia. He was educated in the public schools at Brooklyn. In 1861 he was appointed midshipman at the U. S. Naval Academy, and graduated in 1865. He commanded an exploring expedition to the Arctic regions, which resulted in a number of important discoveries, but which was ill-fated, all but two of the party perishing.

**Delphi**, an ancient Greek town, originally called Pytho, the seat of the famous oracle of Apollo, was situated in Phocis, on the southern side of Parnassus, about 8 mi. n. of the Corinthian Gulf. It was also one of the meetingplaces of the Amphictyonic Council, and near it were held the Pythian games. The oracles were delivered by the mouth of a priestess who was seated on a tripod above a subterranean opening, whence she received the vapors

## Delphos

ascending from beneath, and with them the inspiration of the Delphian god. The oracular replies were always obscure and ambiguous; yet they served, in earlier times, in the hands of the priests, to regulate and uphold the political, civil, and religious relations of Greece. The oracle was celebrated as early as the ninth century B. C., and continued to have importance till long after the Christian cra, being at last abolished by the emperor Theodosius.

Delphos, Allen and Van Wert cos., O., on Miami & Erie Canal, 74 mi. s.w. of Toledo, Railroads: P. Ft. W. & C.; T. St. L. & K. C. (clover leaf route); C. H. & D.; and Northern Ohio. Industries: wheel works, two flouring mills, iron foundry, hoop and stave, hinge coupler, gas engine, and patent fence factories, furniture factory and marble works. Oil and natural gas found in paying quantities. Surrounding country agricultural. The town was first settled in 1834. Pop. est. 1897, 5,000.

Delsarte, FRANÇOIS ALEXANDRE (1811-1871), musician and investigator.b. at Solsme, France. He composed a few melodies and wrote sev-eral romances. He was chiefly known as a teacher of singing and declamation. Many operatic and dramatic celebrities owe their success to his training. At the age of twelve he devised an original method of musical notation. Baurbini was so pleased with his originality that he adopted him. Delsarte sought by an elaborate system to reduce human expression to a science. Some charts represent-His phiing his formulations are extant. losophy has become the basis of culture and criticism. According to Delsarte the trinity is the universal formula of human life, arts, and sciences. Each part of man's three-fold nature has a distinct office to perform and yet is inseparably connected with every other part. The vital forces express themselves by tension, or tone used in the medical sense-that is, power or strength; the mental in words, and The limbs are the emotional by gestures. the primary vital organs; the head is the mental organ and the torso the emotional. All vital movements are from the center; all mental movements toward the center; all normal movements are around the center. Bodily motions should be governed by the laws of opposition, succession, rhythm, force, direction, velocity, and reaction. The Delsarte system has been popularized in the U. S., and its fundamental principles applied to health with excellent results. His influence on plastic, decorative, and dramatic arts has been widely felt. He claimed that every outward manifestation is but the expression of an inner The following rules have been applied state. to the improvement of man's physical condition: 1, Relaxing movements relieve nervous strain and conserve vital energy. 2. Energizing movements increase and direct nervous force. 3, Æsthetic movements produce health. harmonious development, and pleasing expression by harmonizing man's three-fold nature. **Delta**, the name of the Greek letter  $\Delta$ , cor-

responding to the English D. The island

#### Democracy

formed by the alluvial deposits between the mouths of the Nile, from its resemblance to this letter, was named Delta by the Greeks: and the same name has since been extended to those alluvial tracts at the mouths of great rivers which, like the Nile, empty themselves into the sea by two or more diverging branches

**Demand and Supply;** terms used in political economy to express the relations between consumption and production, between the demand of purchasers and the supply of commodities by those who have them to sell. The relations which subsist between the demand for an article and its supply determine its price or exchangeable value. When the demand for a commodity exceeds the supply the price of the commodity is raised, and when the supply exceeds the demand the price falls.

**Demavend** (de-mä'vend), a volcanic mountain of Persia, and the highest peak of the Elbruz chain, 45 mi. s. of the Caspian Sea and about 40 mi. n.e. of Teheran. Its height is about 19,400 ft., and it bears evidence of having been active during the latest geological (if not within the historic) period.

**Dembin'ski**, HENRYK (1791-1864), a Polish general, and leader in the Hungarian revolution of 1849. He served under Napoleon during the Russian campaign of 1812; was governor of Warsaw and commander-in-chief of the Polish army during the revolution of 1830; was appointed by Kossuth commander of the Hungarian troops in 1849, and served till Kossuth's resignation compelled him to seek refuge in France, where he remained till his death.

**Demera'ra** (or Demarara), a division of British Guiana, which derives its name from the river Demerara. It extends about 100 mi. along the coast. lying on the e. of Essequibo and on the w. of Berbice. The soil is very fertile, producing abundant crops of sugar, coffee, cotton, rice, etc. Chief town, Georgetown. Population of province, 125,000. The river, after a course of about 120 mi., flows into the Atlantic.

**Deme'ter**, one of the twelve principal Grecian deities, the great mother goddess, the nourishing and fertilizing principle of nature.

**Demet' rlus** (or Dmitri), the name of a series of impostors who usurped supreme authority in Russia, and led to some of its remarkable revolutions.

**Demi-rilievo** (-ri-li- $\tilde{a}'v\delta$ ), in sculpture, halfrelief, or the condition of a figure when it rises from the plane as if it had been cut in two and only one half fixed to the plane.

**Dem'turge** (Greek, *Demtourgos*, a handicraftsman), a designation applied by Plato and other philosophers to the Divine Being. considered as the Architect or Creator of the universe.

**Democ'racy**, the rule of a people by the people themselves; that form of government in which the sovereignty of the state is vested in the people, and exercised by them either directly, as in the small republics of ancient Greece, or indirectly, by means of representative institutions, as in the constitutional states

of modern times. The term is also applied in a collective sense to the people or populace, especially the populace regarded as rulers.

**Democ' ritus** (b. c. 470-370), a Greek philosopher of the new Eleatic school, a native of Abdëra. He was called "the laughing philosopher," from his habit of laughing at the follies of mankind. In his system he developed the mechanical or atomical theory of his master, Leucippus. Thus he explained the origin of the world by the eternal motion of infinite number of invisible and indivisible bodies or atoms, which differ from one another in form, position, and arrangement, and which have a primary motion, which brings them into contact, and forms innumerable combinations, the result of which is seen in the productions and phenomena of nature.

De'mon (Greek, daimon), a spirit or immaterial being of supernatural but limited powers, especially an evil or malignant spirit. Among the ancient Greeks the name was given to beings similar to those spiritual existences called angels in the Bible. In the New Testament evil spirits are called demons (commonly translated "devils"). A belief in demons is found in the oldest religions of the East.

**Demonstration**, in a logical sense, any mode of connecting a conclusion with its premises, or an effect with its cause. In a more rigorous sense it is applied only to those modes of proof in which the conclusion necessarily follows from the premises. In ordinary language, however, demonstration is often used as synonymous with *proof*.

Demosthenes (-nēz) (B.c. 382-322), the famous ancient Greek orator, was the son of a sword-cutler at Athens. His father left him a considerable fortune, of which his guardians attempted to defraud him. Demosthenes, at the age of seventeen years, conducted a suit against them himself, and gained his cause. He then set himself to study eloquence, and though his lungs were weak, his articulation defective, and his gestures awkward, by perseverance he at length surpassed all other orators in power and grace. He thundered against Philip of Macedon in his orations known as the Philippics, and endeavored to instill into his fellow citizens the hatred which animated his own bosom. He labored to get all the Greeks to combine against the encroachments of Philip, but their want of patriotism and Macedonian gold frustrated his efforts. He was present at the battle of Chæroneia (380 B.C.), in which the Athenians and Bootians were defeated by Philip, and Greek liberty crushed. On the accession of Alexander in 336 Demosthenes tried tostir up a general rising against the Macedonians, but Alexander at once adopted measures of extreme severity, and Athens sued for mercy. It was with difficulty that Demosthenes escaped being delivered up to the conqueror. In 324 he was imprisoned on a false charge of having received a bribe from one of Alexander's generals, but managed to escape into exile. On the death of Alexander next year he was recalled, but the defeat of the

Greeks by Antipater caused him to seek refuge in the temple of Poseidon, in the island of Calauria, on the coast of Greece, where he poisoned himself to escape from the emissaries of Antipater. The character of Demosthenes is by most modern scholars considered almost spotless. His fame as an orator is equal to that of Homer as a poet. Cicero pronounces him to be the most perfect of all orators. He carried Greek prose to a degree of perfection which it never before had reached. Everything in his speeches is natural, vigorous, concise, symmetrical. We have under his name sixty-one orations, some of which are not The great opponent-and indeed genuine. enemy-of Demosthenes as an orator was Æschines.

**Demurr'age,** in maritime law, the time during which a vessel is detained by the freighter, beyond that originally stipulated, in loading or unloading. When a vessel is thus detained she is said to be on demurrage. The name is also given to the compensation which the freighter has to pay for such delay or detention. Demurrage must be paid though it be proved the delay is inevitable; but it cannot be claimed where it arises from detention by an enemy, tempestuous weather, or through the fault of the owner, captain, or crew.

**Demurrer**, in law, a stop at some point in the pleadings, and a resting of the decision of the cause on that point; an issue on matter of law. A demurrer confesses the fact or facts to be true, but denies the sufficiency of the facts in point of law to support the claim or defense.

**Dena'rius**, a Roman silver coin worth 10 asses or 10 lbs. of copper originally, and afterward considered equal to 16 asses. when the weight of the as was reduced to an ounce on account of the scarcity of silver. The *denarius* was equivalent to about 16 cents of our money. There was also a gold denarius equal in value to 25 silver ones.

**Denbigh** (den'bi), a county of North Wales, on the Irish Sca; area, 662 sq. mi., of which about a fourth is arable. There are several beautiful and fertile vales, among the more celebrated of which are the vales of Llangollen. Clwyd, and Conway. Pop. 117,872; capital, Denbigh; pop. 4.507.

Denbigh; pop. 4,507. Denbigh; pop. 4,507. Denis, Sr., a town in France, department of the Seine, 6 mi. n. of Paris. It contains the famous abbey church of St. Denis, a noble Gothic structure in part dating from the eleventh century or earlier, but much has been done in the way of restoration in the present century. St. Denis was the burial place of the kings of France; and all her rulers from Hugh Capet downward, besides some of the earlier dynasties, lay there till 1793, when the revolutionary fury of the convention caused the tombs to be rifled and the church to be denuded.

**Dennison**, Grayson co., Texas. Railroads: M. K. & T.; H. & T. C.; and Texas Pacific. Industries: machine shop, wagon works, planing and grist mills, and bridge works. Coal and iron are within easy reach. The town was
## Denmark

first settled in 1872 and became a city in 1873. Pop. est. 1897, 15,000.

Den'mark, a northern kingdom of Europe, consisting of a peninsular portion called Jutland, and an extensive archipelago lying east of it and comprising the islands of Seeland, Samsö, Lasö, Arrö, Bornholm, and many smaller ones. Besides these there are the outlying possessions of Iceland, Greenland, and the Faroe Islands in the Atlantic Ocean, and Santa Cruz, St. Thomas, and St. John in the West Indies. The area of the home possessions is 15,288 sq. mi., of which Jutland occupies 9,743; pop. 2,185,162. Copenhagen is the capital; other chief towns are Odense, Aarhuus, Aalborg, Randers, and Horsens. Denmark is divided into eighteen provinces or districts, besides the capital, nine of these making up Jutland, while the others embrace the islands. Denmark, whether insular or mainland, is a very low-lying country, the eastern side of Jutland, where the highest elevation occurs, not exceeding 550 ft. All the rocks be-long to the upper series of the secondary and to the tertiary formation. The rock most fully developed is the chalk, above which is an extensive boulder formation containing seams of lignite. Above this are thick beds of clay and marl. Where this prevails, as in Seeland and the east of Jutland, the soil is generally fertile; but where it is overlaid with deep beds of sand, as in the north and west of Jutland, the aspect is extremely desolate. Nearly the whole west coast, indeed, is rendered almost uninhabitable by the drift sand, which has formed an almost uninterrupted line of sterile downs called Klitten, extending from Cape Skagen (or The Skaw) to Blaavands Hook. A large portion of Jutland consists of heathy or moory land, com-paratively unprofitable. Elsewhere it exhibits a fertile, undulating surface. The islands, especially Seeland and Funen, are fertile and present many landscape beauties. Woods of some extent exist, especially in the islands. In earliest prehistoric times the Scotch fir was the prevailing tree, and subsequently the oak. The principal tree now is the beech. The elm, ash, willow, aspen, and birch are met with in small numbers. Pine forests have been planted in the north of Jutland and elsewhere. Denmark has numerous streams but no large rivers: the principal is the Guden, which flows northeast through Jutland into the Cattegat. It is navigable for part of its course. The lakes are very numerous but not large, none exceeding 54 mi. in length by about 14 mi. broad. There are numerous winding inlets of the sea that penetrate far into the land. The largest of these, the Liimford, in Jutland, entering from the Cattegat by a narrow channel, winds its way through to the North Sca, thus making Northern Jutland really an island. Intercourse between the various islands and parts of the kingdom, separated from each other by water, is well kept up by ferries, etc., and the country is well supplied with railways, both in Jutland and the islands. Copenhagen, Aalborg, Aarhuns, and Randers are the chief seaports. Ow-

.

## Denmark

ing to the lowness of the land and its proximity to the sea on all sides, the climate is remarkably temperate for so northerly a region, though the thermometer in winter may sink to 22- below zero, and in summer rise to 89<sup>-2</sup>. Violent winds are frequent, and rains and fogs preva-lent. The agricultural land is greatly subdivided, as the law interdicts the union of small farms into larger. Among crops the greatest area is occupied by oats, which are grown all over the country, but best in Jutland. Barley is grown chiefly in Seeland, and is largely used in brewing beer, the common beverage of the country. Rye is extensively raised. Turnips, beans, peas, flax, hemp, hops, tobacco, etc.. are also grown; but in general, cattle breeding. grazing, and the dairy take up most of the farmer's attention in Denmark. The old Danish breed of horses found chiefly in Jutland, has long been famous for strength, symmetry. docility, and bottom. The herring, turbot, torsk, and salmon are the most abundant. Paper, gloves, the woolens, and earthenware of Jutland, the wooden clocks of Bornholm, are the chief manufactures. There are also iron foundries, sugar refineries, some extensive tanneries, and many distilleries. The commerce of Denmark is carried on chiefly with Great Britain, Germany, Norway, Sweden, and Russia-Germany possessing the largest share. The value of imports has in recent years varied between \$65,000,000 and \$80,000,000. The chief imports are textile manufactures, metal goods. coal, timber, oil, coffee, sugar, tobacco, fruit, etc. The chief exports are cattle, horses, and swine, butter (a most important item), bacon. hides, flour, eggs, and other edibles. Much of the butter and other agricultural produce goes to Britain. In 1895 the mercantile marine had a total tonnage of about 330,033 tons. The railways have a length of about 1,407 mi. Since 1875 the unit of the Danish monetary system has been the krone, or crown. The krone is divided into 100 öre.

The population of Denmark is composed almost exclusively of Danes, with a few thou-sand Jews and others. The Danes have regular features, fair or brownish hair, and blue eyes. They still maintain their reputation for seafaring skill and hospitable customs. They are almost exclusively Lutherans in religion, but unlimited toleration is extended to all faiths. Jews, however, though themselves electors. cannot be elected as representatives. At the head of the educational institutions stand the University of Copenhagen and the Holberg Academy at Soröe. The provinces are well supplied with gymnasia and middle schools. and primary instruction is given at the public expense in the parochial schools. It is rare to meet a peasant who cannot read and write. even among the poorer class.

The government of Denmark was originally an elective monarchy. In 1661 it became a hereditary and absolute monarchy, and in 1849 a hereditary constitutional one, the legislative power being in the king and diet jointly. The diet or *Rigsdag* consists of two chambers, the *Landsthing* or upper house, the *Folkething* or

lower house. The former is a senate of 66 members, 12 of whom are nominated for life by the crown, the others being elected for 8 years. The members of the Folkething are 102 in number, directly elected by universuffrage, and hold their seats for 3 sal The Rigsdad meets every October, and years. all money bills must be submitted to the jower The army consists of all the ablehouse. bodied young men of the kingdom who have arrived at the age of twenty-one years. The time of service is 8 years in the regular troops, and afterward 8 more in the reserve. Every corps has to drill for 30 to 45 days every year. The army on a war footing has a total strength of 1,352 officers and 45,910 men. The navy consists of 45 vessels and 135 guns. The revenue usually amounts to about \$15,000,000. The national debt is \$33,004,722. History.—The oldest inhabitants of Denmark

were the Cimbri, who dwelt in the peninsula of Jutland, the Chersonecus Cimbrica of the Romans. They first struck terror into the Romans by their incursion, with the Teutons, into the rich provinces of Gaul (113-101 B.C.). After this, led by the mysterious Odin, the Goths broke into Scandinavia, and appointed chiefs from their own nation over Denmark, Norway, and Sweden. For a considerable time Denmark was divided into a number of small states, whose inhabitants lived mostly by pir-acy along the neighboring coasts. In 787 they began to make their descents on the eastern coasts of England, and along with other inhabitants of Scandinavia they conquered Normandy in 876-77. Under Gorm the Old all the small Danish states were united in 920, and his grandson Sweyn, now the head of a powerful kingdom, commenced the conquest of Norway and of England, which was ultimately completed by his son Canute. Canute d. in 1035, leaving a powerful kingdom to his successor, who, in 1042 lost England, and in 1047 Norway. In 1047 Sweyn Magnus Estridsen ascended the throne, but with the exception of the great Waldemar the new dynasty furnished no worthy ruler, and the power of the kingdom decayed considerably till the accession of the politic Queen Margaret in 1387, who estab-lished the union of Calmar in 1397, uniting under her rule Denmark, Sweden, and Norway. Under the rule of Christian, Norway, Sweden, Schleswig, and Holstein were connected with the crown of Denmark, but under his successor Christian II Sweden established its independ-Under Frederick I (1523-33), the refence. ormation was introduced. Christian IV of Denmark ascended the throne in 1588, took part in the Thirty Years' War, and engaged twice in a war with Sweden, with most unfortunate results. Frederick III again engaging in war with Sweden in 1657 was equally unsuc-cessful. Christian V and Frederick IV were conquered in the war with Charles XII. Denmark, however, after the fall of Charles XII, gained by the peace of 1720 the toll on the Sound, and maintained possession of Schleswig. After this Denmark enjoyed a long repose. In 1800, having acceded to the northern confed-

eracy, the kingdom was involved in a war with Great Britain, in which the Danish fleet was defeated at Copenhagen, April 2, 1801. In 1807, there being reason to think that Denmark would join the alliance with France, a British fleet was sent up the Sound to demand a defensive alliance or the surrender of the Danish fleet as a pledge of neutrality. Both were de-nied, till the Danish capital was bombarded and forced to capitulate, the whole fleet being delivered up to the British. The war, however, was concluded by which she ceded Heligoland to England in exchange for the DanishWest India Islands, and Norway to Sweden in exchange for Swedish Pomerania and Rügen, which, however, she shortly after surrendered to Prussia, receiving in return Lauenburg and a pecuniary compensation. In June, 1815, the king entered into the German confederacy, as representing Holstein and Lauenburg. In 1848 Schleswig and Holstein revolted and were not finally subdued till 1852. In 1857 the Sound dues were abolished. Frederick VII d. in 1863 and with him the Oldenburg line became extinct. He was succeeded by Christian XI. At the commencement of 1864 the Danish territory was politically distributed into four parts; viz., Denmark Proper, the duchy of Schleswig, or South Jutland, the duchy of Holstein, the duchy of Lauenburg. The measures of the Danish government compelling the use of the Danish language in state schools having given great umbrage to the German population of the duchies, the disputes resulted in the intervention of the German confederation, and ultimately Holstein was occupied by the troops of Austria and Prussia (1864). After a short campaign the Prussians captured Alsen, overran the greater part of Julland, and forced the Danes to accept a peace (August 1). by which they renounced their right to the duchies of Schleswig, Holstein, and Lauenburg. A difference now arose between Austria and Prussia as to what should be done with the duchies, and Prussia showing an evident intention of annexing them, the result was a war between the two powers, which ended in the total defeat of Austria at Sadowa, or Königgrätz, July 3, 1866. By the treaty which followed Austria relinquished all claim to the duchies, which thus fell to Prussia.

Language and Literature.-The Danish language belongs to the Scandinavian branch of the Teutonic family of languages, and is a sister of the Swedish and Norwegian. It is the most modern of the Scandinavian tongues; soft and rather monotonous, with shades of sound difficult for a foreigner to acquire. It is written either in the German or the Roman character. From the long union of Norway with Denmark, Danish became the written language of the Norwegians, and is still the language of the educated classes. 'The oldest literary monuments of the Danish language consist of the laws of the early kings in the twelfth century. During the Reformation period Christian Pedersen (1480-1554) did for the Danish language much what Luther did for the German, by publishing, besides other works, a translation of the New Testament and the Psalter and latterly the complete Bible. Modern Danish poetry commences in the period succeeding the Reformation with hymns, Scriptural dramas, edifying narratives, etc. Justesen Raach and Erik Pontoppidan the elder are among the chief names in this department. Anders Bording (d. 1677) and Thomas Kingo (d. 1723) made names as lyric poets, the sacred poems of the latter being a noble contribution to Danish literature. A new epoch began with Louis Holberg (1684-1754), who was the founder of the Danish stage, and his name and that of the lyric and dramatic poet Ewald mark the brightest period of the national litcrature. Among the comic dramatists Peder Andres Heiberg, and among song writers the celebrated Jens Baggesen, hold the first place. Fresh life was inspired into Danish poetry by Adam Ochlenschläger (1779-1850), contempo-rary with whom was Adolf Wilhelm Schack Staffeldt (1770-1826), a lyric poet of the first rank. In 1811 Bernhard Severin Ingemann made his appearance, first as a lyric poet, but afterward turning his attention to the drama, and later to the historic romance.

Den'sity, in physics, the quantity of matter contained in a body under a given bulk. If a body of equal bulk with another contains double the quantity of matter it is of double the density. Or if a body contain the same quantity of matter as another, but under a less bulk, its density is greater in proportion as its bulk is less than that of the other. Hence the density is directly proportional to the quantity of matter, and inversely proportional to the bulk or magnitude. The relative quantities of matter in bodies are known by their gravity or weight, and when a body, mass, or quantity of matter is spoken of, its weight or gravity is always understood, that being the proper measure of the density or quantity of matter. The weights of different bodies, of equal bulks, indicate their relative densities. The density of solids, fluids, and gases, as compared with that of water, is their Specific Gravity.

**Denta'ria**, coral-root, a genus of plants, natural order Cruciferæ. There are about twenty species, natives of temperate countries. They are ornamental herbs, with creeping, singularly-toothed root-stocks, from which they receive the names of coral-root and tooth-wort. The stem leaves are opposite or in whorls of three, and the flowers are large and purple.

**Denta' tus**, MANIUS CURIUS, an ancient Roman general of Sabine descent. In B. c. 290 he brought to a victorious termination the war with the Samnites, which had lasted for nearly fifty years. In B. c. 275 he defeated King Pyrrhus at Beneventum, for which he received a magnificent triumph. In B. c. 274 he was made consul for the third time and conducted to a successful issue the last war with the southern Italians. He died about B. c. 270.

Den'tils, in architecture, the little cubes

resembling teeth, into which the square member in the bed-molding of an Ionic, Corinthian. or Composite cornice is divided.

Den'tine, the ivory tissue lying below the enamel and constituting the body of a tooth. It consists of an organic basis disposed in the form of extremely minute tubes and cells, and of earthy particles.

Den'tistry, the art of cleaning, extracting, repairing, and replacing teeth. There are two very distinct departments in dentistry, the one being dental surgery, the other what is known as mechanical dentistry. The first requires an extended medical knowledge on the part of the practitioner, as, for instance, a knowledge of diseases whose effects may reach the teeth. of the connection between the welfare of the teeth and the general system, etc., as well as ability to discern latent oral diseases, calculate the effects of operations, etc. The chief operations in this department are scaling, or removing the tartar which has accumulated on the base of the teeth; regulating, the restoring of overcrowded and displaced teeth to their proper position; stopping or stuffing, the filling up of the hollow of a decayed tooth and thus preventing the progress of decay; extracting, a process requiring considerable muscular power and delicacy of manipulation. The second department, mechanical dentistry, is concerned with the construction of artificial substitutes for lost teeth, and requires much mechanical science, it being a very delicate work to give artificial teeth a perfectly natural appearance in shape and color. The actual construction of the teeth, however, has passed largely into the hands of the manufacturers, and the dentist has only the selecting, fitting, and fixing to do. In the U.S. the Baltimore College of Dental Surgery is the oldest, being chartered in 1839: the Ohio College of Dental Surgery followed in 1845; the Philadelphia College of Surgery in 1850; the Philadelphia Dental College in 1863; the New York College of Dentistry in 1865, and various others. The American Journal and Library of Dental Science was established in Baltimore in 1839. Every state has now its state dental society; besides national organizations, of which the American Dental Association is among the most important.

**Denver**, a city, capital of the state of Colorado, named after General Denver, on the right bank of the South Platte River, 15 mi. e. of the Rocky Mountains. It is well built, having imposing public and other buildings, and is increasing with extraordinary rapidity, being the junction of eight important railway systems, and having various flourishing industries. The climate is peculiarly dry and salubrious. The town was founded in 1858. Pop. 106,713.

**Deodoriz ers,** chemical substances which have the power of destroying fetid effluvia. as chlorine, chloride of lime, etc.

D'Eon de Beaumont (dā-on dē bō-mōn). CHARLES GENEVIEVE LOUISE AUGUSTE ANDRE TIMOTHEE (1728-1810). a notorious French char acter, chevalier, doctor of law, diplomatist, etc. In 1755 he was sent as envoy on a difficult mis-

sion to the Russian court, on which occasion he seems to have dressed himself as a woman. He afterward distinguished himself in the Seven Years' War, then went to London as secretary of the French legation, and ultimately became minister plenipotentiary. Having quarreled with the French government, he lived fourteen years in London in a kind of banishment. During these years he had occasionally, probably for purposes of intrigue, dressed and passed as a female, and about this time his sex began to be doubted. In 1777 he returned to France, was ordered to dress as a woman, and continued to do so both there and after he returned to England (in 1785), where he died in great poverty, being then regarded by every one as a female.

**Depart' ment**, the name given to the principal territorial divisions of France. At the time of the French Revolution departments replaced the old division into provinces, the change being voted in the Constituent Assembly in 1789. There are at present eighty-seven departments, each of which is subdivided into arrondissements.

**De Pauw University**, at Greencastle, Putnam co., Ind., one of the chief institutions of learning maintained by the Methodist Church, constituted in 1837. It is excellently endowed, mainly by the liberality of the Hon. W. C. de Pauw, has a staff of 35 professors and teachers, and over 600 students.

**Depo'nent,** 1, in grammar, a verb passive in form, but active or neuter in signification. 2, In law, a person who makes an affidavit, or one who gives his testimony in a court of justice; a witness upon oath.

**Dept' ford** (det' ford), a parliamentary borough, England, in the counties of Kent and Surrey, on the right bank of the Thames, forming now part of London. It has some manufactures of pottery, chemicals, soap, etc. The old naval dockyard was shut up in 1869, but the royal victualling yard is still the largest establishment of its kind. Pop. 101,326.

**Depew**, CHAUNCEY MITCHELL, orator and lawyer, b. in Peekskill, N. Y., April 23, 1834. He graduated at Yale in 1856. In 1861–62 he was a member of the New York Assembly. In 1863 he was elected secretary of state. In 1866 he became attorney for the Harlem Railroad Company, and. in 1869, became counsel for the consolidated New York Central & Hudson River Railroad Company. In 1874 the legislature appointed him regent of the state university. In 1882 he became second vice-president of the New York Central & Hudson River Railroad Company, and in June, 1885, was elected to the presidency. He is also president of the West Shore Railroad Company. At the present time he is president of the Union League Club of New York City, and of the Yale Alumni Association of that city.

De Quincey, THOMAS (1785-1859), a wellknown English author, was the son of a Manchester merchant, and b. at Greenhays, near Manchester. In 1803 he matriculated at Oxford, and it was in the second year of his course there that he began to take opium in order to alleviate severe neuralgic pains. On leaving college he settled at Grasmere, Westmoreland, in the vicinity of Wordsworth and Southey, and devoted himself to literary work. Here or in London he remained till 1828, reading voraciously, and writing for the London Magazine, Knight's Quarterly Magazine, and latterly Bluckwood's Magazine. From 1828 to 1840 he lived in Edinburgh, then removed with his family to Lasswade, which continued to be his headquarters. He d. at Edinburgh.

**Dera Ghazi Khan**, a district and town in the Punjab, Hindustan. The former, which is in Derajat division, has an area of 4,517 sq. mi. and a pop. of 363,346. The town has a pop. of 22,309, half Hindus and half Mohammedans. It has extensive manufactures of silk, cotton, and coarse cutlery.

**Dera Ismail Khan**, a district and a town in Hindustan, in the Punjab, in the division of Derajat. The district lies n. of that of Dera Ghazi Khan on both sides of the Indus, and has an area of 9,296 sq. mi., and a pop. of 441, 649. The town is a staple place for cotton goods. Pop. 22,164.

**Derajat** (-jät'), a division or commissionership of Hindustan, in the Punjab, occupying part of the valley of the Indus, and comprising Dera Ghazi Khan, Dera Ismail Khan, and Bannu; area 17,681 sq. mi. It is well watered and fertile, and contains numerous towns and villages. Pop. 1,137,572, mostly Mohammedans.

Derby, a municipal borough in England. capital of Derbyshire, on the Derwent, 115 mi. n.n.w. London. It has some fine public buildings, among which are the churches of All Saints, St. Alkmund, and St. Werburgh, the county hall, school of art, infirmary, etc. There is also a very handsome free library and museum. The principal manufactures are: silk, cotton, paper, articles in Derbyshire spar, castings, and porcelain, etc. Derby is one of the oldest towns in the kingdom, and is supposed to owe its origin to a Roman station, Derventio, situated at Little Chester, on the opposite side of the river. Pop. 94,146. The county of Derby, or Derbyshire, in the center of the kingdom, area 1,029 sq. mi., five sixths being arable or in permanent pasture. It exhibits much varied and romantic scenery, the southern and eastern parts having a fertile soil, while the northwestern portion is bleak, with a rocky and irregular surface. Oats and turnips are important crops, and dairy-husbandry is carried on to a large extent. Coal is abundant in various parts of the county, iron ore is also plentiful, and lead, gypsum, zinc, fluor-spar, and other minerals are obtained. The manufactures are silk, cotton, and lace, machinery and agricultural im-

plements. Pop. 527,886. Derby, New Haven co., Conn., at the junction of Housatonic and Naugatuck rivers. Railroad, N. Y. N. H. & H. Industries: desk manufactories, cotton mills, etc. Pop. est. 1897, 8,000.

**Der'rick**, a lifting apparatus consisting of a single post or pole, supported by stays and

guys, to which a boom with a pulley or pulleys is attached, used in loading and unloading vessels, etc. Floating derricks of the strongest construction, with an immense boom and numerous blocks, are also used.

**Derrick-crane**, a kind of crane combining the advantages of the common derrick and those of the ordinary crane. The jib of this crane is fitted with a joint at the foot, and has a chain instead of a tension-bar attached to it at the top, so that the inclination, and consequently the sweep, of the crane can be altered at pleasure.

Der'vish (or Dervise; Persian, "poor"), a Mohammedan devotee, distinguished by austerity of life and the observance of strict forms. There are many different orders of them. Some live in monasteries, others lead an itinerant life, others devote themselves to menial or arduous occupations. They are respected by the common people, and the mendicants among them carry a wooden bowl into which the pious cast alms. One of their forms of devotion is dancing or whirling about, another is shouting or howling, uttering the name Allah, accompanied by violent motions of the body, till they work themselves into a frenzy and sometimes fall down foaming at the mouth. They are credited with miraculous powers, and are consulted for the interpretation of dreams and the cure of diseases.

**Desault** (désō), PIERRE JOSEPH (1744-1795), one of the most celebrated surgeons of France. He became principal surgeon in the hospital De la Charité, and in 1788 was put at the head of the great Hôtel Dieu in Paris. Here he founded a surgical school, in which many of the most eminent surgeons of Europe were educated.

Des' cant, in music, an addition of a part or parts to a subject or melody, a branch of musical composition which preceded the more modern counterpoint and harmony, coming into existence at the end of the eleventh or beginning of the twelfth century.

Descartes (da-kart), RENE (1596-1650), a great French philosopher and mathematican, with whom the modern or new philosophy is often considered as commencing. He was educated at the Jesuit College of La Flèche, where he showed great talent. He entered the military profession and served in Holland and in Bavaria. In 1621 he left the army, and after a variety of travels finally settled in Holland, and devoted himself to philosophical inquiries. Descartes, seeing the errors and inconsistencies in which other philosophers had involved themselves, determined to build up a system anew for himself. He also contributed greatly to the advancement of mathematics and physics. The higher departments of geometry were greatly extended by him. His system of the universe attracted great attention in his time, though long since exploded. It rested on the hypothesis of celestial vortices, immense currents of ethereal matter, by which he accounted for the motion of the planets. His works effected a great revolution in the principles and methods of philosophizing.

Descent', in law, is the transmission of the right and title to lands to the heir, on the decease of the proprietor, by the mere operation The rule determining to whom an . of law. estate belongs, on the decease of the proprietor. is that of consanguinity, or relationship by blood, though with some exceptions, as in the case of the portion, or the use of a portion. of a man's property given by the law to his widow. In the U.S. the laws are founded upon the principle of equal distribution both of real and personal estate among heirs of the nearest surviving degree. Kindred in blood are divided into three general classes, viz., l. descendants; 2, ancestors; 3, collateral relatives. that is, those who have descended from the same common ancestor. The civil law computes the degrees by counting the generations up to the common ancestor, as father, grandfather, great-grandfather; or mother, grand-mother, great-grandmother; and from him or her down to the collateral relative, as brother, cousin, etc., making the degree of relationship the sum of these two series of generations." Every person has two sets of ancestors, the paternal and maternal, and therefore two sets of collateral relatives. There is also a distinction of collateral kindred, into those of the whole blood and those of the half blood.

**Desiccation**, a process of dispelling moisture by the use of air, heat, or chemical agents such as chloride of calcium, quick-lime, oil of vitriol, and fused carbonate of potash. *Desiccation cracks*, in geology, are the fissures caused in clayey beds by the sun's heat, and seen in various rock strata.

De Smet, PETER JOHN (1801-1872), missionary, b. in Termonde, Belgium; d. in St. Louis. Mo. In 1821 he sailed from Amsterdam in company of Bishop Verinx. In 1828 he went to St. Louis and assisted in establishing the University of St. Louis, and in 1838 was sent to establish a mission among the Pottawatomies. On April 30, 1840, he attached himself to the yearly caravan of the American Fur Company to proceed as missionary among the Flat Head Indians of the Rocky Mountains. In 1841 he returned to St. Louis, but soon set out anew for Indian conversions. On different occasions he efficiently interceded to prevent strife between the U. S. and the Indians; he was also instrumental in ending the Sioux War.

Des Moines, Polk co., Iowa, on Des Moines and Raccoon rivers. It has 17 diverging lines of railroad. Industries: starch factory, flour mill, woolen mill, six iron foundries, and a large number of other factories. Polk county is underlaid by 500,000,000 tons of coal. Two libraries, 9 colleges, 65 churches, and 4 daily newspapers. The town became a city in 1846. Pop. est. 1897, 50,000.

Des Moines, the largest river in the state of Iowa, rises in the s w. of Minnesota and flows in a s.e. direction till it falls into the Mississippi about 4 mi. below Keokuk, after a course of 300 mi.

**Desmoulins** (då-mö-lan), BENOIT CAMILLS (1760-1794), was conspicuous during the first period of the French Revolution. He was

#### Desna

among the most notable of the pamphleteers and orators who urged the multitude forward in the path of revolution.

**Desna**, a river in Russia, which rises in the government of, and about 50 mi. e. of the town of Smolensk, flows through the governments of Orel and Tchernigov till it joins the Dnieper near Kiev. It is 500 mi. in length and navigable nearly throughout.

**De Soto**, FERNANDO (1496-1542), a Spanish explorer and discoverer of the Mississippi. He accompanied expeditions to the New World under Davila and Pizarro, and played a distinguished part in the conquest of Peru. In 1539 he led an expedition to Florida, whence after many difficulties he penetrated to the Mississippi, where he was attacked with fever and died. The name De Soto has been given to a county in the n.w. of Mississippi, and to several places in the U. S.

**Dessalines** (dā-sà-lēn), JEAN JACQUES (1760-1806), Emperor of Hayti, b. in Africa. His talents for war, his courage, and unscrupulous conduct raised him to command in the insurrections of the colored people, and after the deportation of Toussaint-L'Ouverture, and the subsequent evacuation of the island by the French, Dessalines was appointed governor general for life with absolute power; and the year following (1804) was declared emperor with the title of Jacques I. He was slain by one of his soldiers.

**Dessau** (des'ou), a town in Germany, capital of the duchy of Anhalt, in a beautiful valley on the left bank of the Mulde, mostly well built, with fine squares and many handsome buildings. The manufactures consist of woolens, woolen yarn, carpets, machinery, tobacco, etc. The ducal palace has a picture gallery and interesting relics and antiquities. Pop. 27,766.

**Deter' minism,** a philosophical theory which holds that the will is not free, but is invincibly determined either—according to the older form of the theory—by a motive furnished by Providence, or—according to the modern form — by the aggregation of inherited qualities and tendencies.

**Detroit**, Wayne co., Mich., on Detroit river. Railroads: Michigan Central; Wabash; L. S. & M. S. It is one of the most important of the lake ports. Its marine traffic amounted in 1805 to \$29,000,000. It has many manufacturing industries, there being about 1750 separate establishments employing nearly 40,000 persons. Among them are sawmills, flour mills, ship yards, foundries, tanneries, blast furnaces, tobacco and cigar manufactories, and locomotive car works. There are also extensive pharmaceutical establishments. Detroit has a magnificent system of parks and boulevards and is noted as one of the best drained cities in the U. S. It was settled by the French in 1701. Pop. est. 1897, 210,000.

the French in 1701. Pop. est. 1897, 210,000. Detroit River, or Strait of St. Clair, a river or strait of North America, which runs from Lake St. Clair to Lake Erie. It is 28 mi. long, and of sufficient depth for the navigation of large vessels. It is about  $\frac{4}{5}$  mi. wide opposite Detroit and enlarges as it descends.

Devens, CHARLES, soldier, b. in Charleston, Mass., April 4, 1820; graduated at Harvard in 1838; and became a lawyer. He served in the Civil War, and was brevetted major general after the capture of Richmond. In 1867 he became a superior court justice in Mass., and in 1873 justice of the state supreme court. In 1877 he became attorney general of the U. S., and in 1881 one of the supreme court justices of Mass.

Dev'enter, an old town in Holland, prov. of Overijssel, 8 mi. north from Zutphen, at the confluence of the Schipbeek and Ijssel. Its Industries embrace carpets, cast-iron goods, printed cottons, hosiery, and a kind of cake called Deventer cakes. It has a large export trade in butter. Pop. 22,700.

Deviation of the Compass, the deviation of a ship's compass from the true magnetic meridian, caused by the near presence of iron. In iron ships the amount of deviation depends upon the direction, with regard to the magnetic meridian, in which the ship lay when being built. It is least when the ship has been built with her head south. Armor-plated ships should be plated with their head in a different direction from that in which they lay when built. The mode now generally employed to correct deviation is by introducing on board ship masses of iron and magnets to exactly neutralize the action of the ship's magnetism. Compasses are sometimes carried on masts in iron vessels as a means of removing them from the disturbing influence of the iron of the hull. In this position they serve as standards of comparison for the binnacle compass. Wooden ships are also affected, though in a far less degree, by the direction in which they lie when building.

**Devil**, in theology, an evil spirit or being; specifically the evil one, represented in Scripture as the traducer, father of lies, etc. Most of the old religions of the East acknowledge a host of devils. The doctrine of Zoroaster, who adopted an evil principle called Ahriman, opposed to the good principle and served by several orders of inferior spirits, spread the belief in such spirits among the people. The belief in such spirits among the people. Greek mythology did not distinguish with the same precision between good and bad spirits. With the Mohammedans Eblis, or the devil, was an archangel whom God employed to destroy a pre-Adamite race of jinns, or genii, and who was so filled with pride at his victory that he refused to obey God. The Satan of the New Testament is also a rebel against God. He uses his intellect to entangle men in sin and to obtain power over them. But he is not an independent self-existent principle like the evil principle of Zoroaster, but a creature subject to omnipotent control. The doctrine of Scripture on this subject soon became blended with numerous fictions of human imagination, with the various superstitions of different countries, and the mythology of the pagans. The excited imaginations of hermits in their lonely retreats, sunk as they were in ignorance

and unable to account for natural appearances, frequently led them to suppose Satan visibly present; and innumerable stories were told of his appearance, and his attributes - the horns, the tail, cloven foot, etc. — distinctly described. In consequence of the cures which Christ and his apostles performed on the possessed, the early church believed in a power connected with the consecration of priests to drive out evil spirits. The belief in evil spirits, witches, etc., was in the seventeenth century so common that they became the objects of judicial With the progress of the natural process. sciences, however, in the eighteenth century many wonderful phenomena became explained, and less was heard of witchcraft.

**Devil**, the machine through which cotton or wool is first passed to prepare it for the carding-machines; a teasing-machine.

Devil-fish, the popular name of various fishes, one of them being the angler. Among others the name is given to several large species of ray occasionally captured on the Atlantic and Pacific coasts, and much dreaded by divers, whom they are said to devour after enveloping them in their vast wings. During gales of wind or from strong currents these immense fish are driven into shoal water, and being unable to extricate themselves, fall an easy prey to the vigilance of the fishermen, who obtain considerable quantities of oil from their livers.

**Devil Plant,** a most deadly plant found in the neighborhood of Philadelphia. It has a pleasant appearance, being of a tender green, clinging close to the earth, and sprinkled with small red blossoms, cup-shaped, and holding in their hearts a single drop of moisture, which the sun has no power to dispel, and wherein this plant's most blighting influence is said to lie. Bees by the hundred have been found dead in the blossoms, and a botanist who tasted this poison-drop declared that it was of a sickening sweetness, without odor, and like liquid Allowed to dwell on his tongue, it soon gum. began to burn and raise a blister, while the tongue became swollen and very painful. Cattle eating of it die in a few hours in great agony, with a sort of exaggerated tetanus.

**Devil's Bridge**, a famous bridge in Switzerland, over the Reuss, built of stone from mountain to mountain, 75 ft. in length, on the road over St. Gothard, from Germany to Italy.

**Devil-worship**, the worship paid to the devil, an evil spirit, a malignant deity, or the personified evil principle in nature, by many of the primitive tribes of Asia, Africa, and America, under the assumption that the good deity does not trouble himself about the world; or that the powers of good, and have in consequence to be bribed and reconciled. There is a sect called devil-worshipers inhabiting Turkish and Russian Armenia, and the valley of the Tigris, who pay respect to the devil, to Christ, and to Allah, or the supreme being, and also worship the sun.

**Devon** (Devonshire), a maritime county in the s. w. of England. Area 2,586 sq. mi., the county being the third largest of England. Tin, lead, iron, copper, manganese, granite, and the clay used by potters, and pipemakers are the chief mineral products. The geological formation of the old red sandstone is so largely developed that the term Devonian has to some extent become its synonym. Agriculture is in a somewhat backward state. The clotted cream and cider of Devonshire are well-known as specimens of the county. Pop. 631, 767.

Devo'nian System, in geology, a name originally given to rocks of Devonshire and Cornwall, intermediate between the Silurian and Carboniferous strata, and consisting of sandstones of different colors, calcareous slates and limestones, etc. They are divided into lower, middle, and upper groups, all containing fossils, but the middle most abounding in them, including corals, crinoids, crustaceans, mollusca (especially brachiopods), and cephlaopods. Devonian rocks occupy a large area in Central Europe, as well as in the U.S.. Eastern Canada, and Nova Scotia. The term has been often used as equivalent to old red sandstone.

Dev'onport, a port of England. It is the seat of one of the royal dockyards, and an important naval and military station. A bastioned wall and fosse defend the town on the northeast and south sides, while the sea entrance is protected by heavy batteries on Mount Wise. Connected with the dockyards and fortifications are the gun wharf, foundries machine works, rope walks, storehouses, naval and military barracks, etc. Pop. 54,736.

Dew is a deposition of water from the atmosphere upon the surface of the earth in the form of minute globules. During the day the earth both absorbs and emits heat, but after sunset its supply of warmth is cut off, while it still continues to radiate heat into the surrounding space. Grass, flowers, and foliage being good radiators, lose after sunset the heat which has previously been absorbed by them. without receiving any in return, and their temperature consequently falls considerably below that of the atmosphere. From the proximity of these cold substances the particles of vapor in the adjoining air are condensed and deposited upon their surfaces in the form of dew, or of hoar-frost where the temperature of the earth is below 32°. When the sky is clouded the heat abstracted from the earth's surface by radiation is restored by the clouds, which, being good radiators, send back an equal amount of heat to what they receive; and a balance of temperature being thus maintained between the earth and the sur-The rounding atmosphere, no dew is formed. deposition of dew is likewise prevented by wind, which carries away the particles of air before the vapor contained in them has been condensed. Horizontal surfaces, and those which are exposed to a wide expanse of sky receive a greater supply of dew than sheltered or oblique surfaces, where circumstances diminish the amount of radiation. The heavy dews which fall in tropical regions are in the highest degree beneficial to vegetation. which,

but for this supply of moisture, would, in countries where scarcely any rain falls for months, be soon scorched and withered. But after the high temperature of the day the ground radiates under these clear skies with great rapidity, the surface is quickly cooled, and the watery vapor, which, from the great daily evaporation, exists in large quantities in the atmosphere, is deposited abundantly. This deposition is more plentiful also on plants, from their greater radiating power; while on hard, bare ground and stones, where it is less wanted, it is comparatively triffing. In cold climates the earth, being cold and sufficiently moist, requires little dew; accordingly the clouds, which are so common in damp and chilly regions, prevent the radiation of heat: the surface is thus preserved warm, and the deposition of dew is, in a great measure, prevented.

**Dewás**, a native state of Central India consisting of two combined states with two chiefs. Total pop. 142,162. Dewás, the chief town, has a pop. of 11,921.

Dewberry, an edible fruit belonging to the order of the Rosaceæ, and to the same genus as the bramble, from which it is distinguished by its smaller berries, with fewer grains, and by the bloom, resembling dew, with which they are covered, and from which the plant derives its name. It abounds from Canada to Virginia, and its fruit is delicious.

De Witt, JAN (1625-1672), Grand-pensionary of Holland, celebrated as a statesman and for his tragical end; was the son of Jacob De Witt, burgomaster of Dort. In 1665 the war with England was renewed and conducted by De Witt with great ability till its termination in 1665. In 1672 Louis XIV invaded the Spanish Netherlands and involved Holland in war. De Witt's popularity, already on the decline, suffered still further in the troubles thus occasioned, and he felt it necessary to resign his office of grand-pensionary. At this time his brother Cornelius, who had been tried and put to torture for conspiring against the life of the young Prince of Orange, lay in prison. Jan De Witt went to visit him, when a tumult suddenly arose among the people, and both brothers were murdered.

**Dew-point**, the temperature at which condensation of the vapor in the air takes place. When the temperature of the air has been reduced by radiation to the dew-point, dew is deposited, and an amount of heat set free which raises the temperature of the air. Thus the dew-point will indicate what the minimum temperature of the night is likely to be, a knowledge of which is useful to the horticulturist.

**Dewsbury**, a town, England, in the West Riding of Yorkshire, and 30 mi. s.w. of the town of York, chiefly engaged in the manufacture of heavy woolen cloths, including blankets, carpets, rugs, flannels, baizes, etc.

**Dex'trine**, the soluble or gummy matter into which starch can be converted by the action of dilute acids or malt extract, or by heat. It is remarkable for the extent to which it turns the plane of polarization to the right hand, whence its name. Its composition is the same as that of starch. By the action of hot diluted acid, dextrine is finally converted into grapesugar. It is white, insipid, and without smell. It is a good substitute for gum-arabic in medicine.

**Dextro-compounds**, bodies which cause the plane of a ray of polarized light to rotate to the right. Dextrine itself, dextro-glucose, tartaric acid, malic acid, cinchoine, and many other bodies have this property; while others, which have the opposite effect, of causing the plane to rotate to the left, are called *larocompounds*.

**Dhárwár**, the chief town of Dharwar district, in the Bombay presidency. Hindustan, a straggling place with some trade. There is a fort well planned and strongly situated, but now falling into ruins, and military cantonments at 2 mi. distance. Pop. 27,191. The Dharwar district has an area of 4,535 sq. mi.; pop. 882,907.

**Dhawala'giri** (or Dhaulágiri), one of the highest peaks of the Himalayas, in Nepál; height, 26,826 ft.

Dholpur, native state of Central India, Rajputána; area 1,200 sq. mi.; pop. 249,657.

**Diag'onal Scale**, a scale which consists of a set of parallel lines drawn on a ruler, with lines crossing them at right angles and at equal distances. One of these equal divisions, namely, that at the extremity of the ruler, is subdivided into a number of equal parts, and lines are drawn through the points of division obliquely across the parallels. With the help of the compasses such a scale facilitates the laying down of lines of any required length to the 200th part of an inch.

**Diag'oras**, ancient Greek poet and philosopher, flourished about 425 B. C. He spent a great part of his life in Athens. He attacked the prevailing polytheism, and sought to substitute the active powers of nature for the divinities of the Greeks. On this account he had to leave Athens.

Dial (or sundial), an instrument for showing the hour of the day from the shadow thrown while the sun is shining by a stile or gnomon upon a graduated surface. This instrument has been known from the earliest times among Egyptians, Chaldeans, and Hebrews. From those eastern nations it came to the Greeks. It was introduced into Rome during the first Punic War. Dials are of various construction, horizontal, inclined, or upright, the principle in every case being to show the sun's distance from the meridian by means of the shadow cast by the stile or gnomon. The stile is made parallel with the earth's axis, and may be considered as coinciding with the axis of the diurnal rotation. Consequently, as the sun moves westward the shadow of the stile moves round in the opposite direction, falling on the meridian lines so marked as to represent the hours of the day. The dial, of course, gives solar time, which, except on four days of the year, is slightly different from that of a wellregulated clock. Dials are now rather articles of curiosity or ornament than of use.

Di'alect, the language of a part of a country, or a distant colony, deviating either in its grammar, vocabulary, or pronunciation, from the language of that part of the common country whose idiom has been adopted as the literary language and the medium of intercourse between well-educated people. Al-though the use of provincial dialects becomes inconvenient after a language has acquired a fixed literary standard, the study of such dialects is always valuable to the philologist for the light they throw on the history of the language. The diffusion of education and printed books has much relaxed the hold which the provincial dialects of various countries once had on the people, and in general it may be said that the educated classes of any country now speak each of them a uniform language.

**Dialec' tics,** the old name of logic, or the art of reasoning, but used in Kant's philosophy to mean the logic of appearance, or that logic which treats of inevitable tendencies toward error and illusion in the very nature of reason.

**Dial'ysis,** the separation of the *cripstalloid* constituent elements of a mixture from the *colloid*, the former being bodies which diffuse readily, such as sugar, salt, bichromate of potassium, etc.; the latter bodies which diffuse with difficulty or not at all, bodies resembling glue or gelatin, such as gum, starch, caramel, albumen, the ordinary constituents of food, etc., etc.

Diamagnet' ic, a term applied to substances which, when under the influence of magnetism and freely suspended, take a position at right angles to the magnetic meridian, that is, point east and west. From the experiments of Faraday it appears that all matter is subject to the magnetic force as universally as it is to the gravitating force, arranging itself into two great divisions, the paramagnetic and Among the former are iron, diamagnetic. nickel, cobalt, platinum, palladium, titanium, and a few other substances; and among the latter are bismuth, antimony, cadmium, copper, gold, lead, mercury, silver, tin, zinc, and most solid, liquid, and gaseous substances. When a paramagnetic substance is suspended freely between the poles of a powerful horseshoe magnet it points in a line from one pole to the other, which Faraday terms the axial On the otner hand, when a diamagnetic line. substance is suspended in the same manner it is repelled alike by both poles, and assumes an equatorial direction, or a direction at right angles to the axial line.

**Diam'eter**, the straight line drawn through the center of a circle, and touching the two opposite points of the circumference. It thus divides the circle into two equal parts, and is the greatest chord.

Di'amond, the hardest and one of the most valuable of gems, and the purest form in which the element carbon is found. It crystallizes in forms belonging to the regular or cubic system, the most common being the regular octahedron and rhombic dodecahedron

The finest diamonds are color-(twelve faces). less, perfectly clear, and pellucid. Such are said to be of the finest water. But diamonds are often blue, pink, green, or yellow, and such are highly prized if of a decided and equal tint throughout. The hardness of the diamond is such that nothing will scratch it, nor can it be cut but by itself. The value of a diamond is much enhanced by cutting facets upon it in-clined at certain angles to each other so as to produce the greatest possible play of color and luster. What is called the brilliant cut best brings out the beauty of the stone. Its upper or principal face is octagonal, surrounded by many facets. But this form of cutting re-ouries an originally well-shaped stone. For quires an originally well-shaped stone. other diamonds the rose cut is used. In this form six triangles are cut on top so that their apices meet in a point called the summit. Round this are disposed other facets. Stones which are too thin to cut as rose-diamond are cut as table-diamonds, which have a very slight play of color. The art of cutting and polishing the diamond was unknown in Europe till the fifteenth century, and the stone itself was not nearly so highly valued in the Middle Ages as the ruby.

The uncut diamond looks like a piece of quartz. It is of a dull white color and full of rough seams. In this condition it is set into a matrix of wax which is fastened to the end of a stick. The wax becomes very hard after it is once heated. In another matrix a cheap diamond is set and a workman grinds the two stones together, until the one to be cut has as-The sumed the general form of a brilliant. dust and chips which come off are care-fully collected and used afterward in polish-The rough stone is then firmly ing work. fixed in a matrix of metal composed of zinc and lead and set into a cup-shaped instrument of iron. The workman is then ready to begin cutting. In this process an iron disk turning at the rate of 2,000 revolutions a minute is used. Upon the disk is sprinkled a supply of diamond dust which sinks into the minute pores of the iron and produces the sharpest grindstone that can be made. The workman. with a magnifying glass close to his eye, grinds first the table or top part of the brilliant. This completed, the metal matrix is melted from the stone which is put in, face downward, so that the exact opposite of the stone will be ground. After this, one by one, the facets or bezils are cut, the first two opposite and parallel, and the second two at right angles to the first two. If the diamond is large the corners remaining between the four opposite cuts are also beveled. Then the stone is turned over in its matrix. and the facets between the girdle and the point known as the collet are cut in the same way. Rubies and sapphires are cut by the same general process. Moss-agate, topaz. agate, amethysts and other half-precious stones are first sawed into proper sizes with a soft tin When the agate, for instance, has wheel. been sawed to the proper shape, it is smoothed down on an ordinary grindstone, and then taken in hand by the polisher, who applies it to

#### Diamonds

a fine grindstone, and, after being ground for about an hour, it is ready for the market.

Diamonds are valuable for many purposes. Their powder is the best for the lapidary, and they are used for jeweling watches, as lenses for miscroscopes, and in the cutting of window and plate glass. When used as a glazier's tool the diamond must be uncut. Inferior kinds of diamonds are also extensively used by engineers in rock boring, and by copperplate engravers as etching points. Diamonds are obtained from alluvial deposits (sands, clays, etc.), being separated by washing. They are found in India, Borneo, and other parts of the East; sometimes in North America and Australia; but the chief diamond fields of to-day are Brazil and Cape Colony, the center of the latter being Kimberley in Gruqualand West.

#### Diastase

at \$2,250,000. Recently, by an expensive process, minute crystals of diamond have been artificially produced.

Dian'a, in mythology, an ancient Italian goddess whom the Romans latterly identified with the Greek Artemis, with whom she had various attributes in common, being the virgin goddess of the moon and of the chase, and having as attributes the crescent moon, bow, arrows, and quiver. She seems to have been originally the patron divinity of the Sabines and Latins. She was worshiped especially by women as presiding over births, no man being allowed to enter her temple.

Diana Monkey, a species of monkey found in Africa, and so named from the crescentshaped band on the forehead resembling the crescent moon, which was the symbol of Diana. Dian'dria, the

Diamonds. a.- Great Mogul; b.- Star of the South; c.- Koh-i-nur; d.- Regent; e.- Orloff. All actual size.

Diamonds were discovered in the latter only in 1867. One of the largest diamonds known (weight 367 carats) was found in Borneo about a century ago, and belongs to the Rajah of of Mattan. One of the most celebrated is the Koh-i-noor (Mountain of Light), belonging to the British crown. It weighed originally nearly 800 carats, but by subsequent recuttings has been reduced to 1033 carats. The Orloff diamond, belonging to the Emperor of Russia, weighs 195 carats; the Pitt diamond, among the French crown jewels, 1364. The former, which came from India, has been thought to have originally formed part of the Koh-i-noor stone. Bome of the South African diamonds are also very large, one of them (of inferior color) weighing 428 carats. The largest sum actually paid for a precious stone was \$625,000, given by the Duke of Orleans for the "Pitt" or "Regent" diamond, the stone being now valued Diam'oria, the second class in the Linnæan system, comprehending all genera with flowers having only two stamens, provided the stamens are neither united at their base, nor combined with the style and stigma, nor separated from the pistil.

**Diaphragm**(di'afram), in anatomy, a muscular membrane placed transversely in the trunk, and dividing the chest from the abd om inal cavity. In its natural situation the diaphragm is convex on the upper side and concave on its lower, but when the lungs are filled with air it becomes al most

flat. It is the principal agent in respiration, particularly in inspiration. A complete diaphragm is found only in Mammalia.

**Diarbek'ir**, a town, Asiatic Turkey, capital of the pashalic of same name, on a high bank overlooking the Tigris, and surrounded by a lofty massive wall. It has manufactures of iron and copper ware, leather, silk, woolen, and cotton goods, and a considerable trade. Pop. about 40,000.

**D**i'astase, a substance existing in barley, oats, and potatoes, but only after germination. When in solution it possesses the property of causing fecula or starch to break up at the temperature of  $150^{\circ}$  F., transforming it first into dextrine and then into sugar. It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of  $113^{\circ}$  F., a certain quantity of germinated barley ground and dried in the open air, and

43

then putting the whole under pressure and filtering it. Diastase is solid, white, and soluble in water and diluted alcohol, but insoluble in strong alcohol.

**Diaz**, BARTOLOMEU, a celebrated Portuguese navigator of the fifteenth century, named in 1846 commander of that long succession of exploratory expeditions which the Portuguese court had during this century become distinguished for promoting.

Diaz, PORFINIO, Mexican general, b. at Oaxaca. Sopt. 15, 1830. In 1867 he marched to Pueblo at the head of a Republican army, and took the city by storm, and afterward aided in the capture of the city of Mexico. He was proclaimed president of Mexico by Congress, serving from 1877 till 1880. During his term the tariff was revised, finances were improved, and important lines of railway established. He was succeeded by Gen. Manuel Gonzalez, and became minister of public works. In 1881 he was made governor of the province of Oaxaca. He was again elected president in 1884, 18-8, 1892, and 1896.

Dice, cubical pieces of bone or ivory, marked with dots on each of their six faces, from one to six, according to the number of faces. They are shaken in a small box and then thrown on the table. Dice are often loaded or falsified in some way so as to make the high or the low sides turn down. Dice are very ancient, being well known among the Egyptians and Greeks.

**Dichroite** (di'kro-It), a mineral, a silicate of magnesium, iron, and aluminium, which readily undergoes modifications and passes into other minerals. It exhibits different colors.

Dickens, CHARLES (1812-1870), one of the greatest English novelists, was b. at Landport, Portsmouth. He received a somewhat scanty education, was for a time a mere drudge in a blacking warehouse, and subsequently a clerk in an attorney's office. Having perfected himself in shorthand, however, he became a newspaper critic and reporter, was engaged on the Mirror of Parliament and the True Sun, and in 1835 on the Morning Chronick. In 1835 appeared in the Morning Chronicle the first of that series of Sketches by Boz which brought Dickens into fame. A new class of characters, eccen-tric indeed, but vital representations of the humors and oddities of life, such as Mr. Pickwick, Sam Weller and his father, Mr. Winkle, and others, were made familiar to the public. Under the name of the Posthumous Papers of the Pickwick Club this work was published in two volumes 8vo in 1837. In the same year Dickens was engaged as editor of Bentley's Magazine, to which he contributed Oliver Twist, a work which opened up that vein of philanthropic pathos and indignant satire of institutions which became a distinguishing feature of his works. As the special object of Oliver Twist was to expose the conduct of workhouses, that of Nicholas Nickleby was to denounce the management of cheap boarding schools. Master Humphrey's Clock, issued in weekly numbers, contained among other matter two other leading tales, The Old Curiosity Shop, and Barnaby

Rudge, the latter a historical tale. In 1841 Dickens visited America, and on his return he wrote American Notes for General Circulation. His next novel, Martin Chuzzlewit, dwelt again on his American experiences. The series of Christmas Tales, in which a new element of his genius, the power of handling the weird machinery of ghostly legend in subordination to his own peculiar humor, excited a new sensa-tion of wonder and delight. These enumerated consecutively were: A Christmas Carol, The Chimes, The Cricket on the Hearth. The Battle of Life, The Haunted Man, and the Ghost's Bargain. The extraordinary popularity of these tales created for a time a new department in literature, that of the sensational tale for the Christmas season. In 1845 Dickens went to Italy. and on his return the Daily News was intrusted to his editorial management; but this was an occupation uncongenial to his mind, and in a few months the experiment was abandoned. His Pictures from Italy were published the same year. Next followed his novel of Dombey and Son, and David Copperfield, a work which has a strong autobiographical element in it. In 1850 Dickens became editor of the weekly serial Household Words. In 1853 his Bleak Unue came out. A Child's History of England, commenced in Household Words, was published in 1852-54. Hard Times was published in 1854. Little Dorrit, commenced in 1856, dealt with imprisonment for debt, the contrasts of character developed by wealth and poverty, and executive imbecility, idealized in the Circum-In 1859 All the Year Round locution Office. superseded Household Words; and in the first number of this periodical was begun A Tak of Two Cities. Great Expectations followed in the same paper in 1860. In All the Year R and also appeared a series of disconnected sketches. called the Uncommercial Traveller. Our Mutual Friend, completed in 1865, and published in the usual monthly numbers, with illustrations by Marcus Stone, was the last great serial work which Dickens lived to finish. The first num-ber of his last work, The Mystery of Educin Drood, was issued in 1870, and only three numbers had appeared when he d. somewhat suddenly, at his residence. Gad's Hill Place. near Rochester, on June 9. He was buried in Dickens's work as a Westminster Abbey. novelist is firmly based upon wide and keen observation of men.

Dickinson, ANNA ELIZABETH, orator. was b. in Philadelphia, Pa., 1842. In 1857 she made her first venture as a speaker before the members of a society of "Progressive Friends." who were interested in the antislavery movement. In 1859-60 she taught school in Berks co., Pa., and in 1861, for about nine months, was employed at the U. S. mint, in Philadelphia. After that time she lectured in public. This she did with so much acceptation that, in 1862, she was invited to deliver an oration at Music Hall, in Boston, Mass., under the auspices of the New England leaders of the anti-slavery cause. From there she went to New Hampshire and Connecticut, and later drew large attendances in Cooper Union. New

York City, and at the Academy of Music, Philadelphia. After the close of the war she appeared mostly as a lecturer on the platform of literary societies. In 1876 she entered the dramatic profession, but this venture was unsuccessful.

Dickinson, DANIEL STEVENS (1800-1866), b. in Goshen, Conn., statesman. He became clerk in a clothing store, and afterward surveyed, taught school, and studied law. He became qualified as a lawyer in 1828, and as such settled in Guilford. In 1831 he removed to Binghamton. He became prominent as a Democratic politician, and in 1836 was chosen state senator. In 1842 he was chosen lieuten-ant governor of New York. 1844 he was ap-pointed to fill a vacany in the U.S. Senate, and later the legislature elected him for the full In 1852 he was nominated collector of term. the port of New York, which office he declined. From 1861 to 1863 he was active on the stump in making addresses on the national side; in 1861, also, he was elected attorney general for

the southern district of New York. Dickinson, Јонм (1732-1808), statesman, studied law in Philadelphia and at the Temple, London, and practised his profession in Philadelphia. In 1763 he was elected to the assembly. In 1798 he published his Letters to the Inhabitants of the British Colonies, by a Pennsylvania Farmer, showing that Parliament had no right to tax the colonies, and to him is due the phrase "no taxation without representation." These were republished in London by Benjamin Franklin, as the best presentation of the case, and they were also translated into French and commended by Voltaire. He was a member of the committee to draft the Declaration of Independence. He entered the army as a private. In 1779 he was elected to Congress from Delaware. In 1780 he was made a member of the assembly of Delaware, and was afterward president of that body. In 1872 he was made president of the supreme executive coun-cil\_of Pennsylvania.

Dicta tor, an extraordinary magistrate of the Roman Republic, first instituted B. c. 501. The power of naming a dictator when an emergency arose requiring a concentration of the powers of the state in a single superior officer, was vested by a resolution of the sen-ate in one of the consuls. The dictatorship was limited to six months, and the person who held it could not go out of Italy. The dictator was also forbidden to appear in Rome on horseback without the permission of the people, and he had no control over the public funds without the permission of the senate. He had the power of life and death, and could punish without appeal to the senate or people. All the other magistrates were under his orders

**Dictionary,** a book containing the words. or subjects, which it treats, arranged in alphabetical order. It may be either a vocabulary, or collection of the words in a language, with their definitions; or a special work on one or more branches of science or art prepared on the principle of alphabetical arrangement,

such as dictionaries of biography, law, music, medicine, etc. Among dictionaries of the English language, the earliest seem to have been those of Barett, 1573, and of Bullokar. That of Dr. Johnson published in 1755 1616. made an epoch in this department of literature. Previous to this the chief English dictionary was that of Bailey. a useful work in An enlarged edition of Johnson's its way. dictionary, by the Rev. H. J. Todd, appeared in 1818; and this, again enlarged and modified, was issued under the editorship of Dr. R. G. Latham (1864-72). The chief American dictionary of the English language is that by Noah Webster first published in 1828. It has been frequently republished, and in subsequent editions has almost entirely altered its character. Dr. Richardson's dictionary, first published in two volumes in 1836-37 (at London), is valuable chiefly for its copious illustrative quotations. The large American dictionary by Dr. Worcester has made a good position for itself. Dr. Ogilvie's English dictionary (based on Webster, and first published in 1847-50), has recently been published in a remodeled and enlarged form (4 vols. 1881-82, Chas. Annandale, LL.D., editor). Cassell's Encyclopædic Dictionary, is another extensive and useful work (1879-88). The Standard Dictionary and the Century Dictionary are the latest finished works in English lexicography on a large scale. The chief etymological dictionary of English words is that by Prof. Skeat (1882); the chief French is that of Littré; German, that of Grimm.

**Didactic Poetry**, that kind of poetry which professes to give a kind of systematized instruction on a definite subject or range of subjects. Thus the *Georgics of Vergil* and the *De Rerum Natura* of Lucretius profess to give, the one a complete account of agriculture and kindred arts, the other a philosophical explanation of the world. In a larger sense of the word most great poems might be called didactic, since they contain a didactic element in the shape of history or moral teaching. Dante's *Divina Commedia*, Milton's *Paradise Lost*, or Goethe's *Faust*, for example. The difference may be said to be this, that in the one case the materials are limited and controlled by nothing but the creative fancy of the poet, while in the other they are much more determined by the actual nature of the subject treated of.

**Diderot** ( $d\bar{e}d$ -r $\bar{o}$ ), DENIS (1713-1784), a French writer and philosopher, was b. at Langres, in Champagne, and educated in the school of the Jesuits, and afterward at Paris, at the College of Harcourt. His first works were the *Essau* sur le Mérite et la Vertu (1745); and the Pensées Philosophiques (1746), a pamphlet against the Christian religion. His Lettre sur les Areugles à l'Usage de Ceux qui Voyent, is in the same strain. These heterodox publications cost him an imprisonment for some time at Vincennes. Diderot now tried writing for the stage, but his pieces were failures. In 1749 he had begun along with D'Alembert and some others the Encyclopedia. At first it was intended to be mainly a translation of one already published in English by Chambers. Diderot and D'Alembert, however, enlarged upon this project, and made the new *Encyclopædia* a magnificently comprehensive and bold account of all the thought and science of the time. Besides his articles in the *Encyclopædia* he wrote numerous works, some of which were published after his death.

**Dido** (or Elissa), the reputed founder of Carthage. She was the daughter of the king of Tyre, and after her father's death her brother Pygmalion murdered her husband, Sicharbas, or as Vergil calls him Sichæus, with the view of obtaining his wealth. But Dido, accompanied by many Tyrians of her party, fled with all the treasure over sea, and landing on the const of Africa founded Carthage about 860 B. c.

**Didym'ium**, a rare metallic element occurring along with *lanthanium* in the mineral cerite as discovered by Mosander in 1843. Recently it is said to have been resolved into two new elements: *Praseodymium* and *Neodymium*.

**Dielectric**, a name applied by Faraday to any medium through or across which electrostatic induction can take place. Faraday first showed that electrostatic induction was not action at a distance, but took place by means of the insulating medium separating the two conducttors. The medium he named a *dielectric*, and measured its specific inductive capacity by taking that of common air as unity, \_

**Dieppe** (dē-ep'), a seaport town, France, department Seine-Inférieure, on the English Channel, at the embouchure of the Arques, 93 mi. n.n.w. Paris. Dieppe is one of the chief watering places of France, and is much frequented by visitors in summer and autumn. The manufactures include works in ivory, the most famed in Europe; works in horn and bone, lace-making, sugar-refining, shipbuilding, etc. There is a busy fishery, and the foreign trade is still considerable. In early times Dieppe was the chief port of France, but its prosperity diminished after the revocation of the Edict of Nantes (1685). Pop. 20,804.

Diesinking is the art of preparing dies for stamping coins, buttons, medallions, jewelry, fittings, etc. The steel for the manufacture of dies is carefully selected, forged at a high heat into the rough die, softened by careful annealing, and then handed over to the engraver. After the engraver has worked out the design in intaglio the die is put through the operation of hardening, after which, being cleaned and polished, it is called a matrix. This is not, however, generally employed in multiplying impressions, but is used for making a punch or steel impression for relief. For this purpose another block of steel of the same quality is selected, and being carefully annealed or softened, is compressed by proper machinery upon the matrix till it receives the impression. When this process is complete the impression is retouched by the engraver, and hardened and collared like the matrix. Any number of dies may now be made from this punch by impressing upon it plugs of soft steel. In place of this process

patterns are now frequently engraved upon rollers for transference to sheet metal by rolling pressure.

**Di**'et, a meeting of some body of men held for deliberation or other purposes; a term especially applied to the legislative or administrative assemblies of the German Empire. Austria, etc.

Dietet'ics, that part of medicine which relates to the regulation of diet. The ideal diet is clearly that which, without burdening the viscera uselessly, furnishes all necessary nutritive elements, with due consideration for special physiological conditions in any given case. No single substance contains the elements needed to replace its waste in their requisite proportions and a mixed diet is therefore necessary. The nature of the food most suitable for a healthy man is dependent in part upon general conditions, such as climate and season, and in part upon special conditions of individual habit.

of individual habit. **Differential Thermometer**, an instrument for determining very minute differences of temperature. Leslie's differential thermometer consists of two glass bulbs containing air connected by a bent tube containing some sulphuric acid, the movement of which serves to indicate any slight difference of temperature between the two bulbs.

**Digest'er**, a strong vessel of copper or iron. on which is screwed an air-tight cover with a safety valve, the object being to prevent loss of heat by evaporation. Water may be thus heated to  $400^{\circ}$  F., at which temperature its solvent power is so greatly increased that bones are converted into a jelly.

**Digit**, in arithmetic, any one of the ten numerals, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. Digit is also a measure of a finger's breadth, equal to  $\frac{1}{2}$  in *Digit*, in astronomy, is the measure by which we estimate the quantity of an eclipse. The diameter of the sun or moon's disk is conceived to be divided into twelve equal parts, called *digits*; and according to the number of those parts or digits which are obscured, so many digits are said to be eclipsed.

**Digitigra' da**, a section of the Carnivora. <sup>50</sup> called from their walking on the ends of their toes; as distinguished from the Plantigrada. which, like the bear, place the whole foot upon the ground. This tribe includes the weasel. dog, cat, etc.

**Dijon** (dē-zhōn), a town in eastern France, capital of the department Cote-d'Or. It has important educational institutions and a valuable library. Industries: woolens, hosierycandles, mustard, vinegar. chemicals. paperhangings, etc., tanneries, foundries, machine factories, cotton and oil mills. The trade is considerable, particularly in the wines of Burgundy. Pop. 60,855.

**Dilem' ma**, in logic. an argument in which the same conclusion may be drawn from two contrary propositions. We append one of the most famous of the classical dilemmas. A young rhetorician said to an old Sophist: "lastruct me in pleading and I shall pay you when I gain a cause." The master sued for the re-

ward, and the scholar eluded the claim by a dilemma. "If I gain my cause I shall not pay you, because the award of the judge will be against you. If I lose it I may withhold it, as I shall not have gained a cause." The master replied: "If you gain you must pay me, because you promised to pay me when you gained a cause; if you lose you must pay me, because the judge will award it." The two results which are found equally objectionable are called the "horns" of a dilemma.

Dill, an umbelliferous plant, a native of the southern countries of Europe, the fruits (commonly but erroneously called seeds) of which are moderately warming, pungent, and aromatic, and are employed medicinally as a carminative. In appearance it resembles the fennel. Dill seeds yield dill water and an essential oil, when distilled with water. Dill water is used as a remedy in flatulency and gripes of children.

**Dillon**, JOHN, Irish statesman, b. in Ireland in 1851; entered Parliament in 1880 as a home ruler, was twice imprisoned as a "suspect," and was considered as Parnell's chief lieutenant in the House of Commons.

**Dim'ity, a** stout cotton fabric, ornamented in the loom either by raised stripes or fancy figures. It is usually employed white, as for bed and bedroom furniture.

**Dina** pur, a town, Hindustan, Patna district, Bengal, on the right bank of the Ganges, about 12 mi. n. w. of Patna, cantonment and military headquarters of the district, with extensive barracks. The environs are studded with handsome bungalows. Pop., with cantonment, 37,893.

**Dingo**, the native wild dog of Australia, of a wolf-like appearance and extremely fierce. The ears are short and erect, the tail rather

Dingo.

bushy, and the hair of a reddish-dun color. It is very destructive to the flocks, killing more than it eats.

**Dino'ceras**, a fossil mammal found in the Eocene strata of North America. in some respects akin to the elephant and of equal size, but without a proboscis.

**Dinor' nis,** an extinct genus of large wingless birds — classed among the ostrich tribe the bones of five species of which have been found in New Zealand. The largest must have stood at least 14 ft. in height, several of its

## Diomedes

bones being at least twice the size of those of the ostrich.

**Dinosau'ria**, a group of colossal lizards, resembling the pachydermatous mammals in general appearance, but in reality intermediate between the struthious birds and lizards. The majority, as the Megalosaurus, which attained to 40 ft. in length, were carnivorous: the Iguanodon, however, was herbivorous. They were the land reptiles of the Jurassic, Wealden, and inferior Cretaceous continents.

**Dinothe' rium, a** genus of extinct gigantic mammals, the remains of which occur in Tertiary formations in several parts of Europe.

#### Dinotherium.

**Dinwiddie**, ROBERT (1690-1770), colonial governor of Virginia, was b. in Scotland and was governor of Virginia from 1752 to 1758, when he was recalled, after precipitating the French and Indian War, and by his ill temper, avarice, and incompetence, rendering himself generally unbearable to the Americans.

**Diocle tian** (C. Valerius Diocletianus, surnamed Jorius), a man of mean birth, a native of Dalmatia, proclaimed Emperor of Rome by the army 284 A.D. He defeated Carinus in Mœsia (286), conquered the Allemanni, and was generally beloved for the goodness of his disposition, but was compelled by the dangers threatening Rome to share the government with M. Aurelius Valerius Maximian.

Diogenes OF SINOPE (B.C. 412-323), the most famous of the Cynic philosophers. Having been banished from his native place with his father, who had been accused of coining false money, he went to Athens, and thrust himself upon Antisthenes as a disciple. Like Antisthenes he despised all philosophical speculations, and opposed the corrupt morals of his time; but while the stern austerity of Antisthenes was repulsive, Diogenes exposed the follies of his contemporaries with wit and good humor. As an exemplar of Cynic virtue he satisfied his appetite with the coarsest food. practised the most rigid temperance, walked through the streets of Athens barefoot, without any coat, with a long beard, a stick in his hand, and a wallet on his shoulders, and by night, according to the popular story, slept in a tub (or large earthenware vessel).

**Diomede Islands**, a group of three small islands in Bering's Strait, and midway between Asia and America.

**Diomedes** (dī-o-mē'dēz), in Greek mythology, 1, A king of the Bistones, who fed his horses on human flesh, and used to throw all strangers who entered his territories to those animals to be devoured. He was killed by Hercules, who carried off the horses. 2, One of the heroes at the siege of Troy, the son of Tydeus and Deipyle, and king of Argos, one of the suitors of Helen.

**Dionysius**, the Elder (B.C. 430-367), in Greek history, tyrant or absolute ruler of Syracuse, b. of obscure parentage. He obtained the rank of general, and afterward of commander-inchief; and gaining the support of the army, he seized the supreme power in Syracuse, though only twenty-five years of age. He extended his rule over other cities in Sicily; and after some successes and reverses in the struggle with the Carthaginians he gained a complete victory over them under the walls of Syracuse.

victory over them under the walls of Syracuse. **Dionysius**, the Younger, a tyrant of Syracuse, who in 367 n.c. succeeded his father, Dionysius the Elder.

**Diora' ma,** a mode of painting and of scenic exhibition invented by Daguerre and Bouton, and first exhibited in 1823. It secures a higher degree of illusion than the ordinary panorama, by a mode of uniting transparent painting to the usual opaque method, and causing the light to fall upon the picture both from *before* and behind. At the same time, by means of colored transparent blinds, suspended both above and behind the picture, the rays of light can be intercepted and made to fall at pleasure in graduated tints upon every part of the picture in succession.

**Dip**, in geology, the inclination or angle at which strata slope or dip downward into the earth. The degree of inclination or amount of the dip, which is easily measured by a special instrument, is determined by the angle which a line drawn perpendicular to the direction of the stratum makes with the horizon. The line in which such strata cut the surface is called the *strike*, and is always at right angles to the dip.

**Diphthong,** a coalition or union of two vowels pronounced in one syllable. In uttering a proper diphthong both vowels are pronounced; the sound is not simple, but the two sounds are so blended as to be considered as forming one syllable, as in *void*, *bough*. The term improper diphthong is applied to the union in one syllable of two or more vowels, of which only one is sounded, as in *bean*.

Di phyòdont, a term applied to those animals which develop two sets of teeth, a deciduous or milk set, and a permanent set—as distinct from the monophyodonts, which develop only one set. The majority of mammals are diphydont, though the number of teeth replaced may vary: thus in man twenty teeth of the adult are preceded by a milk set; in the hare, the anterior incisors are not so preceded, but the posterior smaller incisors replace an earlier pair.

**Diplet doscope**, an instrument for indicating the passage of the sun or a star over the meridian, by the coincidence of two images of the object, the one formed by single and the other by double reflection. It consists of an equilateral hollow prism, two of whose sides are silvered on the inside so as to be mirrors, while the third is formed of glass. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side toward the object.

Diplo' macy, the science or art of conducting negotiations, arranging treaties, etc., be-tween nations; the branch of knowledge which deals with the relations of independent states to one another; the agency or management of envoys accredited to a foreign court; the forms of international negotiations. The Cardinal de Richelieu is generally considered as the founder of that regular and uninterrupted intercourse between governments which exists at present between almost all the Christian powers; though the instructions given by Machiavelli to one of his friends, who was sent by the Florentine Republic to Charles V (Charles I of Spain) show that Richelieu was not the first to conceive the advantages that might be derived from the correspondence of an intelligent agent accredited at the seat of a foreign government. Diplomatic agents are of several degrees: 1, ambassadors; 2, envoys extraordinary and ministers plenipotentiary; 3. ministers resident; 4. charges d'affuires; 5. secretaries of legation and atlachés.

**Diplomat'ics**, originally the science of deciphering ancient MSS. It laid down certain principles for the systematic examination of public documents, and taught the forms and styles adopted in them, the titles and rank of public officers subscribing them.

Dip' noi, an order of fishes, including only the singular mudfishes, important as exhibiting the transition between fishes and the amphibia. Formerly Lepidosiren was reckoned the lowest of the amphibia; now it constitutes the highest order of fishes. The body is fish-like in shape. covered with small horny scales of a cycloid character; the pectoral and ventral fins are represented by two pairs of long filiform organs; the heart has two auricles and one ventricle, and the respiratory organs are twofold. consisting of ordinary gills opening externally. and of true lungs—formed by the modified swimming-bladder—communicating with the œsophagus by means of an air-duct or trachea, whence the name.

**Dippel's Oil**, the rectified form of the black fetid oil, containing ammonic carbonate, which can be obtained by the destructive distillation of animal matter, such as stag's horn, ivory, or blood. The cruder form was used in medicine, despite its appearance and odor, until Dippel refined it. His oil was formerly prescribed as an anti-spasmodic and diaphoretic, and as a hypnotic.

**Dipper**, a bird of the genus *Cinclus*, allied to the thrushes. The common dipper, water ousel, or water crow, is about 7 in. in height, with a very short tail, small rounded wings, and large powerful feet; the bill is of moderate length, straight and slender. The male has the upper part of the body dark brown, the throat and breast white, belly rusty. The

## Dipping Needle

Water Ousel.

dipper frequents streams, and feeds largely on water insects and larvæ.

**Dipping Needle**, or Inclination Compass, an instrument for showing the direction of one of the components of the earth's magnetism. In essentials the instrument consists of a light magnetized steel bar supported on a horizontal axis which passes, as nearly as possible, through the center of inertia of the bar. When a needle thus mounted is placed anywhere not in the magnetic equator, it dips or points downward; and if the vertical plane, in which it moves, coincides with the magnetic meridian the position of the needle shows at once the direction of two or more directions, found by making the experiment at different places, indicates the place of the magnetic pole.

Dipsas Cyandon.

**Dipsas**, a genus of Asiatic and tropical American non-venomous serpents of the family Colubridæ, of very elongated form. With the ancients it was a serpent whose bite was said to produce a mortal thirst.

Dip'tera, an order of two-winged insects, of which the common house-fly and blue-bottle are familiar examples.

<sup>•</sup> **Direc' trix**, in math. a line perpendicular to the axis of a conic section, and so placed that the distance from it of any point in the curve is to the distance of

the same point from the focus in a constant ratio; also, the name given to any line, whether straight or not, that is required for the description of a curve. The directrix of a parabola is a line perpendicular to the axis produced, and whose distance from the vertex is equal to the distance of the vertex from the focus.

Disc (disk), the central part of a radiate, compound flower surrounded by the ray. Also a part, sometimes cup-shaped, at the base of

## Distaff

the stamens, consisting in some cases of rudimentary stamens, in others of the modified receptacle In astronomy the term is applied to the face or circular figure exhibited by the sun, moon, or planet in the sky.

Dis' count, the charge made by a banker for interest of money advanced by him on a bill or other document, not presently due. In advancing money on such a security the banker deducts a charge for interest on his advance from the total amount represented on the security, pays the difference, which is called the proceeds of the bill, to the person parting with it, and collects the full amount to reimburse himself for outlay and interest at maturity. Popularly the term discount is applied to any deduction from the full amount of an account made by the party to whom it is paid, especially on prompt or early payment. When a bill which has been discounted is paid by the acceptor before it is due, the discount allowed for prepayment is called *rebate*.

**Dis'crase**, an ore of silver, consisting of antimony and silver. It occurs in hexagonal prisms, massive, disseminated, or granular.

**Dismal Swamp**, a large tract of marshy land in the U. S., beginning a little s. of Norfolk, in Virginia, and extending into North Carolina, containing 150,000 acres: 30 mi. long, from n. to s., and 10 broad. This tract was entirely covered with trees, with almost impervious brushwood between them, but it has now in part been cleared and drained. In the mildst of the swamp is a lake, called *Drummond's Pond*, 7 mi. in length. A navigable canal through the swamp connects Chesapeake Bay and Albemarle Sound.

**D'Israeli** (diz-rā'e-li), ISAAC (1766-1848), English man of letters, and father of the wellknown statesman, was b. at Enfield, Middlesex. An anonymous reply to Peter Pindar, entitled On the Abuse of Satire, was followed in 1701-1703 by the appearance of his Curiositics of Literature, the success of which determined much of his after work. His essay on the Literary Character was published in 1/05, and some time afterward a volume of romantic tales, The Lores of Mejnoun and Leila. Between 1612 and 1822 appeared his Calumities of Authors, Quarrels of Authors, and Inquiry into the Literary and Political Character of Janes I; the three being afterward published collectively under the title of Miscellanics of Literature. In 1823 appeared the commencement of his Life and Reign of Charles I, a work completed in 1831. The greater part of his life was passed in his library.

library. Dis taff, the first instrument employed in spinning. It consisted of a staff, on one end of which the wool or wax was rolled. The spinner held it in the left hand, and drew out the fibers with the right, at the same time twisting them. A small piece of wood called a spindle was attached to the thread, the weight of which carried it down as it was formed. When the spindle reached the ground the thread which had been spun was wound round it, and it was then again fastened near the beginning of the new thread. **Distemper**, in painting, a preparation of opaque color mixed in a watery glue, such as size, white of egg, or gum. It is used now chiefly in scene-painting and in paper for walls, but was employed in the higher departments of art before the introduction of oilpainting in the fifteenth century. Distemper is painted on a dry surface, fresco on wet mortar or plaster.

tar or plaster. Distillation, the volatilization and subsequent condensation of a liquid by a special apparatus, resulting in the separation of the liquid from a mixture. The operation is performed by heating the crude liquid or mixture in a retort or vessel known as the body of the still. This is made of various shapes and materials, and is closed with the exception of a siender neck, which opens into the condenser, a long tube through which the hot vapor from the still is passed. The tube is kept at a sufficiently low temperature to cause the vapor to condense, the common method of securing this being to surround the tube with a constantly renewed stream of cold water. In some cases ice or a freezing mixture may be required to effect condensation. On a large scale the condensing tube is coiled round and round in a tub or box, and is known as a *worm*. From the end of it the vapor condensed into a liquid drops or distils into a receiver. The simplest case of distillation is that of water containing solid matter in solution, the solid matter re-maining behind in the still or retort while the water trickles pure into the receiver. The cold water round the worm requires to be continually renewed, as otherwise it gets heated. When the mixture to be distilled consists of two or more fluids of different boiling points, such as alcohol and water, the more volatile comes off first, accompanied by a certain proportion of the vapor of the other, so that it is hardly possible completely to separate bodies by one distillation. This is effected by repeated successive distillations of the liquid with or without the addition of substances to retain the impurities. When the production of one of the ingredients only is aimed at by this process, it is called rectification, but when it is desired to separate and collect all the liquids present, or to divide a mixture into portions lying within certain ranges of temperature ascertained either by the thermometer or by the amount of liquor run off, or by the appearance of the distillate, etc., the process is called *frac*tional distillation. In the laboratory, distillation is employed for purifying water, for recovering alcohol and ether, for the preparation, purifi-cation, and separation of a great number of bodies. On the large scale, distillation is employed in the preparation of potassium, sodium, zine, mercury; of sulphuric acid, ether, chloroform, sulphide and chloride of carbon, essential oils and perfumes; purification of coal and wood tar, and the products obtained from them; and most extensive of all, the manufacture of whisky, brandy, or other spirit. Sea water is also distilled in many cases for drinking or cooking purposes. Destructive distillation differs from the preceding in this respect, that

the original substance is not merely separated into the bodies by the mixture of which it is formed, but is so acted on that it is completely decomposed, and bodies are produced which had no existence in the original matter. The term is restricted to the action of heat upon complex organic substances out of contact with the air. The products of destructive distilla-tion are numerous and varied. On the manufacturing scale the process is conducted sometimes for one part, sometimes for another part of the products. Coal, for example, is distilled primarily for the gas, but also for ammoniacal water, benzol, anthracene, and sometimes for the sake of the fixed carbon or coke, the volatile portions being neglected and practically wasted. Wood is distilled partly for the sake of the pyroligneous acid and the tar, partly for the charcoal. Bones are distilled for the sake of the charcoal, though the oil is also collected. Shale is distilled solely for the sake of the oil.

District of Columbia. See Columbia.

**Ditmarshes, a** district of Holstein, in Germany, consisting of a monotonous flat stretching along the German Ocean, between the mouths of the Elbe and the Eider, and so little raised above the sea as to require the protection of strong embankments. The area is 500 sq. mi., and the total pop. above 70.000.

Diu, an island of Hindustan belonging to the Portuguese. It was formerly the seat of a considerable commerce, but is now a place of no importance. Pop. 12,636.

Divers, birds remarkable for the habit of diving. The divers (Colymbidæ) are a family

of swimming birds (Natatores). characterized by a strong. streight. rather compressed. pointed. bill about as long as the head: a short and rounded tail; short wings; thin. compresse d legs, placed very far back, and the toes

Great Northern Diver.

completely webbed. They prey upon fish, which they pursue under water, making use partly of their wings, but chiefly of their legs and webbed feet in their subaqueous progression. The leading species are the great northern diver, the red-throated diver, and the black-throated diver. These birds inhabit the Arctic seas of the New and Old Worlds; they are abundant in the Hebrides, Norway, Sweden, and Russia. The great northern diver, loon, or ember-goose, is about 24 ft. long, and is of handsome plumage.

## **Dividing Range**

Dividing Range, Great, an Australian chain of mountains, forming the watershed between

Divers at Work.

the rivers flowing into the Pacific and those running westward. It is situated at an average distance of 30 mi. from the sea, though in some places it recedes as much as 60 mi., and stretches from Cape York on the north to Wilson's Promontory on the south. Culminating point Mount Townshend (7,353 ft.). **Divi-dlyi** (Libi-dibi or Libi-davi), the pods

**Divi-divi** (Libi-dibi or Libi-davi), the pods of *Casalpinia coriaria*, a tree which grows in tropical America, and a member of the family which yields sapan, brazil, and other red woods. The pods are about 1 in. broad and 3 in. long, but are generally bent or curled up; are excessively astringent, containing a large proportion of tannic and gallic acid, for which reason they are used by tanners and dyers.

Divination, the act of divining; a foretelling future events, or discovering things secret or obscure, by the aid of superior beings, or by other than human means. In ancient times and artificial. Natural divination was supposed to be effected by a kind of inspiration or divine afflatus; artificial divination was effected by certain rites, experiments, or observations, as by sacrifices, observation of entrails and flight of birds, lots, omens, position of the stars, etc. Among modes of divination were arinomancy, by axes: belomancy, by arrows; bibliomancy, by the Bible; oneiromancy, by dreams: pyromancy, by fire, etc.

Divine Right, the claim set up by some sovereigns or their supporters to the absolute obedience of subjects as ruling by appointment of God, insomuch that, although they may themselves submit to restrictions on their authority, yet subjects endeavoring to their sovereign's acts are considered guilty of a sin. This doctrine, so cele-

brated in English constitutional history, especially in the time of the Stuarts, may now be considered to be exploded.

Diving, the art or act of descending into water to considerable depths, and remaining there for a time. The uses of diving are important. particularly in fishing for pearls, corals, sponges, ex-amining the foundations of bridges, recovering valuables from sunken ships, and the Without the aid of like. artificial appliances a skillful diver may remain under water for two, or even three minutes; accounts of longer periods are doubtful or absurd. Various methods have been proposed and engines contrived to render diving more-safe and easy. The great object in all these is to furnish the diver with fresh air, without which he must either make but a

short stay under water or perish. Diving-bell, a contrivance for the purpose of enabling persons to descend and to remain

below the surface of water for a length of time, to perform various operations, such as examining the foundations of bridges, blasting rocks, recovering treasure from sunken vessels, etc. Divingbells have been made of various forms, more especially in that of a bell or hollow truncated cone, with the smaller end closed, and the larger one, which is placed lowermost, open. The air contained within these vessels prevents them from being filled with water on submersion, so that the diver may descend in them and breathe freely for a long time, provided he can be furnished with a new supply of fresh

Diving-bell, Inside and Top.

air when the contained air becomes vitiated by respiration. The diving-bell is generally made of cast iron, and has several strong convex lenses set in the upper side or roof, to admit light to the persons within. It is suspended by chains from a barge or lighter, and can be raised or lowered at pleasure upon sig-

# Diving-bell

#### **Diving-dress**

nals being given by the persons within, who are supplied with fresh air injected into a flexible pipe by means of forcing pumps placed in the lighter, while the heated air escapes by a cock in the upper part of the bell. The illustration shows the most recent form of diving apparatus in use on the river Clyde, in which steam is applied to operate all the movements required. A form, called the *nautilus*, has been invented which enables the occupants, and not the attendants above, to raise or sink the bell, move it about at pleasure, or raise great weights with it and deposit them in any

Diving-dress.

which has a corresponding screw, can be at-tached or removed. The helmet has usually three eycholes, covered with strong glass, and protected by guards. Air is supplied by means of a flexible tube which enters the helmet and То communicates with an air-pump above. allow of the escape of the used air there is sometimes another flexible tube, which is led from the back part of the helmet to the sur-face of the water. But in the more improved forms of the dress, the breathed air escapes by a valve so constructed as to prevent water from getting in, though it lets the air out. Leaden weights are attached to the diver, and his shoes are weighted, that he may be able to descend a ladder, walk about below, etc. Communication can be carried on with those above by means of a cord running between the diver and the attendants; or he may converse with them through a speaking tube or a telephonic apparatus. One form of diving-dress makes the diver independent of any connection with persons above the water. It is elastic and hermetically closed. A reservoir containing highly compressed air is fixed on the diver's back, which supplies him with air by a selfregulating apparatus at a pressure corresponding to his depth. When he wishes to ascend he simply inflates his dress from the reservoir. Another form, known as the Fleuss dress, makes the diver also independent of exterior aid. The helmet contains a supply of com-

desired spot. Divingdress, a waterproof dress made of india - rubber cloth used by professional divers, and covering the entire body except the head. The head. dress has a neck-piece or breastplate, fitted with a segmental screw bayonet joint, to which the head-piece or helmet, the neck o f

pressed oxygen, and the exhaled breath is passed through a filter in the breast-piece which deprives it of its carbonic acid, while the nitrogen goes back into the helmet to be mixed with the oxygen, the supply of which is under the diver's own control, and to be breathed over again. A diver has remained an hour and a half under 35 feet of water in this dress. The safe limit of depth at which operations can be carried on with the divingdress is 120 to 150 feet. Diving for pears, sponges, or corals is now to a great extent carried on by means of diving-dresses.

**Divining Rod**, a rod, usually of hazel, with two forked branches, used by persons who profess to discover minerals or water under ground. The rod, if carried slowly along by the forked ends, dips and points downward, it is affirmed, when brought over the spot where the concealed mineral or water is to be found. The use of the divining-rod is still common in many parts, and quite recently various wonderful instances of its efficacy in discovering water have been published in respectable prints.

Division of Labor, a principle employed in great industries for the simplification of the work to be done by each of the workmen engaged in it. The separation of complicated processes into a series of simple operations not only results in a great saving of time, but also demands much less ability on the part of the workman, in order that he may acquire the necessary skill in performing any particular operation. Owing to both of these causes, the saving of time, and the employment of cheaper labor, the cost of producing compli-cated articles is, by the application of this principle, immensely reduced. Division of labor tends to the invention of machinery, and to the effectual use of machinery when in-vented. It increases the skill and desterity of the individual workman; it effects a great saving of time and capital, and it conduces to the more economical distribution of labor by classing work-people according to their ca-pacity. It has, however, a deteriorating effect on the laborer's usefulness as an all-round workman.

DIX, JOHN ADAMS (1798-1879), statesman and soldier, b. in Boscawen, N. H.; d in New York City. In 1814 he became third lieutenant in the Twenty-third Infantry, and, in June, 1814. was transferred to the artillery. He was made first lieutenant in 1816; aide-de-camp to General Brown in 1819: was transferred to the First, then to the Third Artillery in 1821; and In 1826 he reappointed captain in 1825. signed his commission, studied law, and was admitted to the bar in 1828; was appointed secretary of state for New York in 1833; was elected to the state assembly in 1842; and U. S. senator in 1845; was assistant treasurer of the U.S. in 1853; postmaster of New York in 1859; and secretary of the treasury in Buchanan's cabinet in 1861. At the beginning of the Civil War he entered the army and was appointed brigadier general and major general of volunteers. In 1860 he was appointed minister to Paris; and in 1872, was elected governor of New York. He edited a literary journal, . The Northern Light; published various translations.

Dixie (or Dixie's Land), a term which came, by a popular error, to be identified with the South and Southern institutions during the Civil War. It is derived from a Northern negro refrain, which was sung in New York about the beginning of the nineteenth century, and which expressed the supposed regrets of the slaves of a man Dixie, who had shipped his slaves to the South as the abolition sentiment grew stronger. This rude chant afterward was developed into the melody that for a time became the rival of Yankee Doodle.

Dixon, Lee co., Ill., on Rock\*River, 98 mi. from Chicago. Railroads: C. & N. W., and Illinois Central. Industries: piano, shoe, box, sash and blind, and woven-wire factories, planing mill, and condensed-milk factory. Surrounding country agricultural. Dixon was the base of supplies during the Black Hawk War. The town was first settled in 1828 by John Dixon. Pop. est. 1897, 10,000.

Dizful, a town of Persia, near the western boundary, on the river Dizful; a place of great trade and manufactures. Pop. 30,000.

Djokdjokarta, a Dutch residency in the Its forests abound in teak. island of Java. Its natural fertility is great, and rice, coffee, and tobacco are extensively cultivated. It is ruled by a sultan who is dependent on the Dutch. Pop. 441,800. The town is large and regular, and contains the sultan's water-palace, and the seat of the Dutch resident, which is a fort commanding both the palace and the town. Pop. 45,000.

Dnieper (në'per), a great river of Russia which rises in the government of Smolensk, flows first southwest, then southeast, and latterly again southwest to the Black Sea. It begins to be navigable a little above Smolensk, and has a total length, including windings, of 1,230 mi. Among its tributaries are the Beresina, the Pripet, the Desna, and the Psiol. In its lower course there are important fisheries. Between Kiev and Alexandrovsk it forms a series of cataracts, which are now being removed by blasting of the rocks. Since 1838 there have been steamboats on the river, and the trade carried on by it is considerable.

**Dniester** (nës'tèr), a large river of Europe, which has its source in the Carpathian Mountains, in Austrian Galicia, enters Russia at Chotin, and empties itself into the Black Sea, after a course of about 750 mi. Its navigation is difficult on account of frequent shallows and rapids.

Doane, George WASHINGTON (1799-1859), American bishop, b. in New Jersey. He took a great interest in educational matters; taught in Trinity College, Hartford, and, in 1846, founded Burlington College.

Dobrud'sha, THE, a territory forming part of the kingdom of Roumania, included between the Danube, which forms its boundary on the w. and n., the Black Sea on the e., and on the s. by a line stretching from Silistria to

a point a few miles s. of Mangalia. There are some fertile spots, but on the whole it is marshy and unhealthy. The population is of various nationalities, Roumanians, Bulgars, Greeks, Turks, and Jews. The inhabitants support themselves by rearing sheep and buffaloes. The principal town is Babadagh. Pop. about 100,000.

Dock, a name applied to different plants of the genus Rumer, belonging to the rhubarb family. These are large herbaceous plants, with stout roots, alternate and often entire leaves, and bearing panicles of small, greenish flowers. They are very troublesome as weeds, but the roots of some of them are used medicinally as astringents.

**Docks** are usually artificial enclosures for the reception of vessels, and provided with gates to keep in or shut out the tide. They are called *wet-docks* when they are intended to receive vessels for loading and unloading, the gates being in this case constructed so as to keep in the tide, and thus preserve the water within the docks as nearly as possible at the uniform level of high water. They are called dry-docks, or graving-docks, when they are intended to admit vessels to be examined and repaired, the gates in this case being such as to keep out the tide while the shipwrights are engaged on the vessel. There is another kind of dry-docks called floating-docks, which float on the surface of the water, and may be sunk sufficiently to allow of a vessel being floated into them, and then raised again, by pumping the water out of the tanks round the sides. One of the chief uses of a wet-dock is to keep a uniform level of water, so that the business of loading and unloading ships can be carried on without any interruption and without danger of damage to the vessel from straining, low tides, storms, etc.

Graving-docks are built of strong masonry, and their entrance is closed either by swinging gates opening in the middle, and when shut presenting a salient angle to the water in the river or harbor from which the dock is entered, or by a framework called a caisson, built like the hull of a ship, with a keel and a stem at both ends. When the caisson is empty it floats, and may be removed to admit of a vessel being floated into the dock. The caisson being then placed at the entrance and filled with water, again sinks into the grooves intended for it and closes the graving-dock. The water is then pumped out, leaving the ship dry and supported by wooden blocks and props. With regard to floating docks, a common type of construction is the iron floating-dock, built in water-tight compartments, and not closed in at either end. It is sunk to the required depth by the admission of water into so many of the compartments, till the vessel to be docked can float easily above its bottom, and it is then raised by pumping out the water until the ship can be propped up as in a drydock.

A kind of dry-dock, called the hydraulic liftdock, consists of a double row of iron columns, each of which contains a hydraulic press. All

these hydraulic presses can be worked simultaneously by a powerful steam engine, and their combined action has the effect of raising a series of transverse iron girders stretching from the columns on one side to those of the other. An iron pontoon is first floated above these girders, and then sunk so as to rest on them,

Floating-dock.

and the ship to be docked is floated above the pontoon, and supported by blocks resting only upon the pontoon, so that the ship is in no way connected with the columns on each side. The hydraulic presses are then set to work, the girders with the pontoon and ship are raised high enough for the water to be run out of the pontoon, which is then sufficiently buoyant to float the ship. The pontoon may now be floated away clear of the dock, and another take its place. By this plan a number of vessels can be floated for overhauling and repairs in very shallow water and at comparatively slight expense.

**Dock-yards**, establishments supplied with all sorts of naval stores, materials and conveniences for the construction, repairs, and equipment of ships of war. In the U. S. there are nine important navy-yards, located at Brooklyn, N. Y.; Boston Mass.: Portsmouth, N. H.; League Island, Pa.; Portsmouth, Va.; Mare Island, Cal.; New London, Conn.; Pensacola, Fla.; and at Washington, D. C.

**Doctrinaires**, a section of French politicians, represented by the Duke de Broglie, Royer-Collard, Guizot and others who became prominent after the Restoration in 1815. They favored a constitutional monarchy with a balance of power similar to that which then existed in Britain. In the chambers they thus occupied a place between radicals and ultraroyalists. They received the name of *doctrinaires* because they were looked upon more as theoretical constitution-makers than practical politicians, and the term is now used to designate political theorists generally. **Dodge**, AUGUSTUS CÆSAR (1812-1883), b. in Missouri. He was one of the first U. S. senators from Iowa, sitting from 1848 to February, 1855, and was minister to Spain 1855-59. In 1873 he became mayor of Burlington.

Dodge, GRENVILLE MELLEN, b. in Danvers, Mass., April 12, 1831; served with distinction

in the Civil War, and in December, 1864, succeeded General Rosecrans in command of the Department of Missouri. In 1866 he became chief engineer of the Union Pacific railroad, of which he has been many years a director. He served a term in Congress from Iowa, 1868-69.

from Iowa, 1868–69. Dodge, HENRY (1782–1867), soldier, b. in Indiana. He fought in the Black Hawk War, and obtained a colonelcy in the regular army. In 1836 he was made governor of the territory of Wisconsin, and later served two

terms as delegate in Congress. In 1846 he again became governor, and was U. S. senator from the state of Wisconsin from 1848 to 1857.

**Dodge**, MARY MAPES, b. in New York City in 1838; has written extensively for the magazines, and in 1873 became editor of *St. Nicholas.* 

**Dodo** (*Didus Ineptus*), an extinct genus of birds once abundant on the Island of Mauritius, and assigned by naturalists to the order Columbæ, or pigeons, though an extreme modification of the type. It was a massive, clumsy

Supposed Figure of the Dodo.

bird, larger than a swan, covered with down instead of feathers, with short, ill-shaped legs, a strong, bulky, hooked beak, and wings and tail so short as to be useless for flight. Its extinction was due to its organization not being adapted to the new conditions which colonization and cultivation introduced.

**Dodo na**, a celebrated locality of ancient Greece, in Epirus, where was one of the most ancient Greek oracles. It was a seat of Zeus, whose communications were announced to the priestesses in the rustling of the leaves on its oak-tree, and the murmuring of water which gushed forth from the earth.

Dog, a digitigrade, carnivorous animal. forming the type of the genus Canis, which includes also the wolf, the jackal, and, as a sub-genus, the fox. The origin of the dog is a much-debated question, some considering the breed derived from the wolf, an opinion which is based on resemblances of structure, the susceptibility which the wolf shows of being domesticated, the fact of the two animals breeding together and producing fertile young, and the equality in the period of gestation. But all these points are subject to exceptions and reservations which make the matter doubtful. It is generally agreed that no trace of the dog is to be found in a primitive state, the dhole of India, and dingo of Australia being believed to be wild descendants from domesticated ancestors. Several attempts to make a systematic classification of the varieties of dogs have been made but without much success, it being difficult in many cases to determine what are to be regarded as types, and what as merely mongrels and crossbreeds. Colonel Hamilton Smith divides dogs into six groups as follows: 1, Wolf-dogs, including the Newfoundland, Esquimaux, St. Bernard, shepherd's dog, etc.; 2, Watch-dogs and Cattle-dogs, including the German boar-hound, the Danish dog, the matin dog, etc.; 3, Greyhounds, the lurcher, Irish hound, etc.; 4, Hounds, the bloodhound, staghound, foxhound, setter, pointer, spaniel, cocker, poodle, etc.; 5, Curdogs, including the terrier and its allies; 6, Mastiffs, including the different kinds of mastiffs, bull-dog, pug-dog, etc. Dogs have in the upper jaw six incisors, two strong curved canines, and six molars on each side, the first three, which are small and have cutting edges, being called false molars; in the lower jaw are six incisors, two canines, and on each side seven molars. The forefeet have five toes, the hindfeet four or five; the claws are strong, blunt, and formed for digging, and are not retractile. The tail is generally long, and is curled upward. The female has six to ten mammæ; she goes with young nine weeks as a rule. The young are born blind, their eyes opening in ten or twelve days; their growth ceases at two years of age. The dog commonly lives about ten or twelve years, at the most, twenty.

**Dogbane**, an American plant found from Canada to Carolina, belonging to the natural order Apocynaceæ. The whole plant is milky; the root is intensely bitter and nauseous, and is employed in America instead of ipecacuanha. Another species yields a useful fiber, and is known as Canada or Indian hemp.

**Dog days**, the name applied by the ancients to a period of about forty days, the hottest season of the year, at the time of the heliacal rising of Sirius, the dog-star. The time of the

#### Dogma

rising is now, owing to the precession of the equinoxes, different from what it was to the ancients (July 1); and the dog days are now counted from July 3 to August 11, that is, twenty days before and twenty days after the heliacal rising.

**Doge** (döj), formerly the title of the first magistrates in the Italian republics of Venice and Genoa. The first doge of Venice elected for life was Paolo Anafesto, in 697; and in Genoa, Simon Boccanera, in 1339. In the former city the dignity was always held for life; in the latter, in later times, only for two years. In both cities the office was abolished by the French in 1797.

**Dogfish,** a name given to several species of small shark, common around the British Isles. The rough skin of one of the species, the lesser spotted dogfish, is used by joiners and other artificers in polishing various substances, particularly wood. This species is rarely 3 ft. long. S. canicula, the greater dog-

Lesser Spotted Dogfish.

fish, is in length from 3 to 5 ft. It is blackish brown in color, marked with numerous small dark spots. Both species are very voracious and destructive. Their fiesh is hard, dry, and unpalatable. The common or picked dogfish is common in North American seas, aud is sometimes used as food. It is fierce and voracious.

**Dogger-Bank**, an extensive sand bank of the German Ocean, celebrated for its cod fishery. It commences about 36 mi. e. of Flamborough Head and extends e. n. e. to within 60 mi. of Jutland, in some places attaining a breadth of about 60 mi., though it terminates merely in a point. Where shallowest the water over it is 9 fathoms.

**Dog lichen,** the popular name of a plant, common on damp ground, stones, and trunks of trees. It was formerly supposed to be a specific for hydrophobia. Also known as *Ash*colored Ground Literwort.

**Dogma**, an article of religious belief, one of the doctrines of the Christian faith. The history of dogmas, as a branch of theology, exhibits in a historical way the origin and the changes of the various Christian systems of belief, showing what opinions were received by the various sects in different ages of Christianity, the sources of the different creeds, by what arguments they were attacked and supported, what degrees of importance were attached to them in different ages, the circumstances by which they were affected, and the mode in which the dogmas were combined into systems. Lectures on this subject are common in the German universities.

**Dog's Cabbage** (Dog-cabbage), a smooth succulent herb, nat. order Chenopodiaceæ, found in the s. of Europe. Though it is slightly acrid and purgative it is sometimes used as a pot herb.

**Dog's-tooth Ornament,** an architectural ornament or molding consisting of square fourleaved flowers with projecting centers placed in close contact with each other. It is the characteristic decorated molding of early English architecture.

**Dog's-tooth Violet**, a liliaceous plant grown in gardens, so called from the appearance of its white bulbs.

**Dogwatch**, a nautical term distinguishing two watches of two hours each (4 to 6 P. M. and 6 to 8 P. M.). All the other watches count four hours each, and without the introduction of the dogwatches the same hours would always fall to be kept as watch by the same portion of the crew.

**Dol' drums,** among seamen, the parts of the ocean near the equator that abound in calms, squalls, and light baffling winds; otherwise known as the horse-latitudes.

**Dol'ichos** (-kos), a genus of leguminous plants, sub-order Papilionaceæ. They are found in the tropical and temperate regions of Asia, Africa, and America, and all produce edible legumes.

**Dol'ichosaurus** ("long lizard"), an extinct snake-like reptile found in the chalk, whose remains indicate a creature of aquatic habits from 2 to 3 ft. in length.

**Dollar,** a silver or gold coin of the U. S., of the value of 100 cents. The same name is also given to coins of the same general weight and value, though differing somewhat in different countries, current in Mexico, a great part of South America, Singapore, the Philippine Islands, etc. The name is from the Dutch (also Danish and Swedish) daler, from German thaler, so named from German thal, a dale, because first coined in Joachim's Thal, in Bohemia, in 1518.

**Dollart,** THE, a gulf of the German Ocean, at the mouth of the Ems, between the Dutch province of Groningen and Hanover. It was originally dry land, and was formed by irruptions of the sea which took place in 1277 and 1530, overwhelming thirty-four large villages and numerous hamlets.

**Döllinger** (deul'ing-èr), JOHANN JOSEPH IG-NAZ (1799-1890), a celebrated German theologian and leader of the Old Catholic party, was b. at Bamberg, in Bavaria. In 1822 he entered the church, and soon after published *The Doc*trine of the Eucharist during the First Three Centuries, a work which won him the position of lecturer on church history at the University of Munich. In later years he took an active part in the political struggles of the time as representative of the university in the Bavarian Parliament, and as delegate at the Diet of Frankfort voted for the total separation of church and state.

**Dolomite**, a mineral, also called magnesian limestone. It is composed of carbonate of calcium and carbonate of magnesium, and varies from gray or yellowish-white to yellowishbrown. It abounds in the Apennines, Tyrol. Switzerland, Tuscany, North America. etc.. and in England extends from South Shields to Nottingham. A variety called bitter spar. and sometimes *rhomb spar*, is found in crystals having the form of a rhomboid; color. grayish, yellowish, or reddish brown, easily scratched with the knife; semi-transparent. A second variety is denominated *pearl spar*. which has crystals of curvilinear faces and a pearly luster.

**Dolomite Mountains** (or Dolomite Alps). a group of European mountains belonging partly to Tyrol, partly to North Italy, and having the Piave and Rienz on the east, the Adige and Eisack on the west. They arnamed from the prevalence of the mineral dolomite, and present most interesting and picturesque scenery, the peaks being endlessly varied in form. The highest summits are Palle di San Martino (10.958 ft.); Sorapiss (10,798), and Monte Tofana (10,715).

**Dolphin** (*Delphinus*), a cetaceous animal forming the type of a family (Delphinidæ). which includes also the porpoises and narwhal. Dolphins are cosmopolite animals, inhabiting every sea from the equator to the poles; they are gregarious, and swim with extraordinary velocity. The common dolphin

Common Dolphin.

measures from 6 to 10 ft. in length, has a long, sharp shout with numerous nearly conical teeth in both jaws; its fiesh is coarse. rank, and disagreeable, but is used by the Laplanders as food. It lives on fish, mollusca. etc., and often may be seen in numbers round shoals of herring. The animal has to come to the surface at short intervals to breathe. The blow-hole is of a semilunar form, with a kind of valvular apparatus, and opens on the vertex. nearly over the eyes. The structure of the ear renders the sense of hearing very acute, and the animal is observed to be attracted by regu

lar or harmonious sounds. One or two young are produced by the female, who suckles and watches them with great care and anxiety, long after they have acquired considerable size. Compactness and strength are the characteristics of the genus. The name is also commonly but improperly given to a fish, a member of the mackerel family, the beauty of whose colors when dying has been much celebrated by poets. They abound within the tropics, are about 4 or 5 ft. long, very swift in swimming, and are used as food, though said sometimes to be poisonous.

Dome, a vaulted roof of spherical or other curvature, covering a building or part of it, and forming a common feature in Byzantine and also in Renaissance architecture. Cupola is also used as a synonym, or is applied to the interior, dome being applied to the exterior. Most modern domes are semi-elliptical in vertical section, and are constructed of timber: but the ancient domes were nearly hemispherical and constructed of stone. Of domes the finest, without any comparison, ancient or modern, is that of the Rotunda or Pantheon at Rome (1421 ft. internal diameter and 143 ft. internal height), erected under Augustus, and still perfect. Among others the most noteworthy are St. Sophia at Constantinople (104x201 ft.), the cathedral of Santa Maria del Fiore at Florence (189x310 ft.), St. Peter's at Rome (139x330 ft.), St. Paul's, London (112x215 ft.), the Hotel des Invalides (80x173 ft.), and the church of St. Geneviève at Paris (67x190 ft.) The figures represent the internal diameter and height in feet. The finest dome in the U.S. is that of the Capitol at Washington, built of cast-iron.

**Domenichino** (dö-men-i-kē'nö) (1581-1641), *Domenico Zampieri*, an Italian painter of great eminence, of the Lombard school, b. at Bologna. He studied under Annibal Carracci, and afterward went to Rome, where he became painter to Pope Gregory XV. Among his best works are the *Communion of St. Jerome* in the Vatican Museum, the *History of Apollo*, the *Martyrdom of St. Agnes*, and the *Triumph* of Darid.

**Domin'go**, SAN, capital of the Dominican Republic (or San Domingo) in the island of Hayti. It lies on the s.e. coast at the mouth of the Ozama, and has a commodious port. It is the oldest European city in the New World, having been founded in 1494 by Bartholomew Columbus. Pop. about 16,600.

Columbus. Pop. about 16.000. **Dominica** (dom-i-nē'kà). a British West India island, so named because discovered by Columbus on a Sunday, a member of the united colony of the Leeward Islands between Martinique and Guadeloupe. It is about 20 mi. in length, n. to s. and 12 mi. in breadth e. to w; area 186.436 acres. It is rugged and mountainous, but it contains many fertile valleys and is well watered. The shores are but little indented, and are entirely without harbors, but on the west side there are several good anchorages and bays. The principal exports consist of sugar, molasses, coccoa, and lime-juice. The imports and exports amount each to about \$250,000 annually. Dominica was ceded by France to Great Britain in 1763. Roseau is the capital. Pop. 28,211 (including about 300 aboriginal Caribs).

Domin' ical Letter, in chronology, properly called Sunday letter, one of the seven letters of the alphabet, A B C D E F G, used in almanacs, ephemerides, etc., to mark the first seven days of the year and all consecutive sets of seven days to the end of the year, so that the letter for Sunday will always be the same. If the number of days in the year were divisible by seven without remainder, then the year would constantly begin with the same day of the week; but as it is, the year begins and ends on the same day, and therefore the next year will begin on the day following, and on leap years two days following, so that the same series is not repeated till after four times seven, or twenty-eight years.

**Dominican Republic** (or San Domingo), a republic occupying the eastern portion of the island of Hayti; area 20,506 sq. mi. It is fertile and exports mahogany, sugar, tobacco. cocoa, etc., but its resources are as yet but little developed. It formerly belonged to Spain, and is the oldest colonial settlement in America. Its inhabitants are chiefly negroes and mulattoes. Capital, San Domingo. Pop. est. at 504,000. See *Hayti*.

**Dom' incoes**, a game played with small flat rectangular pieces of ivory, about twice as long as they are broad. They are marked with spots varying in number. When one player leads by laying down a domino, the next must follow by placing alongside of it another which has the same number of spots on one of its sides. Thus, if the first player lays down 6-4. the second may reply with 4-8, or 6-7, etc.; in the former case he must turn in the 4, placing it beside the 4 of the first domino, so that the numbers remaining out will be 6-8; in the latter case he must turn in the 6 to the 6 in like manner, leaving 4-7, to which his oppo-nent must now respond. The player who cannot follow suit loses his turn, and the object of the game is to get rid of all the dominoes in hand, or to hold fewer spots than your opponent when the game is exhausted by neither being able to play.

**Domitian** (or in full, Titus Flavius Domitianus Augustus (A. D. 51-96), Roman emperor. son of Vespasian, and brother of Titus; in 81 succeeded to the throne. At first he ruled with a show of moderation and justice, but soon returned to the cruelty and excesses for which his youth had been notorious.

**Domremy la Pucelle** (don-ré-mi lå pu-sål), the birthplace of Joan of Arc, a small French village, department of the Vosges, 7 mi. n. of Neufchâteau. The house is still shown here in which the heroine was b., and in the neighborhood is the monument erected to her memory.

**Don** (ancient *Tanais*), a river of Russia, which issues from Lake Ivan-Ozero, in the government of Tula, and flows s.e. through governments Riazan, Tambov, Voronej, and Don Cossacks, to within 37 mi. of the Volga, where it turns abruptly s.w. for 236 mi., and falls into the Sea of Azof; whole course nearly 900 mi. The chief tributaries are: right bank, the Donetz and Voronej; left, the Khoper and Manitsch. Although not admitting vessels of much draught, the Don carries a large traffic especially during the spring floods, and a canal connects it with the Volga system of navigation. It has also very extensive and productive fisheries.

**Dona'ti's Comet**, so called from the Italian astronomer Donati, who first observed it in June, 1858. Next to the comet of 1811 it is the most brilliant that has appeared this century. It was nearest the earth on Oct. 10, 1858.

**Donax**, a species of grass or reed inhabiting the southern parts of Europe; it grows to a great height and is used for fishing-rods, etc.

**Don' caster**, town of England, West Riding of Yorkshire. It has manufactures of ropes, canvas, machinery, etc. It has been long celebrated for its annual races, now held in the middle of September. Doncaster was originally a Roman station on the line of the old Roman Watling Street. Pop. 25,938.

**Dondrah Head**, the southern extremity of the island of Ceylon. It was the site of the Singalese capital during part of the seventh century, numerous remains of which are still to be found.

**Don'egal**, a maritime county, Ireland, province of Ulster: area 1,197,154 acres. The fisheries are extensive and valuable, and form the chief employment of the inhabitants of the coast and islands. Grain, butter, and eggs are exported. The minerals include marble, lead, copper, etc., but are not wrought to advantage. Pop. 185,211. Donegal, the county town, is a small seaport on the bay of the same name, at the mouth of the river Esk. Pop. 1,416.

**Dongola**, a district of Upper Nubia, Egypt, on both sides of the Nile. It formerly belonged to Egypt and was the seat of a pasha, but since the evacuation of all the country south of Wada Haifa in 1886 by the Egyptian government, has been left in an unsettled state. Its chief products are dates, cotton, indigo, and maize. The population is a mixture of Arabians and indigenous Nubians. Its chief town is Dongola (or *El Ordek*), on the left bank of the Nile. Pop. 6,000.

**Doniphan**, ALEXANDER WILLIAM (1808–1887), soldier, b. in Mason co., Ky. He graduated at Augusta College in 1824, was admitted to the bar in 1830, and began to practise in Lexington, Mo. He was elected to the legislature in 1836, 1840, and 1854. In 1838, when the state militia was summoned out against the Mormons, he commanded the first brigade, and captured Joseph Smith, who escaped, joined his band in Illinois, and afterward called Dr. Doniphan to act as his counsel. He was made colonel of a regiment of mounted veterans equipped for the army of the West, at the beginning of the War with Mexico in 1846. He was a commissioner from Missouri to the Peace Convention in Washington, which endeavored to avert the Civil War.

Donizet 'ti, GAETNO (1798-1848), Italian com-

poser. In 1835 he was appointed professor of counterpoint at the Royal College of Naples, but removed in 1840 to Paris, bringing with him three new operas, Les Martyre, La Farrita, and La Fille du Régiment, of which the last two are among his most popular productions. Of his other operas none except Linda di Chamouni and Don Pasquale achieved any special triumph. He had written as many as sixty-four operas.

Don Juan (Sp. pron. hy-in'), the hero of a Spanish legend which seems to have had some historical basis in the history of a member of the noble family of Tenorio at Seville. According to the legend Don Juan was a libertine of the most reckless character. An insult to the daughter of a governor of Seville brought the indignant father and the profigate don into deadly conflict, in which the former was slain. Don Juan afterward, in a spirit of wild mockery, goes to the grave of the murdered man and invites the statue of him erected there to a revel. To the terror of Don Juan the "stony guest" actually appears at the table to bear him away to the infernal world. The legend has furnished the subject for many dramas and operas. The most fa-mous of the latter is Mozart's Don Gioranni which has made the story familiar to everybody. Among the former are Burlador de s-rilla by Tellez, Don Juan ou Le Festin de Pierre. by Molière, and The Libertine by Shadwell. The Don Juan of Byron bears no relation to the old story but in name and in the libertine character of the hero.

**Donnelly**, IGNATIUS, b. in Philadelphia. Nov. 3, 1831, and studied law. In 1857 he went to Minnesota, became lieutenant governor in 1859, and Congressman from December, 1863. to March, 1869.

**Donnybrook**, a village, Ireland, now mostly in the parliamentary borough of Dublin. Its famous fair, which seldom passed off without riot and bloodshed, was abolished in 1855.

**Don Quixote** (Sp. pron.  $k\bar{e}-\hbar\bar{o}$ 'tā), the title of a famous romance by Cervantes. See (*ir*rantes. The name of the hero, Don Quixote is used as a synonym for foolish knight-errantry or extravagant generosity.

**Doolittle**, JAMES Rood, b. in Washington co., N. Y., 1815: was admitted to the bar in 1837, and removed to Wisconsin in 1851. He became circuit judge in 1853, and from 1857 to 1869 was U. S. senator. He has since practised law in Chicago. In 1872 he presided at the Democratic convention in Baltimore, which endorsed Horace Greeley for the presidency.

**Doomsday** (or Domesday) **Book**, a book containing a survey of all the lands in England. compiled in the reign and by the order of William the Conqueror. The survey was made by commissioners, who collected the information in each district from a sworn jury consisting of sheriffs, lords of manors, presbyters, bailiffs, villeins—all the classes, in short, interested in the matter. The extent, tenure, value, and proprietorship of the land in each district, the state of culture, and in some cases the number of tenants, villeins, serfs, etc., were the matters chiefly recorded. The survey was completed within a year. Northumberland, Durham, Cumberland, and Westmoreland were not included in the survey, probably for the reason that William's authority was not then (1086) settled in those parts. The Domesday Book consists of two volumes, one folio and one quarto. It has been twice republished, the last time (1861-65) in perfect facsimiles of the original.

**Dordogne** (dor-dony), a department of France, which includes the greater part of the ancient province of Périgord, and small portions of Limousin, Angoumois, and Saintonge. Area 3,544 sq. m., of which about a third is fit for the plow. The chief minerals are iron, which is abundant, slate, limestone, marble, and other stone. Mining, iron manufacture, etc., are carried on to a considerable extent, and there are a number of vineyards. The climate is mild, but somewhat changeable. Pop. 492,205. The river DORDOGNE, principal river of the department, rises on the flanks of the Puy-de-Sancy, flows w.s.w., and after a course of 290 miles unites with the Garonne in forming the Gironde.

**Doré** (dö-rā) PAUL GUSTAVE (1833-1883), a prolific French draftsman and painter, b. at Strasbourg. He distinguished himself greatly as an illustrator of books. His illustrations of Rabelais, of Perrault's Tales, Sue's Wandering Jew, Dante's Divina Commedia, and Cervantes's Don Queixote, displayed great fertility of invention, and the fine fantasy of his landscapes and the dramatic effectiveness of his groups acquired for him a European reputation.

**Doria**, one of the most powerful families of Genoa, became distinguished about the beginning of the twelfth century, and shared with three other leading families, the Fieshi, Grimaldi, and Spinola, the early government of the republic (1284-1500).

**Dorians,** one of the four great branches of the Greek nation who migrated from Thessaly southward, settling for a time in the mountainous district of Doris in Northern Greece and finally in Peloponnesus.

**Doric Order**, in architecture, is the oldest, strongest, and simplest of the three Grecian orders, and the one that is best represented among the remains of ancient Greek architecture. The Doric column is distinguished by its want of a base (in the more ancient examples, at least), by the small number of its flutings and by its massive proportions, the true Grecian Doric having the height of its pillars six times that of the diameter. The capital was small and simple, and the architrave, frieze, and cornice were rather plain and massive.

**Dormant State**, a state of torpidity in which certain animals pass a portion of the year. In cold and temperate climates this period of long sleep takes place during the winter months, and is properly called *hibernation*. It commences when the food of the animal begins to get scarce, continues for a longer or shorter period, and is deeper or lighter according to the habits and constitution of the animal

Bats, bears, some animals of the rodent order, such as the porcupine, the dormouse, the squirrel, etc., all the animals belonging to the classes of Amphibia and Reptilia, such as tortoises, lizards, snakes, frogs, etc., and many species of molluscs and insects, hibernate more or less completely, retiring to suitable places of concealment-the bat to dark caves, the hedgehog to fern-brakes, snakes to holes in trees, etc. During hibernation there is a great decrease of heat in the bodies of the animals. The respiration as well as the pulsation of the heart is exceedingly slow, and the irritability of the animal often so low that in some cases it can be awakened only by strong electric shocks. With frogs and amphibious reptiles the dormant state is very common, and if the temperature is kept low by artificial means they may remain dormant for years. The term æstiration has been used to describe a similar condition into which certain animals, such as serpents and crocodiles, in tropical countries pass during the hottest months of the year.

**Dormouse**, a genus of mammiferous quadrupeds, of the order Rodentia. These little animals, which appear to be intermediate between the squirrels and the mice, inhabit temperate and warm countries, and subsist entirely on vegetable food. Their pace is a kind of leap, but they have not the activity of squir-

Dormouse.

rels. While feeding they sit upright and carry the food to their mouth with their paws. The dormice pass the winter in a lethargic or torpid state, reviving only for a short time on a warm sunny day, when they take a little of their hoarded stores and then relapse into the dormant state. They bring forth three or four at a birth.

**D'Orsay**, ALFRED, COUNT (1798-1852). a dilettante artist and man of fashion. When a young man he visited England. He married a daughter of the Earl of Blessington, but after the earl's death, a separation took place, and D'Orsay became an inmate of the Gore House, which the Countess of Blessington had made the center of a famous literary coterie.

made the center of a famous literary coterie. Dorsey, STEPHEN W., b. in Vt., Feb. 28, 1842: served during the Civil War. He went to Arkansas in the "carpet bag" times, and 44

sat as U. S. senator from that state from 1873 to 1879.

**Dorset**, DORSETSHIRE, a maritime county in the south of England, area 627,265 acres. A great part of the county is grass, and dairy husbandry is extensively carried on. Neither coal nor ores of any kind are found, but the quarries yield the well-known Portland stone. Pipe clay, plastic clay, and potter's clay also abound. The principal manufactures are those of flax, canvas, duck, etc., also silk and woolens. Pop. 194,487.

**Dort**, (or Dordrecht), a town, Holland, province South Holland, 14 mi. n.e. Rotterdam, on the Merwede, an arm or part of the Maas, and on an island separated from the mainland by an inundation in 1421. It is an old town, with a fine Gothic church, a good townhouse, museum, etc. It was formerly of more importance than now, but it still carries on an extensive trade, being not only near the sea, but by the Rhine, the Maas, and other water communications, connected with an immense extent of land territory. Pop. 31,067.

**Dort'mund**, a city of Prussia, province of Westphalia, situated on the Ems, 47 mi.n.n.e.of Cologne. It has rapidly increased in recent years, its prosperity being due to its becoming the center of several important railway systems, to the opening of extensive coal mipes in the vicinity, and to the active manufactures of iron, steel, machinery, railway plant, etc. There are also a number of breweries, potteries, tobacco factories, chemical works, etc. It was once a free imperial Hanseatic town, and the seat of the chief tribunal of the Vehme. Pop. 78,435.

**Dory** (or John Dory) (*Zeus faber*), a fish belonging to the mackerel family, celebrated for

#### John Dory.

the delicacy of its flesh. It seldom exceeds 18 in. in length, and is yellowish-green in color with a blackish spot on each side.

**Dot'terel**, a species of plover which breeds in the north of Europe, and returns to the south for the winter. In Scotland it appears in April and leaves in August, the young being hatched in July. It is found all over Europe and Northern Asia. Several species are

represented in the U.S., including the golden plover, the kill-deer, and piping plover.

Dotterel.

**Doual** (dö'ā) (or Douay), a town in France, department Nord, on the Scarpe, 18 mi. s. of Lille. It is one of the oldest towns in France, of which it became a part by the Treaty of Utrecht. It is strongly fortified, has a fine townhouse, several handsome churches, an academy of arts and law, a lyceum, museum and public library, Benedictine college, hospital, etc. ; a cannon foundry, linen manufactories, machine works, tanneries, etc. Pop. 30,-030.

**Doual Bible**, the English translation of the Bible used among English-speaking Catholics, and executed by divines connected with the English College at Douai. The New Testament was published in 1582 at Rheims, the Old in 1609-10 at Douai, the translation being based on the Vulgate. Various revisions have since materially altered it.

**Double-eagle**, an American gold coin of the value of 20 dollars, so called because double the value of the coin called the eagle.

**Double-stars** (or Binary Stars), stars which are so close together that they appear as one to the naked eye, but are seen to be double when viewed through a telescope. One of these stars may revolve about the other, or both may revolve round a common center.

**Doubs** (do), a department of France, having Switzerland on its eastern frontier. Its surface is traversed by four chains of the Jura. The temperature is variable, and the climate somewhat rigorous. About a third of the land is arable, but much the greater part is covered with forests. Maize, potatoes, hemp, flax, are the principal crops. Much dairy produce is made into Gruyère cheese. The minerals include iron, lead, and marble. Pop. 310,963.

**Douglas** (dug'las), capital of the Isle of Man, is frequented by immense numbers of visitors during the summer. Among the objects of interest are the House of Keys, the customhouse, the extensive breakwater, the promenade, etc. Pop. 15,500.

**Douglas** (dug'las), a family distinguished in the annals of Scotland. Their origin is unknown. They were already territorial magnates at the time when Bruce and Baliol were competitors for he crown. As their estates

lay on the borders they early became guardians of the kingdom against the encroachments of the English.

Douglass, FREDERICK (1817-1895), American lecturer and journalist, was the son of a negro slave, and was b. at Tuckahoe in Maryland. Although his father was a white man, he was, according to the law, reared as a slave. In 1832 he was purchased by a Baltimore shipbuilder, but made his escape in 1838. As he had taught himself to read and write, and showed talent as an orator, he was employed by the Anti-slavery Society as one of their lecturers. In 1845 he published his autobiography, and afterward made a successful lecturing tour in England. In 1870 he started a journal entitled The New National Era; in 1871 he was appointed secretary of the commission to Santo Domingo; in 1872, presidential elector; in 1877, marshal for the District of Columbia; recorder of deeds for that district, 1881-86; and U.S. Minister to Hayti in 1890.

**Douglas,** STEPHEN ARNOLD (1813-1861), American statesman, b. in Vermont. He was appointed attorney general for the state of Illinois, and in 1843 elected a member of the House of Representatives. In 1847 he was member of the Senate, and by re-election was a member of this body till his death. He was especially prominent in connection with the question as to the extension of slavery into new states and territories, which he maintained was a matter to be settled by the people of the respective states or territories, and not by Congress. He was a presidential candidate in 1860, when Lincoln was elected.

**Doum Paim** (dom), a palm tree. It is remarkable, like the other species of the genus, for having a repeatedly-branched stem. Each branch terminates in a tuft of large fan-shaped leaves. The fruit is about the size of an apple; it has a fibrous mealy rind, which tastes like gingerbread, and is caten by the poorer inhabitants of Upper Egypt, where it grows.

**Douro** (dö' rō) (or Duero), one of the largest rivers of the Spanish Peninsula, which, flowing west, traverses about one half of Spain and the whole of Portugal, and, after a course of 500 mi., falls into the Atlantic three miles below Oporto. It is navigable for small vessels for about 70 mi.

**Do'ver**, a borough of England, county Kent, 67 mi. s.e. of London. It lies on the coast of the Strait of Dover, and is 21 mi. distant from Calais on the French coast. It is an important railway terminus, and as a port for mail and packet service with the Continent has a large passenger traffic. Shipbuilding, sail making, and fisheries are the chief industries. The harbor has been much improved in recent years. The entrance is protected by the Admiralty Pier, which is nearly half a mile in length. The celebrated castle of Dover stands on a chalk cliff 350 feet in height. Pop. 33,678.

**Dover**, Kent co., Del. Raifroad, Phil., Wil. & Balt. Industries: Canning and glass button factories. Dover is the capital of the state and is the center of a fruit growing region. Pop. est. 1897, 3,200. **Dover**, Strafford co., N. H., on the Cocheco River. Railroads: Boston & Maine; Dover & Portsmouth; and Dover & Winnipiscogee. Industries: Cotton and woolen manufacturies, print works, boot and shoe shops. Pop. est. 1897, 13,500.

**Dover**, STRAITS OF, the narrow channel between Dover and Calais which separates Great Britain from the French coast. At the narrowest part it is only 21 mi. wide. The depth of the channel at a medium in the highest spring tides is about 25 fathoms. On both the French and English sides the chalky cliffs show a correspondency of strata which leaves no room for doubt that they were once united.

**Dow** (or Douw, properly Dou), GERARD (1613-1675), an eminent painter of the Dutch school, was the son of a glazier, and b. at Leyden. He studied under Rembrandt, and united his master's manner in chiaroscuro with the most minute finish and delicacy.

**Dow,** NEAL, temperance reformer, b. in Portland, Me., March 20, 1804. In 1880 he was the candidate of the National Prohibition party for president of the U.S.

**Down**, a county of Ireland, in Ulster. Area 610,730 acres. Agriculture is comparatively advanced, oats, wheat, flax, and potatoes being the principal crops. The native breed of sheep is small, but valued for the delicacy of its mutton and the fine texture of its wool. The principal manufactures are linen and muslin. The fisheries on the coast, principally cod, haddock, and herring, are considerable. The county town is Downpatrick; others are Newtonards and Banbridge. Pop. 266,893.

Newtonards and Banbridge. Pop. 266,893. Doyle, A. CONAN, b. 1850. English writer. Graduated at Stonyhurst College and shortly after made a trip to the Arctic regions. Later he practised medicine at South Sea, in the meantime doing some literary work. Among his more important novels are, A Study in Scarl t, Firm of Girdlestone, Micah Clarke, etc. Dr. Doyle has lectured successfully in the U.S.

**Drachma** (drak'ma), the unit of weight and of money among the ancient Greeks. It was the principal Greek coin, was made of silver, and was worth about 194 cts. As a weight among the Greeks it was about 2 pwt. 7 grains troy.

troy. **Drag'on, a fabulous monster, the stories regarding which reach back almost as far as history. His form is described as generally resembling that of a winged and two-legged serpent, the body covered with scales, the head crested, and the mouth spouting fire. The immediate source of the mediæval conception is probably the Scriptures, modified by accounts brought home by the Crusaders of the crocodiles in Egypt.** 

**Dragon** (or dragon-lizard), a name for several species of lizards inhabiting Asia, Africa, and South America. The common flying lizard, the best type of the genus, is about 10 or 12 inches in length, the tail being extremely long in proportion to the body. The sides are furnished with peculiar extensions of the skin, forming a kind of wings, which help

# **Dragon Fly**

to support it in the air when it springs from branch to branch. Its food consists almost exclusively of insects.

Fringed Dragon.

**Dragon Fly**, a family of neuropterous insects. They have a large head, large eyes, and strong horny mandibles. They are beautiful in form and color, and are of very powerful flight. The great dragon fly is about 4 in. long, and the largest of the British species. They live on insects, and are remarkable for their voracity. The dragon fly deposits its eggs in the water, where the larve and pupe live on aquatic insects. The larval stage lasts for a year. The

Dragon Fly and Nymph.

family is of very wide distribution. The small blue Agrion is a common European form. In the U. S. the dragon fly is known as the devil's darning-needle.

**Dragon's Blood,** a resinous juice, usually obtained by incision from various tropical plants. It differs in composition, and is often much adulterated. It is opaque, of a reddishbrown color, brittle, and has a smooth, shining, conchoidal fracture. It is soluble in alcohol and oil, but scarcely so in water. It is used for coloring varnishes, staining marble, leather, and wood, for tooth tinctures, etc.

# Draining

**Dragon Tree**, a tree-like liliaccous plant, with a stem simple or divided at top, and in old age often much branched. It is a native of the Canaries, and yields the resin known as dragon's blood. It is often grown in stoves and greenhouses.

Dragon Tree.

Drainage Tubes are used in surgery to effect a discharge of matter from an abscess or other collection of matter when a free incision cannot be safely or conveniently made. They are usually made of india rubber or caoutchouc, and are introduced into the abscess or wound so that one end is in contact with the seat of discharge, while the other reaches to the surface of the skin.

**Draining**, in agriculture, a method of improving the soil by withdrawing the water from it by means of channels that are gener-ally covered over. The successful practise of draining in a great measure depends on a proper knowledge of the superficial strata, of their situation, relative degrees of porosity. etc. Some strata allow water to pass through them, while others more impervious force it to run or filtrate along their surfaces till it reaches more level ground below. In general where the grounds are in a great measure flat and the soils of materials which retain the excess of moisture, they require artificial means of drainage to render them capable of yielding good crops whether of grain or grass. The wetness of land which makes it inferior for agricultural purposes, may appear not only as surface water but as water which flows through the lower strata, and to draw off these there are the two distinct operations of surface-draining and under-draining. The rudest form of open drains are the deep furrows lying between high-backed ridges, and meant to carry off the surplus water after the soil is completely saturated, but in doing so they generally carry off also much of the best of the soil and of the manure which has been spread upon it. The ordinary ditch is a common form of water-course useful in certain cases, as in hill pastures. But covered drains at a depth of 4 ft. or so are the common forms in draining agricultural lands. They are gen-

erally either stone-drains or tile-drains. Stonedrains are either formed on the plan of open culverts of various forms, or of small stones in sufficient quantity to permit a free and speedy flltration of the water through them. The box-drain, for instance, is formed of flat stones neatly arranged in the bottom of the trench, the whole forming an open tube. In tiledrains, tiles or pipes of burnt clay are used for forming the conduits. They possess all the qualities which are required in the formation of drains, affording a free ingress to water, while they effectually exclude vermin, earth, and other injurious substances. Drainage tiles and pipes have been made in a great variety of forms, the earliest of which, since the introduction of thorough draining, was the horse-shoe tile, so called from its shape. These should always rest on soles, or flats of burned clay. Pipe tiles, which combine the sole and cover in one piece, have been made of various shapes, but the best form appears to be the cylinder. An important department of draining is the draining off of the waters which are the sources of springs. Sometimes the judicious application of a few simple drains, made to, communicate with the watery layers, will often dry swamps of great extent where large sums of money, expended in forming open drains in the swamp itself, would leave it but little improved. In the laying out of drains the first point to be determined is the place of outfall, which should always afford a free and clear outlet to the drains, and must necessarily be at the lowest point of the land to be drained. The next point to be determined is the position of the minor drains; in the laying out of which the surface of each field must be regarded as being made up of ohe or more planes, as the case may be, for each of which the drains should be laid out separately. Level lines are to be set out a little below the upper edge of each of these planes, and the drains must then be made to cross these lines at right angles. By this means the drains will run in the line of the greatest slope, no matter how distorted the surface of the field may be. All the minor drains should be made to discharge into mains or submains, and not directly into an open ditch or water-course. As a general rule there should be a main to receive the waters of the minor drains from every five acres. The advantages of drainage are obvious. In the first place it allows the soil to be brought into a more suitable condition for the growth of plants, aiding in producing the finely divided and porous state by which the roots and rootlets can spread themselves at will in order to obtain the needed supplies of food, air, and moisture. It also allows the sun's rays to produce their full effect on the soil and plants without being robbed of great part of it by the stagnant water.

**Drake**, SIR FRANCIS (1539-1596), an English navigator, b. at Tavistock, in Devonshire. He served as a sailor in a coasting vessel, and **after**ward joined Sir John Hawkins in his last expedition against the Spaniards (1567), losing nearly all he possessed in that unfortunate enterprise. On the most famous of his voyages Drake passed the Straits of Magellan, plundered all along the coasts of Chile and Peru, sacked several ports, and captured a galleon laden with silver, gold, jewels, etc., to the value of perhaps \$1.000.000. He then ran north, seeking a passage to the Atlantic, but was compelled to return to San Francisco on account of the cold. He then steered for the Moluccas, and holding straight across the Indian Ocean doubled the Cape of Good Hope, and arrived at Plymouth, Nov. 3, 1580, being thus the first of the English circumnavigators.

**Drake**, JOSEPH RODMAN (1795-1820), poet, b. in New York City. At first he was placed to serve in business, but soon abandoned merchandise for the study of medicine. In 1812 he became connected with Fitz-Greene Halleck. His most aspiring poem, *The Culprit Fay*, was written in his twenty-second year.

**Drake,** SAMUEL GARDNER (1798-1875), antiquary, b. in Pittsfield, N. H. He was educated at the public school, and at the age of twenty he became a public school teacher. In 1828 he opened the first antiquarian bookstore in the U. S. He was a founder of the New England Historical and Genealogical Society. He edited some New England works, and published many books of historical and antiquarian subjects.

**Drakenberg Mountains,** a range of South Africa forming the western frontier of Natal, and rising to the height of 9,000 ft., a continuation of the Quathlamba Range.

Drama (Gr., from drao, "I act"), a class of writings which almost entirely consist of dialogue, persons being represented as acting and speaking, and the pieces being usually intended to be acted on the stage by parties assuming the characters of the respective per-sons. Its two great branches are tragedy and comedy, the former, roughly speaking, melancholy in character, the latter cheerful. The origin of the drama must be sought for in the love of imitation, and dramatic performances of some kind are to be met with probably among all nations. Dramatic compositions are found in the Old Testament, for example in Job and the Song of Solomon; and ancient India and China both developed a dramatic literature of their own. The European drama had its origin in Greece. Both forms, tragic and comic, took their rise in the celebrations of the Greek festivals of Dionysus (Bacchus), at which hymns and chants were sung by choruses in honor of the god, and the chorus continued to be a prominent feature of the old Greek drama. Greek comedy commenced about 580-560 B. c. with Susarion, but it was long in attaining regular form. Of the old Greek comedy the chief representatives were Cratinus, Eupolis, Pherecrates, and Aristophanes—the last the greatest. The invention of tragedy is generally ascribed to Thespis about 530 B. C., who was followed by Phrynicus. But the true creator of tragedy was Æschylus. in whose works and those of Sophocles and Euripides it found its most perfect expression. Thespis had only one actor, who from time to

time relieved the chorus by declamation. Æschylus changed this representation into real action by making use of two actors in addition to the chorus. Æschylus also introduced masks; and by means of a long gown and the *cothurnus*, or buskin, the lofty stature of the heroes was imitated. A third actor was first introduced by Sophocles. The accommodations for the spectators were improved, and machinery and scenery introduced. The theaters, which had been formerly built of wood, were now large stone erections capable of containing the greater number of citizens. The regular drama among the Romans was borrowed from the Greeks. Plautus and Terence were imitators of the Greek comedy, Livius Andronicus (240 B. C.) of the Greek tragedy. Of the Roman tragedy, the dramas of Seneca are the only specimens extant. In most modern European countries the regular drama took its rise in the mysteries, miracle-plays, and moralities of the Middle Ages. In Italy, however, it began with a reproduction in Latin The earliest tragedy in of classical models. Italian is Trissino's Sofonisba (1502). Regular comedies in Italian were written by Ariosto, Arctino, Macchiavelli, and others; and to the same period (fifteenth and sixteenth centuries) belongs the Italian Pastoral Drama, which sprung from the ancient idylls, and aimed at a fanciful delineation of Arcadian and mythological scenes. Among the pastoral dramatists of this period are Poliziano, Tasso, and Guarini. The pastorals gave birth to the opera, early masters of which, so far as it may be included in the poetic drama, are Zeno and Metastasio. The Italian drama waned in the seventeenth century, but in the eighteenth genuine comedy and classic tragedy were restored, the former by Goldoni, the latter by Alfieri. Monti, Manzoni, and Niccolini are among the later writers of tragedy.

The other European nations cultivated the dramatic art much later than the Italians. The English and Spaniards devoted their attention to it almost at the same time; the former reaching their acme in Shakespeare, the latter in Lope de Vega and Calderon. The history of the English theater and drama is naturally divided into two parts, the first of which begins with the reign of Elizabeth and ends with the reign of Charles I. The rapid development of the drama during the reign of Elizabeth was entirely unhampered by foreign influence. Lyly, Peele, Greene, Marlowe, Shakespeare, Ben Jonson, Beaumont and Fletcher, Chapman, Webster, Middleton, Marston, Ford, and Massinger are among the chief names connected with the brilliant period of the English drama. During the Commonwealth the Puritans prohibited all kinds of plays, and the theaters were shut up for thirteen years. With Charles II the drama reappeared, and exhibited a licentiousness hardly equaled by that of any other Christian nation. Among the chief names belonging to this period are Dry-den, Otway, Lee, Shadwell, Wycherley, and Etherege. From the close of the seventeenth to that of the eighteenth century British

comedy was cultivated with much success by Cibber, Farquhar, Congreve, Sheridan, and others. During the nineteenth century many writers have been conspicuous by their dramas. Among the chief of these may be noted Byron. Coleridge, Landor, Shelley, Maturin, Talfourd, Milman, Sir Henry Taylor, the first Lord Lytton, Knowles, R. H. Horne, Arnold, Browning, Swinburne, and Tennyson.

The French drama was in a miserable state before Corneille (1600-84), who indeed is looked on as the founder of the drama in France. Racine, Molière, Voltaire, and in later times Hugo, are some of the other distinguished French dramatists. Since about 1820, a new dramatic school has been formed in France, which, departing from the ancient strictness of what is called the *classic*, approaches more and more to the German or British, or what is called the romantic school. The establishment of this school formed part of the general reaction against the excessive adherence to classic models in literature, the leader in the movement being Victor Hugo. C. Delavigne marks the transition from the classical to the beginnings of the romantic school, and among the modern dramatists may be mentioned A. de Vigny, George Sand, A. de Musset, Merimée, Ponsard, Augier, Scribe, Dumas the Younger, and Sardou.

The German drama is of later birth than any we have mentioned, and for a long time the Germans contented themselves with translations and adaptations from the French. Lessing was the first who, by word and deed, broke the French sway (1755), and he was succeeded by Schiller and Goethe, who rank as the greatest of the more modern dramatists. Prominent names in the German drama are Kotzebue, Körner, Schlegel, Tieck, Brentano, Grillparzer, Hebbel, Ludwig, Gutzkow, Freytag, Laube, Von Moser, etc. The Dutch drama begins with the classical tragedies of Koster in the beginning of the seventeenth century, and reached its highest in Vondel (1587-1659). Holberg, Heiberg, Ochlenschläger, Ibsen, and Björnson are the chief names connected with the Scandinavian drama.

The various classes of drama-tragedy, comedy, opera, pastoral, burlesque, farce, etc. -are noticed under their proper headings, but there are numerous varieties and modifications in the modern drama which defy classification.

**Draper**, JOHN WILLIAM (1811-1882). chemist and physiologist. He made many contributions to scientific literature, and devoted much attention to the chemical action of light, in connection with which he effected some discoveries. Among his chief works is his History of the Intellectual Development of Europe.

**Draper**, WILLIAM F., was b. in Lowell, Mass. 1842, where he still lives. His early education was intended to fit him for entrance to Harvard University, but before matriculation he decided to spend some time in the shops owned by his father, who was a manufacturer of cotton machinery, and before the time had passed the war broke out and he left for the front-

After four years' campaigning, during which he was twice wounded and was brevetted brigadier general, was discharged in 1864, and took up the same business as his father. He was a member of General Long's staff, was a delegate to the convention that nominated Hayes, as an elector at large he voted for Harrison, and was chairman of the committee on resolutions in the Republican state convention in 1887. He was a member of the Fifty-third Congress. He is now U. S. minister to Italy.

**Drave** (or Drau) (drä've, drou), a European river which rises in Tyrol, flows e.s.e. across the north of Illyria and the south of Styria, and between Hungary on the left and Croatia and Slavonia on the right, and after a course of nearly 400 mi. joins the Danube 14 mi. east of Essek. It is navigable for about 200 mi.

Dravid' ian, a term applied to the vernacular tongues of the great majority of the inhabitants of Southern India, and to the people themselves who must have inhabited India previous to the advent of the Aryans. The Dravidian languages are generally considered to belong to the Turanian class, and the family consists of the Tamil, Telugu, Canarese, Malayálam, Tulu, Tuda, Gond, Rajmahal, Oraon, etc. Only the first four mentioned have a literature, that of the Tamil being the oldest and most important.

Drawbridge, a bridge with a lifting floor, such as were formerly used for crossing the ditches of fortresses, or any movable bridge over a navigable channel where the height of the roadway is insufficient to allow vessels to pass underneath. Modern drawbridges across rivers, canals, the entrances of docks, etc., are generally made to open horizontally, and the movable portion is called a bascule, balance, or lifting bridge, a turning, swivel, or swing bridge, or a rolling bridge, in accordance with the mode in which it is made to open. Swingbridges are usually divided into two parts meeting in the middle, and each moved on pivots on the opposite sides of the channel, or they may move as a whole on a pivot in the middle of the channel. Rolling bridges are suspended from a structure high above the water, and are propelled backwards and forwards by means of rollers.

**Drawing** is the art of representing upon a flat surface the forms of objects, and their positions and relations to each other. The idea of nearness or distance is given by the aid of perspective, foreshortening, and gradation. The term drawing, in its strict sense, is only applicable to the representing of the forms of objects in outline, with the shading necessary to develop roundness or modeling. In art, however, the term has a wider significance. Highly finished paintings in water color are called drawing, as are also sketches or studies in oils. Drawing, in its restricted sense, may be divided into these kinds: 1, pen drawing; 2, chalk drawing, which may include lead-pencil drawing; 3, crayon drawing; 4, drawing shaded with the brush or hair pencil; 5, architectural or mechanical drawing. Pen drawings are often confined to pure outlines; an appearance of re-

lief or projection being given by thickening or doubling the lines on the shadow side. Finished pen drawings have all the shading produced by combinations of lines. Chalk drawing (including lead-pencil drawings) are most suited for beginners, as errors can be easily corrected. Black, red, and white chalks are used. When the chalk is powdered and rubbed in with a stump, large masses and broad effects can be produced with much rapidity. A combination of hatching and stumping is generally preferable to adhering exclusively to either mode. Crayon drawings are those in which the true colors of the objects represented are more or less completely wrought out with different colored crayons. Drawings shaded with the brush are outlined with the pencil or pen, the shading being laid on or washed in with the brush in tints of India ink, sepia, Architectural and mechanical drawor color. ings are those in which the proportions of a building, machine, etc., are accurately set out for the guidance of the constructor; objects are in general delineated by geometric or orthographic projection. The great schools of painting differ from one another as much in their drawing as in their painting. In Italy the Roman school, through Raphael's fine sense for the beautiful and expressive in form, and through his study of the antique, became the true teacher of beautiful drawing. The Florentine school tried to surpass the Roman precisely in this particular, but it lost by exaggeration what it had gained by learning and a close study of anatomy. In the Lombard school a tender style of drawing is seen through harmonious coloring, and in the Venetian school the drawing is often veiled in the rich-ness of the color. The Dutch school excels in a careful and minute style of naturalistic drawing, combined with great excellence in coloring. The French school in the time of Poussin was very accurate in its drawing; at a later period its style betrayed a great amount of mannerism. David introduced again a purer taste in drawing and a close study of the antique, and these are qualities which distinguish his school (the so-called classical school) from the romantic and eclectic schools of a later period.

**Dreams**, trains of ideas which present them-lves to the mind during sleep. The principal selves to the mind during sleep. feature of the state of dreaming is the absence of voluntary control over the current of thought, so that the principle of suggestion has unlimited sway. There is usually an utter want of coherency in the images that appear before the mental eye, but this want excites no surprise in the dreamer. Occasionally, however, intellectual efforts are made during sleep which would be difficult to surpass in the waking state. It is said that Condillac often brought to a conclusion in his dreams reasonings on which he had been employed during the day; and that Franklin believed that he had been often instructed in his dreams concerning the issue of events which at that time occupied his mind. Coleridge composed from 200 to 300 lines during a dream; the
beautiful fragment of Kubla Khan, which was all he got committed to paper when he awoke, remains a specimen of that dream poem. Dreams are subjective phenomena dependent on natural causes.

**Dredging**, a term applied to the operation of removing mud, silt, and other deposits from the bottom of harbors, canals, rivers, docks, The most simple dredging apparatus is etc. the spoon apparatus, which consists of a strong iron ring or hoop, properly formed for making an impression upon the soft matter at the bottom, so as to scoop it into a large, leather bag attached to the ring and perforated with a number of small holes. The means for working it is a long handle, a suspending rope, and a crane or sweep-pole planted in a boat. Much more effective is the steam dredging machine now in common use. It has a succession of strong iron buckets on an endless chain, which traverses on a frame whose lower end is vertically adjustable so as to regulate the depth at which it works. It is worked by steam, and the buckets tear up the matter at the bottom, raise it, and discharge it into punts or hoppers stationed close to the dredging vessel. Dredg-ing is also the operation of dragging the bottom of the sea in order to bring up oysters, or to procure shells, plants, and other objects for scientific observation. The oyster dredge is a light, iron frame with a scraper like a narrow hoe on one side, and a suspending apparatus on the other. To the frame is attached a bag made of some kind of netting to receive the oysters. The dredges used by naturalists are mostly modifications of the oyster dredge.

Dred Scott Decision.—This decision of the U. S. Supreme Court, delivered by Chief Justice Taney, March 6, 1856, awakened intense interest. The plaintiff, Dred Scott, was a slave in Missouri; his owner took him to Illinois, and also Minnesota, then a territory, both free soil, where he kept him for years, afterward moving back to Missouri, a slave state. The plea of Scott was that his residence in Illinois and Minnesota made him a free man. The decision was that he was a chattel, "without rights or privileges except such as those who held the power and the government might choose to grant him." The decision nationalized slavery by degrading the slave to the level of a horse or a plow, and overrode every sentiment of humanity respecting him.

**Drenthe** (dren'te), a province, Holland. Area 048 sq. mi. The soil is generally poor and the surface largely consists of heath and morass, but the province is famed for its horses and cattle. Drenthe is remarkable for the great number of so-called "giants graves" or barrows scattered over the country. Its capital is Assen. Pop. 125,792.

**Dres' den**, the capital of the kingdom of Saxony, on the river Elbe. It is first mentioned in history in 1206 and has been the residence of the sovereigns since 1485; was greatly extended and embellished by Augustus the Strong (1694-1736), and has rapidly increased during the nineteenth century. Among the chief edifices beside several of the churches are the Museum (joined on to an older range of buildings called the Zwinger), a beautifui building containing a famous picture gallery and other treasures; the Japanese Palace (Augusteum), containing the royal library of from 300,000 to 400,000 volumes, beside a rich collection of manuscripts; the Johanneum, containing the collection of porcelain and the historical museum, a valuable collection of arms, armor, domestic utensils, etc., belonging to the Middle Ages. The royal palace is unattractive externally, but has a fine interior. It contains (in what is called the Green Vault) a valuable collection of curiosities, jewels, trink-ets, and works of art. The theater is one of the finest structures of the kind in the world. The city is distinguished for its excellent ed-ucational, literary, and artistic institutions. among which are the Polytechnic School, much on the plan and scale of a university; the Conservatory and School of Music; the Academy of Fine Arts, etc. The manufactures are not unimportant, and are various in character; the china, however, for which the city is famed, is made chiefly at Meissen, four-teen miles distant. The chief glory of Dresden is the gallery of pictures, one of the finest in the world, which first became of importance under Augustus II, king of Poland and elector of Saxony, but owes its most valuable treasures to Augustus III, who purchased the greater portion of the gallery of the Duke of Modena for \$900,000. The pictures number about 25,-Besides this fine collection the museum 000. contains also engravings and drawings amount-ing to upwards of 350,000. There is here also a rich collection of casts exemplifying the progress of sculpture from the earliest times, and including copies of all the most important antiques. Dresden being thus rich in treasures of art, and favored by a beautiful, natural situation, is the summer resort of many foreigners. It suffered severely in the Thirty Years' War, and also in 1913 when it was the head-quarters of Napoleon's army. It was occupied by the Prussians in 1866 but was evacuated in the following spring. Pop. 276,085.

Dresden, BATTLE OF, a battle fought in 1813 between the French under Napoleon and the allies under Schwarzenberg. Napoleon had come to the relief of the city, which was occupied by the French. The allies assaulted and bombarded the city, and soon after a great pitched battle was fought (August 27), the allies being defeated.

Dresden China, a delicate, semi-transparent, highly finished china made at Meissen near Dresden. The manufacture resulted from an accidental discovery made by Bottger, a young chemist, in 1710, and the vases, statuettes, groups of figures, candelabra, clocks, etc., manufactured during the eighteenth century are highly prized. They are more remarkable for excellence of execution than for purity of design.

Drew, JOHN (1825-1862), American actor. b. at Dublin, Ireland. He came to the U.S. when a boy and appeared on the stage in New York City in 1845. Later he went to Philadelphia and became a favorite. In 1855 he became manager of the Arch street theater in company with William Wheatly. He toured England in 1855, California in 1858, and Australia in 1850.

Drew, JOHN, American actor, son of John Drew and Mrs. John (Louisa) Drew, b. in 1853 in Philadelphia. He first appeared in that city in 1872. Three years later he went to New York and took the part of Bob Ruggles in the Big Bonanza in the Fifth Avenue Theater. Later he appeared with Edwin Booth in Shakespearean plays, and was afterward connected with the Daly Theater where he remained until 1892. In that year he commenced starring on his own account.

**Drexel**, ANTHONY J. (1826-1893), banker. He was the head of the well-known firm of Drexel & Co., Philadelphia, having been identified with it since the age of 13. He was zealous in promoting science and art, especially music, and contributed largely to philanthropic and educational interests. The Drexel Institute of Art, Science, and Industry, Philadelphia, dedicated Dec. 18, 1891, was established by Mr. Drexel, the building costing over \$600,000, with an endowment fund of \$1,000,000. His name is associated with that of his friend, George W. Childs, in the inception of the Childs-Drexel Home for Union Printers, Colorado Springs, Colo., dedicated in 1892; they each contributing \$5,000.

**Drill**, a tool used for boring holes in wood, metal, stone, ivory, etc. It consists of a sharp chisel to which a circular motion is communicated by various contrivances. For drilling iron, steel, etc., a lathe driven by steam is generally used, the drill being fixed into a chuck and the work pressed against it as it revolves. For rock-boring the diamond rockdrill, and instrument with cutting edges made of boart of black diamond, is now generally adopted.

**Drill**, a species of baboon, of a smaller size and less fierce disposition than the mandrill, and like it a native of the coast of Guinea. The face and ears are bare and of a glossy black color, the palms of the hands and soles of the feet are also naked and of a deep copper color.

Drilling, the plan of sowing in parallel rows as distinguished from sowing broadcast. The crops which are now generally drilled are corn, wheat, beans, peas, carrots, clover, flax, etc. The first form of drill was of very simple construction, and was only adapted for sowing one row at a time, but now a great variety of improved implements are in use. Among the principal advantages of drilling over broadcast sowing we may mention that a considerable saving of seed is effected in the sowing of grain crops, but the great advantage is that in the case of green crops it enables the farmer more readily to clean the land both by the hand and by the plow. To keep the soil stirred and pulverized, which can only be properly done when the crops have been drilled, favors the retention and absorption of the moisture.

**Dripstone**, a projecting tablet or molding over the head of a doorway, window, archway, or niche to throw off the rain. It is also called a *weather molding*, and *label* when it is turned square. It is of various forms: sometimes a head is used as a termination or support, at others au ornament or simple molding is adopted.

**Drôme**, a southeast department of France, covered almost throughout by ramifications of the Alps, the average height of which, however, does not exceed 4,000 feet; area 2,508 sq. mi., of which about one fourth is waste, one third under wood, and a great part of the remainder under tillage and pasture. A considerable extent of the area is occupied by vineyards, and several of the wines produced have a high reputation, especially Hermitage. Olives, chestnuts, and silks are staple productions. Valence is the capital. Pop. 314,615.

Dromedary. See Camel.

**Drosom** 'eter (Greek, drosos, "dew ", and metron, "a measure"), an instrument for ascertaining the quantity of dew which falls. It consists of a balance, one end of which is furnished with a plate fitted to receive the dew, the other containing a weight protected from it.

Drowning means death by the air being prevented entering the lungs owing to the mouth and nostrils being immersed in a liquid, the liquid being commonly water. Death may, therefore, occur by drowning in a small quan-tity of water. When death has been caused by drowning, the skin presents the appearance called goose skin, the face and surface of the body generally are usually pale, a frothy liquid is found in the lungs and air passages, and about the lips and nostrils; water may be found in the stomach, and clenched fingers, holding substances grasped at, may serve to show that a struggle has taken place in the water, and that the body was alive at the time of immersion. Complete insensibility arises, it is probable, in from one to two minutes after submersion, recovery, however, being still possible, and death occurs in from two to five minutes. So long as the heart continues to beat, recovery is possible; after it has ceased it is impossible. Newly-born children and young puppies stand submersion longer than the more fully grown. For the restoration of the apparently drowned several methods are suggested. Those of Dr. Benjamin Howard, of New York, will be described.

Place the body on its face, with the roll of clothing under the stomach, the head being supported on the hand. Pull the body over the roll of clothing to expel water from the chest. Then turn the body on the back, the shoulders being supported. Kneel over the body. Place both hands on the lower part of the chest, so that the thumbs hook in under the lowest ribs and the fingers are spread out on the chest. Steadily press forward, raising the ribs, your own body being thus thrown leaning forward. This enlarges the cavity of the chest and causes air to enter. When the ribs have been raised to the utmost extent, with a slight effort push yourself back to the more erect position, allowing the ribs to recoil to their former position. This expels the air. Repeat the process fifteen times a minute.

Meanwhile, if other persons are present they should be occupied rubbing the body and limbs (always upwards) with hands or warm flannel, applying hot flannels, bottles, etc., to the limbs, feet, arm-pits, etc. As soon as the person is sufficiently restored to be able to swallow, give small quantities of hot brandy and water, hot wine and water, hot coffee, etc., and use every effort to restore and maintain warmth. Drowning was formerly a mode of capital punishment in Europe. In Paris a corps of Newfoundland dogs for saving drowning persons is maintained.

**Droz** (drõ), PIERREJACQUET (1721-1790), Swiss mechanician, born at Chaux-de-Fonds. Among his many contrivances were a compensation pendulum, a writing automaton, and an astronomical clock. HENRI LOUIS JACQUET (1752-1791), son of the preceding, followed the same line as his father, and constructed an automaton, representing a young female which played different tunes on the harpsichord; a pair of artificial hands for a young man who was mutilated, by means of which he was enabled to perform most of the necessary offices for himself.

**Druids**, the priests of the Celts of Gaul and Britain. According to Julius Cæsar they possessed the greatest authority among the Celtic nations. They had some knowledge of geometry, natural philosophy, etc., superintended the affairs of religion and morality, and performed the office of judges. They venerated the mistletoe when growing on the oak, a tree which they likewise esteemed sacred. They had a common superior, who was elected by a majority of votes from their own number, and who enjoyed his dignity for life. They took unusual care to fence themselves round with mysteries, and it is probable that they cherished doctrines unknown to the common people; but that they had a great secret philosophy which was handed down by oral tradition is very unlikely.

**Drum**, a musical instrument of percussion. of Eastern origin, either cylindrical or hemispherical in shape, with the end or ends covered with tightened parchment, which is stretched or slackened at pleasure by means of cords with sliding knots or screws. Drums are of three kinds: 1, the long or bass drum played with stuff-nob drum-sticks, and used only in large orchestras or military bands; 2, the side drum, having two heads, the upper one only being played upon by two sticks of wood; 3, the kettledrum, a hemisphere of brass or copper, the end of which is covered with parchment, always used in pairs, one drum being tuned to the keynote, and the other to the fifth of the key, the compass of the two together being an octave.

**Drum-fish**, Drum, *Pogonias chromis*, and other species of the same genus, fishes found on the Atlantic coasts of N. A., and so named from the deep drumming sound they make in the water. They usually weigh about 20 lbs.

**Drummond,** SIR HENRY (1851-1897), b. in Scotland, graduated at University of Edinburgh, and later studied in Germany. He was ordained minister of the Free Church, and in 1884 became professor of science in the Glasgow Free Church College. He published an account of his African trip in 1888. His best known works are, Natural Law in the Spiritual World, The Greatest Thing in the World-Low, and the Ascent of Man. Mr. Drummond has lectured to some extent in the U.S.

**Drummond,** •THOMAS (1797-1840), the inventor of the lime-ball light known by his name, was born at Edinburgh. 'He was educated at Edinburgh and at Woolwich, and entered the army as an engineer. In 1819 he became assistant to Colonel Colby in the trigonometrical survey of Great Britain and Ireland. He invented a heliostat, and first used the light which bears his name about 1825 during the survey of Ireland. He subsequently entered political life, and became in 1835 under secretary for Ireland, a country which he practically ruled with the utmost success for five years.

**Drummond,** THOMAS (1809–1890), b. in Lincoln co., Me., graduated at Bowdoin in 1830, and was admitted to the bar in Philadelphia. In 1835 he removed to Galena, II., and in 1860 became U. S. judge for the district of Illinois Five years later, when the state was divided. he became judge of the northern district, and in 1869 judge of the U. S. circuit court, which office he resigned in July, 1884.

**Drummond**, WILLIAM (1585-1649), of Hawthornden, a Scottish poet distinguished for the elegance and tenderness of his verses. He was educated at the University of Edinburgh. He was the first Scottish writer to abandon the native dialect for the language raised to supremacy by the Elizabethan writers. As a historian he is chiefly remarkable for an ornate style, and a strong attachment to the High Church principles of the Jacobites.

**Drummond Light**, a very intense light produced by turning two streams of gas, one of oxygen and the other of hydrogen, in a state of ignition upon a ball of lime. This light was proposed by Captain Drummond to be employed in light-houses.

**Drupe**, in botany, a stone fruit; a fruit in which the upper part of the pericarp becomes fleshy or softens like a berry while the inner hardens like a nut, forming a stone with a kernel, as the plum, cherry, apricot, and peach. The stone enclosing the kernel is called the *endocarp*, while the pulpy or succulent part is called the *mesocarp*. In some fruits, as these of the almond, the horse-chestnut, and cocoarnut, the mesocarp is not succulent, yet from their possessing the other qualities of the drupe. The date is a drup in which the stone or endocarp is replaced by a membrane.

**Druses**, a curious people of mixed Syrian and Arabian origin, inhabiting the mountains of Lebanon and Anti-Lebanon, in whose faith are combined the doctrines of the Pentateuch, part of the tenets of Christianity, the teachings of the Koran, and the Sufi allegories. They describe themselves as Unitarians and followers of Khalif Hakim Biamr-Allah, whom

they regard as an incarnation of deity, the last prophet, and the founder of the true religion.

Drusus, the name of several distinguished Romans, among whom were: MARCUS LIVIUS, orator and politician, became tribune of the people in 122 B.C. He opposed the policy of Caius Gracchus, and became popular by planting colonies. MARCUS LIVIUS, son of the above, was early a strong champion of the senate or aristocratic party, but showed grea skill in manipulating the mob. He rose to be tribune of the people, and was assassinated B.C. 91. NERO CLAUDIUS, brother of the Emperor Tiberius, b. B.C. 38. By a series of brilliant campaigns he extended the Roman empire to the German Ocean and the river Elbe, and was hence called Germanicus. By his wife Antonia, daughter of Mark Antony, he had a daughter. Livia, and two sons, Germanicus and Claudius, the latter of whom afterward became emperor. He died B.c. 9.

Dry'den, JOHN (1631-1700), English poet, was descended from an ancient family, his grandfather being Sir Erasmus Dryden of Canons Ashby, Northamptonshire. He was b. near Aldwinkle. Northamptonshire, and was admitted a king's scholar at Westminster under the celebrated Dr. Busby, whence he went to Trinity College, Cambridge, being here elected to a scholarship. After leaving the university he went to London, where he acted as secretary to his cousin, Sir Gilbert Pickering, a favorite of Cromwell: and on the death of the Protector he wrote his Heroic Stanzas on that event. In 1661 he produced his first play, The Duke of Guise. This was followed by The Rival Ladics, and The Indian Queen. In 1663 he married Lady Elizabeth Howard. In 1668 he published his celebrated Essay on Dramatic Poery. In 1668 the Maiden Queen, a tragi-comedy, was represented. This was followed in 1670 by the Tempest, an alteration from Shakespeare, in which he was assisted by Sir William Davenant. Dryden was shortly afterward appointed to the offices of royal historiographer and poet laureate. He now became professionally a writer for the stage. The first of his political and poetical satires, Absalom and Achitophel was produced in 1681, and was followed by The Medal, a satire against sedition, and Mac Flecknoe, a satire on the poet Shadwell. At the Revolution Dryden was deprived of the offices of poet laureate and historiographer. During the remaining ten years of his life he produced some of his best work, including his admirable translations from the classics.

Drying-machine, a machine used in bleaching, dyeing, and laundry establishments, consisting of two concentric drums or cylinders, one within the other, open at the top, and having the inner cylinder perforated at its side with numerous small holes. The goods to be dried are placed within the inner cylinder, and the machine is then made to rotate with great velocity, when, by the action of centrifugal force, the water escapes through the holes in the side. The action of the drying machine is the same in principle as that witnessed when a person trundles a mop to dry it.

**Drying-oil**, the name given to linseed and other oils which have been heated with oxide of lead; they are the basis of many paints and varnishes. When exposed to the air they absorb oxygen, and are converted into a transparent, tough, dry mass or varnish.

**Dry-point**, a sharp-pointed instrument used by engravers to incise fine lines in copper without the plate being covered with etchingground or the lines bit in by acid. This tool is much employed in working the more delicate portions of plate produced as etchings.

Du'alism, the philosophical exposition of the nature of things by the hypothesis of two dissimilar primitive principles not derived from each other. Dualism in religion is chiefly confined to the adoption of a belief in two fundamental beings, a good and an evil one, as is done in some Oriental religions, especially that of Zoroaster. In metaphysics, dualism is the doctrine of those who maintain the existence of spirit and matter as distinct substances, in opposition to idealism, which maintains we have no knowledge or assurance of the existence of anything but our own ideas or sensations. Dualism may correspond with realism in maintaining that our ideas of things are true transcripts of the originals, or rather of the qualities inherent in them, the spirit acting as a mirror and reflecting their true images; or it may hold that, although produced by outward objects, we have no assurance that in reality these at all correspond to our ideas of them, or even that they produce the same idea in two different minds.

Dub'lin, the metropolis of Ireland, is situated in Dublin co., on the east coast of the island, at the mouth of the Liffey, the banks of which for more than two miles from the sea are lined with quays. The principal street at right angles to the river is Sackville street, a splendid street 650 yards long and 40 yards wide, forming a thoroughfare which is continued across the river by O'Connell Bridge, a magnificent structure the same width as Sackville street. The principal public secular buildings are the Castle, the official residence of the viceroy; the Bank of Ireland, formerly the Irish Parliament house; Trinity College; the courts of justice; the customhouse; the King's Inns; the post office; rotunda; corn exchange; commercial buildings; the mansion house; city hall or corporation buildings; etc. The most important literary and scientific institutions are Trinity College (Dublin University); the Royal University; the Royal College of Science; the Roman Catholic University; the College of Surgeons; the Royal Dublin Society: the Royal Hibernian Academy of Painting, Sculpture, and Architecture: the Royal Irish Academy for Promoting the Study of Science, Literature, and Antiquities; the Archæological Society; the Royal Zoological Society, etc. A little northwest of the city, up the Liffey, is the Phœnix Park, with an area of 1,750 acres. In it are the Viceregal Lodge, the residence of the Lord Lieutenant;

the chief secretary's and under secretary's official residences; the Royal Hibernian Military School, and the depot of the Royal Irish Constabulary; as also the gardens of the Royal Zoological Society. Pop. 254,709.

**Dublin**, UNIVERSITY OF, an institution founded in 1591, when a charter, or letters-patent, was granted by Queen Elizabeth for the incorporation of the "College of the Holy and Undivided Trinity," the University and Trinity College being practically the same. The corporation now consists of a provost, seven senior fellows, twenty-six junior fellows, and seventy foundation scholars. The senate of the university consists of "the chancellor of the university, or. in his absence, of the vicechancellor, and such doctors or masters of the university as shall have and keep their names on the books of Trinity College." The senate possesses the right of electing the chancellor of the university: it is also the body which grants degrees. The scholarships are tenable for five years, or till the degree of M. A. is attained. The course of general instruction extends over four years. The number of students is usually about 1,300.

**Du Bois,** Clearfield co., Pa., on Sandy Lick Creek, 127 mi. n.e. of Pittsburg. Railroads: R. & C. branch of Pa.: Allegheny Valley; B., R. & P.; and Clearfield & Mahoning. Industries: lumber, roller mill, iron foundry, milling, hosiery nill, machine shops, car works, casket factory, brewery, tannery, and window glass factory. Surrounding country mineral; coal and gas in large quantities. Du Bois was first settled 30 years ago by John Du Bois and John Runbarger, and is still a borough. Pop. est. 1897, 10,000.

**Dubuque** (du- $b\bar{u}k'$ ), a city of Iowa, on the right bank of the Mississippi. It occupies an important commercial position as a railway center and entrepot for the agricultural and mineral products of the northern half of Iowa, and the timber of Wisconsin, and from valuable lead mines in its vicinity. Pop. 30,311.

**Duc'at**, a coin formerly common in several European states, especially in Italy, Austria, and Russia. They were either of silver or gold; average value of the former, 75 cents to \$1.00, and of the latter about \$2.32. It was named from being first coined in one of the the Italian duchies—Lat. *ducatus*, "a duchy."

Du Chaillu (du-shā-yü), PAUL BELLONI, trav-eler, b. in Paris, 1835. In 1852 he came to the U. S. and became a naturalized citizen. In 1855 he began his first journey through Western Africa, and spent till 1859 alone among the different tribes, traveling on foot upward of 8,000 mi. He collected several gorillas, never before hunted, and rarely, if ever, before seen by any European. The result of this journey was published in 1861. A second expedition was made in 1863, an account of which, under the title A Journey to Ashango Land, appeared in 1867. The Land of the Midnight Sun, an account of a tour in Northern Europe (1881), had a considerable success. His latest work is The Viking Age, a treatise on the ancestors of the English-speaking peoples.

#### Dudevant

Duck, the name common to all the webfooted birds constituting the Linnæan genus Anas, now raised into a sub-family Anatine. and by some naturalists divided into two subfamilies, Anatinæ and Fuligulinæ, or land ducks and sea ducks. The ducks are very numerous as species, and are met with all over the world. They are often migratory, going northward in summer to their breeding places Their food is partly vegetable, partly animal The common mallard or wild duck is the original of the domestic duck. In its wild statthe male is characterized by the deep green of the plumage of the head and neck, by a while collar separating the green from the dark chestnut of the lower part of the neck, and by having the four middle feathers of the tail recurved. The wild duck is taken in largequantities by decoys and other means. Some tame ducks have nearly the same plumage as the wild ones; others vary greatly, being generally duller or pure white, but all the males have the four recurved tail feathers. There are several favorite varieties of the domestic duck, those of Normandy and Picardy, in France, and the Aylesbury ducks in England being remarkable for their great size and delicacy of flesh. The musk duck, erroneously called the Muscory duck. a native of South America, is the largest of the duck kind, and approaches nearly to the size of a goose. The canvas-back duck is peculiar to America, and is celebrated for the excellence of its flesh. Other species of ducks are the shoveler, remarkable for the strange form of its bill; the gadwall, which is more rare in America than in Europe; the pintail or sprigtail, remarkable for the form of its tail, abundant in both hemispheres; the black or dusky duck, peculiar to America, and very abundant: the summer or wood duck, remarkable for the form of its great beauty, and for its migrations being directly opposed to those of other species: the teal, the eider duck, so well known for its valuable down; the scoter; the pochard or redhead, the scaup duck or blue-bill; the longtailed duck; the harlequin duck, all found on both continents.

**Duckweed**, the popular name of several species of *Lemna*, nat. order Lemnaceæ, plants growing in ditches and shallow water, floating on the surface, and serving for food for ducks and geese. Five species are known in Britain, and others are common in America. They consist of small fronds bearing naked unisexual flowers.

**Ductil'ity**, the property of solid bodies, particularly metals, which renders them capable of being extended by drawing, while their thickness or diameter is diminished, without any actual fraction or separation of their parts. On this property the wire-drawing of metals depends. The following is nearly the order of ductility of the metals which possess the property in the highest degree, that of the first mentioned being the greatest: gold, silver. platinum, iron, copper, zlnc, tin, lead, nickel, palladium, cadmium.

Dudevant (dud-vän), Armantine-Lucile-Aurore Dupin, Madame (1804-1876), better

known by the nom de plume of George Sand, one of the greatest of French novelists. In conjunction with Jules Sandeau, a young lawyer, she wrote *Rose et Blanche*, which was published in 1831, with the pseudonym Jules Sand. Her son, Maurice Dudevant, b. in Paris, 1825, has written several novels, etc., and has attained a certain reputation as an artist.

Dud'ley, a town of England in an isolated part of Worcestershire inclosed by Staffordshire, 8 mi. n. w. of Birmingham. It is situated in the midst of the "black country," and has extensive coal mines, iron mines, iron works, and limestone quarries. It produces nails, chain-cables, anchors, vices, boilers, fire irons, and has also glass works, brickworks, brass foundries, etc. There are the remains of a castle, said to have been founded in the eighth century by a Saxon prince called Dud, who has given the town its name. Pop. 90,223.

Dudley, JOSEPH (1647-1720). Colonial governor of Massachusetts, b. in Roxbury, Mass. He was the son of Thomas, a former colonial governor. He was graduated at Harvard in 1665, and studied theology; in 1673 he became a magistrate in Roxbury. In 1682 he visited England on behalf of the colonists, but was unable to accomplish their purposes. In 1685 he was appointed president of New England, and in 1687 he was made chief justice of the Supreme Court. From 1690 until 1693 he was chief justice of New York, and in 1603 again went to England to become deputy governor of the Isle of Wight. In 1702 he returned to the U. S. and became governor of Massachusetts. This office he occupied until 1715.

**Dudley Limestone**, a highly fossiliferous limestone belonging to the Silurian system, occurring near Dudley, and equivalent to the Wenlock limestone. It abounds in beautiful masses of coral, shells, and trilobites.

**Duel** (from Latin duellum, from duo, two), a premeditated and prearranged combat between two persons with deadly weapons, for the purpose of deciding some private difference or quarrel. The combat generally takes place in the presence of witnesses called seconds, who make arrangements as to the mode of fighting, place the weapons in the hands of the combatants, and see that the laws they have laid down are carried out. The origin of the practise of dueling is referred to the trial by "wager of battle" which obtained in early ages. This form of duel arose among the Germanic people, and a judicial combat of the kind was authorized by Gundebald, king of the Burgundians, as early as 501 A.D. When the judicial combat declined, the modern duel arose, being probably to some extent an independent outcome of the spirit and institutions of chivalry. France was the country in which it arose, the sixteenth century being the time at which it first became common. Upon every insult or injury which seemed to touch his honor, a gentleman thought himself entitled to draw his sword, and to call on his adversary to give him satisfaction, and it is calculated that 6,000 persons fell in duels during ten

years of the reign of Henry IV. His minister, Sully, remonstrated against the practise; but the king connived at it, supposing that it tended to maintain a military spirit among his people. In 1602, however, he issued a decree against it, and declared it to be punishable with death. Many subsequent prohibi-tions were issued, but they were all powerless to stop the practise. During the minority of Louis XIV more than 4,000 nobles are said to have lost their lives in duels. The practise of dueling was introduced into England from France in the reign of James I; but it was never so common as in the latter country. In France dueling still prevails to a certain extent; but the combats are usually very bloodless and ridiculous affairs. In the German army it is common, and is recognized by law. The ducis of German students, so often spoken of, seldom cause serious bloodshed. In the U.S. duels are now uncommon. In some of the states the killing of a man in a duel is punish-able by death or by forfeiture of political rights, and in a large number the sending of a challenge is a felony. In the army and navy it is forbidden.

Duff'erin, FREDERICK TEMPLE HAMILTON-BLACKWOOD, MARQUIS OF, British statesman and author, son of the fourth Baron Dufferin and a granddaughter of R. B. Sheridan, b. at Florence 1826. He began his public services in 1855, when he was attached to Earl Russell's mission to Vienna. Subsequently he was sent as commissioner to Syria in connection with the massacre of the Christians (1860); was under Indian secretary (1864-66); under secretary for war (1866); chancellor of the duchy of Lancaster (1868-72); governor general of Canada (1872-78); ambassador at St. Petersburg (1879-81); at Constantinople (1882); sent to Cairo to settle the affairs of the country after Arabi Pasha's rebellion (1882-83); viceroy of India (1884-88); British ambassador to Italy (1889). In 1891 he was appointed ambassador to Paris.

**Du'gong**, an herbivorous mammal, the *Halicorē dugong*, belonging to the order Sirenia, which includes the manatees. It is a native

of the Indian seas; possesses a tapering body ending in a crescent-shaped fin, and is said sometimes to attain a length of 20 ft., though generally it is about 7 or 8 ft. in length. The skin is thick and smooth, with a few scattered bristles; the color bluish above and white be-

## Du Guesclin

neath. In its osteology it exhibits some points of correspondence with the Pachydermata. Its food consists of marine plants; it yields little or no oil, but is hunted by the Malays for its flesh, which resembles young beef, and is tender and palatable.

Du Guesclin (dü-gä-klan), BERTRAND (1314– 1380), constable of France. Mainly to him must be attributed the expulsion of the English from Normandy, Guienne, and Poitou.

**Duisburg** (dö'is-burk), a flourishing town in Rhenish Prussia, 13 mi. n. of Düsseldorf. It is an ancient place, believed to be of Roman origin, early rose to be a free town, and became a member of the Hanseatic League. It possesses a beautiful church of the fifteenth century, and has iron manufactories, engineering works, chemical works, cotton and woolen mills, etc.; and a large trade greatly facilitated by a canal communicating with the Rhine, which is about 2 mi. distant. Pop. 47,519.

**Dukama'ra** (L. dukis, sweet, and amarus, bitter; lit. bittersweet), a common British hedge plant, otherwise called bittersweet or woody nightshade. It is found in this country from New England to Arkansas; its root being chewed gives a sensation of bitterness, then of sweetness.

Dul'cimer, one of the most ancient musical instruments, used in almost all parts of the world. The modern instrument consists of a shallow trapezium-shaped box without a top across which runs aseries of wires, tuned by pegs at the sides. and played on by being struck by two cork-headed hammers. It is in much less common use in Europe now than it was a century or two ago, and is interesting chiefly as being the prototype of the piano. It is still, however, occasionally to be met with on the Continent at rustic rejoicings, and in England in the hands of street musicians. The Hebrew psaltery is supposed to have been a variety of the dulcimer.

**Duluth** (du-luth'), a town of the U. S., capital of St. Louis co., Minn., at the s.w. extremity of Lake Superior. Five railroads, including Northern Pacific and St. Paul & Duluth, center here; large docks and other works have been constructed affording a convenient outlet for the surrounding wheat region. Pop. 33,115.

**Dumas** (du-mä), ALEXANDRE (1803-1870), French novelist and dramatist. He was the son of a republican general, and grandson of Marquis de la Pailleterie and a negress, Tiennette Dumas. In 1823 he went to Paris, and obtained an assistant secretaryship from the Duke of Orleans, afterward Louis Philippe. He soon began to write for the stage, and in 1829 scored his first success with his drama *Heary III*. It was produced when the battle between the Romanticists and the Classicists was at its height, and hailed as a triumph by the former school. The same year appeared his Christine, and in quick succession Antony, Richard d'Arlington, Térésa, Le Tour de Nesle, Catharine Howard, Mile. de Belle-Isle, etc. Dumas had now become a noted Parisian character. The critics fought over the merits

#### Dumbarton

of his pieces, and the scandal-mongers over his prodigality and galanteries. Turning his attention to romance, he produced a series of historical romances, among which may be mentioned, Les Deux Dianes; La Reine Margat: Les Trois Mousquetaires with its continuations Vingt Ans Après and Viscomte de Bragelonne. The Monte-Cristo and several others are also well known to English readers through translations. Several historical works were also written by him: Louis XIV et son Siecle; Le Regent et Louis XV; Le Drame de '03; Florence et les Médicie, etc. The works which bear his name amount to some 1,200 volumes, including about 60 dramas; but the only claim he could lay to a great number of the productions is-sued under his name, was that he either sketched the plot or revised them before go-ing to press. He earned vast sums of money, but his recklessness and extravagance latterly reduced him to the adoption of a shifty, scheming mode of living. His *Mémoirce*, be-gun in 1852, present interesting sketches of literary life during the Restoration, but display intense egotism. In 1860 he accompanied Garibaldi in the exposition which freed Naples from the Bourbons. He died at the residence of his son, at Puys, near Dieppe, in 1870.

**Dumas**, ALEXANDRE (1824-1895), son of the above, novelist and dramatist. His works treat mostly of the relations between vice and morals. His first novels, La Dame aux Cametias and Diane de Lys, were very successful, as were also the plays which were founded on them. His dramas, which are much superior to his novels, deal satirically with the characters, follies, and manners of French society.

Du Maurier (du-mö'ri-ä). GEORGE LOUIS PALMELLA BUSSON (1834-1896), artist and caricaturist, was b. in Paris, 1834, but was a naturalized British subject. He went to England in 1851, and studied chemistry, but soon adopted art as a profession. After studying in Belgium and France he began to draw on wood for Once a Week, The Cornhill Magazine, etc. He subsequently joined the Punch staff and became famous through his weekly drawings to that publication. As a novelist he is immortal for his well-known work, Tridby.

Dumbar'ton, a seaport, Scotland, chief town of Dumbarton co. Shipbuilding is carried on to a great extent, and there are foundcalled Alcluyd, and it was the chief town of Cumbria, or Strathclyde. Pop. 13,118. A little to the south is the famous rock and castle of Dumbarton, rising above the Clyde. The rock, which is of basalt, is 240 ft. in height, and about one mi. in circumference at the base. It is one of the fortresses stipulated to be kept in repair by the Act of Union, and the barracks contain accommodation for 150 men. There has been a stronghold here from the earliest times, and the fortress of Dumbarton occupied an important place in Scottish history. The county of Dumbarton is partly maritime, partly inland. More than one half of Loch Lomond and fully two thirds of the islands in it belong to Dumbartonshire. The

Garloch, an arm of the Firth of Clyde, forms a part of the county into a peninsula. The chief minerals are coal, limestone, ironstone, and slate, all of which are wrought more or less. On the banks of the Leven and elsewhere are extensive cotton printing and bleaching establishments; and there are extensive ship-building yards along the Clyde. Vestiges of the Roman wall of Antoninus still exist. Pop. 94,511.

Dumb-bells, weights usually in the form of two iron balls connected by a straight piece for holding, used in gymnastic exercises for strengthening the muscles of the arms and chest.

Dumfries (dum-frēs'), a river port, railway center, and parliamentary burgh, Scotland, capital of the county of same name, and the chief place in the south of Scotland. There are iron foundries, hosiery and tweed factories, tanneries, coach building works, etc. The church of the Minorites which once stood here was the scene of the murder of the Red Comyn by Bruce in 1306. Burns spent his closing years here, and the street in which he lived now bears his name. His remains rest under a handsome mausoleum, and a statue of him was erected in 1882. Pop. 16,673. The county abuts on the Solway Firth. The surface is irregular, but for the most part mountainous, especially in the n. and n.w. districts, where the hills attain a considerable elevation, some of them exceeding 2,000 ft. Good cattle are reared, and are much in request for the English market. The minerals most abundant are coal, lead, iron, antimony, and gypsum. Coal and lead are worked to a small extent. Limestone and freestone abound in various parts. There are no manufactures worth mentioning. Its principal towns are Dumfries, Annan, Sanguhar, Lockerbie, Moffat, and Lochmaben. Pop. 74,308.

Dümouriez (di-mö-ria), CHARLES FRANÇOIS DUPERRIER (1739-1823), a French general of great military talent. He served as an officer in the Seven Years' War. In 1768 he went to Corsica as quartermaster general of the small army which was sent for the conquest of that island, and was afterward made colonel. In 1778 he was appointed governor of Cherbourg. At the Revolution he joined the Jacobins, and subsequently the Girondists, and in 1792 he was minister of foreign affairs. War breaking out between France and Austria, he resigned in order to take command of the army; invaded Flanders, and defeated the Austrians at Jemappes and conquered Belgium. Instead of prosecuting the war vigorously he now entered upon measures for the overthrow of the revolutionary government, issued a proclamation, in which he promised the restoration of the constitutional monarchy in the person of the heir to the crown, but was attacked by the Versailles volunteers, and compelled to flee (April 4, 1793). The convention set a price of 300,000 livres upon his head. At first he retired to Brussels, and after various wanderings found a final refuge in England. His Memoirs, written by himself, appeared in 1794; an enlarged edition in 1822. He was also the author

of a large number of political pamphlets. Düna (dů'nà) (or Western Dvina), a river of Russia, course 650 mi. It is navigable for a considerable distance, but is frozen for about four months each year.

Dünaburg (dü'na-burg) (or Dvinaburg), a fortified town, Russia, government of Vitebsk, on the right bank of the Düna, or Dvina, 112 mi. s.e. from Riga. It carries on various industries, a considerable trade, and has three yearly fairs. Pop. 69,033.

Dunbar', a town of Scotland, in Haddingtonshire, at the mouth of the Firth of Forth. It is a place of great antiquity, having originated in a castle, once of great strength and importance, which underwent several memorable sieges, on one occasion being successfully defended against the English for nineteen weeks by Black Agnes, counters of Dunbar. In 1650 Cromwell totally defeated the Scottish army under David Leslie near the town. The harbor is not very commodious, but the town is an important fishing station. Pop. 3,661.

Dunbar', WILLIAM (1460-1520), the most eminent of all old Scottish poets. On the most riage of James IV to Margaret of England Dunbar celebrated the event in a poem of great beauty, entitled. The Thrissil and the Pair this work with the three states and the Rois. His works, which consist of elaborate allegories, satirical and grimly humorous pieces, and poems full of brilliant description and luxuriant imagination, were first collected by David Laing.

Dun'ciad, THE, a celebrated satirical poem by Pope, in which he gibbets his critics and foes. The first three books were published in 1728; the fourth book, or New Dunciad, appeared in 1742, with illustrations by Scriblerus and notes *variorum*. Cibber was latterly substi-tuted for Theobald as the hero; and among others who figured in the satire were Ambrose Philips. Blackmore, Bentley, Defoe, Dennis Shadwell, Settle, etc.

Dundas' of Arniston, the name of a family several members of which held a conspicuous place in the legal and political history of Scotland.

Dundee', a city, of Scotland, in the county of Forfar, on the north shore of the Firth of Tay, about 8 mi. from the open sea, 37 mi. n. n.e. of Edinburgh; in population the third town in Scotland. The chief educational institution is the University College for males and females, whose first session opened in 1883. The town has long been celebrated for its textile manufactures, particularly those of the coarser descriptions of linen, and it is now the chief seat of the linen trade in Scotland and of the jute trade in Great Britain, there being a great number of mills and factories engaged in the spinning and weaving of flax, jute, and hemp. Shipbuild-ing is extensively carried on, and there are large engineering establishments, etc. Another branch of business is the northern seal and whale fishery. In 1645 Dundee was besieged, taken, and sacked by the Duke of Montrose; and six years afterward it was stormed by

Monk, when a great number of its inhabitants were put to death. Pop. 155.640.

Dundon'ald, THOMAS COCHRANE, EARL OF (1775-1860), British admiral, was b. in Lanarkshire. At the age of eighteen he embarked with his uncle, then Captain, and afterward Sir Alexander Cochrane, in the Hind, of twenty-eight guns, and soon distinguished himself by his daring and gallantry. In 1800 he was appointed to the Speedy sloop-of-war of fourteen guns, and in the course of thirteen months captured over fifty vessels, but was at last captured himself. In 1805 while in command of the Pallas frigate, he took some rich prizes, and for the next four years in the Impérieuse performed remarkable exploits in cutting out vessels, storming batteries, destroying signals, etc. On his return to England he entered Parliament. In 1818 he took service in the Chilean navy, his exploits greatly aiding the national independence of that country, as well as soon after of Brazil. In 1831 by the death of his father, he had succeeded to the name and title of Earl of Dundonald; in 1841 he became vice-admiral of the blue; in 1848 he was appointed commander in chief on the North America and West India station; and in 1851 and 1854 respectively he became vice-admiral of the white, and rear admiral of the United Kingdom.

**Dunedin** (dun-ē'din), capital of the provin-cial district of Otago, New Zealand, and the most important commercial town in the colony, stands at the upper extremity of an arm of the sea, about nine miles from its port, Port Chalmers, with which it is connected by railway. Though founded in 1848 its more rapid progress dates only from 1861 when extensive gold-fields discovered in Otaga attracted a large influx of population. It is well paved, lighted with gas, and has a good supply of water. There are many handsome buildings, both public and private; the municipal buildings, the post office, hospital, lunatic asylum, government offices, the university, high schools (boys' and girls'), the new museum, several banks (especially the Bank of New Zealand), the Athenæum, and mechanics' insti-tute, the Free Masons' hall, two theaters, etc. Wool is the staple export. Several woolen and other manufactories are now in existence. There is a regular line of steamers between this port and Melbourne, and communication is frequent with all parts of New Zealand. Through the opening of the new Victoria Channel from Port Chalmers vessels drawing sixteen feet can now ascend to Dunedin at low water. Pop. 45,865.

**Dunferm' line**, a burgh of Scotland, county of Fife, 3 mi. n. of the Firth of Fourth, and 13 mi. n.w. of Edinburgh. Dunfermline was early a favorite residence of the kings of Scotland, and in it were born David II, James I, Charles I, and his sister Elizabeth. The Benedictine abbey founded by Malcolm Canmore (1070) is now represented chiefly by the Abbey Church, underneath the pulpit of which are the remains of King Robert Bruce. Dunfermline early took the lead in the manufacture of tablelinen, and is still unrivaled by any other town in the kingdom. There are collieries in the neighborhood. Pop. 22,365.

**Dun-fish**, a name for cod cured by being split open, partially salted, piled up in a dark place under salt grass or hay, and then closely packed; named from their dun color.

**Dunkers**(or Tunkers), a religious sect founded in Schwartzenau, Germany, in 1708, and which takes its name from the Ger. *tunken*, to dip, from their mode of baptizing converts.

Dunkirk', a seaport town. France, department Nord at the entrance of the Strait of Dover, surrounded by walls, and otherwise defended by forts and outworks. It has several fine churches, a college, a public library, and a gallery of paintings; manufactures of earthenware. leather, soap, starch, ropes; sugar refineries, breweries, distilleries, etc. Pop. 38,025.

Dunkirk, Chautauqua co., N. Y.. on Lake Erie, 40 mi. w. of Buffalo. Railroads: L. S. & M. S.; N. Y. L. E. & W.; N. Y. C. & St. L.: W. N. Y. & P; D. A. G. & P. Industries: locomotive works, flour mill, four iron foundries. several planing and lumber mills. Surrounding country agricultural, center of the Chautauqua grape belt. The town was first settled in 1809 and became a city in 1880. Pop. est. 1897, 13,000.

**Dunmore,** JOHN MURRAY, EARL (1732-1800), royal governor of Virginia. He was made a peer in 1756, became governor of New York in 1770, and of Virginia in 1771. In 1772 he went to Williamsburg, Va. In 1776 he raided the settlers on York and James rivers, destroying their property and kidnapping their slaves. On December 9 his band was defeated in a skirmish at Great Bridge, in revenge for which he set fire to Norfolk. In the following year his party occupied Gwynn Island, in Chesapeake River, where he was wounded, and from which they were dislodged. In 1786 he was appointed governor of the Bermuda Islands.

Dunmore, Lackawanna co., Pa. Railroads: Erie & Wyoming Valley, and D. L. W. Industries: iron and steel mills, feed mill, and store works. It derives its prosperity chiefly from the anthracite coal mines which are worked in the vicinity. Pop. est. 1897, 12,-000.

Duns, JOHN (1205-1308), commonly called Duns Scotus, an eminent scholastic divine. He was the apostle of realism, which was opposed to the systems of nominalism and conceptualism promulgated by the other sections into which the schoolmen were divided. He d., it is said, at Cologne in 1308, leaving behind him numerous works.

Dun'stan, ST. (925-988), an Anglo-Saxon divine and statesman. He entered the Benedictine order, became an anchorite at Glastonbury, and in 945 was made abbot by King Edmund. After the death of Edmund, Edred, the next king, made him his prime minister and principal director in civil and ecclesiastical affairs. In the reign of Edwy he was banished, but was recalled by Edgar, and made archbishop of Canterbury. He was

again deprived of power on the accession of Ethelred in 978, and devoted the last years of his life to his diocese and the literary and artistic pursuits of his earlier days.

Dupont, SAMUEL FRANCIS (1803–1805), naval officer, b. in Bergen Point, N. J. He was appointed a midshipman in the U. S. navy, 1815, and becamelieutenant in 1826, and commander in 1842. In 1845 he commanded the frigate *Congress.* He served in the war with Mexico, and was made captain in 1855. In 1857 he was sent on special duty to China. In 1861 he was in command of the navy yard in Philadelphia, and equipped and organized the naval force for service in the Civil War. In 1861, he was appointed flag officer, and given the command of the South Atlantic squadron, and carried Gen. W. T. Sherman's force, numbering 10,000 men, to capture Port Royal, S. C. On November 7 he attacked Fort Walker. In August, 1862, he was made a rear admiral. In 1863, Admiral Dupont was relieved by Admiral Dahlgren, and he returned to Wilmington, Del. He was the author of a treatise on the use of floating batteries for coast defenses.

**Düppel** (dup'1), a fortified village in the province of Schleswig, Prussia, on the coast of the Little Belt. The place is of considerable strategical importance and has been the scene of some severe struggles between the Danes, to whom it formerly belonged, and the Germans. It was captured by the Prussians in 1864, after a siege and bombardment which lasted nearly two months.

Durand, ASHER BROWN (1796-1886), painter, b. in Jefferson, N. J. His first great work was to engrave Trumbull's Declaration of Independence. In 1825 he produced Musidora, and in 1828, General Juckson. He made many plates for the annuals, and engraved some heads for the National Portrait Gallery. In 1836 portraiture and landscape painting became his chosen occupations. Of portraits, he completed those of Jackson, J. Q. Adams. Bryant, Kent, and others: of figure paintings he executed Hartey Birch and Washington, The Wrath of Peter Stuyresant, and The Capture of André. His best known landscapes are: The Catskilk from Hillsdale, The Franconia Mountains, Franconia Notch, several views of Lake George, and Kauterskill Core. He was one of the founders of the National Academy of Design, and from 1845 until 1861 its president.

**Duran go**, a town in Mexico, capital of the state of Durango, about 500 mi. n.w., of Mexico, on an elevation 6,845 ft. above the sea. It is well built, has a cathedral, a mint, manufactures of cotton and woolen goods, leather, etc. Pop. 12,000. The state (area 42,530 sq. mi.) is partly mountainous and unproductive, but has valuable gold, silver, and iron mines, and also fertile tracts. Pop. 265,931.

Durant, HENRY TOWLE (1822-1881), philanthropist, was b. in Hanover, N. H. He was graduated at Harvard in 1841, and afterward read law. In 1846 he was admitted to the bar, and began practise in Boston. He became interested in the New York Belting and Packing Company, and in New York state iron mines, which ventures were very profitable. In 1863, he retired from the practise of law, relinquished the pursuit of wealth, and made New York City his residence. He then became impressed with the necessity of a college for the higher education of women, which conviction culminated in the establishment of Wellesley College.

Dürer (dü'rer), ALBERT (1471-1528), German painter, designer, sculptor, and engraver on wood and metal. In 1505 he went to Venice to improve himself in his art. He painted the Martyrdom of Bartholomew for St. Mark's church, which painting was purchased by the Emperor Rudolph and removed to Prague. Maximilian I appointed him his court painter, and Charles V confirmed him in this office. He invented the method of printing woodcuts with two col-Among his masterpieces in painting are a Crucifizion, Adam and Ere, an Adoration of the Magi, and portraits of Raphael, Erasmus, and Melanchthon, who were his friends. Among his best engravings on copper are his Fortune, Melancholy, Adam and Ere in Paradise, St. Hubert, St. Jerome, and the Smaller Passion (so called), in sixteen plates. Among his best engravings on wood are the Greater Passion (so called), in thirteen plates; the Smaller Passion, with the frontispiece, thirty-seven pieces; the Revelation of St. John with the frontispiece, fifteen plates; the Life of Mary, two prints, with the frontispiece.

**Du'ress**, in law, restraint or compulsion, is of two kinds: *duress of imprisonment*, which is imprisonment or restraint of personal liberty: and *duress* by menaces or threats (*per minas*), when a person is threatened with loss of life, or with some kind of injury. An act done under duress is voidable or excusable.

**Durga** (dur'gä), a Hindu divinity, one of the names given to the consort of Siva. She is generally represented with ten arms. In one hand she holds a spear, with which she is piercing Mahisha, the chief of the demons, the killing of whom was her most famous exploit; in another a sword: in a third the hair of the demon chief; and in others the trident, discus, ax, club, and shield.

Durham (du'ram), an ancient city and parliamentary borough in England, capital of the county of the same name, on the river Wear, which is crossed here by four bridges, 14 mi. s. of Newcastle. The principal public buildings are the ancient castle-now appropriated to the uses of the university-the cathedral, and other churches, the townhall, county prison, grammar school, etc. The educational institutions comprise the university, the grammar school, a training school for schoolmistresses, and other schools. There are manufactures of carpeting and mustard. The cathedral occupies a height overlooking the Wear. Pop. 14,863. DURHAM UNIVERSITY was founded in 1832, opened in 1833, incorporated by royal charter in 1837. The county is on the n.e. coast of England, having on the e. the German Ocean, on the n. Northumberland, from which it is divided by the rivers Tyne and Derwent, Cumberland on the w., and Yorkshire on the s., the

45

## Durham

river Tees parting the two counties. Its area is 647,592 acres, of which two thirds are under cultivation. In connection with the commerce of the county may be noticed its foundries, iron works, potteries, glass houses, iron shipbuilding, engine and machine works.

**Durham,** Durham co., N. C., 26 mi. n.w. of Raleigh. Railroads: Southern Ry.; Seaboard Air Line; D. & N.; Oxford & Clarksville, and New York & Western. Industries: tobacco factories, flour mills, two iron foundries, four cotton and two hosiery mills, snuff factory, two woolen mills, box, ice, soap, and numerous other factories. Surrounding country agricultural. The seat of Trinity College. The town was first settled in 1862 and became a city by change of charter in 1805. Pop. est. 1897, 9,000.

**Durmast**, a species of oak, so closely allied to the common oak as to be reckoned only a variety of it. Its wood is, however, darker, heavier, and more elastic, less easy to split, not so easy to break, yet the least difficult to bend. It is highly valued, therefore, by the builder and cabinet-maker.

Düsseldorf (dus' sel-dorf), a town of Prussia; in the Rhenish province, situated on the right bank of the Rhine, 22 mi. n.n.w. Cologne, one of the handsomest towns in the valley of the Rhine. It is a great focus of railway and steamboat communication, and has a number of handsome public buildings, and several remarkable churches. Among the public institutions, particular notice is due to the Academy of Art. It has the honor of having founded a school of painting, which takes the name of Düsseldorf, and has had a large number of distinguished pupils. The industries embrace iron, cotton, leather, tobacco, carpets, chemicals, objects of art, etc., and the trade is large. Pop. 115,190.

**Dutch**, the people and language of Holland, or the Netherlands.

**Dutch Clover,** commonly called white clover, a valuable pasture plant. It has a creeping stem; the leaflets are broad, obovate, with a horseshoe mark in the center; the white or pinkish flowers are in a globular head.

**Dutch Metal**, an alloy containing 84.5-84.7 per cent. of copper and 15.5-15.3 per cent. of zinc, with a fine golden-yellow color, ductile, malleable, and tenacious. When beaten out by a process analogous to that for gold leaf, until the sheets are less than 1-50,000th part of an inch thick, it constitutes Dutch leaf, or Dutch foil, and is used instead of gold leaf for ornamental purposes.

**Dutch Rush**, one of the plants known as horsetails, with a firm texture and so large an amount of silex in the cuticle that it is employed as a fine sandpaper for polishing delicate wood work.

**Duyckinck**, EVERT AUGUSTUS (1816-1878), editor, b. in New York. After graduation at Columbia, in 1835, he studied law, and was admitted to the bar in 1837. He traveled in Europe, and on his return edited, with Cornelius Mathews, a monthly magazine, Arcturus, a Journal of Books and Opinions, from 1840 till

1842. In 1847 he established The Literary World, which he conducted with his brother George until 1853. In 1853-56 he published with his brother the Cyclopardia of American Literature, to which a supplement was added in 1865, and of which a new edition was issued by M. Laird Simons in 1875.

**Dvorak** (dvor-shäk'), ANTON, a Bohemian musical composer, b. in 1841. He studied at the Prague Conservatoire and at Vienna. He has composed several operas on national Bohemian subjects, a number of songs, orchestral arrangement of Bohemian dances, several symphonies, a Stabat Mater, a cantata (The Speter Bride), and an oratorio (St. Ludmilla).

Dwarf, a term applied to any animal or plant greatly below the usual size of its kind. particularly to a human being of small dimen-Accounts of dwarf tribes have been sions. common from early times, such tribes being located especially in Africa; and it would appear from the accounts of Du Chaillu, Schweinfurth, and other travelers, that there are several dwarfish tribes throughout this continent. The Obongo, a race of dwarfs, are described as living in woods near the Okanda River, in wretched huts made of branches. Other races are the Mabongo, and the Akka dwarfs of Central Africa (see Akkas); and a race is said to exist in the Congo State, not as a distinct community, however, but mixed with other tribes. Individual dwarfs occur in all races, and were formerly a fashionable appendage to the courts of princes and the families of nobles. Jeffery Hudson, the favorite dwarf of Charles I. at the age of thirty is said to have been only 18 in. high, though he afterward grew to 3 ft. 9 in. Bébé, the celebrated dwarf of Stanislas of Poland, was 33 in.; Wybrand Lolkes. a Dutch dwarf, when sixty years of age was only 27 in.; Charles H. Stratton, "Gen. Tom Thumb," was 31 in. high at the age of twentyfive; Francis Flynn, "General Mite," was only 21 in. at sixteen.

**Dwarfing**, the process of training up trees or shrubs for ornament in houses so us to cause them never to reach more than a very small size, by keeping them in poor soil; giving them little water, pinching off strong shoots, etc.: practised among the Chinese and Japanese.

practised among the Chinese and Japanese. **Dwight** (dwit), TIMOTHY (1752-1817), American divine, b. in Massachusetts. His father was Col. Timothy Dwight, and his mother was a daughter of Jonathan Edwards. He served as chaplain in the Revolutionary army, and ultimately became president of Yale College. His *Theology* (1818) was for long a standard both in Britain and in America. He was also the author of two poems, the Conquest of Canaan, and Greenfield Hill, besides numerous unimportant works, consisting of dissertations.

**Dwight,** THEODORE (1764-1846), journalist, b. in Northampton, Mass. He studied law, was admitted to the bar, and became engaged in many of the political controversies as a Federalist. After serving in the state senate he was elected to Congress in 1806. He edited the Hartford *Mirror* during the War of 1812. In 1815 he became editor of the Albany Daily Advertiser, and in 1817 he removed to New York, where he founded the Daily Advertiser, which he edited until 1836. He published A History of the Hartford Convention (1833), and the Character of Thomas Jefferson . as Exhibited in His Own Writings (1839).

Dwina, Northern, a Russian river formed by the union of two small streams in the government of Vologda. It flows in a northwesterly direction, and falls by four mouths into the White Sea. At Archangel, before it divides itself, it is 4 mi. broad. It is navigable as far as Suchona, and is connected with the Volga by canal.

Dy'aks, the aborigines of Borneo, chiefly inhabiting the interior of the island. They are a finely formed race, of a yellow complexion, and are described as docile, industrious, and superior to the Malays. The more advanced of them practise agriculture and dwell in neatly constructed and tolerably comfortable houses. In Sarawak they have made considerable advances in civilization. They are mostly heathens. Head-hunting (hunting their enemics to make trophies of their heads) is practised among them, but has been abolished where European influence prevails.

**Dyaus** (dyous), the god of the sky in the older mythology of the Hindus. His name is etymologically connected with that of the Greek Zeus.

**Dyeing** is the art of fixing a new and permanent color on textile substances, usually cotton, linen, silk, and wool. Some preliminary operations are necessary in order to cleanse the stuff from any foreign matters which would prevent the dye having free access to it, as well as to remove any natural coloring which would interfere with the production of bright, clear tints. Cotton and linen fabrics go through a prolonged series of operations in bleaching. Silk is boiled in a solution of fine soap to remove the fatty matter; and wool is cleansed by scouring in weak soap or soda lye or weak ammonia.

The process of dyeing varies much according to the stuff and the coloring matters used. In general animal fibers, like silk and wool, combine more easily with most colors than vegetable fibers, such as linen and cotton. In the case of the former, for example, a simple immersion in aniline dyes is sufficient to produce a fixed color. Such colors are said to be substantive, in relation to the stuffs with which they thus combine. Dyes which will not unite directly with the fibers so as to produce a good and permanent color, are termed adjective. These dyes require the intervention of another agent to fix them on the different stuffs, and the name of *mordunt* is applied to those substances which are employed to make the stuff to be dyed and the dying color combine. Alum, acetate of alumina, chloride of tin, salts of iron, albumen, gluten, tannin, etc., are com-mon mordants. The mordant is generally dissolved in water into which the stuffs to be dyed are plunged. In some cases it is mixed with the color and both are simultaneously applied

to the stuff. An important characteristic of mordants is their power of affecting the natural tint of the dye and thus enabling a variety of shades to be produced at small expense. Thus nitrates tend to give a yellow tinge to the colors, alumina deepens and, oxide of tin brightens the natural tints. A process of dyeing to which the name of Aero-hydraulic Dyeing has been given, consists in forcing the color through the material by hydraulic pressure. The advantages of the process (patented by G. C. Gibbs) are that the color is forced equally through any thickness of the stuff, which thus remains bright till completely worn out.

The dye stuffs in use at the present day are derived alike from the animal, mineral, and vegetable kingdoms. Among animal dyes cochineal, the female insect of Coccus cacti, produces the most valuable of scarlet and crimson dyes. A kindred insect, Coccus ilicis, produces kermes, an important red dye. Galls, which are used both as a dye and a mordant, are produced by the puncture of insects on the leaves and branches of the oak and other trees. Among the vegetable dyes in common use, madder, the root of the Rubia tinctoria is perhaps the most important, furnishing various shades of red. purple, brown, and black, as well as the famous Turkey red. *Munjet* is the root of a closely allied Indian plant. Logwood, Brazil wood, sandalwood, fustic, sappan wood, are the chief woods used for dyeing purposes. For blue dyes, indigo, obtained from Indigofera tinctoria and Indigofera Anil, is still the most generally used. Safflower yields a fine pink dye; various species of lichens give us a series of purple dyes known as archil, cudbear, and litmus. Among mineral pigments Prussian blue, a ferrocyanide of iron; ultramarine, now prepared as a compound of alumina, silica, soda, and sulphur; chrome yellow, cobalt blues, and arsenical greens, are the colors most in use. Among the most notable additions to the list of coloring stuffs within recent years are the aniline dyes of coal-tar origin which yield a great variety of brilliant colors, such as magenta, mauve, aniline, purple, roseine, vio-line, etc. There are few organic substances which under proper treatment will not yield coloring matter, and of late new coloring matters have been obtained from wood sawdust, lichens, mosses, paper and cotton waste, bran, starch, sugar, soot, etc. In addition to those above mentioned, other dye stuffs are alkanet, annatto, catechu, camwood, French berries, divi-divi, sumach, saffron, turmeric, woad, etc.

**Dyer's weed**, a plant of the same genus as mignonette, otherwise called *Yellow weed*, *Weld*, or *Woud*, nat. order Resedaceæ. This plant grows in waste ground: it affords a beautiful yellow dye, and is cultivated for that purpose.

**Dynam'eter**, an instrument used for measuring the magnifying power of telescopes. It consists of a small compound microscope, with a transparent plate, exactly divided, which is fixed to the tube of a telescope, in order to measure exactly the diameter of the distinct image of the eye-glass. Also same as Dynamometer.

**Dynamic Theory**, a theory explanatory of the essential constitution of matter. In the dynamic theory every body is considered as a space filled with continuous matter; porosity then becomes an accidental quality, but compressibility and dilatability essential properties. The state of a body depends entirely on certain attracting and repelling forces; and its volume must change with every change in the relative proportions of these forces. It is opposed to the *atomic theory*, which supposes every body to be composed of indivisible and impenetrable particles termed *atoms*. These are almost infinitely small, with void spaces between them, so that this theory makes porosity essential to matter.

Dynam' ics is the science which deals with the laws of force in their relation to matter at rest or in motion, and as such it is differentiated from *kinematics*, which considers motion mathematically, and apart from the forces producing it. It is to Newton that we owe the clear statement of the three primary laws of force. These are: 1, That every body remains in a state of rest, or of uniform motion along a straight line, unless it is compelled by force to change that state. 2, That change of motion is in proportion to the force employed, and occurs along the straight line in which the force acts. This change of motion includes both change of rate and of direction. 3. That, as the result of every action, there is also and always an equal reaction. These laws, which were formulated from experi-ment, involve the conception of force as a primary influence or action expressed in terms of space, time, and matter. Now, in dealing with the laws of force, a standard of measurement is required which shall be applicable to all forces at all times, and we therefore require to begin by establishing units of space, time, and mass. There are two systems of units in use, the one British, the other French. In the British system the foot is taken as the unit of length, and the second as the unit of time. In the French the centimeter is the unit of length, the second the unit of time; the unit velocity in the one case being that of one foot per second, in the other one centimeter per second. The British unit of mass is the pound (the mass of a certain iump of platinum deposited in the exchequer office, London); the French the gram; and accordingly the French units of space, mass, and time are commonly known as the C. G. S. (centimeter, gram, second) units. As the weight of a pound (or a gram) is not the same at all parts of the earth's surface it cannot give us of itself an absolute or dynamical unit of force, that is, an invariable unit; but unit velocity, we do obtain such a unit. Two absolute units of force are in common use in dynamics, the *poundal* and the *dyne*; the latter being the absolute unit in the C. G. S. system. The former is that force which, acting on the mass of one pound for one second, generates in that

. '

mass a velocity of one foot per second. The latter is that force which, acting on the mass of one gramme for one second, generates in that mass a velocity of one centimeter per second. It is important in dynamics to distinguish between mass and weight. The mass of one pound is the quantity of matter equal to a certain standard quantity (a certain lump of metal) and is quite independent of force. The *weight* of one pound is the force with which the mass of one pound is attracted to the earth's surface by the force of gravity. Another important term is momentum: the momentum of a body in motion at any instant is the product of the mass of the body and the velocity at that instant. Dynamics is divided into two great branches: statics, which treats of solid bodies at rest under the action of forces; and kinetics, which treats of the action of forces in producing motion in solid bodies. Formerly the latter alone was called dynamics, and to this, in conjunction with statics, the general name mechanics was given. In the wide sense dynamics includes also hydrostatics.

Dy'namite, an explosive substance patented by A. Nobel in 1867. As originally made it consists of a siliceous earth obtained at Oberlohe in Hanover and known as kieselguhr, impregnated with 75 per cent. of nitroglycerine, the object of the mixture being to facilitate the carriage and use of the substance by diminishing its susceptibility to explode by shock while not destroying its explosive force. The siliceous matter is of diatomaceous origin: it is extremely friable and porous, and has a considerable absorbent power. Dynamite thus prepared has the appearance of raw sugar. Diatomite, a substance superior to kieselguhr. is now also employed, and various other substances have been used to mix with the nitroglycerine, such as charcoal, sand, sawdust. etc. The mixture remains without change for any length of time, unless exposed to water. It burns away quietly if a light is applied to it, but explodes if heated to a high tempera-ture. Usually it is exploded by a specially arranged fulminating cap. Its explosive force is several times that of gunpowder, which it has largely superseded for blasting.

A dynamite cartridge is about eight inlong and one and a quarter in. in diameter, and weighs about half a pound. Before dynamite can be made the manufacturer must make nitroglycerine, gun cotton, and other explosives. Nitroglycerine is the most powerful explosive yet invented. Glycerine made by soap makers is the basis of nitroglycerine. This is brought to the factory in tank cars and forced by compressed air into storage tanks where it is kept until needed. The factory is usually an isolated building constructed of wood, with no stone or bricks, so that in case of explosion the danger is decreased. The mixture of glycerine, nitric and sulphuric acid, which make nitroglycerine is made in a lead vat. The acids are first mixed and then the glycerine in the form of a fine spray is introduced. The chemical reaction produces heat and the process has to be carefully

watched in order to prevent too high a temperature. When the mixture has cooled it is drawn off. Nitroglycerine is an oily, sweettasting mixture, and so poisonous that severe headaches are caused by simply handling it. Pure nitroglycerine cannot be safely shipped and is seldom used in any form except for cleaning oil wells, and then it is mixed on the spot, placed in tin cartridges, and dropped into the well. When mixed with other substances, however, it may be handled with comparative safety. It is usually mixed with a preparation known as "dope"—a combination of nitrate of soda, wood pulp, and magnesia. This mixture is made in a trough and is then made into cartridges known as dynamite cartridges. The explosive power of dynamite depends upon the proportion of nitroglycerine to the "dope." For ordinary rock blasting about 40 per cent. of nitroglycerine to 60 per cent. of the "dope" is used. Sometimes 75 per cent. of glycerine to 25 per cent. of "dope" is used in breaking up salamanders which form in blast furnaces and in heating furnaces used in making iron. Dynamite is exploded by a cap which is placed in the cartridge just before it is lowered into the hole. Safety fuses and electricity are used for exploding the cap. The fuse is so constructed that it burns three, five, or ten minutes as desired before the cap explodes, and the cap is fired by electricity by sending a current through the platinum wire which is in the cap and which grows white hot when the current is turned on. For some blasting and tunneling gun cotton is used. This is a mixture of nitroglycerine, cotton or wood cellulose, and resembles in looks soft It gives out less fumes than dynagelatin. mite and the fumes do not cause headache. Nitroglycerine is less than fifty years old, be-ing discovered in 1847 in Paris. For several years after its discovery it remained simply as a feared explosive and was made only in small quantities by chemists. It was soon discovered, however, that it could be handled safely by mixing with other ingredients to form dynamite.

Dy'namo, the name now usually given to what was originally called the dynamo-electric machine. The object of such machines is to produce electric currents by means of mechanical power, and they differ from magneto-electric machines, which have a similar object, by the circumstance that in place of the permanent steel magnets which form a necessary part of a magneto-electric machine, electro-magnets are employed. In the original dynamo-electric machines the current by which the electromagnets were made was identical with the current given off by the machine, or else was a portion diverted from it; but in an important class of machines the current which makes

### Dzoungaria

the electro-magnets has an independent source, and to these machines the name "dynamo" is also applied. The advantage of dynamo over magneto machines lies in their greater compactness, arising from the fact that electro-magnets are much stronger than permanent steel magnets of the same bulk. The extensive use of dynamos as the principal commercial sources of electric currents may be said to date from the improvements introduced in their construction by Gramme of Paris. The armatures of the monster dynamos built by the Westinghouse Company for the World's Fair weighed about 21 tons each, and were about 71 ft. in diameter. The total weight of the twelve dynamos was 900 tons, having a maximum capacity of 180,000 lights, and requiring engines with an aggregate of about 12,000 horse power to work them. The dynamos of the Deptford Central Station, London, are, however, the largest and most wonderful electrical machines in the world. The armature ring for each of the 10,000 horse-power dynamos measures 35 ft. in diameter. It is made of cast-iron in eleven pieces. The armature and shaft weigh 225 tons, and the field magnets 350 tons more. This is exclusive of the massive bed-plate on which the engines and field magnets stand.

**Dynamom** eter, any instrument for measuring the relative strength of men or animals, or the force of machinery. Commonly it consists of a spiral spring suitably applied. When the pull upon a draught implement, as a plow for instance, is the point to be determined, the dynamometer is made a link in the draught chain, and the amount of extension or collapse which it suffers indicates the intensity of the strain.

**Dys'odile**, a yellowish or greenish foliated mineral found in limestone, with remains of fish and of plants, which, when ignited, burns and emits a very bad smell.

**Dze'ren** (dze'ron), the Chinese antelope, a remarkably swift species of antelope inhabiting the dry arid deserts of Central Asia, Thibet, China, and Southern Siberia. It is nearly 44 ft. in length, and 24 high at the shoulder.

ft. in length, and 21 high at the shoulder. **Dzig' getai** (or Kiang), an animal found in Central Asia, allied both to the horse and ass. Its head is large like that of the ass, but in form resembles that of the horse. The ears also resemble those of the horse, It runs with a rapidity exceeding that of the best Arabian horses.

**Dzoungaria**, a Chinese territory in Central Asia. It has an area of 147,950 sq. mi., and pop. 600,000. It is administratively connected with Kuldja. and since the surrender of Kuldja by the Russians in 1880 is again under Chinese rule. Dzoungaria, once the center of an independent empire, was first conquered by the Chinese in 1757.

## Eads

E, the second vowel and the fifth letter of the It occurs more frequently English alphabet. in English words than any other letter of the alphabet. Its long or natural sound in English coincides with the sound of i in the Italian and French languages, as in here, mere, me. It has also another principal sound, a short one, heard in met, men. It has besides a sound like a in bare, as in there, where, etc., and the obscure sound which is heard in her. As a final letter in English it is generally silent, but it serves to indicate that the preceding vowel is to have its long sound, as in mane, cane, plume. When two e's come together the sound is generally the same as that of the single e long, as in deem, esteem, need.

Eads, JAMES BUCHANAN (1820-1887), civil engineer; b. at Lawrenceburg, Ind. At the age of thirteen he went to St. Louis, Mo., and became clerk on a steamboat. In 1842 he constructed a diving-bell boat, which was employed in recovering cargoes from sunken ves-sels. This invention brought him a fortune, and a few years later he erected the first glass works west of the Mississippi River. He constructed eight light-draught ironclads, first used at Fort Henry 1862. The same year he designed six bullet-proof propellers with turrets worked by steam, the first application of steam to the manipulation of heavy guns. From 1867 to 1874 he was engaged in designing and constructing the famous "Eads bridge' over the Mississippi River, connecting St. Louis and East St. Louis. This was a great piece of engineering. Eads was the promoter of many improvements along the Mississippi River, especially at New Orleans, where he cut a channel through South Pass 200 ft. wide, with a central depth of not less than 30 ft. He d. at Nassau, Bahama Islands.

Eagle, the general name of raptorial birds that form a group or sub-family (Aquilinæ) of the great family Falconidæ, which includes the eagles, falcons, and hawks. The eagle is popularly regarded as the noblest and most courageous of the rapacious birds. It soars to a greater height than any other bird, from which circumstance the ancients considered it as the bird or messenger of Jove. The genus Aquila which includes the most typical eagles, is distinguished by its long and powerful bill, the curve commencing at the cere, by its wings reaching to the tip of the tail, and by its tarsi being feathered to the toes. The imperial eagle is probably the species to which the popular belief in the courage, strength, and nobleness of eagles is to be traced.  $\mathbf{The}$ golden eagle measures over 6 ft. from tip to tip of the expanded wings, and 3 ft. from the beak to the end of the tail. The adults have the body brownish, becoming darker with age; the feathers of the head and neck pointed,

# Eagle

and of a golden-red hue. This species is found all over the northern hemisphere. It was once common in the Highlands of Scotland, but is now becoming rare. The Kirzhis and other tribes of Central Asia use the golden eagle to kill antelopes, foxes, and even wolves. Another is the erne or sea-eagle, found near the seacoast or lakes, and feeding largely on fish. The general color is gravish-brown, the head pale-colored, the tail white. The bald

Eagle Hawk

eagle, found in North America and Northeast Asia, is the symbol of the U. S. Like all members of the genus his diet is less restricted than that of the true eagles; and he even takes carrion. Another is the serpent eagle, or short-toed eagle, which ranges through Southern Europe, Asia, and especially North Africa. In structure and habits this bird approaches the buzzards.

Eagle, as a symbol. The eagle first appears as a war standard among the Persians, through whom it reached the Egyptians. As the standard of the Roman armies it was first used by Marius, and latterly took the place of all the other emblems at the head of the legions. It was first made of wood, then of silver, and finally, under Cæsar and his successors of gold. In the mediæval ages the eagle became the heraldic emblem of the old German Empire. and was made double-headed in the fourteenth century. When the old German Empire ceased the double-headed eagle was retained by Austria. A double-headed eagle is also the national military symbol of Russia, as a singleheaded eagle is that of Prussia and the U.S. The latter stands with outspread wings guarding a shield, with the motto E pluribus unum.

The eagle is also the badge of several orders. Eagle, a gold coin in the U. S. of the value of ten dollars. It was first coined in 1795. There

ļ

are also half-eagles, quarter-eagles, and double eagles, of proportionate values. Eagle Hawk, a name of birds belonging to

the eagle group, but smaller than the true eagles, with comparatively short wings and long legs, natives of South America.

Eagle Owl, one of a sub-family of owls, the most remarkable species of which is the great horned owl, little inferior in size to the golden

Eagle Owl.

eagle. It is found in the mountainous parts of Central Europe. An allied species, the Virginian horned owl is found in almost every quarter of the U.S.

Eames, EMMA (Emma Hayden Story), American soprano singer, b. in Shanghai, China, 1868. Her parents were visiting in China at the time. She studied music in Boston and Paris and made her debut in 1889 as Juliette. She married Julian Story in London in 1891. She is very popular.

Ear, the organ of hearing. It is situated at

Sectional view of the external, middle, and inter-

sectional view of the external, infante, and inter-nal Ear, showing the interior of the Auditory Canal, Tympanic Cavity, and Eustachian Tube. a, The auditory canal; b, the tympanum; c, the Eu-stachian tube, leading to the pharynx; d, the coch-lea; e, the semicircular canals and vestibule, seen on their exterior by the removal of the surround-ing bony tissue; f, auditory nerve; g, temporal bone. bone.

the side of the head, and in the higher vertebrates is divided into the outer, middle, and inner ear. See Anatomy.

Early, JUBAL A. (1816-1894), general, was b. in Franklin co., Va., and graduated at West Point in 1837. He served in the Florida and In the Civil War he fought Mexican wars. against the Union in the battles of Fredericksburg, Chancellorsville, and Gettysburg: he also commanded in the Shenandoah Valley, where he was defeated by Sheridan. His want of success compelled General Lee to remove him from command. Since the war a manager of the Louisiana lottery.

Earring, an ornament for the ear, consisting of a ring or hook passing through the lobe. with a pendant of diamonds, pearls, or other jewels frequently attached. Earrings were commonly worn among the Oriental nations, and by both sexes, from the earliest times. Among the Greeks and Romans they were not so commonly worn by men as by women.

Earth, the planet which we inhabit, a nearly spherical body which every twenty-four hours rotates from west to east round an imaginary line called its axis-this axis having as its extremities the north and south poles respectively -while in the course of a year it completes a revolution round the sun. To an observer whose view is not obstructed any part of the earth presents itself as a circular and horizontal expanse, on the circumference of which the heavens appear to rest. Accordingly, in remote antiquity, the earth was regarded as a flat, circular body, floating on the water. But even in antiquity the spherical form of the earth began to be suspected. It is only on this supposition that we can explain how the horizon of vision grows wider and wider the higher the position we choose, how the tops of towers and mountains at a distance become visible before the bases, how the hull of a ship first disappears as she sails away, and how as we go from the poles toward the equator, new stars become visible. Besides these proofs there are many others, such as the circular shadow of the earth seen on the moon during an eclipse, the gradual appearance and disappearance of the sun, and, lastly, the fact that since 1519 it has been regularly circumnavigated.

The earth is not, however, an exact sphere, but is very slightly flattened at the poles, so as to have the form known as an oblate spheroid. In this way the *polar diameter*, or diameter from pole to pole, is shorter than the diameterat right angles to this-the equatorial diameter. The most accurate measurements make the polar diameter about 27 mi. less than the equatorial, the equatorial diameter being found to be 7,925.6 mi., and the polar 7,899.14. The earth is regarded as divided into halves-the northern and the southern hemisphere - by the equator, an imaginary line going right round it midway between the poles. In order to indicate with precision the position of places on the earth additional circles are imagined to intersect one another on the surface in such a manner that those of the one set all pass

through both poles, while those of the other are drawn parallel to the equator. The former are called *meridians*, the latter *parallels of latitude*, and by them we can tell the latitude and longitude, and thus the exact position of any place.

Many experiments by various methods have been made in order to determine the average density of the earth, that is, the quantity of matter it contains. Among these methods may be mentioned: 1, that of determining the attraction of a mountain on the direction of a plumb line and calculating from thence the density of the earth; 2, that founded on the difference of oscillation in a pendulum when placed at the summit of a mountain and when at the sea level; 3, the converse of the preceding method, by the determination of the difference of gravity at the top and the bottom of a deep mine, by pendulum experiments; 4, Cavendish's experiment with the torsion balance, which attempts to compare the attractive force of two large lead balls over other two small lead balls with that exercised by the earth. From these and other experiments it has been calculated, taking the mean of all results, that the density of the earth is to that of water as 5,639 to 1.

The earth, in common with the other planets, moves around the sun, completing its revolution in about 365 days and 6 hours, and thus forming our common year. The orbit of the earth is an ellipse, with the sun in one of its foci. Hence the earth is not equally distant from the sun in all parts of the year; being about 3,000,000 mi. nearer at one time than another, its least distance, according to recent calculations, being 89,897,000 mi., its greatest, 92,963,000, and the mean distance, or half the length of the long axis of the orbit, 91,430,000 mi. From this it may be calculated • that the velocity of the earth in its orbit is about 17 mi. a second. In winter (speaking of the northern hemisphere) the earth is nearest the sun and in summer farthest from it: for the difference in the summer and winter temperature is not occasioned by the greater or less distance of the earth from the sun, but by the more or less oblique direction of the sun's rays. The passage of the earth round its orbit causes the sun to appear as if it described a similar orbit in the heavens; and hence it is that at one time of the year one group of stars is seen in the neighborhood of the sun at sunrise and sunset and at another time another group. This apparent path of the sun is the *ecliptic*, and corresponds with what would be the path of the earth as seen from the sun; and the groups of stars through which the sun successively passes form the zodiac.

The earth's daily motion about its own axis takes place, according to mean time, in twenty-three hours, fifty-six minutes, and four seconds. As the axis on which the earth performs its diurnal rotation forms with the plane of its path about the sun an angle of  $23\frac{1}{2}^{\circ}$  (which angle also represents that between the plane of the ecliptic and the plane of the earth's equator), the sun ascends in the heavens from March 21 to June 21 (the summer solstice), about  $23^{12}$  above the equator toward the north pole, and descends again toward the equator from June 21 to September 23; it then sinks till December 21 (the winter solstice), about 2310 below the equator, toward the south pole, and returns again to the equator by March 21. This arrangement is the cause of the seasons, and the inequality of day and night attending them. For all countries lying beyond the equator, day and night are equal only twice in the year (at the equinoxes). At the summer solstice the north pole of the earth is turned toward the sun, and the south pole away from it, and for  $231^{\circ}$  round the former there is a period of longer or shorter duration during which the sun is continually above the horizon for more than twenty-four hours, while round the latter is an equal extent of surface within which the sun for similar periods is below the horizon. The reverse state of matters occurs at the winter solstice. The circles bounding these regions are called respectively the arctic and the antarctic circle, and the regions themselves the polar or frigid zones. Throughout a region extending to 231° on each side of the equator the sun is directly overhead at every point in succession twice in the year. The circles which bound this region are called the tropics, that in the northern hemisphere being the tropic of Cancer, that in the southern the tropic of Capricorn, while the region between is the torrid zone. The regions between the tropics and the polar circles are respectively the north and south temperate zones.

From the evidence furnished by volcanoes, hot springs, sinking of mines, etc., it is known that the earth has a high internal temperature of its own. Taking the average of the various observed rates of increase this temperature seems to increase 1° F. for every 60 ft. of descent. Assuming this to continue, the rocks at a depth of 2 mi. would be as hot as boiling water, and at a depth of 50 mi. the heat would be such as at the surface would melt every known solid. This being so, various theories as to the internal condition of the earth have been proposed: 1, That a thin envelope or crust surrounds a molten interior. It can be shown, however, that as tides must be produced in such a molten mass the cool outer crust would be unable to withstand the enormous force of these unless it were about 2,000 mi. thick. 2, That the interior is solid, with spaces here and there filled with liquid or gaseous material. This theory assumes that there are within the earth enormous cavities filled with molten rock, which escapes, when local pressure is removed, in the form of volcanic outbursts. 3, That the earth consists of a thin crust, a large solid nucleus, and a liquid film between the nucleus and the crust; the temperature at the center being not much greater than comparatively near the surface. 4, That the earth is solid to the center, but any part may become liquid if local pressure is removed. We know that if the pressure on a solid be increased the melting point is correspondingly raised; now the pressure at the center of the earth, or even at the depth of 50 or 100 mi., must be something enormous, and probably is so great as to keep the rocks there permanently in a solid condition, notwithstanding the heat. This last theory is considered the most probable. On the supposition of its correctness volcances might be explained by supposing that at certain points here and there pressure is removed by the elevations of portions of the earth's surface which are constantly taking place, and that this allows the rocks to liquefy. Water may then soak down to these liquid rocks, and being converted into steam produce the various volcanic phenomena.

The earth is believed to have condensed and solidified from a gaseous or nebular condition, and to have once had a far higher temperature than now. If such were the case the outer surface, losing heat by radiation, would be the first part to cool quickly; while the interior, losing its heat by conduction, would not cool so rapidly, and therefore would naturally have a higher temperature than the portion at the surface. This is what all observations indicate the condition of the earth to be, and the shape of the earth also indicates that it must once have been in a fluid state.

Another feature that the earth as a whole presents is its magnetism. When a magnetic needle is balanced on a point it remains at rest in one position only, pointing then nearly due north and south. This can be explained only on the supposition that the earth acts as a great magnet. It has in fact two poles—a north and a south magnetic pole—which are not very far from, but by no means coincident with, the geographical poles. There is also a neutral line or magnetic equator, which does not greatly diverge from the geographical equator. The earth acts upon all magnets as they act upon each other, and it is for this reason that they point north and south.

The surface of the earth contains over 196,-000,000 sq. mi., of which scarcely a third part is dry land, the remaining two thirds being water. The land is arranged into masses of irregular shape and size, the greatest connected mass being in the eastern hemisphere. The chief masses receive the name of continents, detached masses of smaller size forming islands. The surface of the land is variously diversified, exhibiting mountains, valleys, plains, plateaus, deserts, etc. The water area of the earth is divided into oceans, seas, bays, gulfs, etc., while rivers and lakes may be regarded as features of the land surface. The great phenomena of the oceans are currents and tides. The population of the whole earth is estimated at from 1,350 to 1,450 million. The earth is attended by the moon as a subordinate or subsidiary planet.

Earth Currents, violent electrical disturbances of the nature of transient currents, which rush in one direction or the other, and by which telegraph lines, and particularly long submarine lines, are constantly troubled. Their origin and nature are not thoroughly

## Earthquake

understood, but they are found to be very intimately connected with the perturbations of terrestrial magnetism called *magnetic storms*, and these, it is well known, are closely connected both with the appearance of the *aurora borealis* and with the occurrence of the sun's spots.

Earthenware, a name applied to the commoner sorts of pottery ware. The older kinds of earthenware, such as Majolica, Delft ware. Faience, and Palissy ware, are not only glazed, but are besides elaborately colored and enameled and ornamented with raised figures of various kinds.

**Earth-nut**, an umbelliferous plant. The leaves are ternately divided, and the small white flowers are in terminal umbels. The tuber or nut is about 4 or 6 in. below the surface, at the termination of a long slender root. It is brown, the size of a chestnut, of a sweetish, farinaceous nature, resembling in taste the common chestnut. Swine are very fond of the nuts, and fatten rapidly where they are abundant.

Earthquake, a shaking of certain parts of the earth's surface, produced by causes not perceivable by our senses. This motion occurs in very different ways, having sometimes a perpendicular, sometimes a horizontal undulating, and sometimes a whirling motion. It also varies much in degrees of violence. from a shock which is hardly perceptible to one which bursts open chasms and changes the appearance of the ground itself. During these shocks sometimes smoke and flames. but more frequently stones and torrents of water, are discharged. There is little doubt that earthquakes and volcanic eruptions are kindred phenomena, the latter differing from the former principally in proceeding from a permanent crater. All observations go to prove that both are due to disruptions produced by internal heat at a great depth beneath the surface of the earth. Of the particular way in which this force works, however, there are various theories. It has been thought by some that the center of earthquakes and volcanic disturbances is always near the sea or other large supplies of water. and that the disturbances are directly caused by the filtration of the water down to igneous matter, and the consequent generation of vast quantities of steam which frees itself by explosion. Others have sought to explain earthquakes as part of the phenomena of a planet cooling at the surface. The steady contraction of matter caused by the decay of heat would be likely to produce large cavities with an increasing tension of the neighboring strata. till a tremendous subsidence, involving convulsions reaching to the earth's surface, re-The most remarkable moved the strain. earthquakes of modern times are those which destroyed Lima in 1746, and Lisbon in 1755: still more recent are the earthquakes that visited Calabria in 1857, Peru and Ecuador in 1868, the island of Ischia in 1884, Charles-ton and that district of the U.S. in 1886. Menton and the Riviera of Italy in 1887.

## Earths

Earths, a term applied to certain tasteless, inodorous, dry, uninflammable, nonvolatile, insoluble substances, difficultly fusible, and of a moderate specific gravity, which constitute by far the greatest part of the gravel and soil that go to make up the mountains, valleys, and plains of our globe. They include lime, baryta, strontia, magnesia, alumina, etc. The earths were regarded as simple bodies until Sir H. Davy proved them to be compounds of oxygen with metals.

Earth Shine, in astronomy a name given to the faint light visible on the part of the moon not illuminated by the sun, due to the illumination of that portion by the light which the earth reflects on her. It is most conspicuous when the illuminated part of the disc is at its smallest, as soon after new moon. This phenomenon is popularly described as "the old moon in the new moon's arms."

Earth Tremors, slight vibrations of portions of the earth's surface that may be noted by means of special instruments, their cause not being known.

Earthworm, a genus of common worms, order Oligochæta, belonging to the abranchiate (having no branchize, or external respiratory organs) section of the class Annelida. They have a long, cylindrical body, divided by transverse furrows into numerous rings. The mouth is destitute of teeth, and they have no eyes, tentacles, or cirrhi. They are hermaphrodite. The common earthworm attains nearly a foot in length. It subsists on roots, woody fibers, animal matter, etc. It moves by the

Common Earthworm.  $\sigma$ .—Young Worm Escaping from the Cocoon.

contractions of successive parts of the body aided by a double row of bristles. They are of great service to the agriculturist by loosening the soil and increasing its depth. This is chiefly the result of their mode of nourishment, since they deposit the soil they have swallowed, after digestion, in heaps called *worm castings* which brings up rich fine soil to the surface, gradually covering the upper layer sometimes to the extent of several inches.

Earwig, a common insect whose name is derived from its supposed habit of insinuating itself into the ears of persons.

East Cape, the most easterly point of Asia, projecting into Bering's Strait nearly opposite Cape Prince of Wales in Alaska.

Easter, the festival commemorating the resurrection of Christ, observed in many branches of the Christian church. By the

first Christians it was considered to continue the feast of the Passover, at which the paschal lamb, a type of Christ, was sacrificed. Hence its name in Greek, French, and other Romance languages is taken from the pesach, Hebrew The passover. English name comes from the Anglo Saxon *Eostre*, a goddess

whose festival

Common Earwig. of light or spring, a.-Larva; b.-Pupa; c.-Perfect whose festival Insect.

was celebrated in April. There was long a dispute in the Christian church as to the proper time for holding Easter, the Christians of the East celebrating it on the same day as that on which the Jewish Passover fell, that is, the 14th of Nisan, while the majority of the church celebrated it on the Sunday next after this day. The controversy was decided by the Council of Nice in 325, which settled that it was to be reckoned as at present, namely, that Easter is the first Sunday after the full moon which happens upon or next after March 21, and if the full moon happens on a Sunday, Easter day is the Sunday after, but, properly speaking, for the "full moon" in the above the "fourteenth day of the moon" should be substituted.

Easter Island, an island in the South Pacific Ocean, lon. 1090 17' w.; lat. 270 6' s. It is of a

Stone Statues on the side of the Volcano Ronororaka, Easter Island.

triangular form, one side about 12 mi. long, the other two about 9 each; highest point, 1,200 ft. The soil is fertile, but little cultivated. There are some remarkable sculptures on this island, consisting of gigantic stone images in great numbers. The greater part of the island be-

longs to an Englishman, and is utilized as a grazing farm for sheep and cattle. The inhabitants now number about 150, the bulk of them being recently transported elsewhere.

**Eastern Question**, the name given to the diplomatic and national interests affected by the gradual retrocession of the Turkish Empire in Europe, and the problem of disposing of the territory thus left, or presumably to be left. Bulgaria, Roumania, Servia, and Greece are the new states which have naturally arisen on the withdrawal of the Turkish power, and their history in connection with the respective policies of England, France, Austria, and Russia toward them is the history of the phases of the "Eastern Question" so far. The Crimean War of 1854-56 with the Treaty of Paris which followed after it, and the Russo-Turkish War of 1877-78 with the Treaty of Berlin, the Armenian massacres of 1806, and the Turko-Grecian War of 1807. are among the notable events connected with this subject.

**Eastern Roumelia**, a portion of the Turkish dominions in Europe lying on the south of Bulgaria, from which it is separated by the Balkan Mountains; area 13,500 sq. mi. The country is fertile, but agriculture is backward; wheat, wine, tobacco, etc., are produced; timber is abundant. The chief town is Philippopolis. E. Roumelia was constituted an autonomous province of Turkey by the Treaty of Berlin in 1878, but recently attached itself to Bulgaria. Pop. 975,000.

East India Company, a great English company, originally simply a trading association, which played an important part in the history of Hindustan. It was formed in 1590 in London, with a subscribed capital of about \$150,-000, for the purpose of trade with the East In-A charter was granted to it by Queen dies. Elizabeth on Dec. 31, 1600, for fifteen years, renewable for a similar period. In this charter the company is styled the "Governor and Company of the Merchants of London trading into the East Indies." In 1609 the charter was renewed by James I, and made perpetual, reserving power to the crown to recall it at three years' notice. Additional power was granted to the company of seizing and confiscating ships and goods of contraband traders, either in the British dominions or in any of the places where they were authorized to trade. The charter, which expired in 1780, was renewed till 1791. The renewal act provided that the company, which was already bound to submit to the government all dispatches received from India, should submit for approval all dispatches proposed to be transmitted thither. In 1813 the charter was renewed on condition that the right of exclusive trade should be restricted to China, while the Indian trade should be thrown open to all British subjects. The renewal of the company's charter in 1834 took place amid continued opposition to their mercantile, and even to their legislative privileges. The stock was valued at \$30,000,000, which was to bear interest at 10 per cent. and be redeemable after April 30, 1874, on payment of \$60,000,000. The company was now fairly in liquidation,

and on the outbreak of the mutiny of 1857 it was felt indispensable to vest the government of India directly in the crown, and this was accordingly done in 1858. Henceforth the company existed only for the purpose of receiving payment of its capital, and of the dividends due upon capital until its repayment.

**East Indies**, the name loosely applied to Hindustan, the Indo-Chinese peninsula, and a portion of the Eastern Archipelago, but excluding the Philippine Islands, New Guinea, and Australia.

**East Liverpool**, Columbiana co., O., 14 mi. n.w. of Pittsburg; has two national banks, two weekly papers, manufactories, potteries, etc. Pop. est. 1897, 11,000.

East Orange, Essex co., N. J., adjoining Newark. Railroads: Delaware, Lackawanna & Western; and Watching branch of Erie. East Orange is one of the residence suburbs of New York, 12 mi. distant. Not important as a manufacturing or business center, but has a number of pharmacal, watch-case, electrical, and other manufacturing establishments. Although a township in name, it is organized under a general charter and special laws, giving it city government under mayor and common council, and enjoys all city improvements. Pop. est. 1897, 20,000.

Easton, Tabot co., Md., near Avon River, 50 mi. s.e. of Baltimore. Railroads: D. & C. branch of the P. W. & B., and Baltimore. Chesapeake & Atlantic Ry. Industries: three flouring mills, three iron foundries, fertilizer co., and several other small factories. The town was first settled about 1550 and became a town in 1788. Pop. est. 1897, 3,500. Easton, Northampton co., Pa., on Dela-

Easton, Northampton co., Pa., on Delaware River, at the mouth of the Lehigh River. 67 mi. n. of Philadelphia. Railroads: D. L. & W.; Lehigh Valley; Cent. of N. J.; Bang & Port. Industries: flour mills, furniture factories, iron, pulp, cotton, wire, and planing mills, foundries, and blast furnaces. Lafayette College is situated here. Pop. est. 1897, 15,000.

College is situated here. Pop. est. 1897, 15,000. East River, a strait in New York, separating New York from Brooklyn, and connecting Long Island Sound with New York Bay, about 20 mi. long. A great suspension bridge crosses between New York and Brooklyn.

**East Saginaw**, a city of Mich., located on the navigable river Saginaw, about 17 mi. from its mouth in Saginaw Bay (Lake Huron), nearly opposite Saginaw. It has a large trade and important manufacturing industries.

**East St. Louis,** St. Claire co., Ill., on Mississippi River, across the river from St. Louis and connected with it by Eads's bridge. Seventeen railroads have termini here. Industries: several iron companies, three flouring mills, cotton mill, three farm-implement factories, and about twenty others of various kinds. Surrounding country agricultural and coal mining. The town was first settled in 1765 by Richard Mc Carty, and was known as the Mc Carty tract; laid out in 1815 as Jacksonville, changed to Illinoistown in 1817, incorporated in 1859, and became the city of East St. Louis in 1865. Pop. est. 1897, 30,000.

Eaton, JOHN H. (1700-1856), statesman, b. in Tennessee. He was U. S. senator from Tenn., and secretary of war under General Jackson. Later he became territorial governor of Florida, and was minister to Spain 1836-1840.

Eau Claire (5 klar), Eau Claire co., Wis., on Chippewa and Eau Claire rivers, 85 mi. from St. Paul. Railroads: Northwestern; C. M. & St. Paul; and Wisconsin Central. Industries: two flouring mills, two iron foundries, one woolen mill, and a number of other factories. Surrounding country agricultural and mineral. Eau Claire was the scene of an Indian raid in 1858, repelled by Hon. W. P. Bartlett. The town was first settled in 1855, and became a city in 1872. Pop. est. 1897, 20,000.

**Ebena'ceæ**, a natural order of exogenous plants, consisting of trees and shrubs, of which the wood is very hard, and frequently of very dark color in the center, as ebony. The leaves are alternate, and generally coriaceous and shining; calyx monosepaleous and persistent, with three or six equal divisions; corolla monopetalous, with imbricated divisions. The fruit is a globular berry containing a small number of compressed seeds.

**Eb**'ony, the popular name of various plants of different genera, agreeing in having wood of a dark color. The most valuable is the heart-wood of *D. Ebenus*, which grows in great abundance in the flat parts of Ceylon, and is of such size that logs of its heart-wood 2 ft. in diameter and from 10 to 15 ft. long are easily procured. Other varieties of valuable ebony are obtained from *D. Ebenaster* of the East Indies and *D. melanorylon* of Coromandel. Ebony is hard, heavy, and durable, and admits of a fine polish or gloss. The most usual color is black, red, or green. The best is jet black, free from veins, very heavy, astringent, and of an acrid pungent taste. On burning coals it yields an agreeable perfume, and when green it readily takes fire from its abundance of fat. It is wrought into toys, and used for mosaic and inlaid work.

Eccen'tric, a term in mechanics applied to contrivances for converting circular into reciprocating rectilinear motion, consisting of

variously shaped discs attached to a revolving shaft not in their center. An *eccentric wheel* is a wheel fixed on an axis that does not pass through the center. Its action is that of a crank of the same length as the eccentricity.

**Ecclesias' tes** ( $\cdot t\bar{e}z$ ), the title by which the Septuagint translators rendered the Hebrew *Coheleth* ("the gatherer of the people"), a symbolic name explained by the design of the book and the dramatic position occupied by Solomon in it, one of the canonical books of the Old Testament. According to Jewish tradition it was written by Solomon; but the best modern criticism has decided that its style and language, no less than its thought, belong to a much later date.

**Ecclesias' ticus**, the title of a book placed by Protestants and Jews among the apocryphal writings. The author calls himself Jesus the son of Sirach. Originally composed in Aramaic, the book was translated into Greek by the grandson of the original author about the third century B. c.

**Echeneis** (ek-e-ne'is), a genus of fishes, family Scomberidæ or mackerels, having a disc on the head by which the fish can attach itself firmly to a solid object.

Echidna (ē-kid'na), a genus of Australian toothless mammals, in size and general appearance resembling a large hedgehog, excepting that the spines are longer, and the muzzle is protracted and slender, with a small aperture at the extremity for the protraction of a long flexible tongue. The habits of the Echidna

are nocturnal; it burrows, having short strong legs with five toes, and feeds on insects, which it catches by protruding its long sticky tongue. It is nearly allied to the Ornithorhynchus, the two forming a peculiar class of animals, having in their structure some peculiarities at once of mammals, birds, and reptiles.

Echinocactus (e-kī'-) a genus of cactaceous plants inhabiting Mexico and South America, and remarkable for their peculiar forms, being globular, oblong, or cylindrical, and without leaves, fluted and ribbed, with stiff spines clustered on woolly cushions. Some of them are very bulky. The flowers are large and showy.

Echinodermata (e-kī-nō-dēr'ma-ta), a class or subkingdom of invertebrate animals characterized by having a tough integument in which lime is deposited in granules (as in the starfish and sea cucumber), or so as to form a rigid test or shell like that of the sea urchin: and by the radial arrangement of many of the parts of the adult; though this is not necessarily carried out in the digestive and reproductive systems. They are provided with an apparatus for water circulation opening into the *ambulacra* or tubular feet, which are put into use by being distended with fluid. Some of them, as the encrinites or sea lilies, are permanently fixed by a stalk when adult.

Their development is accompanied with metamorphosis, and the embryo shows a distinctly bilateral aspect, though the radiate arrangement prevails in the adult. By some they are classed with the Scolecida in the subkingdom Annuloida. The sexes are distinct.

Echinus (e-ki'nus), Sea Urchin, or Sea Egg, a genus of marine animals, the type of an order of the class Echinodermata. The body is more or less globular and covered with a test or shell, often beset with movable spines. Locomotion is affected by a singular system of ambulacra or "tube-feet," which are distended with water, protruded through pores, and again retracted. The mouth is situated on the inferior surface, generally in the center, is armed with calcareous teeth, and opens into a gullet conducting to a distinct stomach. The stomach has issue into a convoluted intestine which winds round the interior of the shell and terminates in a distinct anus. The anus varies in position, being sometimes on the apical disc and sometimes marginal.

Echo (ek'0), the repetition of a sound caused by the reflection of sound waves at some moderately even surface, as the wall of a building. The waves of sound on meeting the surface are turned back in their course according to the same laws that hold for reflection of light. In order that the echo may return to the place from which the sound proceeds the reflection must be direct, and not at an angle to the line of transmission, otherwise the echo may be heard by others but not by the transmitter of the sound. This may be effected either by a reflecting surface at right angles to the line of transmission, or by several reflecting surfaces which end in bringing the sound back to the point of issue. Sound travels about 1,125 ft. in a second; consequently, an observer stand-ing at half that distance from the reflecting object would hear the echo a second later than the sound. Such an echo would repeat as many words and syllables as could be heard in a second. As the distance decreases the echo repeats fewer syllables till it becomes mono-syllabic. The most practised ear cannot distinguish in a second more than from nine to twelve successive sounds, so that a distance of not less than 60 ft. is needed to enable a common ear to distinguish between the echo and the original sounds. At a near distance the echo only clouds the original sounds, and this often interferes with the hearing in churches and other large buildings. Woods, rocks, and mountains produce natural echoes in every variety, for which particular localities have become famous. In Greek mythology, Echo was a nymph (one of the Oreads) who fell in love with Narcissus and because he did not reciprocate her affection she pined away until nothing was left but her voice.

**Ecija** ( $\ddot{a}'$  thē- $h\ddot{a}$ ), an ancient town of Southern Spain, province of Seville, on the Genil, with manufactures of textile fabrics and a good trade. It is one of the hottest places in Spain. Pop. 24,955.

Eck, JOHANN MAYR VON (1486-1543), the celebrated opponent of Luther. He went to

Rome in 1520 and returned with a papal bull against Luther, in attempting to publish which he met with violent opposition. In 1530, while at the diet of Augsburg, he made the remarkable admission that he could confute the Augsburg Confession by the fathers but not by the Scriptures.

**Eckford**, HENRY (1775-1832), naval architect. b. in Scotland, and d. in Turkey. In 1746, he established himself as a ship builder in New York City. He was employed by the U. S. government during the War of 1812, to construct vessels-of-war for the lakes and inland waters. Mr. Eckford became U. S. naval constructor in 1820, at the Brooklyn navy yard, where, under his direction, the government built six ships of the line, of which the Okiw became the most noted. In 1831 he built a sloop-of-war for the Turkish navy, and was preparing to enter the service of that government as chief naval constructor when he died.

Eclec'tics (Greek, eklektikos, select) is a name given to all those philosophers who do not follow one system entirely, but select what they think the best parts of all systems. In this century the eclectic method found a notable supporter in the French philosopher, Victor Cousin.

Eclipse (ek-lips), an interception or obscuration of the light of the sun, moon, or other heavenly body by the intervention of another and non-luminous heavenly body. Stars and planets may suffer eclipse, but the principal eclipses are those of the sun and moon.

An Eclipse of the Moon is an obscuration of the light of the moon occasioned by an interposition of the earth between the sun and the moon; consequently, all eclipses of the moon happen at full moon; for it is only when the moon is on that side of the earth which is turned away from the sun, and directly opposite, that it can come within the earth's shadow. Further, the moon must at that time be in the same plane as the earth's shadow: that is, the plane of the celiptic in which the latter always moves. But as the moon's orbit makes an angle of more than  $5^{\circ}$  with the plane of the ecliptic, it frequently happens that though the moon is in opposition it does not come within the shadow of the earth.

come within the shadow of the earth. An Eclipse of the Sun is an occultation of the whole or part of the face of the sun occasioned by an interposition of the moon between the earth and the sun; thus all the eclipses of the sun happen at the time of the new moon. An eclipse of the sun begins on the western side of his disc and ends on the eastern: and an eclipse of the moon begins on the eastern side of her disc and ends on the western. The average number of eclipses in a year is four, two of the sun and two of the moon; and as the sun and moon are as long below the horizon of any particular place as they are above it, the average number of visible eclipses in a year is two. one of the sun and one of the moon.

Eclip'tic, the sun's path, the great circle of the celestial sphere, in which the sun appears to describe his annual course from west to east —really corresponding to the path which the

Digitized by Google

The Greeks observed that the earth describes. eclipses of the sun and moon took place near this circle; whence they called it the ecliptic. The ecliptic has been divided into twelve equal parts, each of which contains 30°, and which are occupied by the twelve celestial signs or constellations, called signs of the zodiac, the zodiac being a belt of the heavens extending 9º on each side of the ecliptic. The plane of the ecliptic is that by which the position of the planets and the latitude and longitude of the stars are reckoned. The points at which the equator and ecliptic intersect are subject to a continual variation, receding westward at the rate of about 50 seconds a year. The angle at which the ecliptic stands to the equator is also variable, and has been diminishing for about 4,000 years at the rate of about 50 seconds in a century. Laplace showed, however, that this variation has certain fixed limits, and that after a certain time the angle will begin to increase again. The combined result of these two changes is to cause the pole of the earth not to point constantly to the same spot in the heavens, but to describe an undulating circle round a certain point; but this movement is so slow that it takes many thousand years to complete it.

Ecuador (ek-wå-dör), a republic of South America, situated under the equator (whence it takes its name) between Peru and Colombia; area 118,630 sq. mi.; pop. 1,271,860. The country is divided into a number of provinces, and falls, as regards the surface, into three sections: the comparatively narrow and lowlying coast regions, the mountain region, and the extensive plains on the east. The mountain region is formed by a double range of snow-clad mountains-several of them active volcanoes-which inclose a longitudinal valley or table-land, with a breadth of 20 to 40 mi., and varying in elevation from 8,500 to 13,900 ft. The most elevated of these mountains are, in the western range. Chimborazo, Pichincha, and Cotacachi,-Chimborazo being 20.703 ft. high. In the eastern range are Cayambe, An-tisana, and Cotopaxi (19,500). The cultivated land and the population of Ecuador lie chiefly in this elevated region, which extends along between the summits of the Cordillera, and may be considered as divided by transverse ridges or dikes into the valleys of Quito, Ham-bato, and Cuenca. The chief towns here are Quito, the capital, with a pop. of 80,000; Riobamba, and Cuenca, all situated at a height of 9,000 ft. or more above the sea. The chief ports of Ecuador are Guayaquil and Esmeraldas. The most considerable rivers, the Tigre, Napo, Pastaza, etc., belong to the basin of the Amazon: and some of them, notably the Napo, are navigable for long distances. On the west-ern slope of the Andes the chief rivers are the Esmeraldas and Guayaquil. Ecuador is comparatively poor in Mammalia; although various kinds of deer as well as tapirs and peccaries are found in the forests. Parrots and humming birds are also numerous, but perhaps the most remarkable of the birds in Ecuador is the condor, which dwells on the slopes of the

Andes. Reptiles, including serpents, are nu-The forests yield cinchona bark, merous. caoutchouc, sarsaparilla, vegetable ivory, etc. The climate on the plains, both in the east and the west, is moist, hot, and unhealthy. In the higher regions the climate is rough and cold. but in great part the elevated valleys, as that of Quito, enjoy a delightful climate. Here the chief productions are potatoes, barley, wheat, and European fruits. In the lower regions are grown all the food products of tropical climates-cacao, coffee, sugar, etc. The foreign commerce is not large, the exports and imports being annually about \$7,500,000 each. Cacao forms three-fourths (or more) of the whole export; the remainder is made up of coffee, hides, vegetable ivory, caoutchouc, etc. The mining and manufactures of Ecuador are insignificant. The people are poorly educated. The religion is exclusively Roman Catholic. The executive government is vested in a president elected for four years, who is assisted by a council of state. The congress is the legislative body, and consists of two houses, one formed of senators, two for each province, the other of deputies, one for every 30,000 inhabitants, both elected by universal suffrage. The congress has extensive privileges, and cannot be dis-solved by the president. The seat of government is at Quito. In recent years the revenue and expenditure have been about \$4,000,000 to \$4,500,000 each. The total debt amounts to The money unit is the about \$11,000,000. sucre, equivalent to 69 cents, but the coins of the U.S., France, and Britain circulate. Railways and telegraphs have made little progress. Ecuador, at the time of the conquest of Peru by the Spaniards, formed part of the great em-pire of the Incas. It was erected first into a viceroyalty of Peru, then (from 1564 to 1718) into an independent presidency. From 1718 it became part of the presidency of New Granada. In the revolutionary war against Spain Ecuador, along with the neighboring territories, secured its independence (1822), and was ultimately erected into a separate republic in 1831. Of the present population, the aborigi-nal red race form more than half; the rest are negroes, mulattoes, mestizoes, a degenerate breed of mixed negro and Indian blood, and Spanish Creoles or whites. The latter are the chief possessors of the land, but are deficient in energy.

Edda (meaning "great-grandmother"), the name given to two ancient Icelandic works, the one consisting of mythological poems, the other being mainly in prose. The first of these collections, called the Older or Poetic Edda, was compiled in the thirteenth century. The Prose Edda, or Younger Edda, presents a kind of prose synopsis of the Northern mythology; a treatise on the Scaldic poetry and versification, with rules and examples; and lastly a poem (with a commentary) in honor of Haco of Norway (d. 1263).

Eddy, CLARENCE, organist and composer, b. in 1843 at Deerfield, Ill. At the age of seventeen he was apprenticed to his father, a contractor and builder, and devoted his time to the study of architecture. He studied at Hartford, Conn., under Dudley Buck, and in Germany under August Haupt and others. On his return to the U. S. in 1875 he was made organist of the First Congregational Church of Chicago, and later held the same position in the First Presbyterian Church of that city. He has been director of the Hershey School of Musical Art since 1877. He gave concerts at the Paris International Exhibition in 1889. He has quite a reputation as an author and has published a collection. The Church and Concert Organist, and a translation, Theory of Counterpoint and Fugue by Haupt. He was made a member of the St. Cecilia Academy at Rome in 1896.

Edentata (è-) (or Toothless Animals), the name of an order of Mammalia, though only two genera of the order want teeth, the anteaters and the pangolins. The remainder are merely destitute of teeth in the front of the jaws. The teeth they possess, however, are destitute of enamel, do not have complete roots, and are not replaced by a second set. This order is also characterized by the presence of great claws surrounding the ends of the toes, and more or less approximating to the nature of hoofs. It is divided into two sections, the first comprehending the sloths, which subsist on vegetable food, and the gigantic fossil animals, Megatherium and the Megalonyx: and the second including the armadillos and the ant-eaters, which live mainly on insects, though some of the armadillos eat other sorts of animal food, and also vegetables.

Ed'gar (The Peaceable), one of the most distinguished of the Saxon kings of England, was the son of King Edmond I. He succeeded to the throne in 959, and managed the civil and military affairs of his kingdom with great vigor and success. In ecclesiastical affairs he was guided by Dunstan, and he was a great patron of the monks.

Edgar Atheiing, grandson of Edmund Ironside and son of Edward the Outlaw, was b. in Hungary. After the battle of Hastings, Edgar was proclaimed king of England by the Saxons, but made peace with William and accepted the Earldom of Oxford. Having been engaged in some conspiracy against the king he was forced to seek refuge in Scotland, where his sister Margaret became the wife of Malcolm Canmore. Edgar subsequently was reconciled with William and was allowed to live at Rouen, where a pension was assigned to him. Afterward with the sanction of William Rufus he undertook an expedition to Scotland for the purpose of displacing the usurper Donald Bane, in favor of his nephew Edgar, son of Malcolm Canmore, and in this object he succeeded. He afterward took part in Duke Robert's unsuccessful struggle with Henry I, but was allowed to spend the remainder of his life quietly in England.

**Edgewater,** N. Y., is on Staten Island, near the village of Stapleton. It has various manufactories. It is inhabited chiefly by New York business men. Pop. 14,265.

Edgeworth, MARIA (1767-1849), a celebrated

authoress. Her first novel Castle Rackrent, a tale of Irish life, published in 1801, immediately established her reputation. This was followed by a long series of novels, moral tales, popular tales, etc., among which may be mentioned Belinda, Leonora, Ennui, The Absentee, Helen, etc.

Ed inburgh, the metropolis of Scotland. It is picturesquely situated, being built on three eminences which run in a direction from east to west, and surrounded on all sides by lofty hills except on the north, where the ground slopes gently toward the Firth of Forth. The central ridge, which constituted the site of the ancient city, is terminated by the castle on the w., situated on a high rock, and by Holyrood House on the e. not far from which rise the lofty elevations of Salisbury Crags, Atthur's Seat (822 ft. high), and the Calton Hill overlooking the city. The principal street of the Old Town is that which occupies the crest of the ridge on which the latter is built, and which bears at different points the names of Canongate, High Street, Lawnmarket, and Castle Hill. This ancient and very remarkable street is upward of one mile in length. rising gradually with a regular incline from a small plain at the east end of the town, on which stands the palace of Holyrood, and terminating in the huge rock on which the castle is built, 383 ft. above sea-level. The houses are lofty and of antique appearance. Among the notable buildings are the ancient Parliament House, now the seat of the supreme courts of Scotland; St. Giles's Church, or Cathedral, an imposing edifice in the later Gothic style, recently carefully restored; the Tron Church; Victoria Hall (where the General Assembly of the Established Church meets), with a fine spire; the Bank of Scotland, etc., besides some of the old family houses of the Scottish nobility and other buildings of antiquarian interest. In the Old Town the most remarkable public building is the castle. In an apartment here is kept the ancient regalia of Scotland. No part of the present palace is older than the time of James V (1528). In the n.w. angle of the building are the apartments which were occupied by Queen Mary, nearly in the same state in which they were left by that unfortunate princess. The Advocates' Library, the largest library in Scotland, contains upward of 250,000 printed volumes and 2,000 MSS. It is one of the libraries entitled to a copy of every copyright book published in Great Britain. Besides the buildings already noticed. Edinburgh possesses a large number of important edifices and institutions, chief among which are the Royal Institution (containing accommodation for various bodies), the National Gallery of Scolland, the Museum of Science and Art, the new Episcopal Cathedral of St. Mary's, etc. Edinburgh is the headquarters of the book trade in Scotland, and the seat of the chief government departments. The origin of Edinburgh is uncertain. Its name is thought to be derived from Eadwinsburh, the Burgh of Edwin, powerful Northumbrian king, who absorbed

the Lothians in his rule. The town was made a royal burgh in the time of David I; but it was not till the fifteenth century that it became the recognized capital of Scotland. Pop. 261,261.

Edinburgh, DUKE OF, H. R. H., Prince Al-fred Ernest Albert, K. G., K. P., Duke of Saxony and Prince of Saxe-Coburg-Gotha, the second son of Queen Victoria, was b. at Windsor Castle, Aug. 6, 1844. He was educated by special tutors, and at the age of fourteen joined the steam frigate Euryalus as naval cadet, and served on various foreign stations. In 1862 he declined the offer of the throne of Greece. On his majority he received \$75,000 a year by vote from Parliament, and was created Duke of Edinburgh, Earl of Kent, and Earl of Ulster. In 1867 the duke was appointed to the command of the frigate Galatea. On Jan. 23, 1874, he married the Grand-duchess Marie, only daughter of the emperor of Russia. In 1882 he was made vice admiral, and has since held important commands.

Edison, THOMAS ALVA, inventor, b. at Milan, O., Feb. 11, 1847. His mother taught him to read, and he began work as a train boy on the Grand Trunk R. R. He learned printing and edited and printed the Grand Trunk Herald in the baggage car of the train on which he was employed. A station master whose child he had rescued taught him telegraphy. He was employed by the Western Union Telegraph Company, and there began the series of inventions which have brought him fame and fortune. As a telegraph operator he was noted for the skill and rapidity with which he transmitted messages. After brief sojourns in several Western cities he settled in Boston. Carrying on his experiments there he was able to overcome the difficulties connected with sending two messages in opposite directions at the same time, over the same wire, and invented the duplex telegraph which is highly valued, as it saves expense in the construction of lines. In 1868 he happened to be in New York when the indicator at the Gold and Stock Exchange broke down. He volunteered his services and succeeded in adjusting the instrument. He moved to New York City in 1871. His laboratories were first located at Menlo Park, N. J., and later he established headquarters at Orange, N. J. A score of skilled investigators assist him, and under his leadership invention has been reduced to an art. He has taken out nearly 400 He patents, 29 of these issued in one week. devotes himself mainly to electricity, but he has had marked success in other lines. His most valuable inventions have been patented in other countries as well as in America. Some of his most noted inventions are: the Phonograph, an instrument for making permanent records of articulate sounds; the Microphone, which detects the faintest sound; the Megaphone, by the aid of which ordinary sounds can be heard at a great distance; the *Microtasmeter*. which records minute variations in temperature. His Incandescent lamp combines purity, steadiness, safety, and simplicity, in manipulation. The *Kinetoscope*, which is one of his latest inventions is, as its name indicates, an apparently moving panorama, or machine for throwing moving pictures. Edison clearly holds the foremost position among inventors of the nineteenth century.

Ed'monton, a town in England, county of Middlesex, 74 mi. n. of London, with an extensive trade in timber, carried on by the Lea River navigation. The "Bell at Edmonton" has become famous by association with the adventures of Cowper's John Gilpin. Pop. 25,-380.

Edmund I, king of England, succeeded his brother Athelstan in 940. He conquered Cumbria, which he bestowed on Malcolm, king of Scotland, on condition of doing homage for it himself. He was slain at a banquet, 946.

Edmund II (989-1016), surnamed Ironside, king of England, was the eldest son of Ethelred II. He was chosen king in 1016, Canute having been already elected king by another party. He won several victories over Canute, but was defeated at Ashingdon, in Essex, and forced to surrender the midland and northern counties to Canute. He d. after a reign of only seven months.

**Edmunds**, GEORGE FRANKLIN, b. in Richmond, Vt., Feb. 1, 1828. He became a lawyer, and was a representative in the legislature (1854-1859), serving three years as speaker. In 1861 he was elected to the state senate, and in 1866 became U. S. senator, which offlice he has held by constant re-election to the present day. Senator Edmunds has been president *pro tem.* of the senate, and a member of many important committees. He favored the reconstruction laws, and framed a bill — known by his name — for the suppression of polygamy in Utah. He was a candidate for the presidential nominations in the Republican national conventions of 1880 and 1884.

national conventions of 1880 and 1884. **Edom**, in the New Testament *Idumaa*, in ancient times a country lying to the south of Palestine. The Edomites are said in Genesis to be the descendants of Esau, who was also called Edom (a word signifying "red"), and who dwelt in Mount Seir, the mountain range now called *Jebel Shera*, stretching between the Dead Sea and the Gulf of Akabah. The chief city in this region was Petra, which now presents remarkable ruins, rock-cut temples, etc.

Edred, king of England, son of Edward the Elder, succeeded to the throne on the murder of his brother. Edmund I, in May, 946.

Education (Lat. educo, "I lead forth") is the science of human culture and the art of training the faculties of man to their best uses and their highest results. By it the young are prepared for the proper fulfillment of the duties of civilized life. Man is the true "Wealth of Nations," and education seeks to realize all that is in man as man. It aims at securing the healthy growth and due development of all the activities of the body, mind, and will, so that each person may be able to have a fair start in life and to act well, as members of the community. under a right sense of all life's responsibilities. The teacher molds what is plastic. trains 46

what is pliant, exercises all the innate and actual powers of his pupils. As such, education presents itself in three aspects: 1, hygienic, 2, mental, and 3, moral or religious. It shows us how, 1, to nourish the child in bodily health and to cherish in it feelings of love and goodness, with a knowledge of right and duty; 2, to awaken and exercise the mind's perceptions of nature and conceptions of truth; 3, to inform the intellect and habituate it to know, admire, desire, and do what is right; 4, to enlighten and discipline the conscience, and at length incline and enable it to feel, think, and act as a responsible moral agent.

When considered as an applied science education comprises the following parts: 1, Primary or Elementary, including reading, the means of acquiring a knowledge of the thoughts of others by signs; writing, the means of communicating our thoughts to others by signs; arithmetic, the means of computing, by signs, the numbers and quantities of things; object lessons and history-by the former we are taught something of nature above, below, and around us, as well as the laws by which it is regulated; and by the latter we gain some knowledge of the race to which we belong, its doings, duties, and hopes. 2, Disciplinary or Secondary-all that improving information which goes to make a man able and wise, the gymnastics of the mind, e. g., grammar, physi-ography, mathematics, literature, classical training, health science, political and social economy, and the practical acquisition of mod-ern languages. 3, University or Liberal Studies -all that superior culture designed to make thought a pleasure and learning a refining delight. 4, Professional-those branches of knowledge which are necessary for exercising the higher vocations, e. g., of artist, author, diplomatist, journalist, lawyer, linguist, merchant, physician, preacher, statesman, scientist, teacher, etc. 5, *Technical* or Industrial, manufacturing and artistic-the special training required in agriculture, arts, commerce, engineering, and manufactures. 6, Supplementary, under which may be ranged all those studies and pursuits which are of interest to the individual and for the time, as biography, numismatics, bibliography; those gratifying to the curiosity, or the taste, as archeology, conchology, æsthetics; those calculated to bring men together sympathetically from a common bent of mind, fancy, or hobby; as well as the ordinary every-day information required in common life. such as is stored up in almanacs, classified in handbooks, and met with in newspapers.

À somewhat more scientific or theoretical outline of education or systematic pedagogy arranges its matter into these groups: 1, *Physical*—that which makes and keeps the body healthy; trains it to usefulness, pliancy, and elegance; and induces, by gymnastic drill and athletic exercises, skill of muscle and nerve, acuteness of sense, and handy readiness of frame. 2. *Instrumental*—(a) elementary, as reading, writing, and arithmetic; (b) technical, as drawing, a knowledge of the use and manipu-

### Education

lation of objects, products, machinery, etc.; (c) mental: words and their uses, composition, bookkeeping, etc.; (d) professional: the arts and duties of business, office, factory, workshop. warehouse, field, or shipboard. 3, Informing, as grammar, geography, history (civil and natural), government, taxation, finance, the progress of events, and an acquaintance with topics of every-day interest and necessity. 4. Culturing, as logic, rhetoric, mathematics, science (physical and social), philosophy (ethical, mental, and political), statistics, language, and literature (ancient and modern), criticism, etc. 5, Moral, i. e., relating to duty (personal, family, civil, social, or legal). 6, Political, concerning the rights and responsibilities of citizenship in private, public, or official life. 7, Philosophical, in regard to (a) the theory of life. thought. and action, and the legislation founded on it; (b)scientific ethics and sociology, the history of systems of thought on man, life, and society. 8, Æsthetic, (a) the knowledge, practise, and enjoyment of the fine arts; (b) the perception of the sublime and the beautiful, and the delight derived from natural scenery; (c) the nature, uses, and pleasures of poetry and imaginative literature. 9, Religious, dealing with (a) personal piety; ( $\delta$ ) public worship, and the rights and duties of fellow worshipers; (r) the special duties of members, adherents, and officials in relation to their own and other creeds; (d) social efforts and home influence, etc.;  $(\epsilon)$ missionary enterprise (home and foreign); (f)individual example, state regulations, and church arrangements; (g) public worship or national recognition of God. A theory of education may also be presented to the mind in (a)its nature, (b) its form, and (c) its limits; in its particular elements, as (a) physical, (b) practi-cal, and moral, and (c) intellectual; and in its special systems, as (a) theocratic, (b) national, or (c) humanitarian. These are next found dealing with (a) personal culture, (b) special callings, (c) the duties of home and citizenship.

History .- The history of education leads us to trace the means employed in the training of children under patriarchal rule, as in the earlier races of the earth; in the family circle, as in China; in tribes, as among many savage people; in castes, as in India and other Oriental lands; for military purposes mainly, as in Persia, or for priestly ones, as in Egypt and among the Celtic Druids. It was pursued in ancient Greece with a philosophical design, and in Rome with a practical one. In mediaeval Europe and in modern Thibet an ecclesiastical bent prevailed; in America, Germany, and France a political intent to a large extent regu-lates it. It has not been pursued in the past with the single object of making the best of a man for himself, and doing the best with him in society - as the culture of life. Hence we require to trace its course through slight indications of facts brought together and arranged by a few theoretical links. In the primitive forms of life the chief lessons of the young would be to obey at home, to help with the flocks or toil in the fields, and to refrain from offenses against parents, friends, and neigh-

bors. So long as pastoral and agricultural occupations prevailed, this or little more sufficed. In the dawn of civilization only the priests and their assistants required mental training and moral culture. Hieroglyphics wrapped up their professional secrets for cure of body and for care of soul. Among the Jews the schools of the prophets were training colleges for the brighter minds among the people of Palestine.

After Solomon had wisely advised the Israelites "to train up a child in the way he should go," some mode of education seems to have been adopted. The Greeks looked on strength of sinew and beauty of body as of vast importance. A highly educated priesthood existed both in Greece and Rome. Learning, however, was not confined to that class. The love of wisdom, philosophy, was the leading mark of the Hellenic race. Their zeal for culmark of the Hellenic race. ture called forth a class of teachers, the sophists, who popularized the knowledge and fashioned the opinions of their ages. Socrates taught men to exercise their minds for the discovery of truth. Athens became the university of Rome. Schools existed in Italy for instruction in reading, writing and arithmetic; but Greek was the language of culture. Ability and pliability formed, in their ideal, a complete man; and hence they advocated dexterity in the elementary subjects, readiness in speech, and knowledge of myths, legends, poetry, and history. The pedagogue regulated life and manners; the schoolmaster inculcated instruction and exercised the mind; the father gov-In this Rome erned the character and will. imitated Greece.

The Christian church received from its founder the command to "teach all nations." In this lay the germ of popular education. All the great schools and communities of scholars were connected with the church and its mis-During the Middle Ages the clergy and ity were clearly distinguished. The sions. the laity were clearly distinguished. monks were taught that and what they might teach; grammar, logic, and rhetoric, music, arithmetic, geometry, and astronomy. The knight was taught to ride, fence, shoot, swim, box, hawk, play chess, and sing love songs to his lute and his lady. The toiling masses tilled the soil and wrought at handicrafts. The merchant classes established guilds. Charlemagne, desiring to rule over an enlightened people, set schools afoot in the chief cities of his empire. He enjoined the bishops to see that the children in their dioceses were learned in grammar, arithmetic, music, and gospel truth. Greek poetry was committed to memory, and astrology was a favorite pursuit. The institution of universities and the cultivation of modern tongues: the culture in writing, the multiplication of books, the study of the Roman law, and the need which thus arose for a renewed examination of the Latin language, excited the minds of men and increased the number of those who sought knowledge. Learning revived.

When printing made books readily accessible schools increased rapidly. Scholars like Erasmus passed from land to land, carrying the

torch of knowledge as they went. Luther's appeal from pope to people carried the need of learning into the cottage. In most other lands education was dealt with mainly as a minor branch of religion and an outlet for benevolence. Schools were mostly benefactions or church pertinents. Montaigne insisted that "we have not to train a soul, nor yet a body only, but a man," and he objected to giving children "a smattering of everything in general, but nothing to the purpose in particular.' The practical systems of instruction pursued by Valentine Trotzendorf of Goldberg and John Sturm of Strasburg became the models on which the grammar or classical schools of Germany were formed. Wolfgang von Ratich proposed an improved school system to the German diet (1612). J. A. Comenius, an Austro-Slav and a Moravian brother, devoted his life to improving the instruction and discipline of schools, and making man through them surely, easily, and solidly wise and holy. He is the chief of modern didactic educationists. Milton, through Hartlib, had been led to study Comenius, and to compose his Tractate on Edu-The Commonwealth Parliament entercation. tained the idea of endowing a universal college for "the advancement of learning" on Bacon's ideal. Then the times changed and enthusi-asm waned. John Locke's *Thoughts on Edu-*cation (1690), though discursive and irregular. advocates the careful development both of body and mind in manliness, wisdom, and virtue. Defoe, about 1692, in an Essay on Projects protested against making women "only stewards of our houses, cooks, and slaves;" and said, "The soul is placed in the body like a rough diamond, and must be polished or the luster of it will never appear. And it is manifest that as the rational soul distinguishes us from brutes, so education carries on the distinction, and makes some less brutish than others.' A century and a quarter elapsed before these thoughts ripened into legislation in England.

Meanwhile Emile, a romance of education, by J. J. Rousseau, which maintained that man should have a strong, serviceable body, welltrained muscles and nerves, and ought not to be required to obey, but be led by comradeship. grew into encyclopedism and the Revolution in France, and roused men to consider anew the nature and need of education. Kant philosophized on paideutics; Goethe in Wilhelm Meister supplied his ideal of training a living mind for living its life aright; Fitche explained "the vocation of man" and of "the scholar to be "duty, intelligence, and effectiveness." Pestalozzi, stirred by Emile, proclaiming that vice and misery arose from ignorance, entered on a crusade against their cause. He moved Europe to undertake in some fashion the cultivation of souls as well as soils, and education became the enthusiasm of the age. Froebel founded the kindergarten. The worth of man as an article of culture, and of education as a national industry, gained public attention.

United States.—In the early national legislative recognition of education America holds a

distinguished place. Here universal suffrage and universal education condition each other, and the culture of humanity is brought within the sphere of the state. One of the earliest Education Acts of the original colonists of Massachusetts Bay, incorporated in 1628, was passed in 1632. It required householders to give "their children and apprentices as much learning as would make them able to read perfectly the English tongue, and know the capital laws," which they were bound to obey. A law making the support of schools compulsory and education free and universal was enacted in 1647. This was confirmed in 1692, reaffirmed in 1780, and expressly made a state law in 1789. An appropriation either in taxes or in land, is set aside in each school district for the proper and adequate provision of instruction in each township, and since 1835 a permanent fund for the support and encouragement of education has been established. The management of this fund was by the legislature entrusted to a board of education This has formed the model on in 1837. which the Atlantic, the Central, the Western, the Pacific Coast, and the Southern states, have all, though at more recent dates and with several slight differences, molded their school system. The plan is so elastic and expansive, in regard to course of studies and thoroughness of instruction, that it may be utilized in all places and adapted to all wants. The state demands that suitable schools shall exist and be maintained in a given population. It leaves the nature of the school buildings, the choice of teachers, the supply of books, and the oversight of the instruction in the hands of the local committee; and though it decrees that children must be taught, it leaves the enforcement of the law mainly with the local administrators. In most cases the schooling is free, the Bible is read, but doctrines are not taught. The teachers are examined and certificated, generally by local boards. Normal training schools were instituted in Boston in 1839, and have multiplied greatly. Schools are usually open to boys and girls. The classing of schools has been found difficult, a closer community of interest among teachers and between teachers and their employers being required; and greater uniformity of administration has been aimed at, since the Civil War has made the Union more compact, and the benefit of education more felt and better appreciated. The American statistics of education are very complete, and the reports of the bureau of education highly valuable.

Europe.—Among the states of Europe, Prussia long enjoyed the highest reputation for the excellence of its provisions for the education of the people. Educational enactments prevail in Denmark, Switzerland, and the minor members of the German States' Confederation. Though in Austria and Hungary education has since 1849 been placed in charge of a minister of public worship and instruction, there are some peculiarities in which it differs from the German-speaking states. Boarding and technical schools are more numerous. Nearly

### Education

the whole expense of instruction is provided for from general and local taxation, and is, through all grades, in the main gratuitous Education is almost entirely under the management of the clergy, especially the Jesuits. France owes to a voluntary association, founded in 1815, the initiation of the present national system of popular education. It was organ-ized as "a Society of Public Utility" in 1831. In the Netherlands each district must have at least one elementary school, supported by the local public funds. All teachers undergo examination before being permitted to teach, and all schools are under government inspection. Religious instruction is excluded from public schools, whether elementary or higher. Education in Russia has not yet been thoroughly nationalized. Village schools are upheld mainly by voluntary funds; the gymnasia in the provincial towns are in some cases endowed, in others supported from the imperial treasury. Poor students are allowed maintenance at these and at the universities. There is a minister of education, and many improvements in the diffusion, organization, and teaching of schools followed the abolition of serfdom. Since the union of the Italian peninsula into a kingdom great efforts have been made to increase elementary schools and to provide for adequate instruction in them. Normal schools have been established, and as teachers are prepared they are speedily placed out in the new public and endowed schools.

A social and political revolution in Japan, in 1868, led to the recognition of the importance of education. The new government estab-lished a bureau of education, introduced a number of teachers, and sent into different countries a select number of youths to be trained intellectually and technically. A large number of these, besides several English and American teachers, have been put in charge of schools. English is taught. America has been chosen as the model of their free schools and colleges. It took England a long time to exchange the idea that education is a charity to that of its being a right, a duty, and a safeguard, but it came to that at length. Eton was established by Henry VI in 1441; Westminster, prior to the time of Edward the Confessor, but as it now exists, by Queen Elizabeth. 1561; Charter-House, by Thomas Sutton, 1611: Rugby, by Lawrence Sheriff, 1567. These are endowed seminaries, in which are combined the characteristics of a boarding house and a school. Prior to the Reformation almost all schools were controlled by and in connection with the church, and most of them were grammar schools. From the Reformation until the present century endowed grammar schools supplied a liberal education to those who received their training in them. Early in the present century, Owen, Bentham, Brougham, Horner, James Mill, etc., advocated national education. When the Revolution and the Pestalozzi fervor excited men, various means were adopted to increase the quantity and improve the quality of instruction. The National Society for promoting the education of the

poor in the principles of the established church was founded in 1811. The compulsory educationists started a league at Birmingham, and the denominationalists a union at Manchester in 1869. The Society of Arts brought the chiefs of these bodies together at a conference in 1870. Public educational acts regulate: 1, the constitution, duties, and proceedings of school boards; 2, the appointment of officers and managers by the school boards; 3, the payment and remission of fees; 4, the purchase of sites; 5, the use of compulsory measures to secure attendance; and 6, fixes the tenure of the teacher at the discretion of the board, and arranges for his removal when necessary.

Education flourished in Ireland during the Middle Ages. The Celtic monasteries were centers of light. Their members devoted themselves to prayer, study, and the tran-scription of MSS. or the compilation of books. Missionary zeal excited eagerness for knowledge. Not only did the monks carry learning abroad, as St. Columban did; but scholars from every land and English students of all classes found hospitable welcome, food, books, and instruction in the schools of the saints. A training college for teachers of higher class schools has been established at Finsbury, and the education department now requires from all its certified teachers some knowledge of the history, theory, and practise of education. The Education Society, for examining and expounding the principles of education, was founded in 1875. The Teachers' Guild of Great Britain and Ireland has been founded (1884) to facilitate a closer co-operation among teachers, and with those who are educated in educational effort and progress.

Edward I, known as the Elder (870-925), king of England, son of Alfred the Great. succeeded his father in 901. His reign was distinguished by successes over the Danes. He fortified many inland towns, acquired dominion over Northumbria and East Anglia, and subdued several of the Welsh tribes.

Edward II, surnamed the Martyr (960-979), king of England, succeeded his father. Edgar, at the age of fifteen, in 975. His reign of four years was chiefly distinguished by ecclesistical disputes.

Edward III, king of England, surnamed the Confusior, younger son of Ethelred II. On the death of his maternal brother, Hardicanute the Dane, in 1041, he was called to the throne, and thus renewed the Saxon line. Edward was a weak and superstitious, but wellintentioned prince, who acquired the love of his subjects by his monkish sanctity and care in the administration of justice. His queen was the daughter of Godwin, earl of Kent. He died in 1066, and was succeeded by Harold, the son of Godwin.

Edward, Prince of Wales (1330-1376), surnamed the *Bluck Prince*, the eldest son of Edward III and Philippa of Hainault. In 1346 he commanded part of the forces at the battle of Crécy, and earned the praise of his warlike father. In 1355 he commanded the army which

invaded France from Gascony, and distinguished himself the following year at the great battle of Poictiers. By the Peace of Brétigny the provinces of Poictou, Staintonge, Périgord, Limousin, were annexed to Guienne and formed into a sovereignty for the prince under the title of the Principality of Acquitaine. A campaign in Castile, on behalf of Pedro the Cruel, and the heavy taxes laid on Acquitaine to meet the expenses, caused a rebellion, and ultimately involved him in a war with the French king. His own health did not allow him to take the field, and having seen his generals defeated he withdrew into England, and after lingering some time died, leaving an only son, afterward Richard II.

Edward I (1239-1307), king of England, son of Henry III, was born at Winchester. The contests between his father and the barons called him early into active life, and he finally quelled all resistance to the royal authority by the decisive defeat of Leicester at the battle of Evesham, in 1265. During his reign great progress was made in the establishment of law and order throughout the land.

**Edward II** (1284-1327), king of England, b. at Caernarvon Castle, and the first English Prince of Wales, succeeded his father, Edward I, in 1307.

Edward III (1313-1377), king of England, son of Edward II, by Isabella of France. On his father's deposition in 1327 he was proclaimed king under council of regency, while his mother's paramour, Mortimer, really possessed the principal power in the state.

sessed the principal power in the state. Edward IV (1441-1483), king of England. His father, Richard, duke of York, was grandson of Edward, earl of Cambridge, and duke of York, fourth son of Edward III, while the rival line of Lancaster descended from John of Gaunt, the third son. The York line had intermatried with the female descendants of Lionel, the second son, which gave it the preferable right to the crown. Edward, on the defeat and death of his father at the battle of Wakefield, assumed his title, and having entered London after his splendid victory over the troops of Henry VI and Queen Margaret at Mortimer's Cross. in February, 1461, was declared king by acclamation. Edward V, king of England (1470-1483), the

Edward V, king of England (1470-1483), the eldest son of Edward IV, was in his thirteenth year when he succeeded his father in 1483. He fell into the hands of his uncle, the duke of Gloucester, who made himself king as Richard III and caused the young king and his brother to be sent to the Tower, where it is said, he had them smothered by ruffians.

Edward VI (1537-1553), king of England, son of Henry VIII, by Jane Seymour. At his father's death he was only ten years of age. His education was intrusted to men of the first character for learning, under whose training he made great progress and grew up with a rooted zeal for the doctrines of the Reformation. His reign was, on the whole, tumultuous and unsettled.

Edwards, AMELIA BLANDFORD (1831-1892), an English novelist. As far back as 1853 she began to contribute to periodicals. Among her best-known novels are Hand and Glove; Half a Million of Money; Lord Brackenbury.

Edwards, JONATHAN (1703-1758), a celebrated theologian and metaphysician, h. at East Windsor, Conn. He entered Yale College in 1716, and studied till 1720, in 1722 received a license as preacher. In 1723 he was elected a tutor in Yale College, but resigned in 1726 to be ordained as minister at Northampton, Mass. After more than 23 years of zealous service here he was dismissed by the congregation owing to the severity with which he sought to exercise church discipline. He then went as a missionary among the Indians at Stockbridge, in Massachusetts. Here he composed his famous work on the *Freedom of the Will*, a masterpiece of metaphysical argument. It appeared in 1754, and was completed within four months and a half. In 1758 he was chosen president of the college at Princeton, New Jersey, but d. shortly afterward.

d. shortly afterward. Edwy, king of England, son of Edmund I, succeeded his uncle Edred in 955. Taking part with the secular clergy against the monks, he incurred the confirmed enmity of the latter. The papal party, headed by Dunstan, was strong enough to excite a rebellion, by which Edwy was driven from the throne to make way for his brother Edgar.

**Eel**, the general name of a family of teleostean fishes belonging to the apodal section of the Malacopterygii. They belong to various

The Common Eel.

genera. The genus Anguilla is characterized by its scrpent-like elongated body, by the absence of ventral fins, and the continuity of the dorsal and anal fins round the extremity of the tail. The dorsal fin commences half-way between the head and the anal fin, and the lower jaw projects beyond the upper. In the genus *Conger*, which is exclusively marine, the dorsal fin commences above the pectoral, and the upper jaw is the longer. The smoothness of the body—the scales being inconspicuous—and the serpentine movements of eels are proverbial. The conger and at least three other species the sharp-nosed, the broad-nosed, and the snig-belong to Britain. The species of the sharp-nosed genus, which are both fresh-water and marine, seldom exceed 30 in. in length. Eels avoid cold, and frequently migrate in winter to the mud or brackish water of estuaries where the temperature is higher. They have even been met with in large numbers performing migrations on land, mostly intervening necks of soil covered with damp grass. Some eels spawn in the estuaries of rivers, and immense numbers of the young eels pass up the streams in spring, their passage in England being called the *eel-fare*. Eels are considered excellent food.

Effingham, Effingham co., 111., 100 mi. e. of St. Louis. Railroads: Vandalia Line; Illinois Central; Wabash; and Indiana & Illinois Southern. Industries: two large flouring mills. Surrounding country agricultural. The town was first settled about 1845. Pop. est. 1897, 4,500.

Egbert, considered the first king of all England, was of the royal family of Wessex. He succeeded Brihtric in 802 as king of Wessex. He reduced the other kingdoms and rendered them dependent on him in 829, thus becoming their overlord. He d. in 839.

Ege'ria, a nymph who received divine honors among the Romans. Numa is said to have received from her the laws which he gave to the Romans.

Egg, a body specially developed in the females of animals, and in which, by impregna-tion, the development of the young animal takes place. Birds, reptiles, fishes, insects. and worms are oviparous, i.e., bring forth eggs or ova, as do also, among mammalia, the or-nithorhynchus and echidna. The egg contains the germ of the young animal, as well as the substance which serves for its nourishment. All it needs for its development is external The eggs of animals lower than the heat. birds have usually only three parts, viz., the germinal spot or dot, the germinal vesicle, and the vitellus or yolk; the first being contained in the vesicle, and that again in the yolk. Besides these parts the eggs of birds have the white or albumen, and the shell, which consists of a membrane coated with carbonate of lime. The eggs of birds, especially of fowls, are a pleasant and nutritive food. The common domestic fowl, the turkey, the pea-hen, and the common duck produce the eggs which are commonest in the market. Among reptiles, turtles produce eggs which are good for eating. The eggs of fishes are their roe or spawn. A hen's egg of good size weighs about 1,000 grains, of which the white constitutes 600, the yolk 300, and the shell 100. When the white of an egg is warmed it coagulates to a firm opaque mass. Eggs form an important article in American commerce.

**Egg-bird**, a species of tern, a bird of considerable commercial importance in the West Indies. as its eggs, in common with those of two other species of tern, form an object of profitable adventure to the crews of numerous small vessels.

Eggleston, EDWARD, b. in Vevay, Ind., Dec.

### Eggleston

10, 1837. His education consisted of a knowledge of Latin and some Greek, and an extensive acquaintance with the French language and literature, also Spanish and Italian. When nineteen years old he joined the Methodist ministry and preached for ten years. His literary career began in 1860, as editor of the *Little Corporal*, at Evanston, Ill. In 1870 he

Egg-Bird.

became literary editor of the Independent, in New York City. As he said, the purpose of his novels was to do "something toward describing life in the back country districts of the Western states." His principal novels are, The Hoosier Schoolmaster, The End of the World, Rory, and The Faith Doctor; in history, Household History of the U. S., Eighty Famous American Indians, etc.

**Eggleston**, GEORGE CARY, brother of Edward Eggleston, b. in Vevay, Ind., 1839. He was educated at Indiana Asbury University and Richmond College, Va. Later he practised law in Virginia and was a Confederate soldier throughout the Civil War. Later he became editor-in-chief of *Hearth and Home*, and in 1875, literary editor of the *Evening Post*. In 1889 he became editorial writer of the World. Among the books which he has published are, A Rebel's Recollections; The Wreck of the Red Bird; and The Juggernaut.

**Eggplant**, natural order Solanaceæ, an herbaceous plant, from 1 ft. to 18 in. high, with large white or purplish flowers. The fruit is about the size of a goose's egg, and generally yellow, white, or violet, and when boiled or stewed is used as an article of food. It is cultivated in India, the U. S., etc., and in European hothouses.

Eg'lantine, one of the names of the sweetbrier, a kind of wild rose. The name has sometimes been erroneously used for other species of the rose and for the honeysuckle.

Egmont, LAMORAL, COUNT (1522-1568), a famous Dutch patriot. He entered the military service, accompanied Charles V in his African expeditions, and distinguished himself under Philip II in the battles of St. Quentin and Gravelines. Egmont became involved in the political and religious disputes which arose between the Netherlands and their Spanish rulers. He tried to adjust the difficulties between both parties, and in 1565 went to Spain to arrange matters with Philip. In 1567 the Duke of Alva was sent with an army to the Netherlands to reduce the insurgents. One of his first measures was to seize Count Egmont and Count Horn. After a trial before a tribunal instituted by Alva himself they were executed at Brussels. E'goism, as a philosophical doctrine, the

**E'goism,** as a philosophical doctrine, the view that the elements of all knowledge and the reality of the things known are dependent on the personal existence of the knower. Hence the logical position of the egoist is to doubt the substantial reality of everything except his own existence.

**E'gret**, a name given to those species of white herons which have the feathers of the lower part of the back elongated and their webs disunited, reaching to the tail or beyond it at certain seasons of the year. Their forms are more graceful than those of common herons. The American egret is about 37 in. long to the end of the tail; plumage soft and blended; head not crested; wings moderate; the tail short, of 12 weak feathers.

Egypt (ë'jipt), a country in the northeastern part of Africa, governed by a ruler (the khedive, or viceroy) who pays tribute to the sultan of Turkey, but is virtually independent. Egypt is bounded on the n. by the Mediterranean Sea, on the e. by Arabia and the Red Sea, and on the w. by the Libyan Desert. Its natural southern frontier may be placed about Assouan (about 500 mi. s. of the Mediterranean), near which cultivated land almost disappears and the country begins to assume the features of the Nubian Desert. Egyptian troops, however, still hold the country as far as the Second Cataract of the Nile at Wady Halfa (about 670 mi. s. of the Mediterranean), which is the limit of free navigation for larger vessels. The authority of the khedive extended till recently over the countries on the Upper Nile up to a few degrees from the equator, including Kordofan, Darfur, Bar-el-Ghasal, etc.; but this territory acquired by conquest and known by the general name of the Soudan, has been evacuated owing to the rebellion of the people against Egyptian authority. On the Red Sea littoral the farthest point s. under the Egyptian flag is Suakin. A small strip of n.w. Arabia on the e. of the Red Sea belongs to Egypt, as also the Sinaitic peninsula and the Isthmus of Suez. Area 394,000 sq. mi.; pop. 6,817,265. The capital and largest town is Cairo, the next largest and chief seaport is Alexandria.

The inhabited portion of Egypt is mainly confined to the valley of the Nile, which, where widest (at the Delta), does not exceed 80 mi, and narrows steadily as we ascend its stream till, at the southern frontier, it is only 2 mi. wide. The Nile has no tides, but runs constantly toward the sea at the rate of 21 to 3 mi. an hour. After it enters Egypt it flows in a northward direction but with considerable bends till it reaches a little beyond Cairo, where it divides into two main streams, the Rosetta and Damietta branches, which enclose that portion of land known as the Delta and formed by deposits of alluvial matter. Bordering on the Mediterranean are several salt lakes or lagoons, Menzaleh being the largest, through which is carried the Suez Canal, connecting the Mediterranean and the Red Sea; and also passing through other salt lakes; about 150 mi. s. of the Mediterranean is the lake Birketel-Kurun, fed by the Nile. As very little rain falls in Egypt, the prosperity of the country entirely depends upon the Nile, and especially upon the yearly overflow of the river, which so fertilizes the soil with a brown slimy deposit that it produces two crops a year. Beyond the limits of the inundation and of irrigation there is no cultivation whatsoever. The Nile begins to rise in June, and continues to increase until September, overflowing the low lands along its course, the waters being conveyed by canals where natural channels fail. The Delta then looks like an immense marsh interspersed with islands, villages, towns, and plantations, just above the level of the water. After a few days the water begins to subside, and leaves the land again dry about the end of October. The seed is then sown, and artificial irrigation is maintained by water raised from the river, and distributed by means of chan-nels throughout the fields. The appliances for raising water are simple and primitive; chiefly the shadoof worked by two men, and the sakieh driven by a donkey or an ox. The land is soon covered with green crops, and the first harvest is in March.

At Cairo the valley of the Nile becomes well defined. It is bordered on the east by what are called the Arabian hills, and on the west by the Libyan ranges. Beyond the limits of the valley on the Libyan side are five oases at intervals-those of Khårgeh, Dåkhel, Faråfra, Sîwa, and Bahrîyeh-islands of verdure and cultivation, in some of which artesian wells The great oasis Wah-elare numerous. Khårgeh extends south for 100 mi. These oases are also dependent on the Nile like the rest of habitable Egypt, for the water to which they owe their existence is partly derived from the subterraneous percolation from that river. The territory to the east of the Nile is mainly a bare rocky region, mountainous toward the coast, maintaining a small nomadic population. The broad plains of the Delta and the comparatively narrow valley of the river higher up, make two natural divisions of Egypt, upper and lower. These wer-ciently regarded as separate kingdoms. These were an-The lower part of the valley, however, which includes the fertile tract adjoining Lake Birketel-Kurun, known as the Fayoum, differs so much from the higher part as to give rise to the division into Lower, Middle, and Upper Egypt. The country is now divided into governorates and mudiriehs.

The atmosphere in Egypt is extremely clear and dry, the temperature regular and exceedingly hot. The winter months are the most delightful part of the year; later, the ground becomes parched and dry, and in May the suffocating khamseen, or simoom, begins to blow from the desert plains. Rain is scanty except near the seashore: but at night the dews are heavy in Lower Egypt, and the air cool and refreshing. Egypt is not remarkably healthy, as, in addition to visitations of plague and cholera, ophthalmia, diarrhœa, dysentery, and boils are very prevalent.

The rock formations of Egypt consist largely of nummulite limestone, especially at the Nile and in the Libyan Desert, and of granite, sycnite, porphyry, and other crystalline rocks in the Arabian Desert (between the Nile and Red Sea), with sandstone in the south. Over a great extent of Egypt the rocks are covered with shifting sands, and in the lands bordering on the Nile by the alluvium deposited during the inundations, and which consists of an argillaceous earth or loam, more or less mixed with sand. Among the useful minerals found in the country are granite, syenite, basalt, porphyty, limestone, alabaster, natron, bitumen, salt, and sulphur.

Now as formerly there is little timber, the principal trees, besides the date palm and tamarisk, being the sycamore fig, and acacia or gum-arabic tree, which last does not attain to any size n. of Wady Halfa. The papyrus plant, once so important, is now to be found only in one or two spots. Of it was manufactured a paper which was supplied to all the ancient world. Besides the lotus or water-lily of the Nile, Egypt has always been celebrated for its production of corn, barley, a great variety of the bean class, leeks, garlic, onions, flax, and for plants of the cucumber tribe. To the products of ancient times have been added the sugar cane, cotton plant, indigo, and tobacco.

Egyptian oxen were celebrated in the ancient world. The camel was early introduced: horses and asses have always abounded; sheep and goats are numerous; the cat is universal as a domestic animal. Wild animals include the hyena, jackal, fox, lynx, genet, ichneumon. jerboa, wild goat, gazelle and one or two other antelopes, hare, etc. The crocodile formerly reached the Delta, but is now seldom seen below Assouan. Water fowl are plentiful; so are vultures and other birds of prey. The sacred ibis is still found in the south, and the pelican in the northern lagoons. Among the countless insects are the sacred beetle, the locust, and mosquito.

In spite of the fact that at least two and sometimes three successive crops may be gathered in a year, agriculture in Egypt is still in a very low state; and the extreme poverty and generally wretched condition of the cultivators render improvement difficult. There are few trades which have attained a development of any importance. The tanning and potterymaking, however, deserve praise; coarse cotton cloths are made; silk is cultivated; and the sugar cane is grown to a considerable extent. The commerce of Egypt is considerable, and has greatly increased since the construction of the Suez Canal and the railways. The railways have a length of about 1,200 mi. The total value of exports amounts to \$65,750,000, that of imports to \$56,000,000.

Of the inhabitants of Egypt those of the peasant class, or Fellahs as they are called, appear to be descendants of the ancient

Egyptians mixed with Arab blood. Having embraced Mohammedanism, they are often denominated Arabs, though regarded by the true Arab with contempt. The Copts are the descendants of the ancient Egyptians who embraced and still cling to the Christian religion. Though comparatively few in number, their education and useful talents enable them to hold a respectable position in society, as clerks, accountants, etc. With those aboriginal inhabitants are mingled, in various proportions, Turks, Arabs (chiefly Bedouins), Armenians, Berbers, negroes, and a considerable number of Europeans, especially Greeks and Levantines.

The government of Egypt is in the hands of the khedive, or viceroy, who is assisted by a ministry formed on the model of those of Western Europe. The title and government are hereditary, but the khedive, as a Turkish vassal, has to pay an annual tribute to the sultan of \$3,500,000. For some years previous to 1882 two controllers general, appointed respectively by France and Britain, had extensive powers of control in the administration of the country; but in that year the French having refused to lend assistance in putting down the rebellion of Arabi Pasha, a British army occupied Egypt, and the government has since been carried on under the supervision of Britain, various reforms having been introduced. Egypt is much burdened by the public debt, which amounts to the sum of \$517,278,200.

History .- The Egyptians are the earliest people known to us as a nation. When Abraham entered the Delta from Canaan they had long been enjoying the advantages of a settled government. They had built cities, invented hieroglyphic signs, and improved them into syllabic writing, and almost into an alphabet. They had invented records, and wrote their kings' names and actions on the massive tem-ples which they raised. The arrangement of Egyptian chronology is still a much disputed point among scholars. A list of the kings of Egypt, arranged in 30 dynasties, was given by the priest Manetho (about 250 B. C.), and this division is still used. The Fourth Dynasty is distinguished as the "Pyramid Dynasty." Three of its kings, Khufa, Khafra, and Menkaura (according to Herodotus, Cheops, Chephren, and Mykerinos), built the largest pyramids. The date assigned to these kings in the chronology of Lepsius is 2800-2700. About 2100 Egypt was conquered by the Hyksos, or shep-herd kings, who invaded Egypt from the east and established their capital at Tanis (Zoan). The Theban princes seem, however, to have preserved a state of semi-independence, and at last a revolt commenced which ended by the shepherd kings being completely driven out of Egypt by King Aahmes (Amäsis) of Thebes (about 1600), the first of the Eighteenth Dy-nasty. With Aahmes and the expulsion of the shepherd kings began the reigns of those great Theban kings who built the magnificent temples and palaces at Thebes. The Ramessides form the Nineteenth Dynasty. They com-mence with Rameses I, who seems to have been

of Lower Egyptian extraction. His grandson, the great Rameses II, or Sesostris, was successful against the neighboring Arabs, and covered Egypt with magnificent buildings. Rameses II was probably the Pharaoh who oppressed the Hebrews, and the exodus may have occurred under his successor Meneptah, or Merenptah. Under the later Ramessides the Egyptian Empire began to decay. A new dynasty (Twentyfirst) came to the throne with King Hirhor. He attempted to restore Egyptian rule to the East, and conquered and plundered Jerusalem. After his death Egypt was torn by civil wars, and eventually the Ethiopians, under Shabak (Shabako), conquered it. Uahbra (the Greek Apries, the Hophrah of the Bible) and Aahmes II followed. About 532 Cambyses, king of About 532 Cambyses, king of Persia, overran Egypt and made it a Persian province. During the reign of Cambyses the Egyptians suffered much oppression. After the Persian defeat at Marathon the Egyptians rose and recovered their independence for a short time, but were again subdued, and, in spite of two other revolts, Egypt remained a Persian province till Persia itself was conquered by Alexander the Great, B. c. 332.

Egypt now became a Greek state, many Greeks having been already settled in the country, and the Egyptians were treated as an inferior race. Alexandria was founded an inferior race. as the new Greek capital. On Alexander's death his general, Ptolemy, took possession of the throne and became the first of a Greek dynasty that for three hundred years made Egypt one of the chief kingdoms of the world. The Ptolemies were magnificent patrons of letters and arts. Theocritus, Callimachus, Euclid the geometrician, the astronomers Eratosthenes and Aratus, etc., flourished under their rule. But while the Alexandrian Greeks managed to keep down the native Egyptians, they were themselves sinking under the Romans. Ptolemy Auletes went to Rome to ask help against his subjects, and the famous Cleopatra maintained her power only through her personal influ-ence with Julius Cæsar and Mark Antony. On the defeat of Mark Antony by Augustus B. C. 30, Egypt became a province of Rome. It was still a Greek state, and Alexandria was the chief seat of Greek learning and science. On the spread of Christianity the old Egyptian doctrines lost their sway. Now arose in Alexandria the Christian catechetical school which The sects produced Clemens and Origen. of Gnostics united astrology and magic with religion. The school of Alexandrian Platonics produced Plotinus and Proclus. Monasteries were built all over Egypt; Christian monks took the place of the pagan hermits, and the Bible was translated into Coptic.

On the division of the great Roman Empire (A. D. 337), in the time of Theodosius, into the Western and Eastern Empires, Egypt became a province of the latter, and sank deeper and deeper into barbarism and weakness. It was conquered 640 A. D. by the Saracens under Caliph Omar. As a province of the caliphs it was under the govern-

ļ
ment of the celebrated Abbasides--Harunal-Rashid and Al-Mamun-and that of the heroic Sultan Saladin. The last dynasty was, however, overthrown by the Mamelukes (1250); and the Mamelukes in their turn were conquered by the Turks (1516-17). The Mamelukes made repeated attempts to cast off the Turkish yoke, and had virtually done so by the end of last century, when the French conquered Egypt and held it till 1801, when they were driven out by the British under Abercromby and Hutchinson.

On the expulsion of the French a Turkish force under Mehemet All Bey took possession of the country. Mehemet Ali was made pasha, and being a man of great ability administered the country vigorously and greatly extended the Egyptian territories. At length he broke with the Porte, and after gaining a decisive victory over the Ottoman troops in Syria in 1839, he was acknowledged by the sultan as viceroy of Egypt, with the right of succession in his family. Mehemet Ali d. in 1849, having survived his son Ibrahim, who d. in 1848. He was succeeded by his grandson Abbas, who, dying in 1854, was succeeded by his uncle Said, son of Mehemet. Under his rule railways were opened, and the cutting of the Suez Canal commenced. After Said's death Ismail Pasha, a grandson of Mehemet Ali, obtained the government in 1803. His administration was vigorous but exceedingly extravagant, and brought the finances of the country into disorder. In 1866 he obtained a firman from the sultan granting him the title of khedive. In 1879 he was forced to abdicate under pressure of the British and French governments, and was replaced by his son Tewfik. In 1882 the "na-tional party" under Arabi Pasha revolted and forced the khedive to flee. On July 11 a British fleet bombarded Alexandria and restored the khedive, and at Tel-el-Kebir Arabi's forces were totally crushed on September 13. Λ rebellion in the Soudan under the leadership of Mohammed Ahmed, the so-called mahdi. now gave the government trouble. In 1883 the mahdi's forces annihilated an Egyptian force under Hicks Pasha in Kordofan. British troops were now despatched to Suakin and inflicted two severe defeats on the mahdi's followers there. But the British cabinet had resolved to abandon the Soudan; and General Gordon, already famous for his work in this district, was sent to effect the safe withdrawal of the garrisons (1884). By this time, however. the mahdi's forces were strong enough to shut the general up in Khartoum. For nearly a year he held the town, but perished (January, 1885) before the relief expedition under Sir Garnet Wolseley could reach him. Since then the idea of retaining the Soudan has been given up. Prince Abbas succeeded as khedive in 1892the British still retaining control.

Ancient Cirilization.—The civilization of the Egyptians had reached a high pitch from the earliest period to which we can trace their history. The masonry of the passages in the great pyramid has not been surpassed at any age. In mechanical arts the carpenter, boat-

builder, potter, leather-cutter, glass-blower. and others are frequently represented on their ancient monuments, and we see the blow pipe. bellows, and siphons: the press, balance, lever: the saw, the adze, the chisel, the forcers, the syringe, harpoon, razors; we have also glazed pottery, the potter's wheel, and the kiln: and dated specimens of glass of the time of Thoth-mes III, 1445 B. C. Gold beating, damascening. engraving, casting, inlaying, wire drawing, and other processes, were practised. The proc-esses of growing and preparing flax, as well as the looms employed, are all depicted. The social and domestic life of the ancient Egyptians is pictured for us on the walls of their The rich spent much of temples and tombs. their time in hospitality and entertainments, especially of a musical kind. In the country districts the superintendence of the agricultural works or the fisheries on their estates was varied by the sports and pleasures of a country life. The lower orders were poor and country life. uneducated, scantily fed and clothed, and held in contempt by the higher classes. But there was no strict separation into caste; and although the priests formed a ruling bureaucracy, the highest posts were open to the successful scholar. Next to the priesthood in importance was the military class or order, who were all landholders and bound to serve in time of war. Below these were the husbandmen, who paid a small rent to the king. Egyptian custom seems to have allowed but one wife, who occupied an honorable and wellestablished position as the "lady of the house."

The two main principles on which the religion of Egypt was based appear to have been the existence of an omnipotent Being, whose various attributes being defined, formed a series of divinities; and the deification of the sun and moon. Each group of divinities formed a triad composed of a chief male deity, with a wife or sister and a son, as Osiris, Isis, and Horus, or Amun, Maut, and Khonso. Among the other gods of the Egyptian Pantheon are Ra, the sun, usually represented as a hawkheaded man. Mentu and Atmu are merely two phases of Ra, the rising and the setting sun. The worship of the bull Apis is connected with Osiris. Scrapis is the defunct Apis, who has become Osiris. Seth, or Set, represents the power of evil. Ammon (Egyptian Amen), originally a local god, owed his importance to the greatness of his city. Thoth is the chief moon-god, and is Thebes. generally represented as ibis-headed. Anubis. the jackal-headed, belonged to the family of Osiris, and presided over mumification. Besides these deities the Egyptians worshiped beasts, reptiles, and even vegetables, probably as symbols. The Egyptians believed in the transmigration of souls, and in the existence of a future state, in which mankind would be rewarded or punished according to their actions while on earth.

Ancient Architecture and Sculptures. — The monuments of Egypt are of two main periods —those built in the times of the Pharaohs, or

native kings, and those built during the rule of the Greeks and Romans (subsequently to 330 B.C). The former period was by far the longer and more important, and to it belong the most characteristic examples of Egyptian architecture, such as pyramids, vast temples, some of them cut in the solid rock (as at Ipsambul), rock-cut tombs, gigantic monolithic obelisks, and colossal statues. The characteristic features of the style are solidity, boldness, and originality. Among its peculiar characteristics may be noted: symmetry of structure; the gradual converging of the walls of some of its edifices, especially of the propylæa or tower gateways of its temples; roofs and covered ways being flat, and composed of immense blocks of stone reaching from one wall or column to another, the arch not being employed nor yet timber; columns numerous, close, and massive, generally without bases, and exhibiting great variety in their capitals, from a simple square block to an elaborate composition of palm leaves or other forms suggested by vegetation; the employment of a large concave molding in the entablature, decorated with vertical flutings or leaves; walls and columns decorated with a profusion of sculptures in outline or low-relief, representing divinities, men, and animals, with innumerable hieroglyphics, brilliant coloring being often superadded. The pyramid is one of the best known forms of Egyptian art, and there is little doubt that these structures were intended as the tombs of kings. The leading features of the Egyptian temples were these: a gateway flanked by two lofty *pylons* formed the entrance to a square court. From this court the way leads through a second gateway to an inner court surrounded by a colonnade. Beyond this is the chamber of the temple known as the Hall of Columns, the center avenue of which was higher than the rest of the hall, and consisted usually of twelve columns, which supported a flat roof formed of massive stones, light being admitted at the sides of this elevated portion. To the Hall of Columns succeeded a series of smaller chambers, the roofs of which were generally sup-ported by six or four columns. These apartments frequently surrounded a dark chamber -the most sacred in the temple-the holy of holies. The surface of each architectural feature was engraved with its particular ornament appropriately colored. In the caretto, or hollow molding of the cornice, it was customary to place the name and titles of the Pharaoh or king; the architrave stone was symbolically ornamented with the names of the divinities to whom the temple was dedicated, and of the sovereign in whose time it was built. The abacus of the column was invariably decorated with the royal titles. The capitals were painted in accordance with the intention of the form; if, for instance, the expanded papyrus was shown, the leaves of the calyx would be yellow and the filaments green. Beneath were horizontal bands of blue and white, and then a representation of the king offering gifts to the gods of the temple; and.

lastly, the yellow and red lines at the base of the shaft signified the brown leaves that en-velop the base of the stalk of the natural plant. The Egyptian temple was invariably rectangular, with its walls inclining inward, and never more than one story high, and the approach to it was frequently through an ave-nue of sphinxes. The temples built during the sway of the Greeks and Romans, though having a general resemblance to the earlier ones, differed in some respects, as in the use of more elaborate capitals, more salient forms in the architectural and sculptural decorations, etc. A peculiar kind of mural sculpture was practised among the Egyptians, the outline of the object to be represented being cut into the surface, while the minor forms and rotundity are shown within this incised outline, thus forming a kind of "hollow relief."

**Egyptol'ogy**, the science of Egyptian antiquities, or that branch of knowledge which deals with the language, history, etc., of ancient Egypt.

**Ehrenbreitstein** (ā' ren-brIt-stIn), a Prussian fortress of great strength situated opposite the confluence of the Moselle with the Rhine, on a precipitous rock 387 ft. above the river, and inaccessible on three sides. The fortifications, which were erected in 1816-26 at a cost of \$6,000,000, can accommodate a garrison of 14,-000 men, and possess room for stores to last an army of 60,000 for a year.

**Eider** (i-dèr), a river of Prussia, rises in Holstein, and forms the boundary between Schleswig and Holstein, falling into the North Sea at Tönning after a course of 92 mi.

**Eider Duck**, a species of duck found both in America and Europe. Its favorite haunts are solitary rocky shores and islands. The eider duck is about twice the size of the common duck. The male is black, heal and back white, with a black crown. The female

Eider Duck.

is reddish drab spotted with black, and with two white bands on the wings. They feed largely on shellfish. crustaceans, etc. Their nests are usually formed of drift grass, dry seaweed, etc., lined with a large quantity of down, which the female plucks from her own breast. In this soft bed she lays five eggs, which she covers over with a layer of down.

If this, with the eggs, is removed the bird repeats the process. One female generally furnishes about 1 lb. of down, but the quantity is reduced by cleaning. This down, from its superior warmth, lightness, and elasticity, is in great demand for beds and coverlets; and the districts in Norway and Iceland where these birds abound are guarded with the greatest vigilance as a most valuable property. As found in commerce this down is in balls of the size of a man's fist, and weighing from 3 to 4 lbs. It is so fine and elastic that 5 lbs. of the best quality is sufficient for a whole bed. The down from dead birds is little esteemed, having lost its elasticity. The king eider duck is another species resembling the preceding and inhabiting the same coasts.

**Eiffel**, GUSTAVE. engincer, b. in 1832 at Dijon, France. He first attracted attention by the construction of a bridge, in which was employed for the first time, the compressed air method of sinking foundation cylinders. This was followed by many other works of great en-gineering skill. The most important among these and the one which has made his name famous throughout the civilized world is the Eiffel Tower of the Paris Exposition of 1889. This tower is 984 ft. high, and at the elevation The weight of 896 ft. it is 33 ft. in diameter. of iron used in construction is 7,300 tons. On the top is an immense lantern to which a system of elevators run. Mr. Eiffel was made an officer of the Legion of Honor in recognition of his genius. He was, however, connected with the Panama scandal of 1893, and was convicted of misappropriating funds of the canal company. For this he was sentenced to fine and imprisonment.

**Eisleben** (is'lā-bên), a town, Prussian Saxony, 25 mi. n.w. of Merseburg, celebrated as the place where Luther was born and where he died. There are many memorials of Luther, and also a bronze statue of the reformer erected in 1883. Copper is extensively worked in the neighborhood. Pop. 23,175.

**Eject' ment**, in law, an action wherein the title to lands and tenements may be tried and the possession recovered. It is commenced by a writ addressed to the tenant in possession and all entitled to defend the possession, bearing that the plaintiff lays claim to the property in question, and calling upon all interested to appear within a certain time to defend their right, failing which the tenant in possession will be ejected. In its older form the action was remarkable for certain curious legal fictions on which procedure was based.

**Ekat'erinburg**, a town, Russia, in the government and 170 mi. s.e. of Perm, founded in 1723 by Peter the Great. It is the center of the mining and metallurgy of the Ural region; and gem-cutting, making of machinery, cloth, candles, etc., are industries. Pop. 36,750.

**Ela'in**, the oily principle of fat obtained by submitting fat to the action of boiling alcohol, allowing the stearin to crystallize, and then evaporating the alcoholic solution. It possesses much the appearance and properties of vegetable oil, and forms soaps with alkalies.

#### Elasticity

E'lam, the ancient name of a country or region in Asia, east of the Lower Tigris. A king of Elam is said in the cuneiform inscriptions to have conquered Babylonia and Assyria about 2300 B. c. It was latterly incorporated in the Persian Empire.

E'land, a species of antelope inhabiting Africa, the largest of all the antelopes, being about the size of an ox. Its flesh, especially that of the thighs, which are dried and used

in this state, is highly prized, and consequently the animal is nearly exterminated in the neighborhood of Cape Colony, where it was once common. The color is a light or grayish brown, and it possesses a short mane. The horns, which are about 18 in. long and nearly straight, are spirally keeled.

Elastic'ity is the property in virtue of which bodies resist change of volume and change of shape, and recover their former figure or state after external pressure, tension, or distortion. The former is called elasticity of volume, the latter elasticity of shape. The name Compressibility is also used in connection with the elasticity of volume; and Rigidity, or resistance to change of shape, in connection with the latter. Fluids possess no rigidity whatever: they offer no permanent resistance to change of shape; while a solid body, unless it is distorted beyond certain limits, called the limits of elasticity, tends to return to its original form. Both fluids and solids possess elasticity of volume, and tend to resume their original volume after compression. The elasticity of volume of the former is perfect; whatever compression they have been subjected to, they return under the same conditions of temperature to precisely their original volumes when the forces of compression are removed. In the case of solids there are limits to their elasticity of volume as well as to their elasticity of form: thus gold may be made permanently denser by hammering. There is one law of elasticity. the celebrated law of Hooke: Strain is proportional to stress; or, in other words, whatever be the nature of the distortion the amount of it is proportional to the stress that produces it. This law is only considered as applicable so long as we do not go beyond the limits of elastiolty.

El'ater, the name of a family of beetles, remarkable for their ability to throw themselves to a considerable height in the air, when placed on their back, by a vigorous muscular movement. Hence their names of springing-beetles, clickbeetles, skipjacks, etc. When alarmed, the elater counterfeits death. Flowers, grass, and decaying wood are the habitations of these animals, which are almost always found singly. The larvæ are often very injurious to vegetation, especially those which devour the roots of herbaceous plants, and are known from their slenderness and hardness as wire worms. The fireffies of America belong to the family. They possess luminous properties, which are unlike those of the glow worm, etc., being seated near the head.

Elba, a small island in the Mediterranean, in the province of Livorno (Leghorn), Italy, separated from the mainland by the Strait of Piombino, about 6 mi. wide. This island is 18 mi. long and from  $2\frac{1}{2}$  to  $10\frac{1}{2}$  mi. broad, and is traversed by mountains rising to a height of over 3,000 ft. It is rich in iron, marble, granite, salt, etc., and iron ore is exported. Excellent wine and fruits are produced. It has two seaports, Porto-Ferrajo (the capital) and Porto-Longone. The Treaty of Paris in 1814 erected Elba into a sovereignty for Napoleon, who resided in it from May 4, 1814, to Feb. 26, 1815. Pop. 24,000.

**Eibe** (elb), a river of Germany, one of the largest in Europe. It rises on the s.w. slopes of the Schneekoppe (or Snowcap), one of the Riesengebirge, between Bohemia and Silesia. The length, including windings, is upward of 780 mi. It is more or less navigable for about 470 mi., but its estuary at Cuxhaven is much encumbered with sand banks. It is well stocked with fish. On July 1, 1870, the navigation of the Elbe was declared free from Hamburg to Melnik in Bohemia.

**Elberfeld** (el'bèr-felt), a town of Rhenish Prussia, 15 mi. e. of Düsseldorf. It has no historical or antiquarian importance, its prosperity, which is of recent date, being largely due to the cotton manufacture. Linen, woolen, silk, and mixed silk goods. ribbons, and velvet are extensively made and exported. There are numerous mills for spinning cotton twist, linen yarn, and worsted, and numerous dyeworks, and miscellaneous industrial establishments. Pop. 242,078.

ments. Pop. 242,078. **Elbeuf** (el-beuf), a town of France, dep. Seine-Inférieure, 11 mi. s.s.w. of Rouen, in a valley on the left bank of the Seine. It is well built, and has eight artesian wells. It has spinning mills, dye works, and is an important center for the production of woolen manufactures, chiefly of lighter cloths and fancy goods. It is also an entrepôt for the finer and heavier cloths of Louviers and Sedan. It communicates by steamers with Paris, Rouen, and Havre. Pop. 21,173.

**Elbing**, a seaport town of West Prussia, on the Elbing, near its entrance into the Frische-Haff. It was once a flourishing Hanse town, and is still a place of considerable industry and trade, the manufactures including iron goods, machinery, brass and tinplate goods. It has also ship building yards. Pop. 38,278. Elburz, a lofty mountain range extending

**Eiburz**, a lofty mountain range extending over Northern Persia, parallel with and overlooking the Caspian. Highest peak, Mt. Demavend, 19,400 ft.; average height, 6,000 to 8,000 ft.

Elder, a name given to different species of the genus Sambucus, nat. order Caprifoliaceæ. These are small trees or shrubs, with opposite and pinnated leaves, bearing small, white flowers in large and conspicuous corymbs, small berries of a black or red color, and bitand emetic properties. The wood of the young shoots contains a very large proportion of pith. The common elder of Britain is a wild shrub or small tree, distinguishable by its winged leaves; its clusters of small, cream-white flowers, and the small black berries by which these are succeeded, and from which a kind of wine is sometimes made. The dwarf elder or danewort is also found in many parts of Britain, and was vulgarly supposed to have sprung from the blood of the Danes. Two species inhabit North America, S. canadensis, a common plant from the 49th to the 30th parallel of latitude, the berries of which are black and have a sweet taste; and S. pubescens, which bears red berries, and inhabits Canada, the northern parts of New England, and the Alleghany Mountains. Elder wood is yellow. and in old trees becomes so hard that it is often substistituted for boxwood. Its toughness also is

Flowering Branch of Common Elder. a.-flower; b.-berries.

such that it is made into skewers, tops for fishing rods, etc. The light pith is utilized for balls for electric experiments, and various ointments, drinks, and medicinal decoctions are made from the bark, leaves, flowers, and berries.

**El Dora'do**, a country that Orellana, the lieutenant of Pizarro, pretended he had discovered in South America, between the Orinoco and Amazon rivers; and which he named thus on account of the immense quantities of gold and precious metals which, he asserted, he had seen in Manoa, the capital of the country.

Eleat'ic School, a Grecian philosophical sect, so called because it originated in Elea, a town of Magna Græcia (Southern Italy), of which also three of its most celebrated teachers, Parmenides, Zeno, and Leucippus, were natives. The founder was Xenophanes of Colophon, who came to Elea late in life, bring-ing with him the physical theories of the Ionian school, to which he added a metaphysic. The two schools soon drifted widely apart especially in respect of method. Starting from the observation of external nature, the Ionians endeavored to discover some elementary principle, as water, air, fire, or a combination of elements, by the action of which the phenomena they observed might be accounted for. The Eleans made the abstract idea of Being, or God, deduced from the contemplation of the universe as a whole, their starting point; and their reasonings sometimes led them to deny the reality of external phenomena altogether.

**Elecampane** (el-i-kam-pān'), a plant of the natural order Compositæ, found in the U.S. and Europe, and in Asia. It is 3 or 4 ft. high; the radical leaves are often 2 ft. and more in length; the flowers are large and yellow; the

Elecampane; a.-flower.

root, which is perennial, possesses a bitter camphor-like taste. It was formerly much used as a stimulant for all the secreting organs.

**Electoral College** in the U. S. is a body of men who are chosen by the prople of the several states to elect the president and vice-president. The number of electors chosen by each state is equal to the whole number of members that each state sends to both houses of Congress. No senator or representative or person holding an office of profit or trust under the U. S. can be chosen as an elector. The

#### Election

day on which electors are chosen must be the same in all states-the Tuesday next after the first Monday in November. It is ordained by the Constitution that the electors shall meet in their respective states on the first Wednesday in December and vote by ballot for president and vice-president, one of whom, at least, shall not be an inhabitant of the same state with themselves, and they shall make distinct lists of all persons voted for as president, etc., and of the number of votes for each: which lists they shall sign and certify and transmit, sealed, to the seat of government of the U.S., directed to the president of the Senate. A majority of the whole number of electoral votes is necessary to elect. If no candidate has a majority of votes, the House of Representatives must choose either of the three persons having the highest number of votes. On the second Wednesday of February of the year following the election the electoral votes are opened and counted by both Houses of Congress, which meet in the hall of the Representatives. The electors do not use discretionary powers but cast their votes for the candidates previously nominated by their respective parties.

1

1

Election, in politics, the selection by voting of a person or persons to occupy some post or office. The most important elections are those of the members of the legislative assemblies of the different countries, and as to the manner in which these are carried out strict laws are in force. In such elections voting by ballot is now general. Jurisdiction of election laws of the U. S. extends to such officers of federal government as are elective, viz., the president, vice-president, and members of the House of Representatives. The election of officers of the state governments is regulated by the several state codes. The president and vice-president are elected by a college of electors, which college is composed of as many electors as there shall be senators and representatives in Congress at the time of the ap-pointment of such electors. The people vote pointment of such electors. The people vote directly for these electors. Members of Congress are elected as follows: Each state is entitled to two senators in Congress, who are elected by the legislatures of the several states: members of the House of Representatives are elected directly by the people. All citizens of the U. S. are entitled to vote except citizens of the District of Columbia. In 1870 persons of African descent were given the right to par-ticipate in elections. The states of the Union from time to time enact laws for the regulation and management of their local elections. embracing the choice of the officers of the state. city, and county. The constitutions of the several states secure to citizens the right of suffrage. The laws of each state provide the means of effecting the ends of the constitution, and prescribe the qualifications of voters, which vary somewhat in the different states. In all the states the following qualifications may be classed as universal: That the elector shall be over twenty-one years of age, neither lunatic nor a pauper, and prepared to take, if necessary, an oath of allegiance to the federal

government. The length of residence in the state previous to an election is fixed by the state law and varies in the different states. Property qualification is required only in Rhode Island. Some of the states require an ability to read and write. In the state of Wyoming the right of suffrage is extended to women, with power to hold office.

**Electrical Fishes,** a name given to fishes possessing the property of communicating an electric shock when touched with the hand or any electric conductor. One of the best known is the electric eel, a native of South America. It is of nearly equal thickness throughout; head and tail obtuse; ordinary length  $3\frac{1}{4}$  to 4 ft. The seat of the four electrical organs is along the under side of the tail, and they are said to possess the power of knocking down a man, and of painfully numbing the affected limb for several hours after the shock. After a few discharges, however, the faculty of producing a shock is impaired, and an interval of rest is required for a new storage of force.

**Electric Battery**, the original name of what is now more commonly called a battery of Leyden jars, the old name having been given before galvanic batteries were invented. See *Galranic Battery*.

Electric clock, a clock driven or controlled by electricity, the latter being the ordinary meaning of the term. One clock driven in the ordinary way can be made to control by electric currents another clock (or clocks) also driven in the ordinary way so as to make it keep accurate time. The method of R. L. Jones, more or less modified, is now in very extensive use. By means of it one high-class clock compels a number of other clocks at considerable distances to keep time with it. The clocks thus controlled ought to be so regulated that if left to themselves they would always gain a little, but not more than a few minutes per day. The pendulum of the controlling clock, in swinging to either side, makes a brief contact, which completes the circuit of a galvanic battery, and thus sends a current to the controlled clock. The currents pass through a coil in the bob of the pendulum of the controlled clock, and the action between these currents and a pair of fixed magnets urges the pendulum to one side and to the other alternately. The effect is that, though the controlled clock may permanently con-tinue to be a fraction of a second in advance of the controlling clock, it can never be so much as half a second in advance. An electrically controlled clock usually has close beside it a small magnetic needle, which moves to the one side or the other according to the direction of the current, and thus shows whether the currents are coming. The arrangements are usually such that at every sixtieth second (that is, at every exact minute) no current is sent, and the needle stands still. Any small error is thus at once detected.

**Electric Dynamo.** The commercial electrical generator is called a dynamo. It consists of an armature, which is made to revolve at a high speed, by means of a steam engine,

water wheel, or other prime mover, in the field of a powerful electro-magnet. The practical principle at the base of all dynamos is the fact, that every motion of conductor past a magnet, or of a magnet past a conductor, induces electricity. The revolving part of a dynamo, called the armature, is made up of copper wires or bars wound upon an iron core, which may be either a ring, drum, or disc. The field magnets of the dynamo are placed in relation to the armature so that it revolves in the magnetic field, cutting the lines of force. The copper bars are insulated from the core and from each other by mica or paper, and are so wound around the core that one part of the copper is entering the field, thus increasing its "potential," while the other is leaving the field and decreasing it, producing a flow from positive to negative. The current is collected, or brought to one conductor, by means of the commutator of the dynamo, and is led to the conductor through brushes of copper or carbon.

If the magnetic field is strong, and there are many turns of wire on the armature so that each wire cuts many lines of force in a given time, a current of high tension is secured. If the magnetic field is weak, and the armature has but few turns of wire, the current is low tension. In some dynamos, the armature revolves in the field, and in others the field magnets revolve around the armature. Dynamos are continuous when the current is direct or flows one way all the time, and alternating when the current rapidly and constantly changes from positive to negative.

Tesla's oscillator works on the reciprocating principle. That is, the armatures are on each end of a shaft which project beyond a steam box, in which a pair of pistons, actuated by steam, drive the shaft, shuttle fashion, back and forth at an extremely rapid rate. The armatures shoot back and forth in the magnetic field of a powerful electro-magnet, and the result is a current of tremendous strength, high voltage, and great frequency.

high voltage, and great frequency. Electric Heating. When a c When a conductor is large enough it carries the electrical current without heating, but when the wire or conductor has not enough capacity for the current the resistance gives rise to heat. Electricians have taken advantage of this fact to use electricity for heating, cooking, and welding. The wire is imbedded in an enamel which has about the expansive degree of the conductor. The current, meeting resistance, heats the wire. If there was no substance present to convey off this heat the wire would fuse or weld, but the enamel carries off the heat generated, and the current continues to pass along the wire. In practise, the enamel plates, with the wire buried in them, are placed in ovens, on the bottoms of kettles, pans, and other kitchen utensils, in broilers, gridirons, and on the polishing surface of flatirons. By this means frying, boiling, baking, broiling, and stewing are performed by the heat produced by electricity. Welding iron and steel and other metals susceptible of being united un-

47

der high temperatures and pressure, is done by pressing together the surfaces to be welded, and then passing through them a current of high voltage. In practise, the parts to be welded are clamped together, and more pressure is applied when the metal, at the point of weld, is brought to a welding heat. One particular advantage found in welding by electricity is that the surfaces do not oxidize, consequently, there is no necessity for using a flux.

Electric' ity, the name given to the unknown cause of certain effects of various kinds which are found to be closely connected one with an-other. They include two distinct kinds of attraction and repulsion (electrostatic and electrodynamic), the magnetization of iron, the deflection of magnetic needles, the production of heat and light in certain circumstances, the separation of certain chemical compounds into their constituents, and spasmodic actions on the nervous and muscular systems of animals. The name is derived from the Greek *electron* (amber), the fact that amber when rubbed attracts light particles, such as small pieces of paper, having been known to the ancient Greeks. Friction was the only artificial source of electricity employed until Galvani, near the close of last century, accidentally obtained it by the contact of two metals with the limbs of a frog; and Volta, developing Galvani's discovery, invented the first galvanic or voltaic battery. Electricity produced by friction is called *frictional electricity*; that produced by chemical action on metals, rollaic electricity.

Conductors and Nonconductors. - All substances which, like amber, could be made to show electrical attraction by rubbing them, were called *electrics* by early writers on electricity. They included glass, amber, sulphur, shellac, rosin, silk, flannel, etc. The name nonelectrics was given to other bodies which were supposed not to be susceptible of excitation by friction. The bodies called nonelectrics were also called conductors, from the power which they exhibited of allowing electricity to pass through them. Electrics were also called nonconductors. The names conductor and non-conductor are still retained, but the names electric and nonelectric are discarded as being founded on a mistake. Electricity can be excited by the friction of a conductor against a non-conductor, and is, in fact, so excited in the ordinary electrical machine, in which glass rubs against an amalgam spread on a cushion. A metallic rod furnished with a glass handle can be electrified by rubbing it with flannel, the glass preventing the electricity from being conducted away through the hand. Substances thus electrified exhibit two opposite kinds of electricity, known Bodies respectively as positive and negative. charged with the same kind of electricity repel each other: those charged with opposite kinds attract each other. An instrument for indicating the presence of electricity is called an electroscope.

*Electric Conduction.*—All solid and liquid substances allow electricity to pass through them to some extent, but the differences of degree are enormous. The best conductors are the metals, especially gold, silver, and copper. Perfectly pure copper conducts about seven times as well as iron. Substances which have excessively small conductive power are not called conductors, but insulators, so that a good insulator is another name for an excessively bad conductor. Among the best insulators may be mentioned glass, paraffin (the wax, not the oil), ebonite, shellac, mica. india rubber, and gutta The ratio of the conducting power of percha. a metal to that of one of these substances is about a thousand million billions to one. Water occupies an intermediate position between these two extremes. In experiments with frictional or influence machines it behaves as a conductor, but in experiments with galvanic batteries it behaves as an insulator. The word *resistance* is used in the opposite sense to conducting power; a good insulator is said to have high resistance, and a good conductor to have low resistance.

Electrostatics is that branch of the general science of electricity which treats of the repulsions between like and the attractions between unlike kinds of electricity, The fundamental law of electrostatics is, that if e and  $\dot{e}$  denote two quantities of electricity collected in two spaces very small in comparison with the distance between them, the mutual force which they exert upon each other is directly as the product ed, and inversely as the square of the distance. If the two quantities ed are both positive, or both negative, the force is a repulsion, but if one is positive and the other negative, it is an attraction. Electrostatic attractions and repulsions manifest themselves in two distinct ways: namely, 1, as attractions and repulsions between electrified bodies: 2. as producing changes in the distribution of electricity on conductors. This second effect is called *electrostatic induction*. The different portions of the charge of one and the same conductor act upon one another according to the general law of repulsion, and thus produce the actual distribution, which is entirely on the surface, all electricity being repelled from the interior. The interposition of an insulating substance between two quantities of electricity alters the amount of the forces which they exert upon each other. In a broad sense electrostatics may be held to include within its range all the phenomena of frictional electricity and of the electricity produced by influence machines, such as those of Holtz, Voss, and Wimshurst. See Electric Machine.

Electric Discharge.—The rapid escape of electricity from a charged body is an electric discharge. When the discharge takes place through a conductor it is called continuous, and when it takes place through a nonconductor (for example through air) it is called a disruptive discharge. The name "electric discharge" is especially applied to cases in which the escaping electricity produces luminosity. Three kinds of such discharges have been distinguished—the spark, the brush, and the glow. The spark is accompanied by a sound which varies from a faint crack to a loud bang. In

# Electricity

nature it is seen on the largest scale in the case of lightning, which is a discharge of atmospheric electricity. In many cases the electric spark presents no definite shape, but looks like a mere point of fire, or, if very bright, is enlarged by its dazzling effect on the retina; but when it leaps across a space of several inches of air it assumes a crooked shape bearing a remarkable resemblance to a flash of light-ning. The brush discharge is only faintly luminous. It occurs especially at sharp points and edges of highly-charged bodies. It is barely visible by daylight, and its appearance in the dark is that of a luminous halo. It projects only a small distance into the air surrounding the body from which the charge is escaping. The glow discharge simply renders the surface of the body luminous, and does not extend into the air at all. In some modern electric apparatus beautiful effects of electric discharge are shown. Thus by causing a discharge to take place in highly-rarefled air or gas it is made to jump across a considerable interval, and the whole intervening space is filled with a beautiful nebulous luminosity, the color of which depends on the nature of the gas. If the vacuum is sufficiently good the luminosity is seen to be disposed in transverse stripes, technically called striæ.

Dissipation of Electricity.—An electrified body left to itself gradually loses its electricity. This effect is due to more causes than one. Ĭſ the body is a conductor and has any sharp points or edges these afford a ready channel for the escape of the charge into the air. Some loss occurs by particles of dust in the air being attracted to the body and then repelled after coming in contact with it. But the chief loss in the case of a smooth conductor on insulating supports usually occurs by leakage over the surface of the supports, owing to a thin film of moisture from which it is difficult to keep them free. This is especially the case with glass supports. Dissipation can be almost completely prevented by surrounding the electrified body with an artificially dried atmosphere. The most usual means of doing this is to place a shallow dish of sulphuric acid in the closed vessel in which the body is contained. The loss by dissipation can thus be reduced to one or two per cent. of the entire charge per diem.

Distribution of Electricity. — When a conductor has a permanent charge there is no electricity in its interior. The charge resides entirely at the surface, and is not distributed equally over the whole surface, but is thickest (so to speak) at those parts which project most. At sharp edges, and still more at sharp points, the density is exceedingly great, and hence the electricity has a strong tendency to leak away.

Electric Currents.—What is known as an electric current is a peculiar condition of a wire or other conductor of electricity. in virtue of which it deflects magnetic needles in its neighborhood, magnetizes a piece of soft iron round which it is coiled. has its own temperature raised, and exhibits various other effects. This

# Electricity

condition of a wire occurs both in connection with frictional and voltaic electricity, and can be produced by attaching its ends to the two terminals of a galvanic battery, or to the two terminals of a magneto-electric machine, and in various other ways. An electric current may be regarded at pleasure as consisting in the flow of positive electricity in one direction through the wire in question, or of negative electricity in the opposite direction, or of both electricities simultaneously one in each direction. What is conventionally called the direction of the current is the direction in which the positive electricity may be regarded as flowing. The "strength" of a current denotes the quantity of electricity that passes through the wire in the unit of time. The deflecting force which a current exerts on a magnetic needle-other things being equal-is propor-tional to the strength of a current; but the quantity of heat which it generates in a given time is proportional to the square of its One effect of currents is the decomstrength. position of certain chemical compounds, and this effect, like that first mentioned, is simply proportional to the strength of the current. Instruments for measuring the strengths of currents by chemical decomposition are called voltmeters, and instruments for measuring them by the deflection of magnetic needles are called galvanometers. The currents by which telegraphs are worked are usually obtained from galvanic batteries; but the far stronger currents required for electric lighting are usually produced by machines called dynamos driven by steam or water power. The currents in such machines are due to magneto-electric induction.

*Electro-dynamics* is that branch of electrical science which treats of the attractions and repulsions exhibited between wires or other conductors through which currents are passing. If two wires are parallel, they will attract each other when currents are passing the same way through them both, and will repel each other when the currents are opposite. If the wires are inclined to each other at any angle, there is not only an attraction or repulsion, but a still more marked tendency to rotation which is not satisfied till the wires have become parallel and the currents flow in the same direction through them both. When there are only two straight wires these forces are feeble and require delicate apparatus for their exhibition; but by employing coils of wire the forces are multiplied, and an instrument constructed on this principle called the electro-dynamometer has been much employed. for the measurement of currents. The whole science of electro-dynamics is due to Ampère who discovered its main facts, and reduced them by ingenious experiments, combined with very abstruse reasoning, to a single mathematical formula which includes them all.

Velocity of Electricity.—Daily experience with the electric telegraph shows that electrical action is propagated with great rapidity. The time that intervenes between the sending of a signal from one station and its visible effect

at another, depends on a variety of circumstances. The time is notably longer for underground or submarine wires than for wires suspended in the air on poles. When one end of a long submarine or subterranean telegraph wire is suddenly put in connection with a galvanic battery or other source of electricity, the current which flows out of the other end into the earth does not begin sharply but gradually, and takes a measurable time to attain its full strength. Hence an instrument which is delicate enough to show a very feeble current, will show the effect earlier than one which requires a strong current to move it. An instrument in which the moving parts are small and light has also an advantage over one in which they are large and heavy. Something, too, depends on the nature of the source of electricity employed. A source which acts with sudden violence, like the discharge of a Leyden jar or an induction coil, will make the effect appear earlier than a comparatively gen-tle source, such as an ordinary galvanic bat-tery. Electricity has not a definite velocity like light or sound. It is rather comparable to waves on water, which travel with very va-rious speeds according to their length and the depth of the water. The highest speed ever observed in the transmission of electric effects was that obtained by Wheatstone in his celebrated experiment with a rotating mirror. In this experiment a Leyden jar was discharged through half a mile of wire with three interruptions in it, at each of which a spark was formed by the electricity leaping across. One interruption was in the middle, and the other two were at the ends, one end being close to the knob of the jar, and the other end close to its outer coating. The wire was so arranged that all three interruptions were near together; and by observing the reflections of the three sparks in a rotating mirror, he was able to discover that the middle spark occurred sensibly later than those at the two ends, these latter being simultaneous. The lagging of the middle spark behind the other two was regarded as the time that electricity took to travel through a quarter of a mile of wire, and the velocity thus found for electricity was 230,000 mi. per second, a velocity greater than that of light, which is between 185,000 and 186,000 mi. per second. Observations made in connection with the use of the electric telegraph for determining longitudes, have shown that the time which intervenes between the sending and receiving of a signal was about four tenths of a second between Aden and Bombay, two tenths of a second between Alexandria and Malta, two tenths between Malta and Berlin, and about one eighth of a second between Greenwich and Valentia.

Electrical Theories.—If we endeavor to explain electrical phenomena by regarding electricity as a substance, we are met by two difficulties: one is that electricity adds nothing to the weight of a body; the other is that electrical phenomena are dual, as if there were two opposite kinds of electricity which destroy each other when they unite. Du Faye mainł

tained the existence of two electrical fluids endowed with opposite qualities, and called them the vitreous and the resinous fluid. Franklin endeavored to account for the same phenomena by assuming the existence of a single electric fluid, and supposing an electrifled body to be a body which possesses either more or less than the normal quantity of this fluid. If more, it was said to be positively, and if less, negatively electrified. Franklin's positive and negative corresponded with Du Faye's vitreous and resinous. Whenever electricity is generated the two opposite kinds are always produced in exactly equal quantity. Modern theories favor the idea that electricity is not a substance or a pair of substances, but a special kind of motion, and that the two opposite electricities are two opposite states of motion of the particles of a medium which is believed to pervade all bodies and all space: the same medium whose vibrations constitute light.

Applications of Electricity. — The employment of electricity commercially and industrially is daily increasing in importance. The electric telegraph has long been familiar, and the telephone is now almost equally so. Electric lighting is rapidly extending, and electric railways or tramways are increasing in number. The operations of electro-metallurgy are also of great importance.

of great importance. The Electric Transmission of Power is the transmission of power to a distance by electricity, effected by employing the source of power to drive a machine called a dyname which generates an electric current. This current is conveyed by a copper conductor insulated from the earth to the distant station. where it passes through a machine called an electro-motor, one part of which (called the armature) is thereby made to revolve, and imparts its motion to the machinery which is to be driven.

This is the simplest arrangement, and is that which is commonly employed when the original currents are not of such high tension as to be dangerous to life in the case of accidental shocks. There is, however, a great waste of power in employing low-tension currents when the distance is great; hence it is becoming a common practise to employ hightension currents for transmission through the long conductor which connects the two stations, and to convert these into low-tension currents before they reach the houses or workshops where they are to be used. This is done sometimes by employing the high-tension currents to drive a local dynamo which generates low-tension currents, sometimes by employing them to charge storage cells arranged in long series, and afterward connecting these cells in shorter series. The discovery that a Gramme machine is reversible-that is to say, when two Gramme machines are coupled together. one operating as a generator the other will act as a motor-was an important step taken in the transmission of power. Numerous efforts. since then, have been made to utilize elec-tricity for the transmission of power over a

long range. For this purpose the alternating current seems eminently adapted. The possibilities offered by electrical transmission of water power for sections of country favored with waterfalls are numerous, and should result in making them great industrial centers. Already arrangements have been made to utilize the immense power now wasting at the Niagara Falls by electrical transmission. From a point above the Falls to a point below, a tunnel through the rock has been completed and has developed 125,000 horse power, which is carried to Buffalo, N. Y., and other points.

The phrase, "distribution of electricity" has been used during the last few years to denote the supplying of strong currents of electricity from central stations where they are germinated, to houses, street lamps, etc., in their vicinity. The central station contains a few powerful dynamo machines, driven usually by steam power. The positive and negative terminals of the dynamo are put in connection with the positive and negative main conductors which are to supply the district, and from these mains smaller conductors branch off to the houses or lamps. All these conductors are of copper, that metal when pure having seven times the conductivity of iron. Different methods are in use for keeping the supply of electricity steady in spite of the varying de-mands made upon it. In some systems of distribution, instead of the two main conductors being one positive and the other negative, each is positive and negative alternately, the reversals taking place some hundreds of times per second. The currents are then said to be alternating. When such reversals do not take place, the currents are said to be *direct*.

To produce electricity direct from heat, without the intervention of steam boilers, engines, and dynamos, has been the dream of electricians for years. In the latter part of 1806, Dr. W. W. Jacques of Boston, Mass., discovered that if oxygen, whether pure or diluted, as in air, be caused to combine with carbon, not direct, as in the case of combustion, but through an intervening electrolyte, the energy of the carbon may be converted directly into electrical energy instead of into heat. Practically the active or oxidizing element of the Jacques cell is supplied with an excess of oxygen by means of an artificial air blast or air pump. The electrolyte, whose first action after the cell is set up, is to release its oxygen and so permit it to attack the carbon, is thus continually renewed by fresh charges of oxygen, which are at once carried to the carbon for a continued attack. The carbon is consumed and electrical energy is developed in a corresponding degree, the rate of consumption and the strength of the electric current being gauged by the rapidity with which the air is supplied to the electrolyte compound.

The generating apparatus of the Jacques cell consists of a pure iron pot, surrounded by a suitable furnace, and containing caustic soda, into which extends a circular piece of carbon. An air pump forces into the caustic soda an excess of oxygen. One pole is the carbon cylinder, the other is the iron pot. The apparatus is set in operation by bringing the furnace and its enclosed generator and electrolyte of caustic soda to a temperature of about 1,000°. From a battery of 100 Jacques cells, each 12 in. deep and 1½ in. in diameter, a current has been obtained averaging about 90 volts and supplying 30 16-candle power incandescent lamps 19 hours.

X-Rays is the popular name of the phenomena caused by the discharge of electricity through highly rarefled air, gases, and vapors. It was given that name by Prof. Roentgen, the eminent German scientist, who first produced "shadowgraphs," or photographs of substances which are opaque to ordinary light, because scientists differed as to the exact nature of the rays. They are called "cathodic" rays because they emanate from the kathode (or cathode), the negative electrode in Crookes's tube. In 1857 Dr. Heinrich Geissler, a celebrated German scientist, passed a current through a tube from which the air was exhausted. The tube from which the air was exhausted. tubes were made of thin glass, and in each end platinum wire passed through to the inside of These were the well-known Geissler the tube. tubes, which for many years have been used to illustrate the phenomena which accompanies the discharge of electricity through highly rarefied gases and vapors. The platinum wires usually were tipped with small spheres or disks of platinum or aluminum. When the terminals of a secondary coil were connected with the electrodes of the tube, and an electric current was sent over the wires, various colored-light effects take place in the tubes. Dr. Crookes, an English scientist, succeeded in exhausting the air in a Geissler tube to a much higher degree than Geissler was able to do. The exhaustion was carried as high as the one twenty-millionth of an atmosphere. In experimenting with a Crookes's tube, Prof. Roentgen discovered that the rays from the cathode electrode possessed the power of passing through opaque substances such as leather, paper, wood, flesh, and other materials that cannot be penetrated by ordinary light. He found that the radiation acted on sensitive photograph plates, so that he was able to produce shadows of substances which, in varying degrees, retarded the passage of the cathodic rays. For instance, he was able to photograph coins concealed in leather pocket books; the bones of the hand, arm, leg, etc., lead pieces hidden away between the leaves of a thick book, nails in a block of wood, etc. He gave his discovery to the world in the early part of 1896, and at once the Roentgen X-rays caused a furore in the scientific world. It was found that the X-rays could be used for locating fractures of bones, bullets, and other foreign substances in the human body, and at last the entire skeleton of small birds and animals was photographed by interposing the living body between a Crookes's tube and the photographic plate. Development of the X-rays extended until it was possible and practical to show the entire human skeleton on a phosphorescent screen.

The Crookes tube generally employed is irregularly globular in form, with the cathode tipped with an aluminum button or circular plate. It is actuated by a storage battery or other, source of electricity through a Ruhmkorff coil or other form of spark coil. The Crookes tube is placed on one side of the hand, body, or other object to be "skiagraphed" and the X-rays, passing through the object, affect the sensitive plate, and a shadow picture is the result. This process is called "skiagraphing. The picture is not a photograph, in the ordinary sense of the word, but is a shadow, in which the deeper or darker parts take the form of the material which offers the greatest re-sistance to the passage of the X-rays. In practise the current is automatically broken many times a second. X-rays are a form of radiation which some scientists believe is similar to the etheric vibrations that produce the phenomena of light, electricity, heat, magnetism, etc.

**Electric Light**, a light obtained through heating a suitable body to incandescence by causing a current of electricity to pass through the body. The substance usually employed for this purpose is carbon, which has two recommendations: first, its power of bearing a very high temperature without melting: and secondly, its high emissive power, which is the source of most of the light in the flame of a candle, an oil lamp, or a jet of gas.

Until quite recent years the only kind of electric light in practical use was what is now called the arc light. The arc light is obtained by causing two sticks of carbon, one of them in connection with the positive and the other with the negative terminal of a battery or dynamo, to touch each other for an instant so as to complete the circuit, and then separating them and keeping them steadily at a small Before the carbons have distance apart. Before the carbons have touched, the cold air between them prevents the current from passing, but as soon as they touch they become intensely heated, and if they are not separated too far the air between them is hot enough to serve as a conductor. The light is emitted partly by the ends of the carbons, especially of the positive carbon, and partly by the gaseous matter (containing also fine particles of solid carbon) which occupies the intervening space and forms the arc or streak of light joining the two carbon points. When the source of electricity is an alternating current machine each carbon is alternately positive and negative several times in a second, and the two points behave alike. When the source is a direct current machine or a galvanic battery the positive carbon wears away about twice as fast as the negative, and the positive carbon becomes hollow at the end, while the negative remains pointed. The hollow in the positive carbon is the brightest part of the whole arrangement; and when a beam of light is to be thrown in some definite direction, care should be taken that this hollow is exposed to view in that direction.

To keep the carbons at the proper distance apart a special contrivance called a "regulator " is employed. There are many varieties of regulator, but they all depend on the principle that increase of distance between the carbons causes increase of resistance. They usually contain an electro-magnet through which either the whole or a portion of the current passes, and the variations in the strength of this magnet arising from change of resistance are taken advantage of to cause the motion, in one direction or the opposite, of a piece of iron which locks and unlocks the mechanism.

As regards the material of the carbon sticks, Sir Humphry Davy used pieces of wood charcoal, and the substance deposited in the interior of gas retorts has sometimes been employed, but it is now usual to employ a mixture of powdered carbon (from gas retorts), lampblack, syrup, and gum. with a very little water. The sticks are obtained by forcing this pasty mixture through a draw plate: they are then baked, and after being again impregnated with syrup, are heated to a high temperature.

Arc lights give the largest amount of light for a given amount of horse power expended in driving the dynamo; but incandescent lights, which have been introduced by Edison, Swan, and other inventors of late years, possess several advantages. Owing to the absence of oxygen, there is no combustion in an incandescent lamp, and hence the carbon does not waste away. The want of means to obtain a sufficiently good vacuum was the chief cause which prevented the earlier introduction of such lamps. Sprengel's mercurial pump. with Crookes's improvements, has supplied this want. All the incandescent lamps agree in having a carbon filament suspended in racuo. but they differ in the mode of preparation of the carbons and in other details.

The light of an incandescent lamp is extremely steady, affording a great contrast to the flickering which is neveraltogether absent from arc lights. Its temperature is lower, and hence its color is not blue or violet, like that of most arc lights, but slightly yellow, though whiter than gas. It is superior both to gas and to the arc light in giving off no products of combustion to vitiate the air of an apartment. The Jablochkoff light occupies an intermediate place, but more nearly resembles the arc lamps. It is lighted by temporarily inserting a piece of carbon to connect the ends of the two sticks; and after a fair start has once been obtained, the top of the plaster of paris is hot enough to act as a conductor. Its incandescence contributes a portion of the light of the lamp, and it gradually burns away so as never to project quite as far as the carbons. Alternating currents are now always used with it, as the two carbons may then be exactly alike and will wear away equally.

The introduction of electric lights for commercial uses may be said to date from the lighting of the Avenue del Opéra at Paris by Jablochkoff lamps, a few years previous to the Paris Electrical Exhibition of 1881. The electric light, as previously known, was considered

too dazzling for street purposes, but the Jab-lochkoff "candles," which, even when naked, are far less dazzling than "arc" lights, were concealed from direct view by opal globes, and instead of single points of dazzling brightness, presented an appearance like a row of full moons. Inventive ingenuity has been largely expended upon the details of electric lighting, as the records of the Patent Office will testify -for cut-outs, arc-lamp regulators, sockets and keys, dynamo regulation, systems of distribution, etc. The generator has attained an unrivaled degree of perfection, almost 95 per cent. of the power obtained being yielded as electric energy. The continuous current-dynamo is now a work of art. The various steps of its construction are operations of peculiar skill. The electric light has been applied to a great. many special uses; for instance, in dentistry and surgery the incandescent lamp is used to explore hidden recesses of the human frame, and on ships the arc lamp is a searchlight. In submarine work electric lighting has proven of great value. Street lighting with arc lamps has had an enormous development, and nearly all towns of any progress in the U. S. have their streets electrically lighted. The extraordinary development in the application of alternating currents is specially notable. This system of lighting has spread with such rapidity that it is now in general use all over the U.S. The meter has received its due share of attention from the unwearying inventor, more than 200 patents from the U.S. Patent Office having been issued for direct and alternating currents.

In 1896, Nicola Tesla, and D. McFarlane Moore, American electricians, exhibited still another form of electric light. This is called "fluorescent" and "glow" lights, and is obtained by the passage of electric discharge through the rarefled gas in a vacuum tube. In such light there is no combustion and only a very little heat. Moore has succeeded in filling tubes six feet long and three inches in diameter with a bluish white light, and Tesla, by employing a current of extremely high frequency and high tension has developed an intense electro-magnetic field, so that he is able, by merely placing an exhausted lamp bulb within this field, to produce a glow without use of conducting wires. This method of electric lighting at this time (1897) is yet in the experimental stage.

**Électric Machine**, any machine for producing powerful electrical effects. The name is, however, seldom applied to machines depending on magneto-electric principles, and is practically confined to two classes of machines those which act by friction, and those which act by electrostatic induction. The former are called Friction Machines and the latter Influence Machines. For many years the former were the only kind known, but they have now been almost superseded by the latter. In friction machines the electricity is generated by the friction of either a glass cylinder or a circular glass plate against cushions covered with an amalgum of zinc and tin. The positive electricity which is thus developed on the surface of the glass is given off to an insulated brass conductor furnished with teeth like those of a comb, the sharp points of which are nearly in contact with the glass. The negative electricity which is at the same time generated on the cushion must be provided with some means of escaping, or the action of the machine would soon stop. It is usually allowed to escape to the earth by a brass chain connected with the cushions; but in some machines a negative conductor connected with the cushions is insulated like the positive conductor by a glass support. Negative sparks can then be drawn from this conductor at the same time that positive sparks are drawn from the other.

Electric "power" is a phrase of such common usage that it has reached the dignity of an accepted term. As a matter of fact, electricity, in itself, is never a source of power. It is an agency, a form of energy, by which mechanical power may be transferred from an ordinary prime morer, as a steam engine, water wheel, or wind mill, to a secondary motor. The motor is that which does the work. In its important application to machinery, electricity performs an office similar to that performed by a line of shafting, a belt, cable, rope, or a pipe filled with compressed air; it transmits power. Although some small motors are energized or driven with batteries as the source of power or energy; and some have the initial power producer in the form of windmills and water wheels, the bulk of the work done by the electric motor has the stationary steam engine as the prime motor mover.

The steam engine drives the dynamo; the dynamo, the generator of the electric current, is connected by wires, called conductors, with the motor. When the motor is used to propel machinery, it takes the place of the steam engine, and by means of shafting. belts, or other mechanical appliances for transmitting power, gives motion to machinery. Another, and a rapidly extending method of employing electric motors for propelling machinery, is to give each machine or group of machines in a machine shop, railroad shop, printing establishment, etc., such motors, being connected with the dynamo in the engine room. By this method, the use of power, wasting, shafting, and belting either is entirely discontinued, or such appliances are used simply when one motor operates a group of machines.

It is estimated that shafting and belting absorb over 30 per cent. of the gross power of engines before the delivery of any power whatever for actual work. Thus the electric motor, installed for operating individual machines, or groups of machines, directly saves money by removing the wasteful loss of power due to the friction and weight of belting and shafting. The development of the electrical industry may be shown by the single fact that in 1886 there were less than 5,000 electric motors used in the U.S. At least 4,000 were driving small fans and sewing machines. At that time a 10-horse power motor was considered very large, and it was estimated that less than 50 such motors were in use. In 1897 over 500,000 electric motors are used. Motors of over 100 horse power are common, and there are some of over 1,000 horse power in actual use. In some establishments over 500 motors are in use, aggregating, in some cases, more than 6,000 horse power. Concerns that use 100 or more motors, requiring for their operation from 1,000 horse power and upward, are common. In many cities and towns, a central power station, generally also used for electric lighting, furnishes "power" for motors to their subscribers.

Wherever there is water power in a community of any considerable size, the water wheels drive the dynamos, which generate electricity for motors. In some of the northwestern states power obtained from the flow of water from artesian wells, is transformed into electric energy, which furnishes electric light and electric "power." The most notable instance of electricity generated with water power used as a prime mover, is to be found in the immense hydraulic work of Niagara Falls.

Electric Railways .- In its application to railroads and street railways, electricity has made marvelous strides. Electricity is capable of being supplied to a moving motor through fric-tional or rolling contact. No other agency capable of transmitting power possesses this all-important quality. So it is, that by means of wires or other forms of conductors, extended along the road-bed of the railway, in such wise that the "trolley wheel" contact shoe, or other form of contact, can readily touch the conductor, the electric current is supplied to the motor no matter how swiftly the motor travels. As early as 1864 Jean Henry Cazal, a French engineer, proposed to utilize natural powers; such as water, air, and wind for operating railways, by the electrical transmission of power. In 1879 Dr. Werner Siemens exhibited an electric railway at the Industrial Exhibition in Berlin. This railway was circular, about 1,000 ft. long, and the motor was five horse power. Thomas A. Edison was the first to construct an actual dynamo-electrical railway in America. This was done in the spring of 1880, at Menlo Park, N. J., the track being 90 rods in length. Stephen D. Field, of California, exhibited an electric locomotive at the Exposition of Railway Appliances in Chicago, June, 1883. Both Edison and Field utilized the rails of the track to convey the current to the motor. Dr. Joseph R. Finney of Pittsburg, is credited with the invention of the "overhead trolley" system of electric traction. In 1882 his first experimental car was exhibited and successfully operated in Allegheny, Pa. A suburban line, 2 mi. in length extending from Baltimore to Hampden, Md., was the first electric street railway operated in America for actual commercial service. It was put in operation Sept. 1, 1885. In 1888, all the street railways of Richmond, Va., were equipped with elec-tric motors. In 1896, according to Poor's Manual of Railroads, there were 13,556 mi. of

# Electric Railways

electric street railway in operation in the U.S., divided among the states as follows:

State.	Miles.	State.	Miles.
Alabama	95.33	Missouri	635.39

Electric railways may be divided into four classes: 1, The "overhead system," commonly called the "trolley" system, in which the current for the motor is taken from a wire suspended over and parallel with the tracks. 2, The "third rail system," in which a rail, running parallel, either to one side or between the rails of the track, is the conductor. 3. The "conduit or underground system" in which the conductors are placed in a trench or conduit below ground. 4. The "storage battery system," in which the current is furnished by storage batteries, charged at the power station, and carried on the motor cars. The overhead or trolley system, is the one used almost entirely for electric street cars in the U.S.

The standard overhead system can be described as follows: In addition to the road-bed, rails, and cars common to all street railways, there is a "power plant," at some convenient point on the line, where the steam boilers, engine, and dynamo for generating the electric current, are stationed. The current generated by the dynamo is conducted by a wire to the "main conductor" or "feed wires," which are carried on posts along the street railway line. Over the center of the track, and running par-allel with it, is the "working conductor," or "trolley wire" as it is commonly called. The working conductor is divided into sections, each one or more miles in length, and each station is supplied with currents from the main conductor; thus, a break in any one part of the circuit will not cause any interruption of the circuit. The current on the working conductor or trolley line, is led down to the motor through the trolley, a wheel at the end of a pole which projects upward from the roof of the electric car. The trolley wheel is in continual contact with the trolley wire, and the current passes down the trolley pole by means of a wire to the motor, which is connected by gearing with the axles of the car.

# Electro-Dynamometer

After passing through the motor, the current passes into the wheels of the car, and thence into the track. The rails of the track are connected together with copper wire, furnishing a continuous conductor to lead the current back to the dynamo, thus completing the circuit. In addition to the track connection, the earth is employed as a conductor. At intervals large plates of metal are buried in the wet ground, and wires lead from the rails to the buried plate. Before the current reaches the motor, it passes through the controller which is to the electric car what the throttle valve and reversing lever are to the steam locomotive. The motorman, by moving the handle of the controller starts the car and regulates the speed and shuts off the current. He can also reverse the motor, thus alding the brakes in making an emergency stop. The "third rail" system, in a general way, has much of the construction of the overhead system, but its working conductor is a third rail, placed on insulated supports, which in turn rest on the cross ties. sliding shoe moves with the car over the third rail, and thus "picks up" the current, which then goes through the controller, motor, etc. The modern third rail system had its real beginning on the Intramural railroad of the World's Columbian Exposition in Chicago, 1893. It is intended to be used where electric motors are substituted for steam locomotives. and on railroads whose road-bed is so well protected by fencing or by reason of being elevated that danger due to the electric current is re-duced to the minimum. The most notable instance of the use of the third rail system is the Metropolitan elevated railway in Chicago. It is the first railroad built with the design of using the third rail system.

The underground or conduit system of electric traction employs a trench, channel, or conduit which extends under the tracks. In this conduit the working conductors are laid, and contact is secured either by trolley wheels or a sliding shoe attached to an arm which extends down under the motor car.

The storage battery system employs storage batteries which are carried in the motor car, and which are charged at the power plant of the railway. As yet there is more or less doubt as to the practicability of the storage battery system, but its advocates claim that the plan is feasible and eminently practical. Several lines are operated with storage batteries in the U.S.

Electro-dynamometer, an instrument used for the measurement of electric currents by means of the mechanical forces which they exert upon each other. It contains two coils of wire, one fixed and the other movable; the latter being either larger or smaller than the other so as to be able to pass either outside it or through it. Both coils are in vertical planes and have the same vertical diameter, round which the movable one can revolve so as to set its own plane at an angle with the plane of the other. The terminals of the movable coil dip in cups of mercury, one of which is in connection with one end of the fixed coil, and the

.

## Electrolysis

other with one of the binding screws of the instrument. The other binding screw is in connection with the other end of the fixed coil. Hence when the two binding screws are connected with a battery or some other source of electricity, the current has to pass through both coils. Its effect is exhibited by a tendency in the movable coil to set its plane in coincidence with that of the fixed coil, and in such a manner that the current will circulate the same way round both coils. This tendency is resisted by mechanical means provided for the purpose—usually by the torsion of a wire from the end of which the movable coil hangs; and the measurement is usually made by applying torsion until the planes of the two colls are at right angles. The amount of torsion thus applied is proportional to the mutual force exerted by the two coils, and this is proportional to the square of the current, since when we double the current through one we also double the current through the other.

Electrol'ysis, is the chemical decomposition of certain compound bodies under the action of a current of electricity. The following are the main facts to be mentioned. When an electrolyte (as a body capable of electrolytic decomposition is called) is subjected to a current of electricity of sufficient intensity, it is broken up into two elements, which appear, one of them at one electrode and the other at the other electrode; thus, if two platinum plates connected with the first and last plates of a battery be plunged in a trough containing a solution of chloride of silver, the chlorine is given off at the plate by which positive electricity enters, that is, at the plate which is connected with the copper plate of the battery, and the silver is deposited at the plate connected with the zinc plate of the battery. The two elements are liberated at these places in quantities chemically equivalent. Thus for quantities chemically equivalent. Thus for every 103 grams of silver deposited at one side of the vessel 35.5 grams of chlorine are given off at the other side. When a compound consisting of a metallic and a nonmetallic part is decomposed, the nonmetallic part is set free at the electrode at which the current enters and the metallic part at the opposite electrode. Hydrogen acts as a metal. Electrolysis takes place only when the electrolyte is in a liquid state, and involves a transfer of the materials of which the compound is composed from one part of the vessel to another.

The electrolytic action of the current is the same at all parts of the circuit. If the current is made to traverse several vessels, each containing the same substance, all in series (that is, the current that leaves the first entering the second, and so on), it will be found that in each of the cells precisely the same amount of decomposition goes on. There will be the same weight of silver deposited at one side, and the same weight of chlorine set free at the other.

The same quantity of electricity decomposes chemically equivalent quantities of different electrolytes. If we pass the current through a series of cells containing different electrolytes, for example, water, chloride of silver, sulphate of soda, and collect the products of decomposition, we find that the quantities of hydrogen, silver, and sodium set free are strictly proportional to the chemical equivalents of these bodies. Further, in the battery which gives rise to the electric current, if precautions are taken to avoid disturbance by local action on the plates, it is found that the action which goes on in each of its cells is chemically equivalent to that in each of the decomposing cells.

The quantity of the electrolyte decomposed in a given time is proportional to the strength of the current. Currents are often measured in practise by observing the weight of copper deposited in a given time from a solution of sulphate of copper.

Electro-magnet, a piece of iron temporarily converted into a magnet by means of a current of electricity sent through a wire which is coiled round it. The wire is usually covered with silk, cotton, gutta percha. or some other insulator, to prevent the current from leaping across, and to compel it to travel through the whole length of the wire. The more pure and soft the iron is, the stronger will its magnetism be while it lasts, and the more completely will it disappear when the current stops. Steel is less affected than soft iron for the time, but remains permanently magnetized after the current ceases. Electro-magnets are usually much more powerful than other magnets of the same size. The iron which is magnetized by the current passing round it is called the core. It is frequently straight, the wire being wound upon it like thread upon a reel; but very frequently it has the shape of a U, or horseshoe, the wire being coiled round the two ends and the bend of the U left uncovered.

To predict which end will be the north pole, the following rule may be employed: Let the core be a straight bar of iron held in front of you pointing left and right, then if the current ascends on the side next you, and descends on the further side, the north pole is to your left hand the south pole to your right. If the straight bar is then bent into horseshoe shape, its poles will not be changed. There is no necessity to inquire whether the wire forms a right-handed or a left-handed helix, this circumstance having no influence on the question of poles. Indeed, in most cases (just as in the case of thread on a reel) the helices are some right-handed and some left-handed.

An electro-magnet is said to be made when the current is sent through its coil, and unmade when the current is stopped. In some applications of electro-magnets it is necessary to make and unmake them in rapid succession. It is then preferable for the core to consist of a bundle of iron wires rather than of a solid bar.

**Electro-magnetism**, a term that in its broadest sense denotes the science which treats of the relation between magnetism and electricity. In a narrower sense a magnetic effect produced by electricitv is said to be *electro-magnetic*, while an electrical effect produced by the agency of magnets is called *magneto-electric*. In the preceding article we have described

#### Electro-metallurgy

one electro-magnetic effect-the making of an electro-magnet by means of a current. Another important electro-magnetic effect is the deflection of the magnetic needle by a current of electricity passing near it. The simplest experiment to illustrate this action is to take an ordinary mariner's compass, hold just above it a copper wire parallel to the needle of the compass, and then, while the wire is in this position, let its two ends be connected with the two poles of a galvanic battery. The needle will instantly turn away from its north-and-south position, and will remain deflected as long as the current continues to pass over it. If the current flows from south to north, the north end of the needle is turned to the west; and if the current is in the opposite direction, the needle turns the other way. This is the easiest test for determining the direction in which a current is flowing through a wire; and it is the basis of the construction of galranometers, which are the instruments chiefly em-The ployed for the measurement of currents. current tends to make the needle take a position at right angles to the direction of the current; but as the earth tends to make the needle point north and south, the position actually taken is between the two. The fact that a current deflects a needle was discovered by Ersted of Copenhagen, and the general rule for the direction of the deflection was thrown into the following form by Ampère: Imagine the current to enter at your feet and come out at your head, then the north pole of a needle in front of you will be deflected to your left. This rule holds good whether the current is above the needle, below it, or in any other position. The rule may also be put in the following form: Imagine an ordinary screw placed so that the current is in its axis; the north pole of the needle will turn to the same side to which that part of the circumference which is next it turns when the screw advances in the direction of the current.

The leading fact of magneto-electricity is that when a magnet is moved in the neighborhood of a wire or other conductor, the motion causes a current of electricity in the conductor; and a similar effect occurs if the wire is moved while the magnet remains at rest. In the experiment above described, of making a magnetic needle turn on its pivot by sending a current through a wire held above it, the motion of the needle produces for the time being a weakening of the current. If the needle were made by mechanical means to turn the contrary way, it would strengthen the current for the time being. If there were no original current, the turning of the needle to either side by mechanical means would produce a current in the wire. The current thus produced is always opposite in direction to that which would aid the motion.

**Electro-metal'lurgy**, the art of depositing metals from solutions of their salts upon metallic or other conducting surfaces by the agency of an electric current. Its operations may be classified under three heads: the making of facsimiles, the formation of permanent coatings, and the obtaining of a pure metal

from an impure. In every instance the current enters the solution by a plate of the metal in question, which is immersed in it, and leaves the solution by the conducting surface on which the deposit is formed. The plate at which the current enters (called the anode) is gradually dissolved, and an equal quantity of the metal is at the same time deposited on the surface by which the current leaves the solution (called the *cathode*). The source employed for giving the current was formerly a galvanic battery, but is now more frequently a dynamo machine, in which the armature is constructed of much stouter wire than is used in dynamos intended for other purposes. Copper lends itself with special readiness to electrical deposition, and the solution employed for the purpose is usually a saturated solution of sulphate of copper; but if the surface to be coated is of iron, steel, or zinc, it is necessary to employ an alkaline solution, in which cyanide of potassium and carbonate of soda are usually the chief ingredients, a salt of copper being present in comparatively small quantity. For electro-gilding, a solution containing cyanide of potassium and cyanide of gold is employed; and for electro-plating, a solution of cyanide of potassium and cyanide of silver. It so happens that the impurities which usually occur in copper roughly smelted from the ore consist of substances which either cannot be dissolved in a solution of sulphate of copper, or cannot be deposited on a copper surface from such a solution. Hence when a plate of crude copper is used as the anode, pure copper is deposited on the cathode, and most of the impurities fall to the bottom of the vessel. Pure copper is now produced in enormous quantities by the method here described, the purity being a most essential requisite in copper wire for electrical purposes. The most important instance of the deposition of a permanent coating is electrotyping, See Electrotype.

Electrom'eter, an instrument used for accurate electro-statical measurements. Stated in precise technical language, its purpose is to measure the difference of potential between two conductors. Most of the electrometers in actual use are inventions of Sir William Thomson, who was the first to give accuracy to this branch of electrical measurement. His quadrant-electrometer is the instrument chiefly used, and its indications are usually given by means of a small movable mirror which reflects a spot of light from a lamp on to a paper scale. When the two conductors which are tested have the same *potential* the spot of light stands in the middle of the scale, and its movement to either side indicates the difference of their potentials. The instrument is sufficiently delicate to give a sensible displacement when the two conductors are the two plates of a single galvanic cell; and a displacement twice as great will be obtained by combining two such cells.

**Electro-motive Force**, a phrase (commonly abbreviated into the three initial letters e.m. f.) which is of very frequent use in modern

electrical literature, especially in connection with electric currents. The e.m.f. in a wire through which a current is flowing may be compared to the difference of pressures in a long, narrow, horizontal pipe, through which water is flowing. As the difference of the pressure at the two ends of the pipe forces the water through in spite of frictional resistance, so the difference of the *potentials* at the two ends of the wire forces the current through in spite of the electrical resistance of the wire. This difference of potentials is another name for electro-motive force. Each cell of a battery is a source of e.m.f., and when the cells are connected in the usual way (technically called in series) their e.m.f.'s are added together, so that, for example, the e.m.f. of a battery of ten cells is ten times the e.m.f. of one cell. E.m.f. can also be produced in a wire by moving a magnet in its neighborhood and this e.m.f. will be exactly proportional (other things being equal) to the velocity of the motion. The commercial unit of e.m.f. is the coll. Its magnitude may be inferred from the statement that the e.m.f. of a single cell is usually more than one volt, and less than 24 volts. The highest e.m.f. permitted by the Board of Trade in wires which are liable to be touched by the public is about 200 volts. It is no unusual thing for a dynamo to give an e.m.f. of 1,000 or 2,000 volts. Currents produced by a source of high e.m.f. are often called *cur*rents of high tension. They are found to be necessary when several arc lamps are to be supplied in series, and they are also necessary (on the score of economy) when power is desired to be transmitted by electricity to great distances.

**Electro scope**, any apparatus for showing the presence of electricity without giving quantitative measurements. One form consists of two stiff straws loosely tied together at the top, so that they are free to open out at the bottom whenever they repel each other. If they are placed in conducting communication with an electrified body they will open out. A more sensitive instrument is the goldleaf electroscope. Here the two gold leaves diverge under the influence of an electrified body held over the instrument. The gold leaves are attached to the lower end of a short rod of brass, whose upper end carries the brass knob which forms the top of the instrument. These metal parts are supported by the glass shade which insulates them from the earth, and the upper part of which is coated with varnish, but this is not essential. The two gold leaves originally hang down parallel, and nearly touching each other. When an electrifled body is slowly brought down over the knob from a good height above it, the unlike electricity is attracted to the knob, and the like electricity is repelled into the gold leaves, which, in consequence of being thus electri-fled, repel each other. The two little brass columns standing up from the base are in connection with the earth, and their presence increases the divergence of the leaves. As soon as the electrified body above is removed, the leaves

come together again. If, however, while the leaves are standing apart under the influence of the body overhead, the knob is touched with the finger, the leaves will instantly come together. It will then be found that either lowering or raising the influencing body causes them to open out again; and if the influencing body is removed they will open out to the same width at which they stood just before the knob was touched. The leaves and knob have now a charge opposite to that of the influencing body, and the electroscope can now be used to show whether the charge of a second influencing body is positive or negative. If the second body has the same kind of electricity as the first, it will diminish the repulsion; if it has the opposite kind, it will increase the repulsion.

Electrotyping consists in making a solid plate of metal by use of a mold and galvanic action, and is performed as follows: A form of type or wood cut is cleansed and dusted with finely powdered plumbago. A type form is laid face upward on a powerful press, a sheet of beeswax upon a lead plate is placed on top of the form and an impression taken in the press. The wax mold so formed is coated with powdered lead (plumbago) to give it a surface for the galvanic current. After the loose particles of lead are blown off, it is washed with a weak solution of sulphate of copper, then dusted with iron filings. It is then suspended in a bath consisting of two parts of sulphate of copper and one part of sulphuric acid placed in the water in the tub. The wax plate is then connected with the negative pole of a battery, and a sheet of copper is hung in front of the wax and connected with the positive pole. The current is then turned on, and the copper is drawn from the plate and deposited upon the wax mold. After several hours it is removed from the bath and the shell of copper is taken from the wax. It is then "backed up" with lead or type metal, planed smooth when cold, the edges finished, and it is ready for the press. The plate when complete is about onesixth of an inch thick. When placed on the spress these plates are mounted upon a block with rachets on the side and foot which make them type high. Electrotype copies of steel engravings are made in practically the same manner as described above. Great care has to be taken, however, in preparing a steel plate so that the copper will not adhere to it.

El'ements, the simplest constituent principles or parts of anything; in a special sense, the ultimate indecomposible constituents of any kind of matter. In ancient philosophies the term was applied to fire, air, earth, and The mediæval chemists, however, abwater. sorbed in the study of metals and mineral substances, supposed that the metals consisted of an elemental sulphur and an elemental mercury mixed together more or less perfectly and in different proportions. To these were subsequently added salt and some others, so that about the middle of the seventeenth century the first principles amounted to five, divided into two classes: the active, consisting of mercury or spirit, sulphur or oil, and salt;

## Elephant

and the passive, consisting of water or phlegm, and earth or the terrestrial part. The names remained, not so much as denoting substances or ultimate principles as gradually coming to denote functions; the first great modification being the expansion of the idea of elemental sulphur into phlogiston by Stahl, as the result of which the adherents of the phlogistic theory applied the term to phlogiston, to the gases then discovered, the mineral, vegetable, and animal acids, the alkalies, earths, and metallic calces, oil, alcohol, and water. The substances considered as simple naturally changed with the change of theory introduced by Lavoisier. who considered as elements, oxygen, nitrogen, hydrogen, sulphur, phosphorus, and carbon, the metals and the earths, and, as Boyle had already suggested, practically defined an element as a body not yet decomposed, the definition now commonly adopted.

El'ephant, the popular name of a genus or subfamily of fivetoed proboscidian mammals, usually regarded as comprehending two species, the Asiatic and the African.

Tips of Trunks of (a) African and (b) Indian Elephants.

From a difference in the teeth, however, the African species is sometimes treated as a distinct genus, and some authors divide the Asiatic elephants into several species, such as the Indian elephant, the Ceylon elephant, and the Sumatra elephant. The so-called white elephants are merely albinos. The African elephant is distinguished from the Asiatic species by its greater height, its larger ears, its less elevated head and bulging or convex forehead, the closer approximation of the roots of the tusks, and the greater density of the bone. It has also only three external hoofs on the hind feet, while the Asiatic has four. All elephants are remarkable for their large, heavy, short bodies sup-ported on columnar limbs, a very short neck. a skull with lofty crown and short face bones. with the exception of the premaxillaries, which are enlarged to form tusk-sockets. To compensate for the short neck, they have the long proboscis, often 4 or 5 ft. in length, produced by the union and development of the nose and upper lip. It is made up of muscular and membranous tissue, the only cartilages being the valves at the entrance of the nares. The trunk is of great strength and sensibility, and serves alike for respiration, smell, taste, suction, touch, and prehension. The tusks, which are enormously developed upper incisor teeth, are not visible in young animals, but in a state of maturity they project, in some instances ? or 8 ft. The largest on record (possibly that of an extinct species) weighed 350 lbs. Elephants sometimes attain the height of 15 ft.. but their general height is about 9 or 10. Their weight ranges from 4,000 to 9,000 lbs. The female is gravid twenty months, and sel-

# Elephant

dom produces more than one at a birth; this, when first born, is about 3 ft. high, and continues to grow till it is 16 or 18 years of age. It is said they live to the age of 100 years and upward. They feed on vegetables, the young shoots of trees, grain, and fruit. They are polygamous, associating in herds of considerable size under the guidance of a single leader. An elephant leaving or driven from a herd is not allowed to join another, but leads a solitary, morose, and destructive life. These are popularly known as "rogues." Elephants are caught either singly or in herds. In the for-mer case it is necessary to catch adroitly one of the elephant's legs in the noose of a strong rope, which is then quickly attached to a tree; another leg is then caught until all are securely His captors then encamp beside fastened. him, until under their treatment he becomes tractable. When a number are to be caught a strong enclosure is constructed, and into this the elephants are gradually driven by fires,

Heads of (A) African and (B) Indian Elephants.

noise, etc. With the aid of tame elephants the wild ones are tied to trees and subjected to the taming process. The domesticated elephant requires much care, and a plentiful supply of food, being liable to many ailments. The daily consumption of a working elephant is, according to Sir J. E. Tennent, 2 cwts. of green food, about half a bushel of grain, and about 40 gallons of water. Their enormous strength, docility, and sagacity make them of great value in the East for road making, build-ing, and transport. They are used by the great on occasions of pomp and show, being often richly caparisoned, and bearing on their back a howdah containing one or more riders, be-sides the mahout or driver sitting on the animal's neck. Tiger shooting is often practised from an elephant's back. The fossil remains of the genus Elephas indicate the former existence of at least 14 species; and a still larger number of species belong to the allied genus Mastodon. The smallest full-grown elephant on record is a dwarf elephant, named Lili, from Sumatra. It is 36 in. high and weighs 172 pounds.

### **Eleusinian Mysteries**

**Elephan'ta**, a small island in the Bay of Bombay. It is celebrated for its rock temples or caves, the chief of which is a cave temple supposed by Fergusson to belong to the tenth century, 130 ft. long, 123 broad, and 18 high, supported by pillars cut out in the rock, and containing a colossal figure of the trimurti, or Hindu trinity, Brahma, Vishnu, and Siva. This temple is still used at certain Hindu festivals.

**Elephant Fish**, a fish of the order Elasmobranchii (rays and sharks), so named from a proboscis-like structure on the nose; called also southern chimæra. It inhabits the Antarctic seas, and is palatable eating.

**Eiephanti ne, a** small island of Egypt, in the Nile, opposite Assouan (Syene). It is covered with ruins piled upon each other,— Egyptian, Roman. Saracen, and Arabic,—the most important being a gateway of the time of Alexander, a small temple dedicated to Khnum and founded by Amenophis III, and the ancient Nilometer mentioned by Strabo. **Elephant Seal** (the Proboscis Seal, or Sea

**Elephant Seal** (the Proboscis Seal, or Sea elephant), the largest of the seal family. There are probably two species, one found only on the coast of California and Western Mexico, the other in Patagonia, Kerguelen Island, Heard's Island, and other parts of the Southern seas. They vary in length from 12 to 30 ft., and in girth at the chest from 8 to 18 ft.

Elephant Seal.

The proboscis of the male is about 15 inches long when the creature is at rest, but clongates under excitement. The females have no proboscis, and are considerably smaller than the male. Both species are becoming rare from their continual slaughter.

their continual slaughter. **Elephant's Foot**, the popular name of a plant of the natural order Dioscoreaceæ, distinguished by the shape of its root stock, which forms a nearly hemispherical mass rising a little above the ground, covered with a thick corky bark. It has a slender climbing stem growing to a length of 30 or 40 ft., with small heart-shaped leaves and greenish-yellow flowers.

**Eleusinian Mysteries,** the sacred rites anciently observed in Greece at the annual festival of Dēmētēr, or Ceres, so named from their original seat Eleusis. As a preparation for the greater mysteries celebrated at Athens and Eleusis, lesser Eleusinia were celebrated at Agræ on the Ilissus.

**Eleu' thera,** one of the largest of the Bahama Islands. It is of very irregular shape, its length being about 70 mi., and its breadth in general from 2 to 4 mi., though in one part 10. Pop. over 5,000.

El'evator, 1, a mechanical contrivance consisting of a series of boxes or buckets attached to a belt traveling round two drums, one above and one below, for hoisting grain, meal, etc., into a mill or storehouse from a ship's hold, etc. In the U. S. large buildings containing such contrivances, and in which grain is stored, receive the same name. 2, An apparatus for raising or lowering persons or goods to or from different levels in warehouses, hotels, etc., consisting usually of a cage or movable platform.

Elgin, Kane co., Ill., on Fox River, 38 mi. n.w. of Chicago. Railroads: C. & N. W.; C M. & St. P.; Elgin, Joliet & Eastern. Industries: watch works, flouring mill, iron foundry, shoe, silver plate, condensing, watch case, and a number of other factories. Surrounding country dairy. Illinois Hospital for Insane located here. The town was first settled in 1835 and became a city in 1854. Pop. est. 1807, 22,000.

Eigin Marbles, the splendid collection of antique sculptures brought chiefly from the Parthenon of Athens to England by the seventh earl of Eigin (1766-1841) in 1814, and afterward purchased by Parliament for the British Museum at a cost of \$175,000 (less than half what had been expended on them). They consist of figures in low and high relief and in the round, representing gods, goddesses, and heroes; the combats of the Centaurs and Lapithæ; the Panathenaic procession, etc. They exhibit Greek sculpture at its highest stage, and were partly the work of Phidias.

Ell, one of the Hebrew judges, the predecessor of Samuel. He was high-priest and judge for forty years. His two sons having been slain and the ark taken in battle by the Philistines. the news proved so severe a shock that he fell and broke his neck, at the age of ninety-eight.

**Eli'jah**, the most distinguished of the prophets of Israel, flourished in the ninth century B. C., during the reigns of Ahab and Ahaziah, and until the beginning of the reign of Jehoram, his special function being to denounce vengeance on the kings of Israel for their apostasy. Elijah at length ascended to heaven in a chariot of fire, Elisha, his successor, being witness.

Eliot, CHARLES WILLIAM, educator, b. in Boston, Mass., in 1834. In 1853 he graduated at Harvard College, and in the following year was appointed tutor in mathematics at his Alma Mater. He was made assistant professor in mathematics and chemistry in 1858. He taught chemistry in Lawrence Scientific School in 1861. In 1863 he went to Europe, where he studied chemistry. On his return in 1865 he became professor of chemistry in the Massachusetts Institute of Technology. He

was elected president of Harvard University in 1869, which position he still holds. He has done considerable to advance the cause of higher education. He is a fellow of the American Academy of Sciences and has been mad-LL.D. by Williams, Princeton, and Yale. He wrote a standard Manual of Qualitative Chemical Analysis, published in 1869.

El'iot, GEORGE (1820-1880), the assumed literary name of Mary Ann, or, as she preferred to write the name in later years, Marian Evans. English novelist. She was the daughter of a Warwickshire land agent and surveyor, and was b. at Griff, near Nuneaton. She received at Coventry an excellent education. Her first literary undertaking was the completion of Mrs. Hennell's translation of Strauss's Life of Jesus (1846). After spending two years abroad she boarded at the house of John Chapman. editor of the Westminster Review, of which she became sub-editor. It was not, however, until January, 1857, that she came prominently into public notice, when the first of a series of tales entitled Scenes from Clerical Life appeared in Blackwood's Magazine. The series came to an end in November, 1857, and in the following year the publication of Adam Bede placed her in the first rank of writers of fiction. It was succeeded by the Mill on the Floss, Silas Marner. Romola, Felix Holl, Middlemarch, and Daniel De-ronda. In addition to those prose works she published three volumes of poems, The Spanish Gypsy, Agatha, and the Legend of Jubal. Her last work published during her life was the series of essays entitled The Impressions of Theophrastus Such. In May, 1880, she married Mr. John Cross, but did not survive the marriage many months, dying rather suddenly at Chelsea

El'iot, JOHN (1604-1690), "the apostle to the Indians," was b. in England, and graduated at Cambridge University. In 1631 he removed to Boston. In 1632 he connected himself with a church at Roxbury, Mass., which connection was not severed until a short time before his death. He learned the language of the Indians. and devoted himself to improving their condition. He translated the Bible into the Indian tongue, and published an Indian grammar. He died at Roxbury, Mass.

Ell'sha, a Hebrew prophet, the disciple and successor of Elijah. Many miracles of prediction and cure, and even of raising the dead. are ascribed to him, but his figure is less original and heroic than that of his master. He held the office of prophet for fully sixty-five years, from the reign of Ahab to that of Joash.

Elix'ir, a word of Arabic origin, applied by the alchemists to a number of solutions employed in attempting the transmutation of metals into gold, and also to a potion, the *elixir vita*, or elixir of life, supposed to confer immortality. It is still used for various popular remedies, for the most part composed of various aromatic and stimulative substances held in solution by alcohol.

Elizabeth (1533-1603), queen of England, daughter of Henry VIII and of Anne Boleyn, was b. at Greenwich, and almost immediately

declared heiress to the crown. After her mother had been beheaded (1536) both she and her sister Mary were declared bastards, and she was finally placed after Prince Edward and the Lady Mary in the order of succession. On the accession of Edward VI Elizabeth was committed to the care of the queen-dowager Catherine; and after the death of Catherine and beheadal of her consort, Thomas Seymour, she was closely watched at Hatfield, where she received a classical education under William Grindal and Roger Ascham. At the death of Edward, Elizabeth vigorously supported the title of Mary against the pretensions of Lady Jane Grey, but continued throughout the whole reign an object of suspicion and sur-In self-defense she made every veillance. demonstration of zealous adherence to the Roman Catholic faith, but her inclinations were well known. On Nov. 17. 1558, Mary's reign came to a close, and Elizabeth was immediately recognized queen by Parliament. The first great object of her reign was the settlement of religion, to effect which a Parliament was called on January 25, and dissolved on May 8, its object having been accomplished. The nation was prepared for a return to the Reformed faith, and the Parliament was at the bidding of the court. The ecclesiastical system devised in her father's reign was re-established, the royal supremacy asserted, and the revised prayer book enforced by the Act of Uniformity. Elizabeth's first Parliament approached her on a subject which, next to religion, was the chief trouble of her reign, the succession to the crown. They requested her to marry, but she declared her intention to live and die a virgin. With the unfortunate Mary, Queen of Scots, were connected many of the political events of Elizabeth's reign. On her accession the country was at war with France. Peace was easily concluded (1559); but the assumption by Francis and Mary of the royal arms and titles of England led to an immediate interference on the part of Elizabeth in the affairs of Scotland. She entered into a league with the Lords of the Congregation, or leaders of the Reformed party; and throughout her reign this party was frequently serviceable in furthering her policy. She also gave early support to the Huguenot party in France, and to the Protestants in the Netherlands, so that throughout Europe she was looked on as the head of the Protestant party. The detention of Mary in England (1568-87), whither she fled to the protection of Elizabeth, led to a series of conspiracies, beginning with that under the earls of Northumberland and Westmoreland, and ending with the plot of Babington, which finally determined Eliza-beth to make away with her captive. The state of France consequent on the accession of Henry IV, who was assisted by Elizabeth, obviated any danger from the indignation which the deed had caused in that country; and the awe in which King James stood of Elizabeth, and his dread of interfering with his own right of succession to England, made him powerless. But Philip was not to be so appeased, the execution of Mary lending edge to other grievances. The fleets of Elizabeth had galled him in the West Indies, her arms and subsidies had helped to deprive him of the Netherlands; the Armada was already in preparation. Accordingly he called the Queen of England a murderess, and refused to be satisfied even with the sacrifice she seemed to be prepared to make of her Dutch allies. The Armada sailed on May 29, 1588. Its fate is too well known to need recapitulation. The war with Spain dragged on till the close of Elizabeth's long reign. During her reign the splendor of her government at home and abroad wassustained by such men as Burleigh, Bacon, Walsingham, and Throgmorten.

Eliz' abethan Architecture, a style of architecture which prevailed in England during the reigns of Elizabeth and James I. It succeeded to the Tudor style, properly so called, with which it is sometimes confounded. The Elizabethan is a mixture of inferior Gothic and debased Italian, producing a singular heterogeneousness in detail, with, however, wonderful picturesqueness in general effect, and domestic accommodation more in accordance with the wants of an advancing civilization than was afforded by the styles which preceded it. The chief characteristics of Elizabethan architecture are: windows of great size both in the plane of the wall and deeply embayed, ceilings very richly decorated in relief, galleries of great length, very tall and highly-decorated chimneys, as well as a profuse use of ornamental strap work in the parapets, window heads, etc.

**Elizabeth Islands**, a group of sixteen American islands south of Cape Cod, with a permanent pop. of about 100.

**Elizabeth Petrovna**, empress of Russia (1709-1762), daughter of Peter the Great and Catharine, ascended the throne in 1741, as the result of a conspiracy, in which Ivan VI, a minor, was deposed. She was a patron of literature, founded the University of Moscow, and corresponded with Voltaire.

**Elizabeth**, Union co., N. J., on Staten Island Sound, 5 mi. s.e. of Newark. Railroads: Pennsylvania, Central New Jersey, Lehigh Valley, and B. & O. Industries: Sewing machine, several iron foundries, car works, copper works, wire works, two shipyards, fertilizing and oil works. Surrounding country agricultural. It is the site of one of the battles of the Revolutionary War (1780), and was the point of exchange of prisoners during that period. The town was first settled in 1600 by Dutch and English in the employ of East India Co., and became a city in 1866. Pop. est. 1897, 46,000. **Elizabeth Stuart**, queen of Bohemia (1506-

Elizabeth Stuart, queen of Bohemia (1500-1662), daughter of James I of England and VI of Scotland. By her daughters, Elizabeth, Charlotte, and Sophia, she was the ancestress of Louis Philippe and of George I, and her sons, Rupert and Maurice, became famous Cavalier leaders.

**Elizabeth**, queen of Roumania, was b. in Germany, Dec. 29, 1843. She married King (then prince) Charles of Roumania.

Eik (Moose, or Moose Deer), the largest of the deer family, a native of Northern Europe, Asia, and America. The elk or moose has a

short compact body, standing about 6 ft. in height at the shoulders, a thick neck, large clumsy head, and horns which flatten out almost from the base into a broad palmate form with numerous snags. In color the elk is grayish brown, the limbs, sides of head, and coarse mane being, how-

Head of Elk.

Head of Elk. ever, of a lighter Their flesh resembles beef rather than hue. venison. For the most they are inoffensive, and so exceedingly wary that they are approached only with difficulty. The Indians and half-breeds are the most skillful moose hunters. The moose has a wide range in Canada. extending from the Arctic Ocean and British Columbia to New Brunswick and Nova Scotia; and it is found also in Maine. It feeds largely on the shoots of trees or shrubs, such as the willow and maple, and on bark, etc.

Elk, Irish, a large deer found in the Pleistocene strata, and distinguished by its enormous antlers, the tips of which are sometimes 11 ft. apart. Though a true deer, its antlers differ from those of living species in that the beam is flattened into a palm. To sustain the great weight, unusually large and strong limbs and neck vertebræ were required. Its remains are found not only in Ireland, but in Scotland and England, and on the Continent, where they occur in lacustrine deposits, brick clay, and ossiferous caves.

Elkhart, Elkhart co., Ind., on St. Joseph and Elkhart rivers, 100 mi. e. of Chicago. Railroads: Big Four, Elkhart & Western, L. S. & M. S. Industries: three flouring mills, iron foundry, paper, brass novelty, band instrument factories, and carriage and harness manufacturing. The surrounding country is agricultural. Elkhart was first settled in 1831, and became a city in 1875. Pop. est. 1897, 14,000

Elkins, STEPHEN B., secretary of war, was b. in Perry co., O., Sept. 26, 1841. In New Mexico had extensive business interests; after-ward in West Virginia. Appointed secretary of war in 1891. In 1894 he was elected U.S. senator.

Ellery, WILLIAM (1727-1820), b. in Newport, R. I.; was one of the signers of the Declaration of Independence. He served several years in the Continental Congress, and for thirty years was collector of Newport. His son Frank rose to the rank of commodore in the navy

Ellipse', a figure in geometry ranking next in importance to the circle, and produced

when any cone is cut by a plane which passes through it not parallel to nor outting the base. Kepler discovered that the paths described by the planets in their revolutions round the sun are ellipses, the sun being placed in one of the foci.

Ello'ra (or Elo'ra), a ruinous village, Hin-dustan, Deccan, Nizam's Dominions, 13 mi n.w. of Aurangabad, famous for its rock and cave temples excavated in the crescent-shaped scarp of a large plateau.

Ellsworth, EPHRAIM E. (1837-1861), American soldier. He was commissioned colonel of a company of zouaves, which he organized, and which enlisted on the Union side at the outbreak of war in 1861. He tore down a Confederate flag from the roof of a hotel at Alexandria, and while descending from the roof was shot dead by the proprietor, Jackson, who was

immediately killed by a soldier. Ellsworth, OLIVER (1745-1807), American statesman, b. in Conn. He distinguished himself in state affairs and in the Continental Congress, and was a member of the convention which drafted the Constitution of the U.S. In 1789 he was elected U.S. senator from Connecticut and was chairman of the committee which organized the federal judicial system. He was chief justice of the U.S. supreme court (1796-1799), and, later, together with Patrick Henry and Governor Davie, negotiated a treaty with France. He became prominent in state affairs and in the Continental Congress. and was a member of the federal convention of 1787 which prepared the Constitution of the U.S. It was on his motion that the words "National government" in that organic act were replaced by the definition "Government of the United States." Ellwood, THOMAS (1639-1713), an early writer

among the Quakers. About 1660 he was induced to join the Society of Friends, and soon after published a book entitled An Alarm to the Priests. He was imprisoned on account of his religion, but subsequently became reader to Milton, and is said to have suggested to him the idea of writing the Paradise Re-gained. In 1705 and 1709 he published the two parts of his Sacred History. His works include a poetical life of King David, the Davideis.

Ellsworth, Hancock co., Me., on Union River, 20 mi. s.e. of Bangor. Railroad: Maine Central. Industries: shoe factory, iron foundry. wooien mill, lumber mills, and ship yards. Surrounding country agricultural and granite. The town was first settled in 1763 and became a city in 1868 or 1869. Pop. est. 1897, 5,000.

Elm, a genus of trees, consisting of thirteen species, all natives of the northern temperate zone. They have bisexual flowers with a campanulate calyx, as many stamens as there are divisions in the limb of the calyx, and two styles. The common elm is a fine tree, of rapid and erect growth, and yielding a tall stem, remarkable for the uniformity of its diameter throughout. It is very common as a timber tree in England; but as it rarely produces seed it is questionable whether it is in-

It is a native of the south and digenous. middle of Europe, and the west of Asia. The average height of a mature tree is 70 or 80 ft., but some reach 150 ft. The wood is brown, hard, of fine grain, not apt to crack, and is used for many purposes. The tree generally attains maturity in 70 or 80 years. The moun-tain elm, a native of Scotland, grows to a less height than the English elm, is of slower growth, and yields a much shorter bole, but it is far bolder in its ramification and more It usually attains to the height of hardy. about 50 ft. It does not produce suckers, like the English elm, but yields seed freely. The timber is strong and elastic, and the tree often yields large protuberances of gnarled wood, finely knotted and veined, and much esteemed for veneering. The smooth-leaved elm first appeared about the middle of last century. The most ornamental tree of the genus is the weeping elm. The American or white elm is abundant in the Western states, attaining its

Common Eim. a.-flower; b.-fruit.

loftiest stature between lat. 42° and 46°; here it reaches the height of 100 ft., with a trunk 4 or 5 ft. in diameter, rising sometimes 60 or 70 ft. before it separates into a few primary Its wood is not much esteemed. The limbs. red or slippery elm is found over a great extent of country in Canada, Missouri, and as far south as lat. 31°; it attains the height of 50 or 60 ft., with a trunk 15 or 20 in. in diam-eter; the wood is of better quality than that of the white elm. The leaves and bark yield an abundant mucilage. The wahoo, inhabiting from lat. 37° to Florida, Louisiana, and Arkansas, is a small tree, 30 ft. high. The branches are furnished on two opposite sides with wings of cork 2 or 3 lines wide; the wood is finegrained and heavy.

**Elmira**, Chemung co., N. Y., on Chemung River, 275 mi. w. of New York, and 150 mi. e. of Buffalo. Railroads: Erie: Delaware, Lackawanna & Western; and Lehigh Valley & Northern Central (Pa.). Industries: bicycle factory, boots and shoes, bridge works, glass works, and numerous others. Surrounding country agricultural. Elmira is the birthplace of Senator David B. Hill. The town was first settled about 1790, and became a city in 1864. Pop. est. 1897, 37,000.

**Elmo's Fire,** ST., a meteoric appearance often seen playing about the masts and rigging of ships. If two flames are visible (Castor and Pollux) the sailors consider it a good omen; if only one (Helena), they regard it as a bad one.

El Paso, El Paso co., Tex., on Rio Grande River, 300 mi. w. of Dallas. Surrounding country agricultural and mineral. Railroads: G. H. & S. A.; A. T. & S. F.; Mexican Central; R. G. S. M. & P.; Southern Pacific; and Texas Pacific. Industries: large smelting furnaces, cigar factories, brick, tile, shingle and mattress factories. The town was first settled in 1850 and became a city in 1880. Pop. est. 1897, 15,500.

Ely, Richard THEODORE, political economist, b. in 1854 at Ripley, N. Y. He was educated at Dartmouth and Columbia colleges, and at the University of Heidelberg, Germany. From 1885 to 1892, he was professor of political economy at Johns Hopkins University. Later he filled the same chair in the University of Wisconsin, a position which he continues to hold. His writings are condemned by some on account of their socialistic tendencies. This criticism, however, was not considered just by the board of regents of the university, and he was officially exonerated from the accusation. Among his more important works are: French and German Socialism; The Labor Times; Recent American Socialism; The Labor Movement in America, Cooperation in America; Problems of To-day; and Outlines of Economics.

Ely, IsLE OF, a district in England, in the county of Cambridge, separated on the south by the Ouse from the remaining portion of the county. It is about 28 mi. long by 25 mi. broad; area 227,326 acres.

Elyria, Lorain co., O., 25 mi. w. of Cleveland. Railroads: Lake Shore and Michigan Southern. Manufactures: grindstones and tobacco. Pop. est. 1807, 6,100.

**Elys'ium** (Elysian Fields), among the Greeks and Romans the regions inhabitated by the blessed after death. They are placed by Homer at the extremities of the earth, by Plato at the antipodes, and by others in the Fortunate Islands (the Canaries). They were at last transferred to the interior of the earth, which is Vergil's notion.

**El'zevir** (or Elzevier), the name of a family of publishers and printers, residing at Amsterdam and Leyden, celebrated for the beauty of the editions of various works published by them, principally from 1595 to 1680.

**Emanation**, in a specific sense, an idea at the center of many philosophic systems which seek to explain the universe as an eternal efflux or emanation from the Supreme Being, comparable with the efflux of light from the sun. Traces of the doctrine are found in the system of Zoroaster. It had a powerful influence on the ancient Egyptian and Greek philosophy. **Emancipation Proclamation** was issued by President Lincoln, Jan. 1, 1863, "as a fit and necessary war measure for suppressing rebellion." It freed all slaves in any states and portions of states actually in rebellion, and which were unrepresented in Congress, or not in possession of the Union armies.

Éman 'uel the Great (1471-1521), king of Portugal, ascended the throne in 1495. During his reign were performed the voyages of discovery of Vasco de Gama, of Cabral, of Americus Vespucius; and the heroic exploits of Albuquerque, by whose exertions a passage was found to the East Indies, the Portugal dominion in Goa was established, the Brazils, the Moluccas, etc., were discovered. The commerce of Portugal, under Emanuel, was more prosperous than at any former period. The treasures of America flowed into Lisbon, and the reign of Emanuel was justly called "the golden age of Portugal."

**Embaiming** (em-bäm'ing), the process of filling and surrounding with aromatic and antiseptic substances any bodies, particularly corpses, in order to preserve them from corruption. The ancient Egyptians employed the art on a great scale, and other peoples, for example the Assyrians and Persians, followed them, but by no means equaled them in it.

Egyptian Mummy.

The ancient Peruvians appear to have injected and washed the corpses with the fluid that flows from imperfectly burned wood, which would of course contain pyroligneous acid, creosote, and other antiseptics. Pliny alludes to the use of a similar fluid by the Egyptians for embalming. In later times bodies have been preserved a long time by embalming, especially when they have remained at a low and uniform temperature, and have been protected from the air. Of the various modern artificial means of preserving bodies, impregnation with corrosive sublimate appears to be one of the most effective, next to immersion in spirits. An injection of sulphate of zinc into the blood vessels is said to be very effective.

**Emberiz** idæ, a family of small birds belonging to the order Insessõres and tribe Conirostres, typical genus *Emberiza*. It includes the buntings, the snow-flake, the yellow-hammer, and reed sparrow. The ortolan belongs to this family. By some naturalists they are classified as a subfamily of the finches.

**Em blements**, in law, the crops actually growing at any time upon land. They are considered in law as personal property, and pass as such to the executor or administrator of the occupier, if the latter die before he has actually cut, or reaped, or gathered the same.

**Embroid ery**, figured work in gold, or silver, or thread silk, wrought by the needle, upon cloths, stuffs, or muslins. In embroidering stuffs a kind of stretching-frame is used, because the more the piece is stretched the

easier it is worked. The art was common in the East in very ancient times. The Jews appear to have acquired it from the Egyptians; Homer makes frequent allusion to it; and Phrygia was celebrated for its embroidery, which was in great demand at Rome. The Anglo-Saxons had a continental reputation, and from the eleventh to the sixteenth century the art of pictorial needlework was of the highest importance both as a recreation and as an industry. Embroidery is commonly divided into two classes: white embroidery applied to dress and furniture, in which the French and the Swiss excel; and embroidery in silk, gold, and silver, chiefly in demand for ecclesiastical vestments, etc. The Chinese, Hindus, Persians, and Turks excel in work of this kind.

**Embryology** is that division of Anatomy which treats of the growth of the fertilized ovum. The portion of life history considered under *Embryology* is limited in placental mammals to a period extending from the moment of conception to the moment in which the anatomical connection between mother and young is terminated. While the limitation seems natural enough, it is open to the following objections:—

I. In many animals, most fishes for example, there never is any anatomical union between parent and embryo, and the embryonic period must be otherwise estimated; this tendency to lead an independent existence is often carried to the point when even fertilization of the ovum takes place outside the female.

2. In other animals, such as birds and reptiles, while the ovum remains for some time after fertilization within the maternal body. it exists independently except as it profits by the maternal heat and protection. This internal incubation usually becomes shortly external, and the mother continues to warm and protect the egg until the young animal bursts open the shell and ceases to exist as an embryo

3. Many processes, embryonic or developmental in their character, are continued after birth (e. g., formation of bone in cartilage. maturation of the genital organs, eruption of the teeth, etc.) coincidently with processes which result simply in growth, or increase in bulk or weight, so that the embryonic existence of the individual cannot be said truly to stop at birth. Furthermore, though the higher mammals cease at birth to maintain their young through a placenta, yet for a variable time thereafter the physiological union between mother and offspring continues to be nearly as intimate as before, by virtue of the helplessness of the young and the lacteal function of the mother. The student, therefore, of Philosophical Anatomy, will see in the act of parturition (childbirth) merely one epoch in the life history of an individual, which commences with the fertilization of the ovum and terminates only when the process of evolution is checked by death. To properly appreciate the manifold changes seen in watching the development of various species from ovum to adult, it must be constantly borne in mind that it is only through

such changes (often startling in abruptness and radical in character; as, e.g., in the changes in the larva to the pupa and imago in certain insects, or from mysis to zooea in crustacea) that the embryo can conquer the vicissitudes of environment and attain to adult existence.

Two laws form the basis of modern Embryology: 1, Virchow's Law-Omnis cellula e cellulo; which affirms that all organic life (a union of organs composed of cells) originates in the cell and becomes complex through cell division and cell specialization (or physiological division of labor); 2, Von Baer's Lawthe individual in developing assumes at first a generalized form common to many types, but, proceeding, becomes more and more specialized, and less and less like parallel types until finally the completed individual stands alone. Development is from the general to the special, from the homogeneous to the heterogeneous. The evolutionary hypothesis sees in successive stages of the developing embryo dim adumbrations of long extinct ancestors, otherwise unrepresented and forgotten. "Ontogeny, or the development of the individual is a recapitulation of phylogeny, or the evolution of the race." While we may not see in this doctrine of recapitulation (Haeckel) a literal statement of the unfolding of every embryo, it is certain that at successive stages of embryonal life the human foetus (for example) assumes conditions and forms bearing strong resemblances to the embryo or adults of lower forms of life. In this connection also it is proper to refer to the rival theories of Evolution and Epigenesis; the former doctrine originated in its crudest form by the ancients, and in our time revived with great subtilety by Weissmann, holding that the embryo exists preformed in the smallest ovum and requires only fecundation to cruse it to unfold into the adult; the latter, first held by Wolff, and now most generally adopted, contending that the growth of the embryo is a process of new formation, organs arising de novo through the stimulus upon the cell mass of conditions at present largely un-known. W. H. ALLPORT.

Em'eraid, a well-known gem of pure green color, somewhat harder than quartz. It is a silicate of aluminum and the rare element glucinum or beryllium, which was detected in it by Vanquelin after it had been discovered by the same chemist in the beryl. Its color is due to the presence of chromium. Its natural form is either rounded or that of a short sixsided prism. It is one of the softest of the precious stones, but is not acted on by acids. Emeralds of large size and at the same time free from flaws are rare; the largest on record is said to have been possessed by the inhabit-ants of the valley of Manta in Peru when the Spaniards first arrived there. It was as big as an ostrich egg, and was worshiped as the mother of emeralds. The ancients, who valued them, especially for engraving, are said to have procured them from Ethiopia and Egypt. The finest are now obtained from Colombia. The Oriental emerald is a variety of the ruby, of a green color, and is an extremely rare gem.

**Emeraid Green** (known also as Schweinfurth green, and by a great number of other names), a vivid, light green pigment, prepared from arseniate of copper, and used both in oil and water-color painting. It is extremely poisonous.

Em'erson, RALPH WALDO (1803-1882), poet and prose writer, b. at Boston. He graduated at Harvard in 1821, for five years taught school, and in 1829 became minister of a Unitarian church in Boston, but in 1832 resigned his charge. He spent the greater part of 1833 in Europe, where he made the acquaintance of Walter Savage Landor, Wordsworth, and Carlyle; and on his return began his career as a lecturer on various subjects, in which capacity he acted for a long series of years. In 1835 he took up his permanent residence at Concord, Mass., and in 1836 published a small volume called Nature. He was one of the original editors of the Dial, a transcendental magazine begun in 1840. Two volumes of his essays were published in 1841 and 1844, and his poems in 1846. His miscellaneous addresses had been published in England in 1844, and on visiting Great Britain in 1847 he was welcomed by a large circle of admirers. In 1850 he published Representative Men; in 1856, English Traits; in 1860, The Conduct of Life; in 1869, May Day and Other Poems, and Society and Solitude; in 1871, Parnassus, a collection of poems; in 1876, Letters and Social Aims. Emerson showed cer-tain similarities with Carlyle, of whom he was a friend and correspondent. Their correspondence appeared in 1883. He also numbered among his associates Bronson Alcott, Thoreau, Ellery Channing, and Margaret Fuller. He was one of the most original and influential writers the U.S. has produced.

Em'ery, an impure variety of corundum, of blackish or bluish-gray color, chiefly found in shapeless masses and mixed with other minerals. It contains about 82 per cent. of alumina, and a small portion of iron; is very hard; is infusible, and is not attacked by acids. The best emery is brought from the Levant. chiefly from Cape Emeri in Naxos. It also occurs in Spain. It is employed in cutting and polishing precious stones; in smoothing the surface of the finer kinds of lenses preparatory to their being polished; in the polishing of marble; by cutlers, locksmiths, glaziers, and other artisans. For all these purposes it is pulverized in large iron mortars or in steel mills, and the powder, which is rough and sharp, is carefully washed and sifted into eight or ten different degrees of fineness. Emery paper and emery cloth are made by laying a thin coat of glue upon the fabric, and dusting the emery from a sieve of the reouired size.

the emery from a sieve of the required size. Emery wheels are made of a cement in which the ground emery is contained, and the excellence of the wheel depends upon the nature of the cement. The aim is to make a cement which will wear away with the emery and not leave the cutting material below the surface of the wheel. The cement must also be strong enough to withstand the centrifugal force, and not fly to pieces when the wheel re-

volves at a high speed. The wheel must have an even texture throughout, and the same density, so that one side will not wear out before the other and thus throw the wheel out of balance. Various kinds of cement are made. For example, leather treated with acids and a strong glue, hard rubber, litharge, linseed oil, shellac, celluloid, silicate of soda, chloride of calcium, glue, and oxychloride of zinc. The emery is prepared for mixing with the cement by rolling or crushing the rock. For cutting and grindstone purposes, the emery crushed under a stamp or in a rock crusher is the best, as the corners and edges of the particles are sharper, but for polishing, the emery ground between rollers is preferred. Wooden wheels with leather glued to their rims, and emery powder glued on to the leather, are used for polishing. The wooden wheel is built up from segments glued and pinned together. Buffing wheels for polishing brass, nickel-plated sur-faces, copper, gold, and silver, are made of cotton or woolen cloth cut into discs and held together by iron flanges in the center.

**Emeu** (Emu) ( $\bar{e}$ 'm $\bar{u}$ ), a large cursorial bird, formerly dispersed over the whole Australian continent, but now almost extirpated in many districts. It is allied to the cassowary, but is distinguished by the absence of a "helmet"

on the top of the head. It nearly equals the ostrich in bulk, being thicker in the body, though its legs and neck are shorter. Its feet are three-toed, and its feathers, which are double, are of a dull sooty-brown color, those about the neck and head being of a hairy texture. The wings are small and useless for flight, but the bird can run with great speed, and emeu coursing as a sport is said to surpass that of the hare. The flesh of the young emeu is by some considered a delicacy. The emeu is a bird of the plain, the cassowary of the forest. It is easily tamed, and may be kept out of doors in temperate climates. It feeds on vegetable matter, fruits, roots, etc.

**Emeu Wren**, a small Australian bird allied to the warblers, somewhat similar to a wren, but having the tail feathers long, stiff, and thinly barbed, similar to emeu feathers.

Emigration, the departure of inhabitants from one country or state to another for the purpose of residence. The prime cause of such removal is over-population, though it is often influenced by particular and temporary incidents, such as an industrial crisis, a religious or political movement, the creation of a new colony, the desire to escape from laws regarded as oppressive or from compulsory military service. In barbarous times a tribe having exhausted the tract on which it had established itself, naturally migrated to more tempting territory. In Greece, the limited territories of the states rendered the occasional deportation of part of the inhabitants to form new colonies a necessity; while at Rome, where the land was held by a few proprietors, and the trades and professions mainly exercised by slaves, the larger part of the free population had few sources of income apart from the occupation of portions of conquered territory in Italy and elsewhere. During the Middle Ages emigration was to some extent stayed by the fact that the feudal system confined the mass of the people to the soil or within the insuperable limits of a corporation. Emigration, in its proper sense, to America, commenced with the departure of the Puritans who colonized New England; after which the Germans colonized Pennsylvania, the Dutch New York, the Swedes Delaware, the French Canada and Louisiana. Still the current of emigration was slow until 1815, when its rapid increase at first occasioned some alarm. Ultimately, however, acts forbidding emigration were either repealed or allowed to be-come obsolete, and toward the close of the period 1815-45 the annual emigration from Britain (only 2,081 in 1815) had risen on three occasions to fully 100,000. In 1847 it rose to over a quarter of a million, while in the five years, 1849-53, the average annual emigration was not less than 323,000. From the year 1855 the numbers diminished considerably, the annual average of the period 1855-59 being 134,304, and that of 1860-64 being only 127,779. Succeeding quinquennial periods, however, show, with the exception of the period 1875-79, a fairly steady increase, the numbers of the annual averages being: 1865-69,165,283;1870-74. 203,275; 1875-79, 124,503; 1880-84, 262,441. Of late years the higher numbers have been well maintained, the total for the year 1891 being 334,543, of whom 33,752 emigrants went to the North American colonies, 252,016 to the U.S., 19,957 to Australia and New Zealand, and 28.-775 to other places. Against these numbers there must, of course, be set a large influx. every year, of immigrants from abroad, the number of these in 1891 being 151,360. Other European countries have also sent out large numbers of emigrants, especially Germany, the Scandinavian countries, and Italy; Germany being second in numbers only to the United Kingdom. The great bulk of the Germans come to the U.S. Many Italians have in re-

cent years emigrated to the Argentine Republic. Em'met, ROBERT (1780-1803), an Irish patriot, b. at Cork. He was expelled from Trinity College, Dublin, in 1798, on the ground of exciting disaffection and rebellion, and having become an object of suspicion to the government, quitted Ireland. He returned there on the repeal of the suspension of the Habeas Corpus Act, and became a member of the Society of United Irishmen for the establishment of the independence of Ireland. In July, 1803, he was the ringleader in the rebellion in which Lord Kilwarden and others perished. He was arrested a few days afterward, tried, and executed. His fate excited special interest from his attachment to Miss Sarah Curran, daughter of the celebrated barrister.

Emotion, a term variously used by psychologists; sometimes as one of the divisions of feeling, the other being sensation; sometimes as opposed to feeling when the latter is identified with sensation; and sometimes as distinct from both sensation and feeling, when the last term is rigidly confined to the sense of pleas-ure or pain. In any of these uses, however, emotions are distinguished from sensations in that sensations are primary forms of consciousness arising by external excitation, are comparatively simple and immediately presenta-tive phenomena, and are definite in character and capable of localization; while emotions are secondary or derived forms of consciousness, are complex and representative, and are vague and diffused. Sensations are said to be "peripherally initiated, "while emotions are cen-trally initiated. When, in addition to its being distinguished from sensation, it is also distinguished from feeling, emotion is applied to the whole psychical condition accompanying the sense of pleasure or pain (feeling). The muscles of the body and the organic functions of the system are often considerably influenced by emotion, which naturally seeks an outward expression unless held in check by what Darwin has called serviceable associated habits.

**Emped** ocles (-klēz) (B. c. 460-400), a Greek philosopher of Agrigentum, in Sicily. He is said to have introduced the democratic form of government in his native city, and the Agrigentines regarded him with the highest veneration as public benefactor, poet. orator, physician, prophet, and magician.

**Emporia,** Lyon co., Kan., on Neosha River, 120 mi. s.w. of Kansas City. Railroads: Santa Fé, and two branches of M. K. & T. Industries: two flouring mills, iron foundry, creamrounding country agricultural. The State Normal School is located here, also Emporia College (Presbyterian). The town was first settled in 1857 and became a city in 1872. Pop. est. 1807, 10,000.

**Èmul'sion**, a medical preparation, consisting of an oily or resinous substance made to combine with water by some substance that itself has the property of combining with both, such as gum arabic, the yolk of eggs, almonds, etc.

**E'mys**, a genus of tortoises, type of the family Emydidæ which includes the terrapins of America and others.

Enam'el, a vitreous glaze of various colors

fused to the surface of gold, silver, copper, and The art of enameling, other substances. which is of great antiquity, was practised by the Assyrians and by the Egyptians, from whom it may have passed into Greece, and thence into Rome and its provinces, where various Roman antiquities with enameled ornamentation have been discovered. The Byzantines of the tenth century produced excellent cloisonné enamels on a gold base, the cloisonné process consisting in tracing the design in filicts of gold upon the gold plate and filing up the small molds thus formed with enamels, the design appearing in colored enamels separated by thin gold partitions or cloisons. In some cases, however, the enamels were filled into hollows beaten out in the gold plate, which formed part of the field. In the twelfth century the town of Limoges acquired the high reputation for inlaid enamels which it held till the fourteenth century, and reacquired in the sixteenth for its painted enamels. The costliness of the sculptured ground had led the Italians early in the fourteenth century to substitute the practise of incising the de-sign on the face of the plate, and then cover-ing it with a transparent enamel. The further step, which made the Limousin workshops famous, consisted in the method of superficial enameling, in which opaque colors or colors laid on a white opaque ground were used. The Limoges school degenerated greatly in the seventeenth century, but its method with certain modifications in detail is still employed. The basis of all kinds of enamel is a perfectly transparent and fusible glass, which is rendered either semitransparent or opaque by the admixture of metallic oxides. White enamels are composed by melting the oxide of tin with glass, and adding a small quantity of manganese or phosphate of calcium to increase the brilliancy of the color. The addition of the oxide of lead, or antimony, or oxide of silver, produces a yellow enamel. Reds are formed by copper, and by an intermixture of the oxides of gold and iron. Greens, violets, and blues are formed from the oxides of copper, cobalt, and iron. In the middle of the last century enameling was largely applied to the decoration of snuff boxes, tea canisters, candlesticks, and other small articles. Of late years it has been extensively applied to the coating of iron vessels for domestic purposes, the protection of the insides of baths, cisterns, and boilers, and the like. Enameling in colors upon iron is now common, iron plates being thus treated by means of various mixtures, and words and designs of various kinds being permanently fixed upon them by stenciling, for advertising, signboards, etc.

Encar' pus, in architecture, a sculptured ornament in imitation of a garland of fruits, leaves, or flowers, suspended between two points. The garland is of greatest size in the middle, and diminishes gradually to the points of suspension, from which the ends generally hang down. The encarpus is sometimes composed of an imitation of drapery similarly disposed, and sometimes of an as-

# **Encaustic Painting**

semblage of musical instruments, implements of war or of the chase.

Encaustic Painting, a kind of painting practised by the ancients, for the perfecting of which heating or burning in was required. Pliny distinguishes three species, in all of which wax was used along with colors. The art has been revived in modern times, but has not been greatly employed.

**Encaustic Tiles,** ornamental paving tiles of baked pottery, much used during the Middle Ages in the pavements of churches and other ecclesiastical edifices. The encaustic tile, strictly so called, was decorated with patterns formed by different colored clays inlaid in the tile and fired with it. The art appears to have originated in the latter part of the twelfth century, to have attained its highest perfection during the thirteenth, and to have sunk into disuse in the fifteenth.

Encke (en'ke), JOHANN FRANZ (1791-1865), German astronomer, b. at Hamburg. He became assistant in the observatory of Seeberg, near Gotha. Here he calculated the orbit of the cometobserved by Mechain, Miss Herschel, and Pons, predicted its return, and detected a gradual acceleration of movement, ascribed by him to the presence of a resisting medium. The fame of his works led to his appointment as director of the Berlin Observatory.

En' crinite, a name often applied to all the marine animals of the order Crinoidea or stone lilies, class

Enerinite Stems. (Mountain Limestone.)

Echinodermata, but more specifically restricted to the genera having rounded, smooth stems attached to the bottom, and supporting the body of the animal, which has numerous jointed arms radiating from a central disc, in which the mouth is situated.

Encyclopædia (Cyclopædia, or Cyclopedia), a systematic view of the whole extent of human knowledge or of particular departments of it, with the subjects arranged generally in alphabetic order. Varro and Pliny the Elder, among the Romans, attempted works of an encyclopiedic nature, the latter in his wellknown Historia Naturalis, or Natural History. Other ancient encyclopædic works were those of Stobæus and Suidas, and especially of Mar-cianus Capella. In the thirteenth century a work on a regular plan was compiled by the Dominican Vincent of Beauvais, in which was exhibited the whole sum of the knowledge of the Middle Ages. His work was entitled Speculum Historiale Naturale, Doctrinale, to which an anonymous author added, some years later. a Speculum Morale. Roger Bacon's Opus Majus also belonged to the encyclopædic class. In the seventeenth-century various encyclopædic works were compiled, such as the Latin one of Johann Heinrich Alsted. In 1674 appeared the first edition of Moreri's Le Grand Diction-naire Historique; in 1677 Johann Jacob Hoff-mann published at Basel his Lexicon Universale;

and in 1697 appeared Bayle's famous Dictionnaire Historique et Critique, which is still of great value. The first English alphabetical encyclopædia was the Lexicon Technicum, published in 1704. Among the chief English works of this kind are: 1, Ephraim Chambers's Cyclopædia, or & Universal Dictionary of Arts and Sciences, published in 1728 in 2 vols. folio. The Encyclopedia Britannica, published in Edinburgh, in nine editions - the first in 1788. the last in 1875-88 (24 vols. 4to, besides an index vol. 1880). The chief American encyclo-pædias are the Encyclopædia Americana, in 13 vols., 1829-33; the New American Cyclopedia, in 16 vols., 1858-63 and 1881, and Johnson's Universal Cyclopedia, 4 vols., 1874-77, and 8 vols., 1885. Of the French cyclopedias the most famous is the great Dictionnaire Encyclomost ramous is the great Dictionnate Engla-pédique by Diderot and D'Alembert; the Eng-clopédie Méthodique, ou par Ordre des Matières, Paris, 1781-1832, in 201 vols. 4to, of which 47 are plates; the Encyclopédie Moderne, 1824-32. 20 vols; and the large and valuable Grand Dictionnaire Universel du XIX Siècle, edited by Larousse, 16 vols. folio (with supplementary vols.). Numerous works of this kind have been published in Germany, the most popular being the Conversations-Levikon of Brockhaus, now in its thirteenth edition; Meyers's Kontersations-Lexikon, in its fourth edition; and that issued by Spamer, now in its second edition. The most comprehensive is the Allgemeine Encyklopadie, originally edited by Professors Ersch and Gruber, begun in 1818, and not yet completed. The index to the Chinese Encyclopadia of Literature and Science, complete in 5,040 volumes — the most stupendous literary undertaking ever projected - fills twenty substantial volumes.

Endicott, WILLIAM C., b. in Salem, Mass.. Nov. 19, 1827; was a justice of the Massachusetts supreme court from 1873 to 1883, and in 1884, as the Democratic candidate, was defeated in the race for the governorship. He was secretary of war under Mr. Cleveland.

Endless Screw, a mechanical contrivance, consisting of a screw, the thread of which gears into a wheel with skew teeth, the obliquity corresponding to the angle of pitch of the screw. It is generally employed as a means of producing slow motion in the adjustments of machines, rather than as transmitter of any great amount of power.

great amount of power. Endogenous Plants (en-doj'e-nus) (or Endogens), one of the large primary classes into which the vegetable kingdom is divided, so named in consequence of the new woody bundles being developed in the interior of the stem, in which there is no distinction of pith and bark. In transverse section these bundles appear scattered through the cellular matter. being more compact toward the circumference. The other organs of the plants are also characteristic. The leaves are generally parallel-veined, the flowers usually with three organs in each whorl, the seed has an embryo with one cotyledon, and the radicle issues from a sheath and is never developed into a tap-root in germination. To this class belong palms,

grasses, rushes, lilies, etc. Endogens increase in thickness only to a limited extent; hence they are not injured by twining plants as exogens are.

Endorhiza (-ri'za), in botany, a term descriptive of the radicle of the embryo of monocotyledonous plants, which is developed inside a sheath from which it issues in germination.

En'doskeleton, in anatomy, a term applied to the internal bony structure of man and other animals in contradistinction to *exoskeleton*, which is the outer and hardened covering of such animals as the crab, lobster, etc.

En'dosperm, the tissue surrounding the embryo in many seeds and which is contained with it within the testa. It contains the supply of food for the germinating embryo, and is also called albumen or perisperm.

Endym'ion, a personage of Greek mythology, according to various accounts a huntsman, a shepherd, or a king of Elis, who is said to have asked of Zeus, or to have received as a punishment, eternal sleep. Others relate that Selēnē, or Diana, conveyed him to Mount Latmos in Caria, and threw him into a perpetual sleep in order that she might enjoy his kisses whenever she pleased.

Ene'ma, any liquid or gaseous form of medicine for injection into the rectum. It is most commonly administered to induce peristaltic action of the bowels, but it is often the most desirable means of conveying into the system nourishment or stimulants.

En'ergy, in physics, the power that a body or system possesses of doing work. A body may possess energy in one of two forms, viz., as kinetic energy, that is, the energy due to mo-tion, and potential energy, that is, energy due to what may be called a position of advantage. Thus a moving mass, a bullet, for example, can do work in virtue of its motion, and the name kinetic energy is given to energy of this kind. Under this name is also included energy belonging to molecular motion, to electricity in motion, to heat and light, and to actual chemical action. Again, as examples of potential energy, we may take the case of a mass raised up to a position in which it is capable of doing work by falling-the weight of a clock, for instance; but the term also includes the energy due to electrical separation, to absorbed heat, and to chemical separation, as in gunpowder, which is ready to do work by means of its explosion. From the investiga-tions of Joule and others into the nature and phenomena of heat and the discovery of the equivalence of a definite quantity of mechanical energy to a definite quantity of heat, the grand principle of the conservation of energy was established. This asserts that the total amount of energy in the universe, or in any limited system which does not receive energy from without, or part with it to external matter, is invariable. If energy of any form seems to disappear in such a case it reappears in some other form. Thus, mechanical energy may be converted into heat. Heat again may be converted into the energy of electricity in motion, or into the potential energy of

chemical separation. And electrical energy, whether potential or kinetic, and the energy of chemical separation, are also convertible into heat. Connected with this principle is another which states that no known natural process is exactly reversible, and that if we transform mechanical energy into heat, for example, we never can pass back and obtain from the heat produced precisely the amount of mechanical energy with which we commenced. Whatever attempt is made to transform and retransform energy by an imperfect process, and no known process is perfect, part of the energy is necessarily transformed into heat. and is dissipated so as to be incapable of further useful transformation. It therefore follows, that as energy is in a constant state of transformation, there is a constant process of degradation of energy going on, a process by which energy constantly approaches the unavailable form of uniformly diffused heat; and this will go on till the whole of the energy of the universe has taken this final form.

En'field, a market town, England, county of Middlesex, 9 mi. n. by e. of London. It is the seat of the government manufactory of rifles and small arms. Pop. 31,532.

En'gadine, a beautiful valley in Switzerland, in the Grisons, on the banks of the Inn, bordering on the Tyrol, about 50 mi. long, but in some parts very narrow, divided into Upper and Lower. The pop. of the whole valley amounts to about 12,000. The cold, dry climate and mineral springs have made the valley a favorite resort for invalids.

Enghien (an.gi-an), LOUIS ANTOINE HENRI DE BOURBON, DUKE OF (1772-1804), b. at Chantilly. From 1796 to 1799 he commanded the vanguard of Condó's army, which was disbanded at the peace of Lunéville (1801). He was generally looked upon as the leader of the émigrés, and was suspected by Bonapartists of complicity in the attempt of Cadoudal to assassinate the first consul. An armed force was sent to seize him in Baden in violation of all territorial rights, and he was brought to Vincennes, 1804. A mock trial was held and he was shot in the ditch outside the walls.

En'gine, a mechanical contrivance in which one or other of the natural forces is utilized for the performance of work of some kind; often distinctively a steam engine.

**England,** including Wales, the southern and larger portion of the island of Great Britain. Its figure is, roughly speaking, triangular, but with many windings and indentations, the coast line measuring not less than 2,765 mi. The length of the country, measured on a meridian from Berwick nearly to St. Alban's Head, is 365 mi. Its breadth, measured on a parallel of latitude, attains its maximum between St. David's Head, in South Wales, and the Naze, in Essex, where it amounts to 280 mi. The area is 58,311 sq. mi., of which 50,-933 sq. mi. are in England, and 7,378 sq. mi. in Wales. This is exclusive of the Channel Islands and the Isle of Man, which together would add 302 sq. mi. more to the area. The subdivision of England into counties is said to date from the time when the country was still under several kings, but it does not appear to have assumed a definite form till the time of Alfred the Great. The existing division was first completed in the time of Henry VIII. The capital of England and of the British Empire is London. The cities next in size are: Liverpool, Manchester, and Salford, Birmingham, Leeds, Sheffield, Bristol, Nottingham, Bradford, and Hull. *Physical Features.*—The chief indentations

Physical Features.—The chief indentations are: on the east, the Humber, the Wash, and the Thames estuary; on the west, the Solway Firth, Morecambe Bay, Cardigan Bay, and the Bristol Channel. The most extensive stretches of flat coast are on the east, in the co. of Lincoln, and from the southern part of Suffolk to the South Foreland in Kent, and in Sussex and Hants on the south coast. The chief islands are: Holy Island, the Farne Islands, Sheppy, and Thaneton the east coast; the lsle of Wight on the south; the Scilly Isles at the southwest extremity; and Lunday Island, Anglesey, Holyhead, and Walney on the west.

The loftiest heights of England and Wales are situated at no great distance from its western shores, and consist of a succession of mountains and hills, stretching, with some interruptions, from north to south, and throwing out numerous branches on both sides, but particularly to the west, where all the culmi-nating summits are found. The northern portion of this range has received the name of the Pennine chain. In Derbyshire The Peak rises to the height of 2,030 ft. Amid these mountains lie the celebrated English lakes, of which the most important are Windermere, Derwent Water, Coniston Lake, and Ullswater. Here also is the highest summit of Northern England, Scawfell 3,-210 ft. The Pennine chain, with its appended Cumbrian range, is succeeded by one which surpasses both these in loftiness and extent, but has its great nucleus much farther to the west, where it covers the greater part of Wales, deriving from this its name, the Cumbrian range. Across the Bristol Channel from Wales is the Devonian range. Other ranges are the Cotswold Hills proceeding in a northeasterly direction from near the Mendip Hills; the Chiltern Hills taking a similar direction farther to the east; and the North and South Downs running eastward, the latter reaching the south coast near Beachy Head, the former reaching the southeast coast at Folkestone.

Large part of the surface of England consists of wide valleys and plains. Beginning in the north, the first valleys on the east side are those of the Coquet, Tyne, and Tees; on the west the beautiful valley of the Eden, which, at first hemmed in between the Cumbrian range and Pennine chain, gradually widens out into a plain of about 470 sq. mi. The most important of the northern plains is the Vale of York, which has an area of nearly 1,000 sq. mi. Properly speaking it is still the same plain which stretches, with scarcely a single interruption, across the counties of Lincoln, Suffolk, and Essex, to the mouth of the Thames, {

and to a considerable distance inland, comprising the Central Plain and the region of the Fens.

England is well supplied with rivers, many of them of great importance to industry and commerce. Most of them carry their waters to the North Sea. If we consider the drainage as a whole, four principal river basins may be distinguished, those of the Thames, Wash, and Humber belonging to the German Ocean; and the Severn belonging to the Atlantic. The basin of the Thames has its greatest length from e. to w., 130 mi., and its average breadth about 50 mi.; area 6, 160 sq. mi. The basin of the Wash consists of the subordinate basins of the Great Ouse, Nen, Welland, and Witham, which all empty themselves into that estuary, and has an area computed at 5,850 sq. mi. The basin of the Severn consists of two distinct portions, that on the right bank, of an irregularly oval shape, and having for its principal tributaries the Teme and the Wye; and that on the left, of which the Upper Avon is the principal tributary stream. The area of the whole basin is 8,580 sq. mi. The next basin, that of the Humber, the largest of all, consists of the three basins of the Humber proper, the Ouse, and the Trent, and its area is 9,550 sq. mi., being about one sixth of the whole area of England and Wales. Other rivers unconnected with these systems are the Tyne, Wear, and Tees in the northeast; the Eden, Ribble, Mersey, and the Dee in the northwest.

In regard to the minerals, climate. agriculture, manufactures, etc., of England, see Great Britain.

Cicil History.-The history of England proper begins when it ceased to be a Roman po session. On the withdrawal of the Roman forces, about the beginning of the fifth century A. D.. the South Britons, or inhabitants of what is now called England, were no longer able to withstand the attacks of their ferocious northern neighbors, the Scots and Picts. In the middle of the fifth century the occasional Teutonic incursions gave place to persistent inva-sion with a view to settlement. These Teutonic invaders were Low German tribes from the country about the mouths of the Elbe and Weser, the three most prominent being the Angles, the Saxons, and the Jutes. Of these the Jutes were the first to form a settlement. taking possession of part of Kent, the Isle of Wight, etc.; but the larger conquests of the Saxons in the south and the Angles in the north gave to these tribes the leading place in the kingdom. The struggle continued 150 years, and at the end of that period the whole southern part of Britain with the exception of Strathclyde, Wales, and West Wales (Cornwall), was in the hands of the Teutonic tribes. This conquered territory was divided among a number of small tribes or petty chieftaincies. seven of the most conspicuous of which are often spoken of as the *Heptarchy*. Each state was, in its turn annexed to more powerful neighbors; and at length, in 827, Egbert, by his valor and superior capacity, united in his own person the sovereignty of what had formerly been

seven kingdoms, and the whole came to be called England, that is Angle-land.

While this work of conquest and intertribal strife had been in progress toward the establishment of a united kingdom, certain impor-tant changes had occurred. The conquest had been the slow expulsion of a Christian race by a purely heathen race, and the country had returned to something of its own isolation with regard to the rest of Europe. The conversion of Kent, Essex, and East Anglia was followed by that of Northumberland and then by that of Mercia, of Wessex, of Sussex, and lastly of Wight, the contest between the two religions being at its height in the seventh century. The legal and political changes immediately consequent upon the adoption of Christianity were not great, but there resulted a more intimate relation with Europe and the older civilizations, the introduction of new learning and culture, the formation of a written literature, and the fusion of the tribes and petty kingdoms into a closer and more lasting unity than that which could have been otherwise secured.

The kingdom, however, was still kept in a state of disturbance by the attacks of the Danes, who had made repeated incursions during the whole of the Saxon period, and about half a century after the unification of the kingdom became for the moment masters of nearly the whole of England. But the genius of Alfred the Great, who had ascended the throne in 871, speedily reversed matters by the defeat of the Danes at Ethandune (878). The defeat of the Danes at Ethandune (878). two immediate successors of Alfred, Edward (901-925), and Athelstan (925-940), the son and the grandson of Alfred, both vigorous and able rulers, had each in turn to direct his arms against these settlers of the Danelagh. The reigns of the next five kings, Edmund, Edred, Edwy, Edgar, and Edward the Martyr, are chiefly remarkable on account of the conspicuous place occupied in them by Dunstan, who was counsellor to Edmund, minister of Edred, treasurer under Edwy, and supreme during the reigns of Edgar and his successor. During the tenth century many changes had taken place in the Teutonic constitution. Feudalism was already taking root; the king's authority had increased; the folkland was being taken over as the king's personal property; the nobles by birth, or ealdermen, were becoming of less importance in administration than the nobility of thegns, the officers of the king's court. Animosities between the English and the Danes became daily more violent, and a general massacre of the latter took place in 1002. The following year Sweyn invaded the kingdom with a powerful army and assumed the crown of England. Ethelred was compelled to take refuge in Normandy; and though he afterward returned, he found in Canute an adversary no less formidable than Sweyn. Ethelred left his kingdom in 1016 to his son Edmund, who displayed great valor, but was compelled to divide his kingdom with Canute; and when he was assassinated in 1017 the Danes succeeded to the sovereignty of the whole.

Canute (Knut), who espoused the widow of

Ethelred, that he might reconcile his new subjects, obtained the name of Great, not only on account of his personal qualities, but from the extent of his dominions, being master of Denmark and Norway as well as England. In 1035 he died, and in England was followed by two other Danish kings, Harold and Hardicanute, whose joint reigns lasted till 1042, after which the English line was again restored in the person of Edward the Confessor. On Edward's death in 1066 Harold, son of Earl Godwin, obtained the crown. He found, how-ever, a formidable opponent in the second cousin of Edward, William of Normandy, who instigated the Danes to invade the northern counties, while he, with 60.000 men, landed in the South. Harold vanquished the Danes, and hastening southward met the Normans near Hastings, at Senlac, afterward called Battle. Harold and his brothers fell (Oct. 14, 1066), and William (1066-87) immediately claimed the government as lawful king of England, being subsequently known as William I, the Conqueror. For some time he conducted the government with great moderation; but being obliged to reward those who had assisted him, he bestowed the chief offices of government upon Normans, and divided among them a great part of the country. The revolts of the native English which followed were quickly crushed.

At his death, in 1087, William II, commonly known by the name of Rufus, the conqueror's second son, obtained the crown, Robert, the eldest son, receiving the duchy of Normandy. In 1100, when William II was accidentally killed in the New Forest, Robert was again cheated of his throne by his younger brother Henry (Henry I), who in 1106 even wrested from him the duchy of Normandy. His reign was also marked by the suppression of the greater Norman nobles in England, whose power (like that of many continental feudatories) threatened to overshadow that of the king, and by the substitution of a class of lesser nobles. In 1135 he died in Normandy, leaving behind him only a daughter, Matilda.

By the will of Henry I his daughter Maud, or Matilda, wife of Geoffrey Plantagenet. Count of Anjou, and frequently styled the Empress Matilda, because she had first been married to Henry V, emperor of Germany, was declared his successor. But Stephen, son of the Count of Blois, and of Adela, daughter of William the Conqueror, raised an army in Normandy, landed in England, and declared himself king. After years of civil war and bloodshed an amicable arrangement was brought about, by which it was agreed that Stephen should continue to reign during the remainder of his life, but that he should be succeeded by Henry, son of Matilda and the Count of Anjou. Stephen died in 1154, and Henry Plantagenet ascended the throne with the title of Henry II, being the first of the Plantagenet or Angevin kings. He was also in the possession of Anjou, Normandy, and

Aquitaine. Henry II found difficulty in abridging the exorbitant privileges of the clergy, who claimed exemption not only from the taxes of the state, but also from its penal enactments, and who were supported in their demands by the primate Becket. The king's wishes were formulated in the Constitutions of Clarendon (1164), which were at first accepted and then repudiated by the primate. The assassination of Becket, however, placed the king at a disadvantage in the struggle, and after his conquest of Ireland (1171) he submitted to the church, and did penance at Becket's tomb. To curb the power of the nobles he granted charters to towns, freeing them from all subjection to any but himself, thus laying the foundation of a new order in society.

Richard I, called Cœur de Lion. who in 1189 succeeded to his father, Henry II, spent most of his reign away from England. Returning homeward from Palestine in disguise through Germany, he was made prisoner by Leopold, duke of Austria, but was ransomed by his subjects. In the meantime John, his brother, had aspired to the crown, and hoped, by the assistance of the French, to exclude Richard from his right. Richard's presence for a time restored matters to some appearance of order; but having undertaken an expedition against France, he received a mortal wound at the siege of Chalons, in 1199.

John was at once recognized as king of England, and secured possession of Normandy; but Anjou, Maine, and Touraine acknowledged the claim of Arthur, son of Geoffrey, second son of Henry II. On the death of Arthur, while in John's power, these four French provinces were at once lost to England. John's opposition to the pope in electing a successor to the see of Canterbury in 1205 led to the kingdom being placed under an interdict; and the nation being in a disturbed condition, he was at last compelled to receive Stephen Langton as archbishop, and to accept his kingdom as a fiel of the papacy (1213). His exactions and misgovernment had equally embroiled him with the nobles. In 1213 they refused to follow him to France, and on his return defeated, they at once took measures to secure their own privileges and abridge the prerogatives of the crown. King and barons met at Runnymede, and on June 15, 1215, the Great Charter (Magna Charta) was signed. It was speedily de-clared null and void by the pope, and war broke out between John and the barons, who were aided by the French king. In 1216, however, John died, and his turbulent reign was succeeded by the almost equally turbulent reign of Henry III.

During the first years of the reign of Henry III the abilities of the Earl of Pembroke, who was regent until 1219, retained the kingdom in tranquillity; but when, in 1227, Henry assumed the reins of government he showed himself incapable of managing them. The struggle long maintained in the great council (henceforward called Parliament) over money grants and other grievances reached an acute stage 1363, when civil war broke out. Simon de Montfort who had laid the foundations of the House of Commons by summoning representatives of the shire communities to the Mad Parliament of 1258, had by this time engrossed the sole power. He defeated the king and his son Edward at Lewes in 1264, and in his famous Parliament of 1265 still further widened the privileges of the people by summoning to it burgesses as well as knights of the shire. The escape of Prince Edward, however, was followed by the battle of Evesham (1265), at which Earl Simon was defeated and slain, and the rest of the reign was undisturbed.

On the death of Henry III, in 1272, Edward succeeded without opposition. In 1292 Bal-I liol, whom Edward had decided to be rightful heir to the Scottish throne, did homage for the fief to the English king; but when, in 1294, war broke out with France, Scotland also declared war. The Scots were defeated at Dunbar (1296), and the country placed under an English regent: but the revolt under Wallace (1297) was followed by that of Bruce (1306), and the Scots remained unsubdued. The reign of Edward was distinguished by many legal and legislative reforms, such as the separation of the old king's court into the Court of Exchequer, Court of King's Bench, and Court of Common Pleas, the passage of the Statute of Mortmain, etc. Two years later the imposition of taxation without consent of Parliament was forbidden by a special act. The great aim of Edward, however, to include England, Scotland, and Wales in one kingdom proved a failure, and he died in 1307, marching against Robert Bruce. The reign of his son Edward II was unfor-

The reign of his son Edward II was unfortunate to himself and to his kingdom. He made a feeble attempt to carry out his father's last and earnest request to prosecute the war with Scotland, but the English were almost constantly unfortunate; and at length. at Bannockburn (1314), they received a defeat from Robert Bruce which ensured the independence of Scotland. The king soon proved incapable of regulating the lawless conduct of his barons; and his wife, a woman of bold, intriguing disposition, joined in the confederacy against him, which resulted in his imprisonment and death in 1327.

The reign of Edward III was as brilliant as that of his father had been the reverse. The main projects of the third Edward were directed against France, the crown of which he claimed in 1328 in virtue of his mother, the daughter of King Philip. The victory won by the Black Prince at Crécy (1346), the capture of Calais (1347), and the victory of Poitiers (1356) ultimately led to the Peace of Brétigny in 1360, by which Edward III received all the west of France on condition of renouncing his claim to the French throne. Before the close of his reign, however, these advantages were all lost again, save a few principal towns on the coast.

Edward III was succeeded in 1377 by his grandson Richard II, son of Edward the Black Prince. The people of England now began to show, though in a turbulent manner. that

they had acquired just notions of government. In 1380 an unjust and oppressive poll tax brought their grievances to a head, and 100,000 men, under Wat Tyler, marched to-ward London (1381). Wat Tyler was killed while conferring with the king, and the prudence and courage of Richard appeased the insurgents. Despite his conduct on this occasion Richard was deficient in the vigor necessary to curb the lawlessness of the nobles. In 1398 he banished his cousin, Henry Bolingbroke: and on the death of the latter's father, the Duke of Lancaster, unjustly appropriated his cousin's patrimony. To avenge the injustice Bolingbroke landed in England during the king's absence in Ireland, and at the head of 60,000 malcontents compelled Richard to sur-He was confined in the Tower, and render. despite the superior claims of Edmund Mortimer, Earl of March, Henry was appointed king (1399), the first of the house of Lancas-Richard was, in all probability, murdered ter. early in 1400.

The manner in which the Duke of Lancaster, now Henry IV, acquired the crown rendered his reign extremely turbulent, but the vigor of his administration quelled every in-surrection. The most important-that of the Percies of Northumberland, Owen Glendower, and Douglas of Scotland-was crushed by the battle of Shrewsbury (1403). During the reign of Henry IV the clergy of England first began the practise of burning heretics under the act de haretico comburendo, passed in the second year of his reign. The act was chiefly directed against the Lollards, as the followers of Wickliffe now came to be called. Henry d. in 1413, leaving his crown to his son, Henry V, who revived the claim of Edward III to the throne of France in 1415, and invaded that country at the head of 30,000 men. The disjointed councils of the French rendered their country an easy prey; the victory of Agincourt was gained in 1415; and after a second campaign a peace was concluded at Troyes in 1420, by which Henry received the hand of Katherine, daughter of Charles VI, was appointed regent of France during the reign of his fatherin-law, and declared heir to the throne on his death. The two kings, however, d. within a few weeks of each other in 1422, and the infant son of Henry thus became king of England (as Henry VI) and France at the age of nine months.

England during the reign of Henry VI was subjected, in the first place, to all the confusion incident to a long minority, and afterward to all the misery of a civil war. Henry allowed himself to be managed by any one who had the courage to assume the conduct of his affairs, and the influence of his wife, Margaret of Anjou, a woman of uncommon capacity, was of no advantage either to himself or the realm. In France (1422-53) the English forces lost ground, and were finally expelled by the celebrated Joan of Arc, Calais alone being retained. The rebellion of Jack Cade in 1450 was suppressed, only to be succeeded by more serious trouble. In that year Richard, duke of York, the father of Edward, afterward Edward IV, began to advance his pretensions to the throne, which had been so long usurped by the house of Lancaster. His claim was founded on his descent from the third son of Edward III, Lionel, duke of Clarence, who was his great-great-grandfather on the mother's side, while Henry was the great-grandson on the father's side of John of Gaunt. duke of Lancaster, the fourth son of Edward III. Richard of York was also grandson on the father's side of Edmund, fifth son of Edward III. The wars which resulted, called the Wars of the Roses, from the fact that a red rose was the badge of the house of Lancaster and a white one that of the house of York, lasted for thirty years, from the first battle of St. Albans, May 22, 1455, to the battle of Bosworth, Aug. 22, 1485. Henry VI was twice driven from the throne (in 1461 and 1471) by Edward of York. whose father had previously been killed in battle in 1460. Edward of York reigned as Edward IV from 1461 till his death in 1483, with a brief interval in 1471; and was succeeded by two other sovereigns of the house of York, first his son Edward V, who reigned for eleven weeks in 1483; and then by his brother Richard III, who reigned from 1483 till 1485, when he was defeated and slain on Bosworth field by Henry Tudor, of the House of Lancaster, who then became Henry VII.

Henry VII was at this time the representative of the house of Lancaster, and in order at once to strengthen his own title, and to put an end to the rivalry between the houses of York and Lancaster, he married in 1486 Elizabeth, the sister of Edward V and heiress of the house of York. The king's worst fault was the avarice which led him to employ in schemes of extortion such instruments as Empson and Dudley. He d. in 1509.

The authority of the English crown, which had been so much extended by Henry VII, was by his son Henry VIII exerted in a tyrannical and capricious manner. The most important event of the reign was undoubtedly the Reformation; though it had its origin rather in Henry's caprice and in the casual situation of his private affairs than in his conviction of the necessity of a reformation in religion, or in the solidity of reasoning employed by the reform-Henry had been espoused to Catharine ers. of Spain, who was first married to his elder brother Arthur, a prince who died young. Henry became disgusted with his queen, and enamored of one of her maids of honor, Anne Boleyn. He had recourse, therefore, to the pope to dissolve a marriage which had at first been rendered legal only by a dispensation from the pontiff; but failing in his desires he broke away entirely from the Holy See, and in 1534 got himself recognized by act of Parliament as the head of the English Church. He d. in 1547. He was married six times, and left three children, each of whom reigned in turn, These were: Mary, by his first wife, Catharine of Aragon; Elizabeth, by his second wife, Anne Boleyn; and Edward, by his third wife, Jane Seymour.

Edward, who reigned first with the title of Edward VI, was nine years of age at the time of his succession, and d. in 1553 when he was only sixteen. His short reign, or rather the reign of the Earl of Hertford, afterward Duke of Somerset, who was appointed regent, was distinguished chiefly by the success which attended the measures of the reformers, who acquired a great part of the power formerly engrossed by the Catholics. The intrigues of Dudley, duke of Northumberland, during the reign of Edward, caused Lady Jane Grey to be declared his successor; but her reign, if it could be called such, lasted only a few days. Mary, daughter of Henry VIII, was placed upon the throne, and Lady Jane Grey and her husband were both executed. Mary, a bigoted Catholic, seems to have wished for the crown only for the purpose of re-establishing the Roman Catholic faith. Political motives had induced Philip of Spain to accept of her as a spouse; but she could never prevail on her subjects to allow him any share of power. She d. in 1558.

Elizabeth, who succeeded her sister Mary, was attached to the Protestant faith, and found little difficulty in establishing it in England. Having concluded peace with France (1559), Elizabeth set herself to promote the confusion which prevailed in Scotland to which her cousin Mary had returned from France as queen in 1561. In this she was so far successful that Mary placed herself in her power (1568), and after many years' imprisonment was sent to the scaffold (1587). As the most powerful Protestant nation, and as a rival to Spain in the New World, it was natural that England should become involved in difficulties with that country. The dispersion of the Armada by the English fleet under Howard, Drake, and Hawkins was the most brilliant event of a struggle which abounded in minor feats of valor. In Elizabeth's reign London became the center of the world's trade, the extension of British commercial enterprise being coincident with the ruin of Antwerp in 1585. In literature not less than in politics and in commerce the same full life displayed itself, and England began definitely to assume the characteristics which distinguish her from the other European nations of to-day.

To Elizabeth succeeded (in 1603) James VI of Scotland and I of England, son of Mary Queen of Scots and Darnley. His accession to the crown of England in addition to that of Scotland did much to unite the two nations, though a certain smouldering animosity still lingered. His dissimulation, however, ended in his satisfying neither of the contending ecclesiastical parties-the Puritans or the Catholics; and his absurd insistence on his divine right made his reign a continuous struggle between the prerogative of the crown and the freedom of the people. His extravagance kept him in constant disputes with the Parliament, who would not grant him the sums he demanded, and compelled him to resort to monopolies, loans, benevolences, and other illegal methods. The nation at large, however, continued to prosper through the whole of this inglorious reign. His son Charles I who succeeded him in 1625, inherited the same exalted ideas of royal prerogative, and his marriage with a Catholic, his arbitrary rule, and illegal methods of raising money, provoked bitter hostility. Under the guidance of Laud and Stafford things went from bad to worse. Civil war broke out in 1642 between the king's party and that of the Parliament, and the latter proving victorious, in 1649 the king was beheaded.

A commonwealth or republican government was now established, in which the most prominent figure was Oliver Cromwell. Mutinies in the army among Fifth-monarchists and Levelers were subdued by Cromwell and Fairfax, and Cromwell in a series of masterly movements subjugated Ireland and gained the important battles of Dunbar and Worcester. At sea Blake had destroyed the Royalist fleet under Rupert, and was engaged in an honorable struggle with the Dutch under Van Tromp. But within the governing body matters had come to a deadlock. A dissolution was necessary, yet Parliament shrank from dissolving itself, and in the meantime the reform of the law, a settlement with regard to the church, and other important matters remained un-touched. In April, 1653, Cromwell cut the knot by forcibly ejecting the members and putting the keys of the house in his pocket. From this time he was practically head of the government, which was vested in a council of thirteen. A parliament-the Little or Barebones Parliament-was summoned, in December of the same year. Cromwell was installed Lord Protector of the Commonwealth of England, Scot-land, and Ireland. With more than the power of a king, he succeeded in dominating the confusion at home and made the country feared throughout the whole of Europe. Cromwell d. in 1658, and the brief and feeble protectorate of his son Richard followed.

There was now a widespread feeling that the country would be better under the old form of government, and Charles II, son of Charles I, was called to the throne by the Restoration of 1660. He took complete advantage of the popular reaction from the narrowness and intolerance of Puritanism, and even latterly endeavored to carry it to the extreme of establishing the Catholic religion. The abolition of the censorship of the press (1670), and the reaffirmation of the habeas corpus principle are the most praiseworthy incidents of the reign.

As Charles II left no legitimate issue, his brother, the Duke of York, succeeded him as James II (1685-88). An invasion by an illeritimate son of Charles, the Duke of Monmouth, who claimed the throne, was supported by the wholesale butcheries of such instruments as Kirke and Jeffreys. The whole nation was prepared to welcome any deliverance, and in 1689 William of Orange, husband of James's daughter Mary, landed in Torbay. James fled to France, and a convention summoned by Wiliam settled the crown upon him, he thus

becoming William III. Annexed to this settlement was a Declaration of Rights circumscribing the royal prerogative by depriv-ing him of the right to exercise dispensing power, or to exact money, or to maintain an army without the assent of Parliament. This placed henceforward the right of the British sovereign to the throne upon a purely statutory basis. A toleration act, passed in 1689, released dissent from many penalties. An armed opposition to William lasted for a short time in Scotland, but ceased with the fall of Viscount Dundee, the leader of James's adherents; and though the struggle was prolonged in Ireland, it was brought to a close before the end of 1691. The following year saw the origination of the national debt, the exchequer having been drained by the heavy military ex-penditure. A bill for triennial parliaments was passed in 1604, the year in which Queen Mary died. For a moment after her death William's popularity was in danger, but his successes at Namur and elsewhere, and the obvious exhaustion of France, once more confirmed his power. The treaty of Ryswick followed in 1697, and the death of James II in exile in 1701 removed a not unimportant source of danger. Early in the following year William also died, and by the act of settlement Anne succeeded him.

The closing act of William's reign had been the formation of the grand alliance between England, Holland, and the German Empire, and the new queen's rule opened with the brilliant successes of Marlborough at Blenheim (1704) and Ramilies (1706). Throughout the earlier part of her reign the Marlboroughs practically ruled the kingdom, the duke's wife, Sarah Jennings, being the queen's most intimate friend and adviser. In 1707 the history of England becomes the history of Great Britain, the Act of Union passed in that year binding the parliaments and realms of England and Scotland into a single and more powerful whole. See art. Great Britain.

English Art.— As regards architecture little can be said with regard to the style prevalent between the invasion of the Anglo-Saxons and the Norman Conquest, from the fact that the remains of buildings erected in England before the Conquest are few and insignificant. The Norman style was introduced in the reign of Edward the Confessor. The Norman period proper extends from about 1090 to 1150, some of the best examples being parts of the cathedrals of Rochester, Winchester, Durham, and Canterbury. In the brief period 1160 to 1195 a marked change took place in the adoption of the pointed arch and what is known as the Early English style. Improved methods of construction led to the use of lighter walls and pillars instead of the heavy masses employed in the Norman style. Narrow lancet-shaped windows took the place of the round arch; bold projecting buttresses were introduced; and the roofs and spires became more lofty and more pointed, while in the interiors pointed arches rested on lofty clustered pillars. The Early English style has been regarded as lasting from 1190 to

1270, when the *Decorated style* of Gothic began to prevail. The transition to the Decorated style was gradual, but it may be considered as lasting to 1377. Between 1360 and 1300 the Decorated style gave place to the *Perpendicular*, which prevailed from 1377 to 1547, and was an exclusively English style. Gothic architecture, though it lingered on in many districts, practically came to an end in Eng-gland in the reign of Henry VIII. The Eliza-bethan and Jacobean styles which followed were transitions from the Gothic to the Italian, with which these styles were more or less freely mixed. In the reign of Charles I, Inigo Jones designed, among other buildings. Whitehall Classic style. After the great fire in London (1666) Sir Christopher Wren designed an immense number of churches and other build-ings in classic style, particularly St. Paul's Cathedral. Various phases of classic or Renaissance continued to prevail during the eighteenth and the earlier part of the nine-teenth century. About 1836 the Gothic revi-val commenced, and that style has been employed with considerable success in the churches erected in recent times. The Houses of Parliament, erected in 1840-1860 in the Tudor style, the Law Courts of Salford, St. Pancras railway station, and the Law Courts of London (opened 1822) in the Gothic served to sustain an impetus that had been given to the use of that style. At the present day Gothic is much employed for ecclesiastical and collegiate buildings, and a mild type of Re-naissance for civil buildings. Of late years a style that has received the name of "Queen Anne" is much in vogue for private residences. It is very mixed, but withal highly picturesque. The most striking novelties in the nineteenth century have been induced by the extensive use of iron and glass, as exemplified in the Exhibition building of 1851, the Crystal Palace. Sydenham, and the great railway stations.

Very little is known of the state of the art of *painting* among the Anglo-Saxons; but in the ninth century Alfred the Great caused numerous MSS, to be adorned with miniatures, and about the end of the tenth century Archbishop Dunstan won reputation as a miniature painter. Under William the Conqueror and his two sons the painting of large pictures began to be studied, and Lanfranc, archbishop of Canterbury, adorned the vault of his church with paintings. Down to the eighteenth century a succession of foreign painters resided in England, of whom the chief were Mabuse, Hans Holbein, Cornelius Jansen, Vandyck, Lely, and Kneller. Of native artists few are of importance prior to William Hogarth (1697-1764). Throughout the eighteenth century English artists attained higher eminence in portrait-painting than in other departments, and it culminated in Sir Joshua Reynolds (1723 -92), Thomas Gainsborough (1727-88), and Romney (1734-1802). Landscape painting was represented by Richard Wilson (1714-82), who painted classical scenes with figures from heathen mythology, and by Gainsborough already

mentioned, who painted scenes of English nature and humble life. The Royal Academy of Arts, of which Reynolds was the first president, was established in London in 1769. In landscape the reputation of Turner (1775-1857) stands alone, solitary, colossal. Other distinguished landscape painters are Clarkson Stanfield (1798-1867); David Roberts (1796-1864), who greatly excelled in picturesque architect-ure; Wm. Müller (1812-45); and John Constable (1776-1837); whose works exercised great influence in France. In historical painting Hilton (1786-1839), Eastlake (1703-1865), Etty (1787 -1849), E. M. Ward (1816-79), C. W. Cope (b. 1811), and D. Maclise (1811-70) attained celeb-John Philip (1817-67) greatly distinrity. guished himself by his scenes from Spanish life and by his mastery in color. Landseer (1802-73) stands by himself as a painter of animals.

In 1824 the nucleus of the National Gallery was formed by the purchase of the Angerstein collection, and in 1832 the vote was passed for the erection of the National Gallery building. The competitions held in Westminster Hall in 1843, 1844, and 1847, with a view to the decoration of the houses of Parliament, exercised great influence on art. Up to this time English pictures were rather distinguished for color and effect of light and shade than for carefulness of modeling and exactness of drawing. In aiding to bring about a more accurate and careful style of work, the Pre-Raphaelites (1840-60), while seeking to restore in their practise an early phase of Italian art, exercised a beneficial influence, while they themselves ultimately abandoned the style to which at the first they had been devoted.

which at the first they had been devoted. The modern group of British painters may be held to date from about 1850. Prominent among these the following may be named: In historical painting Leighton, Alma-Tadenfa, Watts, Long, Goodall, Holman Hunt. Burne-Jones, and Madox Brown, as also W. P. Frith, whose Derby Day and Railcay Station so descriptive of modern life, may well be classed as historical. In figure painting, or genre, T. Faed, Erskine Nicol, Fildes. Orchardson, Herkomer, and Pettie. In portraiture Millais, Frank Holl, Ouless, and Richmond. In landscape Linnell, Hook, Peter Graham, John Brett, and Keeley Halswelle. In water colors the most eminent artists have been Girtin, Cotman, Liverseege, Stothard, Turner, and David Cox.

English sculpture was long merely an accessory to architecture, and few English sculptors are known by name till comparatively modern times. During the Renaissance period Torregiano came from Italy and executed two masterpieces in England, the tomb of the mother of Henry VII, and that of Henry himself at Westminster. After the Restoration two sculptors of some note appeared, Grinling Gibbons, a wood carver, and Caius Gabriel Cibber. John Flaxman and his rival and successor, Sir Francis Chantrey, acquired renown by the busts and statues which they made of many of the eminent men of the time. W. H. Thorneycroft, J. E. Boehm, E. Onslow Ford.

C. B. Birch, and Alfred Gilbert are among the foremost sculptors of the present time.

English Language. - The language spoken in England from the settlement of the Anglo-Saxons to the Norman Conquest (say 500-1066) is popularly known as Anglo-Saxon, though simply the earliest form of English. It was a highly inflected and purely Teutonic tongue presenting several dialects. The Conquest introduced the Norman-French, and from 1066 to about 1250 two languages were spoken. the native English speaking their own language, the intruders speaking French. During this period the grammatical structure of the native language was greatly broken up. inflexions fell away, or were assimilated to each other; and toward the end of the period we find a few works written in a language resembling the English of our own day in grammar, but differing from it by being purely Saxon or Teutonic in vocabulary. Finally. the two languages began to mingle and form one intelligible to the whole population. Nor-mans as well as English, this change being marked by a great infusion of Norman-French words, and English proper being the result. English is thus, in its vocabulary, a composite language, deriving part of its stock of words from a Teutonic source and part from a Latin source, Norman-French being in the main merely a modified form of Latin. In its grammatical structure and general character, how-ever, English is entirely Teutonic, and is classed with Dutch and Gothic among the Low German tongues. If we divide the history of the English language into periods we shall find three most distinctly marked: 1. the Old English or Anglo-Saxon, extending down to about 1100; 2, the Middle English. 1100-1400 (to this period belong Chaucer, Wickliffe, Langland); 3, Modern English. A more detailed subdivision would give transition priods connecting the main ones. The chief change which the language has experienced during the modern period consists in its ab-sorbing new words from all quarters in obdience to the requirements of advancing science, more complicated social relations, and increased subtlety of thought. At the present time the rapid growth of the sciences already existing, and the creation of new ones, have caused whole groups of words to be introduced, chiefly from the Greek.

English Literature.—Before any English literature. in the strict sense of the term, existed. four literatures had arisen in England-the Celtic, Latin, Anglo-Saxon, and Anglo-Norman. The first includes such names as those of Taliesin, Llywarch Hen, Aneurin, and Merlin or Merddhin. The Latin literature prior to the Conquest presents those of Aldhelm, Bede. Alcuin, Asser, Ethelwerd, and Nennius. With the coming of the Normans, although the Anglo-Saxon Chronicle was continued until 1134, the native language practically ceased for a time to be employed in literature. Latin being employed in law, history, and philosophy: French in the lighter forms of literature. The Latin literature included important contribu-

tions to the Scholastic philosophy by Alexander Hales (d. 1245), Duns Scotus (d. 1308), and William of Occam (d. 1347), the philosophic works of Roger Bacon(1214-92), the Golias poems of Walter Map, and a long list of chronicles or histories, either in prose or verse, by Eadmer (d. 1124), Ordericus Vitalis (d. 1142), William of Malmesbury (d. 1143), Geoffrey of Monmouth (d. 1154), Joseph of Exeter (d. 1195), Roger of Wendover (d. 1237), Giraldus Cambrensis (d. 1222), and Matthew Paris (d. 1259).

Apart from a few brief fragments, the first English writings after the Conquest are the Brut of Layamon (about 1200), based on the Brut of Wace. Next in importance come the rhyming chroniclers, Robert of Gloucester, and Robert of Brunne, or Mannyng (d. 1340). To this pre-Chaucerian period belong also several English translations of French romances -Horn, Tristrem, Alisaunder, Havelok, and Between the beginning and the midothers. dle of the fourteenth century the English speech had entered upon a new phase of development in the absorption of Norman-French words. A rapid expansion of the literature followed, having as the foremost figure that of Chaucer (1340-1400), who. writing at first under French influences, and then under Italian, became in the end the most representative English writer of the time. Contemporary with him were the poets William or Robert Langland (1332-1406), John Gower (1325-1408), John Barbour (1316-95). In prose the name of John Wickliffe (1324-84) is pre-eminent, the English version of Mandeville's Travels being apparently of later date.

The period from the time of Chaucer to the appearance of Spenser, that is, from the end of the fourteenth to near the end of the sixteenth century, is a very barren one in English literature, in part probably owing to foreign and domestic wars, the struggle of the people toward political power, and the religious controversics preceding and attending the Reformation. The literature was chiefly polemical, the only noteworthy prose prior to that of More being that of Reginald Pecock (1390-1460), Sir John Fortescue (1305-1485), the Paston Letters (1422-1505), and Malory's *Morte d' Arthur* (completed 1460-70); the only noteworthy verse, that of John Skelton (1460-1520).

It was now that several events of European importance combined to stimulate life and enlarge the mental horizon—the invention of printing, or rather of movable types, the proomy, the discovery of America, the Renaissance, and the Reformation. The Renaissance spread from Florence to England by means of such men as Colet, Linacre, Erasmus, and Sir Thomas More (1480–1535), the last noteworthy as at the head of a new race of historians. Important contributions to the prose of the time were the *Tyndale New Testament*, printed in 1525, and the *Coverdale Bible* (1535). The first signs of an artistic advance in poetic literature are to be found in Wyatt (1503–42) and Surrey (1516-47), who nationalized the sonnet.

and of whom the latter is regarded as the introducer of blank verse. The drama, too, had by this time reached a fairly high stage of development. The mystery and miracle plays, after the adoption of the vernacular in the fourteenth century, passed from the hands of the clergy into those of the laity, and both stage and drama underwent a rapid seculari-The morality began to embody matzation. ters of religious and political controversy, historical characters mingled with the personification of abstract qualities, real characters from contemporary life were introduced, and at length farces on the French model were constructed, the Interludes of John Hayward (d. 1505) being the most important examples. To Nicholas Udall (1504-56) the first genuine comedy, Ralph Roister Doister, was due, this being shortly afterward followed by John Still's Gummer Gurton's Needle. The first tragedy, the Ferrex and Porrex, or Gorboduc of Sackville and Norton, was performed in 1561, and the first prose play, the Supposes of Guscoigne in 1566. Gascoigne and Sackville were in other regards than drama noteworthy among the earlier Elizabethans; but the figures which bulk most largely are those of Sidney and Spenser. In drama Lyly, Peele, Greene, Nash, and Marlowe are the chief immediate precursors of Shakespeare, Marlowe alone, however, being at all comparable with the great Contemporary and later dramatic master. writers were Ben Jonson, the second great Elizabethan dramatist, Middleton Marston, (better known as a satirist). Chapman, Thomas Heywood, Dekker, Webster, Ford, Beaumont and Fletcher, and Massinger. In Elizabethan prose the prominent names are those of Roger Ascham, Lyly the Euphuist, Hooker, Raleigh, Bacon, the founder in some regards of modern scientific method, Burton, Herbert of Cherbury, and Selden, with Overbury, Knolles. Holinshed, Stowe, Camden, Florio, and North. The issue of the authorized version of the Bible in 1611 may be said to close the prose list of the period.

After the death of James I the course of literature breaks up into three stages, the first from 1625 to 1640, in which the survivals from the Elizabethan Age slowly die away. The "metaphysical poets." Cowley, Wither, Her-bert, Crashaw, Habbington, and Quarles, and the cavalier poets, Suckling, Carew, Denham, all published poems before the close of this period, in which also Milton's early poems were composed, and the Comus and Lycidas published. The second stage (1640-60) was almost wholly given up to controversial prose, the Puritan revolution checking the production of pure literature. In this controversial prose of the time Milton was easily chief. With the Restoration a third stage was begun. Milton turned his new leisure to the composition of his great poems; the drama was revived, and Davenant and Dryden, with Otway, Southerne, Etherege, Wycherley, Congreve, Vanbrugh, and Farquhar in their first plays, and minor playwrights, are the most representative writers of the period. Butler established a genre

49

in satire, and Marvell as a satirist in some respects anticipated Swift; Roscommon, Rochester, and Dorset contributed to the little poetry: while in prose we have. Hobbes, Clarendon, Fuller, Sir Thomas Browne, Walton, Cotton. Pepys and Evelyn, John Bunyan, Locke, Sir William Temple, Owen Feltham, Sir Henry Wotton, James Harrington, and a crowd of theological writers, of whom the best known are Jeremy Taylor ("Spenser of prose" and "Shakespeare of divines"). Richard Baxter, Robert Barclay, William Penn, George Fox, Isaac Barrow, John Tillotson, Stillingfleet, Bishop Pearson, Sherlock, South, Sprat, Cudworth, and Burnet. Other features of the last part of the seventeenth century were the immense advance in physical science under Boyle, Isaac Newton, Harvey, and others, and the rise of the newspaper press.

rise of the newspaper press. Dryden's death in 1700 marks the commencement of the so-called Augustan Age in English literature. During it, however, no greater poet appeared than Pope (1688-1744), in whom sagacity, wit, and fancy take the place of the highest poetic faculty, but who was a supreme artist within the formal limits of his conception of metrical art. Against these formal limits signs of reaction are apparent in the verse of Thomson, Gray, Collins, Goldsmith, and in the productions of Macpherson and Chatterton. The poets Prior, Gay, and Ambrose Phillips inherit from the later seventeenth century, Gay being memorable in connection with English opera; and there are a large number of small but respectable poets. It is in prose that the chief development of the eighteenth century is to be found, Defoe and Swift led the way in fiction and prose satire: Steele and Addison, working on a suggestion of Defoe, established the periodical essay. Goldsmith also falls into the fictional group as well as into those of the poets and the essayists. Johnson exercised during the latter part of his life the power of a literary dictator, with Bosweil as literary dependent. The other chief prose writers were Bishop Berkeley, Arbuthnot, Bolingbroke, Burke, the historians David Hume, William Robertson, Edmund Gibbon; the political writers Wilkes and Junius; the economist and moral philosopher, Adam Smith; the philosophical writers, Hume, Bentham, and Dugald Stewart; the scholars, Bentley, Sir William Jones, and Richard Porson; the theologians, Atterbury, Butler, Warburton, and Paley, and some inferior playwrights, of whom Rowe, John Home, Colley Cibber, Colman the elder, Foote, and Sheridan were the most important.

With the French Revolution, or a few years earlier, the modern movement in literature may be said to have commenced. The departure from the old traditions, traceable in Gray and Collins, was more clearly exhibited in the last years of the century in Cowper (1731-1800) and Burns (1759-96), and was developed and perfected in the hands of Blake, Bowles, and the "Lake Poets," Wordsworth, Coleridge, and Southey; but there were at first many survivals from the poetic manner of the seventeenth century, such as Erasmus Darwin, Dr. John

Wolcot, Robert Bloomfield, and Samuel Rog-Among the earlier poets of the century, also, were George Crabbe, Sir Walter Scott. Hogg, Campbell. A more important group was that of Byron, Shelley, and Keats with which may be associated the names of Leigh Hunt, Thomas Moore, and Landor. Among the earlier writers of fiction there were several women of note, such as Maria Edgeworth, and Jane Austen. The greatest name in fiction is Sane Austen. The greatest name in action is unquestionably that of Scott. Other prose writers were Mackintosh, Malthus, Hallam, James Mill. Southey, Hannah More, Cob-bett, William Hazlitt, Sydney Smith. In the literature since 1830 poetry has included as its chief names those of Praed, Hood. Sidney Dobell, Alexander Smith, Charles Mackay William Allingthem Elizabeth Bar. Mackay, William Allingham, Elizabeth Barrett-Browning, Coventry Patmore, Lord Lytton (Owen Meredith), Arthur Hugh Clough. Matthew Arnold, Dante G. Rossetti, Robert Buchanan, Wm. Morris, Swinburne, and last and greatest, Tennyson and Browning. A brilliant list of novelists for the same period includes Lord Lytton, Ainsworth, Benjamin Disraeli (Earl of Beaconsfield), Dickens, Thackeray, Charles Kingsley, Charlotte Bronté. Wilkie Collins, George Mac Donald, Charles Reade, George Eliot, William Black, Thomas Hardy, R. D. Blackmore, George Meredith. Mrs. Craik (Miss Muloch), Mrs. Öliphant. Miss Yonge, Miss Thackeray, and others. To the historical and biographical list belong Allison. Macaulay, Carlyle, Cornwall Lewis, Milman. Froude, Lecky, Kinglake, John Richard Green, Dean Stanley, John Morley, Leslie Stephen. Prominent among the theological writers have been Dr. Newman, Whately, Augustus and Julius Hare, Maurice, Hamilton. Alford, Stopford Brooke, Liddon, Isaac Taylor. James Martineau, and Caird. In science and philosophy among the chief writers have been Sir W. Hamilton, John Stuart Mill, Alex-ander Bain, Hugh Miller, Charles Darwin, Humler Marthell Mar Miller, Charles Darwin, Huxley, Tyndall, Max Müller, Herbert Spencer. T. H. Green. Of the other prose writers of importance the chief are De Quincey, Harriet Martineau, Sir Arthur Helps, Ruskin, Mat-thew Arnold, W. E. Gladstone. For American Literature see United States.

English Channel, the arm of sea which separates England from France, extending, on the English side, from Dover to the Land's End; and on the French, from Calais to the Island of Ushant.

Engraving, the art of representing objects and depicting characters on metal, wood, precious stones, etc., by means of incisions made with instruments variously adapted to the substances operated upon and the description of work intended. Impressions from metal plates are named engravings, prints, or plates; those printed from wood being called indifferently wood engravings and woodcuts. While, however, these impressions are not altogether dissimilar in appearance, the processes are distinct. In plates the lines intended to print are incised, and in order to take an impression the plate is daubed over with a thick ink which fills all the lines. The surface is then wiped perfectly clean, leaving only the incised lines filled with ink. A piece of damp paper is now laid on the face of the plate, and both are passed through the press, which causes the ink to pass from the plate to the paper. This operation needs to be repeated for every impression. In the wood block, on the contrary, the spaces between the lines of the drawing are cut out, leaving the lines standing up like type, the printing being from the inked surface of the raised lines, and effected much more rapidly than plate printing.

Engraving on wood, intended for printing or impressing from, long preceded engraving on metals. The art is of Eastern origin, and at least as early as the tenth century engraving and printing from wood blocks was common in China. We first hear of wood engraving being cultivated in Europe by the Italians and Germans in the thirteenth century. For a hundred and fifty years, however, there is small indication of the practise of the art, which was at first confined to the production of block books, playing cards, and religious prints. In the fifteenth century the art of printing from engraved plates was discovered in Florence by Maso Finiguerra. Engraving had long been used as a means of decorating armor, metal vessels, etc., the engravers generally securing duplicates of their work before laying in the niello (a species of metallic enamel) by filling the lines with dark color, and taking casts of them in sulphur. The discovery of the practicability of taking impressions upon paper led to engraving upon copper plates for the purpose of printing from. The plates for the purpose of printing from. date of the earliest known niello proof upon paper is 1452. The work of the Florentine engravers, however, was almost at once surpassed in Venice and elsewhere in North Italy by Andrea Mantegna (1431-1505), Girolamo Mocetto, Giovanni Batista del Porto, and others. In Marc Antonio Raimondi (1475-1534), who wrought under the guidance of Raphael, and reproduced many of his works, the art reached its highest point of the earlier period, and Rome became the center of a new school, which included Marco da Ravenna (d. 1527), Giulio Bonasone (1531-1572), and Agostino de Musis (d. 1536). In the meantime, in Germany the progress of the art had been not less rapid. Of the oldest school the most important engraver is Martin Schongauer (1420-1488). He was, however, surpassed a generation later by Albert Durer (1471-1528), who excelled both in copper and wood engraving, especially in the latter. The Dutch and Flem-ish schools, of which Durer's contemporary, Lucas van Leyden was the head, did much to enlarge the scope of the art. Rubens (1577-1640) influenced engraving through the two Bolswerts, Vorstermann, Pontius and P. de Jode, who engraved many of his works on a large size. Toward the end of the seventeenth century etching, which had before been rarely used, became more common, and was practised with great success by Rembrandt

(1607-1669) and other painters of that period. In France Noel Garnier founded a school of engraving about the middle of the sixteenth century; but it produced no work of any high distinction until the reign of Louis XIV, when Nanteuil's pupils Gerard Edelinck and Gerard Audran flourished. But these were all surpassed about the middle of the eighteenth century by Wille (1717-1807), a German resident in Paris. Before the middle of the seventeenth century England produced little noteworthy work, availing herself principally of the work of foreign engravers, of whom many took up temporary and even perma-nent residence. The first English engraver of marked importance was William Hogarth (1697-1764). Vivares (1712-1782). a Frenchman by birth, laid the foundation of the English school of landscape engraving, which was still further developed by William Woollet (1735-1785), who was also an excellent engraver of the human figure. The substitution of steel for copper plates (1820-1830) gave the power of producing a much larger number of fine impressions, and opened new possibilities for highly finished work. During the closing years of the eighteenth century line engraving attained a depth of color and fullness of tone in which earlier works generally are deficient, and during the present century it has reached a perfectness of finish which it had not previously attained. Among engravers who have produced historical works of large size and in the line manner the names of Raphael Morghen (1758-1833), Longhi (1766-1831), and Toschi, in Italy; of Forster (1790-1872), and Blanchard (b. 1819), in France; of John Burnet (1784-1868), J. H. Robinson (1796-1871), Geo. T. Doo (1800-1886), J. H. Watt (1799-1867), and Lumb Stocks (b. 1812), in England, stand preeminent. In the period 1820-60 landscape engraving attained a perfection in Great Britain which it had not attained in any other country, or at any other time. In the period 1830-45 various publications called Annuals, composed of light literature in prose and verse, and illustrated by highly finished engravings in steel, were very popular. The unrivaled illustrations of Rogers's Poems and Rogers's Raly, after Turner and Stothard, belong to this Many of the originals of the engravperiod. ings in the Annuals were finished pictures of large size. A great part of the difficulty in engraving on a small scale from a large picture, consists in determining what details can be left out, and still preserve the full effect and character of the original. Since 1870 many plates have been produced by a combination of etching and dry point, a comparatively cheap and rapid process. Such works have been fashionable and very popular with collectors. But while some of them have been excellent of their kind, the process is of limited resource, and the best works in this manner will not stand comparison with the masterpieces of line engraving. In France and in Germany some able line engravers are in practise.

Line Engraving, as implied by the term, is executed entirely in lines. The tools are few and simple. They consist of the graver, or burin, the point, the scraper, and the burnisher; an oil stone or hone, dividers, a parallel square, a magnifying lens; a bridge on which to rest the hand; a blind or shade of tissue paper, to make the light fall equally on the plate, callipers for leveling important erasures, a small steel anvil, a small pointed hammer, and punches. In etching, the following articles are required: a resinous mixture called etching ground, capable, when spread very thinly over the plate, of resisting the action of the acids used; a dauber for laying the ground equally; a hand vice; some hair pencils of different sizes, and bordering wax, made of Burgundy-pitch, beeswax, and a little oil.

In engraving, the plate, which is highly polished and must be free from all scratches, is first prepared by spreading over it a thin layer of ground. The surface is then smoked, and the outline of the picture transferred to it by pressure from the paper on which it has been drawn in fine outlines by a black lead pencil. The picture is then drawn on the ground with the etching needle, which removes the ground in every form produced by it, and leaves the bright metal exposed. A bank of wax is then put round the plate and diluted acid poured on it, which eats out the metal from the lines from which the ground has been removed, but leaves the rest of the plate untouched. The leaves the rest of the plate untouched. plate is then gone over with the graver, the etched lines clearly defined, broken lines connected, new lines added, etc. Sometimes the plate is rebitten more than once, those parts which are sufficiently bitten in the first treatment being stopped with varnish, and only the selected parts exposed to after-biting. Finally the burnisher is brought into play alternately with the graver and point to give perfectness and finish. Such is the process for landscape In historical and portrait engravengraving. ing of the highest class, the lines are first drawn on the metal with a fine point and then cut in by the graver, first making a fine line and afterward entering and re-entering till the desired width and depth of lines is attained. Much of the excellence of such engravings depends on the mode in which the lines are laid, their relative thickness, and the manner in which they cross each other. In historical engraving etching is but little used, and then only for accessories and the less important parts.

Soft-ground Etching .- The ground, made by mixing lard with common etching ground, is laid on the plate and smoked as before, but its extreme softness renders it very liable to injury. The outline of the subject is drawn on a piece of rough paper larger than the plate. The paper is then damped, and laid gently over the ground face upward, and the margins folded over and pasted down on the back of When the paper is dry and tightly the plate. stretched the bridge is laid across, and with a hardish pencil and firm pressure the drawing The presis completed in the usual manner. sure makes the ground adhere to the back of the paper at all parts touched by the pencil,

## Engraving

and on the paper being lifted carefully off. these parts of the ground are lifted with it, and the corresponding parts of the plate thus left bare are exposed to the subsequent action of the acid. The granulated surface of the paper, causing similar granulations in the touches on the ground, gives the character of a chalkdrawing. The biting-in is effected in the same manner as already described, and the subject is finished by rebiting and dotting with the graver.

Stipple, or Chalk Engraring, in its pure state. is exclusively composed of dots, varying in size and form as the nature of the subject demands; but few stipple plates are now produced without a large admixture of line in all parts. flesh excepted. A great advance, however, has been made in stipple engraving by the introduction of large and varied forms of dotting in the draperies, the results almost rivaling line engraving in richness and power.

line engraving in richness and power. The process of Aquatint and Mezzotint will be found under their respective heads, the latter differing from all other styles of engraving in that the lights and gradations are scraped or burnished out of a dark ground that has first been wrought upon the plate, instead of the forms being corroded or cut into a plain surface.

The Mixed Style is based on mezzotinto, which, still forming the great mass of shading. is in this method combined with etching in the darker, and stipple in the more delicate parts. By this combination a plate will produce a larger number of good impressions than were it done entirely in mezzotinto.

Engraving on Wood .- Wood engravings are made on Turkish boxwood which ranges in value from one eighth of a cent to eight cents a square inch. The finer the grain the higher the price, and the fine, close-grained wood is only used for the best work. The wood is cut across the grain, and as a boxwood log is seldom over four inches in diameter, the blocks of wood are joined together. So perfect is the joining that the joints cannot be detected. A slab of boxwood is as thick as type are long. One side of the slab is polished and finished. and wherever there are imperfections in the wood, a hole is bored and a plug of wood is neatly inlaid. A block of the required size is sawed from the slab and prepared for the artist. If the artist is to draw the design or picture to be engraved on the block, the engraver scours the face of the block with pum-ice stone and a little water. When the wood is bright enough the water is dried off and a little flake white is rubbed over the surface. This gives a drawing surface. The artist then sketches the design and turns the block over to the engraver.

Sometimes the object which is to be reproduced by the wood engraver is photographed on the face of the block. A reverse negative is obtained, and the face of the wood is coated with gelatin and treated with a mixture of zinc white and acids. The surface is then sensitized with nitrate of silver in a "dark room." The negative is clamped to the block.

film side next to the wood, and a photographic print is made in the usual manner. The wood engraver's tools are delicate and made of the finest steel, and are called gravers. These include "tint" tools, which are used for cutting mechanical or perfectly straight parallel lines; "lozenge" tools, used for cutting artistic or curved lines; elliptical tools, gouges, etc. If a slip of the knife is made, a hole is bored in the block where the tool slipped, and a plug of wood is inserted. Before the engraver begins cutting out the design he gums a piece of paper over the sketch or photograph, he tears out a hole over that part of the work where he begins engraving. The of the work where he begins engraving. paper keeps the hand and fingers from smudging the drawing, and as the work progresses he enlarges the hole. After the job is finished a proof is taken under a hand press, and if it is satisfactory the woodcut is sent to the electrotyper, as the printing is not done from the

woodcut, but from electrotypes of it. En'nius, QUINTUS (B.C. 239-169), an early Latin poet, considered by the Romans as the father of their literature, was b. at Rudiæ.

**Enns**, a river in Austria, which rises in the Alps of Salzburg, and enters the Danube a little below the town of Enns. Total course about 160 mi.

**Enoch**, Book of, an apocryphal book of an assumedly prophetical character, to which considerable importance has been attached on account of its supposed quotation by St. Jude in the fourteenth and fifteenth verses of his epistle. It is referred to by many of the early fathers; is of unknown authorship, but was probably written by a Palestinian Hebrew. Its date is also uncertain, critical conjecture ranging from 144 B.C. to 132 A.D.

Ensliage (or Silage), green forage crops preserved as near as possible in its natural condition for stock food. If properly handled it is relished by nearly all kinds of farm animals, especially by cattle. At the present time it is largely used by dairy farmers. All kinds of forage can be used for ensilage but corn is the favorite crop. An air-tight mow or silo is used for storing ensilage. It is generally made in a portion of the barn and should be very near the place of feeding. The higher the silo the better the ensilage will keep as it becomes more compact, thus better excluding the air. Some build the silo round, others octagonal, but more generally they are square with diagonal pieces perhaps six or eight inches wide, placed in the corners. The bottom should be on a cement floor. The main point in raising corn for ensilage is to get as large a crop as possible of both forage and corn. When the corn is of both forage and corn. nearly ripe enough for ordinary cutting, it is drawn to the silo and cut in proper lengths for storing, It is well distributed in the silo and thoroughly tramped, special care being taken at the sides and corners. Two days' time is sufficient for filling the average silo. If the silo is 20 or 30 ft. in height, the ensilage will settle from 5 to 7 ft., and if more ensilage is required it can be refilled after settling three or four days. One or two loads of straw is run

#### Entozoa

through the cutter and placed on top of the ensilage for covering. In the winter it is fed with little trouble. The cattle will eat it up clean. Horses and sheep also are very fond of it. A small amount of space for storing a large amount of stock food is one of the economic points in favor of ensilage. A cubic foot in the silo will weigh 40 to 50 fb.

Entab' lature, in architecture, the horizontal, continuous work which rests upon a row of columns, and belongs especially to classical architecture. It consists of three principal

Example of Doric Entablature.

divisions — the architrare immediately above the abacus of the column, next the *frieze*, and then the cornice. In large buildings projections similar to and known also as entablatures are often carried round the whole edifice, or along one front of it.

Enta'da, a genus of leguminous phants, suborder Mimoseæ, containing about a dozen species of climbing tropical shrubs, remarkable for the great size of their pods. *E. scandens* has pods which measure from 6 to 8 ft. in length. The seeds have a hard, woody, and beautifully polished shell, and are often made into snuff-boxes, scent-bottles, etc.

**Entail**', in law, the settlement of an estate by which a freehold is limited to a person and the heirs of his body, with such particular restrictions as the donor may specify. Entailed estates are divided into general and special, the former when the estate is given to the donee and his heirs without exception, the latter when the estate is limited to certain heirs to the exclusion of others.

Entomol' ogy, the branch of zoology which treats of the insects, the name being from Greek entôma, animals "cut in," the transverse division or segmentation of the body being their most conspicuous feature. See Insects.

Entozo'a, a general name for those annulose parasitical animals, which infest the bodies of other animals. Some are found in the intestines, others in the liver, brain, muscles, and other tissues. They pass through different stages in their development, and at each stage occupy a different tissue and usually a different animal. Entre Rios (en'tre  $r\bar{s}$ 'os) ("between rivers"), a province of the Argentine Republic, lying between the Uruguay and the Parana: area est. at 45,000 sq. mi.; pop. 300,000. The province is largely pastoral. Capital Concepcion, with a pop. of 10,000. En'try, in law, the act of taking possession

En'try, in law, the act of taking possession of lands or tenements by entering or setting foot on the same.

En'velopes, the paper covers that enclose letters or notes. They became common shortly after the introduction of the penny postage system; were at first made chiefly by hand, but are now not only shaped, but folded, gummed, etc., by machinery.

**E'ocene**, in geology, a term applied to the lower division of the Tertiary strata, from Gr. eos, dawn, and kainos, recent, because remains of existing organic species first occur here. The Eocene beds are arranged in two groups, termed the lower and Upper Eocene; the strata formerly called Upper Eocene being now known as Oligocene.

Eozo'ic Rocks, the name given to the oldest fossiliferous rocks, such as the Laurentian and Huronian of Canada, from their being supposed to contain the first or earliest traces of life in the stratified systems.

Ep'acris, a genus of monopetalous exogens, the typical genus of the natural order Epacridaceæ, distinguished by having a colored calyx with many bracts, a tubular corolla with smooth limb, stamens affixed to the corolla, and a five-valved, many-seeded capsule. The species are shrubdy plants, with axillary, white, red, or purple flowers, generally in leafy spikes. The order Epacridaceæ consists of Australia. The fruit of some species is eaten under the name of Australian cranberry, and they are cultivated in greenhouses for their flowers.

**Ep'act**, in chronology, the excess of the solar month above the lunar synodical month, and of the solar year above the lunar year of twelve synodical months. The epacts then are annual and menstrual, or monthly. Suppose the new moon to be on January 1: the month of January containing 31 days, and the lunar month only 29 days, 12 hours, 44 minutes, 3 seconds; the difference 1 day, 11 hours, 15 minutes, 57 seconds, is the mentrual epact. The annual epact is nearly 11 days; the solar year being 365 days, and the lunar year 354.

**Epaminon' das** (B. c. 418-362), an ancient Greek hero, who, for a short time, raised his country, Thebes, to the summit of power and prosperity. He took the leading part in the struggle during which Spartan supremacy in Greece was destroyed, and the supremacy of Thebes temporarily secured. Four times he successfully invaded the Peloponnesus at the head of the Thebans.

**Ephem'era**, the typical genus of the insect family Ephemeridæ, Neuropterous insects, so named from the extreme shortness of their lives in the perfect state. They are known as *May-flies* or *day-flies*, and are characterized by the slenderness of their bodies; the delicacy of their wings, which are erect and unequal, the anterior being much the larger; the rudimentary condition of the mouth; and the termination of the abdomen in three filiform appendages. In the state of larvæ and pupæ they are aquatic and exist for years. When ready

Development of the May-fly.

for their final change they creep out of the water, generally toward sunset of a fine summer evening. They shed their whole skin shortly after leaving the water, propagate their species, and die, taking no food in the perfect state.

Eph'esus, an ancient Greek city of Lvdia. in Asia Minor, one of the twelve Ionian cities on the south side of the Caystrus, near its mouth. It was at one time the grand emporium of Western Asia, having a convenient and spacious harbor. The first great temple, begun about B.C. 650 and finished after 120 years, was burned by the notorious Herostratus B.C. 356. A second and more magnificent was then erected, which was burned by the Goths in A.D. 262. Some interesting remains have recently been discovered by excavation. Several church councils were held here, especially the third ecumenical council of 431, at which Nestorius was condemned. The site of the city is now desolate; near it is a poor village, Aiasoluk.

E'phraim, the younger son of Joseph, and the founder of one of the twelve tribes of Israel.

Ep'ic, a poem of the narrative kind. Some authorities restrict the term to narrative poems written in a lofty style and describing the exploits of heroes. Others widen the definition so as to include not only long narrative poems of romantic or supernatural adventure, but also those of a historical, legendary, mockheroic, or humorous character. Epic is distinguished from drama in so far as the author frequently speaks in his own person as narrator: and from lyrical poetry by making the

predominant feature the narration of action rather than the expression of emotion. Among the more famous epics of the world's literature may be noted: Homer's *lkad* and *Odyssey*; Vergil's *Æneid*; the German *Nibelungenited*; the Anglo-Saxon poem of *Beowulf*; the French Song of Roland; Dante's Divina Commedia; Tas-Bo's Gierusalemme Liberata; Ariosto's Orlundo Furioso; Milton's Paradise Lost; Spenser's Fairy Queen; Camoens's Lusiad (Portuguese); and Firdusi's Shah Nameh (Persian). Hesiod's Theogony; the poetic Edda; the Finnish Kalewala; the Indian Mahdbhårata may be described as collections of epic legend. The historical epic has an excellent representative In Barbour's Bruce; and specimens of the mockheroic and humorous epic are found in The Battle of the Frags and Mice; Reynard the Fox; Butler's Hudibras; and Pope's Rape of the Lock.

**Epicte' tus** (60-94), a Greek Stoic philosopher, b. in Phrygia. He lived long at Rome, where, in his youth, he was a slave. Though nominally a Stoic, he was not interested in Stoicism as an intellectual system; he adopted its terminology and its moral doctrines, but in his discourses he appeared rather as a moral and religious teacher than as a philosopher.

Epicu'rus (B.c. 342-270), a Greek philosopher, founder of the Epicurean school, was b. in the island of Samos. He settled at Athens B. C. 306, and established a philosophical school. Here he spent the remainder of his life. His pupils were numerous and enthusiastically devoted to him. His theory of the universe was based on the atomic theory of Democritus. The fundamental principle of his ethical system was that pleasure and pain are the chief good and evil, the attainment of the one and the avoidance of the other of which are to be regarded as the end of philosophy. Peace of mind, based on meditation, he considered as the origin of all good. The philosophy of Epicurus has been violently opposed and frequently misrepresented. In ancient times his philosophy appears to have been more popular in Greece than in Rome, although his disciples were numerous in both. Epicurus was a very voluminous writer, but few of his writings are extant, what we possess comprising only some fragments of a Treatise on Nature, two letters, and detached passages.

Epicycloi dal Wheel, a wheel or ring fixed to a framework, toothed on its inner side, and having in gear with it another toothed wheel of half the diameter of the first, fitted so as to revolve about the center of the latter. It is used for converting circular into alternate motion, or alternate into circular. While the revolution of the smaller wheel is taking place any point whatever on its circumference will describe a straight line, or will pass and repass through a diameter of the circle, once during each revolution. In practise, a piston rod or other reciprocating part may be attached to any point on the circumference of the smaller wheel.

**Epigæa**  $(-j\bar{e}'a)$ , a genus of shrubs of the heath order, characterized by having three leaflets on the outside of the five-parted calyx:

and by the corolla being salver-shaped, fivecleft, with its tube hairy on the inside. The trailing arbutus is the Mayflower of North America.

Epilo'blum, the willow herb, a genus of plants, nat. order Onagracess. The species are herbs or under-shrubs with pink or purple, rarely yellow, flowers, solitary in the axils of the leaves or in terminal leafy spikes. The seeds are tipped with a pencil of silky halrs, and are contained in a long four-celled capsule. There are more than fifty species scattered over the arctic and temperate regions of the world.

**Epimachus,** (e-pim'a-kus), a genus of slender-billed (tenuirostral) birds of the Hoopoe family, resembling the birds of paradise in the exceeding luxuriance and brilliancy of their plumage.

**Epiph'any,** a festival, otherwise called the manifestation of Christ to the Gentiles, observed on January 6 in honor of the adoration of our Saviour by the three magi, or wise men, who came to adore him and bring him presents, led by the star. As a separate festival it dates from \$13.

Ep'iphyte, a plant which grows and flourishes on the trunks and branches of trees, adhering to the bark, as a moss, lichen, fern, etc., but which does not, like a parasite, derive any nourishment from the plant on which it grows. Many orchidaceous plants are epiphytes.

Épi'rus, a country of ancient Greece corresponding to the southern portion of modern Albanla. The most interesting locality in it was Dodona. The inhabitants were only in part Greeks. The Molossians at last acquired the ascendency, and the kings of this tribe took the name of kings of Epirus. The most celebrated king of Epirus was Pyrrhus, who made war upon the Romans. Epirus became a Roman province in 168 B. c., and shared the fortunes of Rome till it was conquered by the Turks.

**Epistemol'ogy**, that department of metaphysics which investigates and explains the doctrine or theory of knowing: distinguished from *ontology*, which investigates real existence or the theory of being.

Ep itaph, an inscription upon a tomb or monument in honor or memory of the dead. Epitaphs were in use both among the Greeks and Romans. The Greeks distinguished by epitaphs only their illustrious men. Among the Romans they became a family institution, and private names were regularly recorded upon tombstones. The same practise has generally prevailed in Christian tombstones epitaphs usually give brief facts of the deceased's life, sometimes also the pious hopes of survivors in reference to the resurrection or other doctrines of the Christian faith, etc.

**Epithe' lium,** in anatomy, the cellular layer which lines the internal cavities and canals of the body, both closed and open, as the mouth. nose, respiratory organs, blood-vessels, etc., and which is analogous to the cuticle of the outer surface. There are several varieties of epithelium.

Epoch (or Era) is a fixed point of time, commonly selected on account of some remarkable event by which it has been distinguished, and which is made the beginning or determining point of a particular year from which all other years, whether preceding or ensuing, are computed. The creation and the birth of Christ are the most important of the historical epochs. The creation has formed the foundation of various chronologies, the chief of which are: 1, The epoch adopted by Bossuet, Ussher, and other Catholic and Protestant divines, which places the creation in B. c. 4004. 2, The Era of Constantinople (adopted by Russia) which places it in B. c. 5508. 3, The Era of Antioch, used till A. D. 284, placed the creation B. c. 5502. 4, The Era of Alexandria, which made the creation B. c. 5492. This is also the Abys-sinian Era. 5, The Jewish Era, which places the creation in B. c. 3760. The Greeks computed their time by periods of four years called Olympiads, from the occurrence every fourth year of the Olympic games. The first Olympiad, being the year in which Coræbus was victor in the Olympic games, was in the year B. C. 776. The Romans dated from the supposed era of the foundation of their city, April 21 in the third year of the sixth Olympiad, or B. c. 753. The Christian Erg, or mode of computing from the birth of Christ as a starting-point was first introduced in the sixth century, and was generally adopted by the year 1000. This event is believed to have taken place earlier, perhaps by four years, than the received date. The Julian epoch, based on the coincidence of the solar, lunar, and indictional periods, is fixed at 4713 B. c., and is the only epoch established on an astro-nomical basis. The Muhammedan Era, or Ilejira, commences on July 16, 622, and the years are computed by lunar months. The Chinese reckon their time by cycles of 60 years. Instead of numbering them as we do they give a different name to every year in the cycle. Epsom Salt, sulphate of magnesium, a ca-

**Epsom Salt**, sulphate of magnesium, a cathartic salt which appears in capillary fibers or acicular crystals. It is found covering crevices of rocks, in mineral springs, etc., but is commonly prepared by artificial processes from magnesian limestone by treating it with sulphuric acid, or by dissolving the mineral *kienerite* in boiling water, allowing the insoluble matter to settle, and crystallizing out the Epsom salt from the clear solution. It is employed in medicine as a purgative, and in the arts. The name is derived from its having been first procured from the mineral waters at Epsom.

Equa tor, that great circle of our globe every point of which is  $00^{\circ}$  from the poles. All places which are on it have invariably equal days and nights. Our earth is divided by it into the northern and southern hemispheres. From this circle is reckoned the latitude of places both north and south. There is also a corresponding celestial equator in the plane of the terrestrial, an imaginary great circle in the source of the terrestrial.

the heavens the plane of which is perpendicular to the axis of the earth. It is everywhere  $90^{\circ}$  distant from the celestial poles, which coincide with the extremities of the earth's axis, supposed to be produced to meet the heavens. During his apparent yearly course the sun is twice in the celestial, and vertically over the terrestrial equator, at the beginning of spring and of autumn. Then the day and night are equal all over the earth, whence the name equinox. The magnetic equator is a line which pretty nearly coincides with the geographical equator, and at every point of which the vertical component of the earth's magnetic attraction is zero; that is to say, a dipping needle carried along the magnetic equator remains horizontal. It is hence also called the *aclinic line*.

Equato' rial, an astronomical instrument contrived for the purpose of directing a telescope upon any celestial object, and of keeping the object in view for any length of time. notwithstanding the diurnal motion of the earth. For these purposes a principal axis resting on firm supports is mounted exactly parallel to the axis of the earth's rotation, and consequently pointing to the poles of the heavens, being fixed so as to turn on pivots at its extremities. To this there is attached a telescope moving on an axis of its own in such a way that it may either be exactly parallel to the other axis, or at any angle to it; when at right angles it points to the celestial equator. By this means a star can be followed by one motion from its rising to its setting. In some observatories the equatorials have the necessary motion given them by clock-work.

**Equestrian Order**, the order of "Knights" in ancient Rome. The *equites* or knights originally formed the cavalry of the army. They are said by Livy to have been instituted by Romulus, who selected 300 of them from the three principal tribes. About the time of the Gracchi (123 B. C.) the equites became a distinct order in the state, and the judges and the farmers of the revenue were selected from their ranks. They held their position in virtue of a certain property qualification, and toward the end of the republic they possessed much influence in the state.

Equidæ, the horse family, a family belonging to the order Ungulata, or hoofed mammals, and subdivision Perissodactyla, characterized by an undivided hoof formed of the third toe and its enlarged horny nail, a simple stomach, a mane on the neck, and by six incisor teeth on each jaw, seven molars on either side of both jaws, and by two small canne teeth in the upper jaw of the males and sometimes in both jaws. It is divided into two groups—one including the asses and zebras. the other comprising the true horses.

Equinoc'tial, in astronomy, the circle in the heavens otherwise known as the celestial equator. When the sun is on the equator there is equal length of day and night over all the earth; hence the name equinoctial. Equinoctial gales, storms which are observed generally to take place about the time of the sun's crossing the equator, that is, at the vernal and autumnal equinox, in March and September. *Equinoctial points* are the two points wherein the celestial equator and ecliptic intersect each other; the one, being in the first point of Aries, is called the *rernal* point; and the other, in the first point of Libra, the *autumnal* point. These points are found to be moving backward or westward at the rate of 50" of a degree in a year. This is called the precession of the equinoxes.

E'quinox, the precise time when the sun enters one of the equinoctial points, or the first point of Aries about the 21st of March, and the first point of Libra about the 23d of September, making the day and night of equal length all over the world. At all other times the lengths of the day and of the night are unequal, their difference being the greater the more we approach either pole, while in the same latitude it is everywhere the same.

Eq'uity, in law, the system of supplemental law administered in certain courts, founded upon defined rules, recorded precedents, and established principles, the judges, however, liberally expounding and developing them to meet new exigencies. While it aims to assist the defects of the common law, by extending relief to those rights of property which the strict law does not recognize, and by giving more ample and distributive redress than the ordinary tribunals afford, equity by no means either controls, mitigates, or supersedes the common law, but rather guides itself by its analogies, and does not assume any power to subvert its doctrines. Courts of equity grant redress to all parties where they have rights, ex aquo et bono, and modify and fashion that redress according to circumstances. They bring before them all the parties interested in the subject matter of the suit, and adjust the rights of all

Equity of Redemption, in law, the advantage allowed to a mortgager of a reasonable time to redeem an estate mortgaged, when it is of greater value than the sum for which it is mortgaged.

**Erard,** SEBASTIEN (1752-1831), a celebrated musical instrument maker. He went to Paris at the age of eighteen, and in concert with his brother, Jean Baptiste, produced pianofortes superior to any that had previously been made in France.

**Erasis' tratus,** an ancient Greek physician. He lived in the third century before the Christian era, and was the first who systematically dissected the human body. His description of the brain and nerves is much more exact than any given by his predecessors.

**Éras' mus**, DESIDERIUS (1467-1536), a Dutch scholar, b. at Rotterdam. In 1402 he went to Paris to perfect himself in theology and polite literature. In 1510 he wrote his *Praise of Foldy* while residing with Sir Thomas More, and was appointed Margaret professor of divinity and Greek lecturer at Cambridge. In 1514 he returned to the Continent, and lived chiefly at Basel, where he died.

Eras' tus, the learned name of Thomas Lie-

ber (1523-1584), a Swiss physician, who maintained the opinions from which the well-known epithet of *Erastian*, as now used, is derived. He was successively professor of medicine at Heidelberg, and of ethics at Basel. He maintained in his writings the complete subordination of the ecclesiastical to the secular power; and that the church had no right to exclude any one from church ordinances, or to inflict excommunication.

**Er'ato**, in Greek mythology, one of the Muses, whose name signifies loving or lovely. She presided over lyric and especially amatory poetry.

**Eratos' thenes,** (B. c. 276–194), an ancient Greek astronomer, born at Cyrene, in Africa; was librarian at Alexandria, and gained his greatest renown by his investigations of the size of the earth. He rendered much service to the science of astronomy, and first observed the obliquity of the ecliptic.

Erckmann-Chatrian (shåt-ri-än), the joint name of two French-Alsatian writers of fiction. Emile Erckmann, born at Pfalzburg, 1822, studied law at Paris. Alexandre Chatrian, born at Soldatenthal, near Pfalzburg, 1826, was for some time teacher in the Pfalzburg College. They formed a literary partnership in 1847, but it was not till the appearance of L'Ilustre Docteur Mathéus in 1850 that success attended them.

**Er'ebus,** in Greek mythology, the son of Chaos and Darkness. The name Erebus was also given to the infernal regions.

**Erebus**, Mount, a volcano of the Antarctic regions in S. Victoria Land; height 12,400 ft.

**Erectheus** (e-rek'thūs), in Greek mythology, a personage associated with the early history of Athens, and to whom a fine temple was built on the Acropolis.

Er'furt, an important town in the Prussian province of Saxony. It has a fine cathedral dating from the thirteenth century, and several handsome Gothic churches. The university, founded in 1378 and suppressed in 1816, was long an important institution. There are still a royal academy of science and a royal library with 60,000 vols. The monastery (now an orphanage) was the residence of Luther from 1501 to 1508. The industries are varied, including clothing, machinery, leather, shoes, ironmongery, chemicals, etc. Pop. 58,385.

Er'got, the altered seed of rye and other grasses caused by the attack of a fungus. The seed is replaced by a dense homogeneous tissue largely charged with an oily fluid. In its perfect state this germinates and produces the claviceps. When diseased rye of this kind is eaten in food for sometime, it sometimes causes death by a kind of mortification called dry gangrene.

Eric, the Red, a Norwegian navigator, who located in Iceland in 982. He sailed from Brediflord in 983 to reach some western shore visited by one of his countrymen in former times. The land which he found he called Greenland. In 985 he returned to Iceland, where he so interested the people in his discovery that they organized a fleet of twenty sail for a new voyage. Some of the ships were lost in a storm, but he succeeded in reaching the Greenland coast with fourteen, and located on

the flord at some distance from the ocean. His son Lief, twelve years later. is said to have discovered the continent of North America, which he called Markland an d Finland.

Erica(e-ri'ka), the heath, a large genus of branched, rigid shrubs, type of the nat. order Ericaceæ, most of which are natives of South Africa, a few being found in Europe and Asia. The

Ergot of Bye. A sia. The leaves are narrow and rigid, the flowers are globose or tubular, and four-lobed.

Ericacceæ, a nat. order of oxogenous plants. Er'icsson, JOHN (1803-1889), engineer, b. in Sweden. He served for a time in the Swedish Army; removed to London in 1826, and to New York in 1839. He is identified with numerous inventions and improvements on steam machinery and its applications. His chief inventions are his caloric engine, the screw propeller (1836), which has revolutionized navigation, and his turret ships, the first of which, the Monitor, distinguished itself in the American Civil War, and inaugurated a new era in naval warfare. He latterly devoted himself to studies of the earth's motion and the intensity of solar heat.

**Erie** ( $\overline{e}$ ' ri), one of the great chain of North American lakes, between Lakes Huron and Ontario, about 265 mi. long. 634 mi. broad at its centre, from 40 to 60 fathoms deep at the deepest part; area 9,600 sq. mi. The whole of its southern shore is within the territory of the U. S., and its northern within that of Canada. It receives the waters of the upper lakes by Detroit River at its southwestern extremity, and discharges its waters into Lake Ontario by the Niagara River at its northeast end. The Welland Canal enables vessels to pass from it to Lake Ontario. It is shallow compared with the other lakes of the series, and is subject to violent storms. The principal harbors are Buffalo, Erie, Cleveland, etc.

Erie, a city, Pennsylvania, an important railway and commercial center on the southern shore of Lake Erie. There are numerous iron works (including foundries, rolling mills, blast furnaces, etc.), petroleum refineries, breweries, tanneries, wood working factories, etc. The harbor is one of the best on the lake. Pop. 40,634. Eric Canal, the largest in the U. S., serving to connect the great lakes with the sea. It begins at Buffalo on Lake Erie, and extends to the Hudson at Albany. It is 363 mi. long; has in all 72 locks; a surface width 70 ft., bottom width 42 ft., and depth 7 ft. It is carried over several large streams on stone aqueducts: cost nearly \$10,000,000, and was opened in 1825. The navigation is free.

Eriom eter, an optical instrument for measuring the diameters of minute particles and fibers, from the size of the colored rings produced by the diffraction of the light in which the objects are viewed.

**Eris**, in the Greek mythology, the goddess of discord. Not being invited to the marriage of Peleus, she revenged herself by means of the *apple of discord*.

**Ér'ivan**, a Russian town, capital of government of the same name in the lieutenancy of the Caucasus, on the Sanga, north of Mount Ararat. It has a citadel, barracks, a cannon foundry, and some manufactures. Pop. 12,505. The government has an area of 10,705 sq. mi., and a pop. of 583,957.

Er mine, the stoat, a quadruped of the weasel tribe, found over temperate Europe, but commonly in the north. In consequence of the change that occurs in the color of its fur at different seasons—by far most marked in the Arctic regions—it is not generally known that the ermine and stoat are the same. In winter,

Ermine.

in cold countries or severe seasons, the fur changes from a reddish brown to a yellowish white, or almost pure white, under which shade the animal is recognized as the ermine. In both states the tip of the tail is black. Like many other species of this genus the ermine has the faculty of ejecting a fluid of a musky odor. Its fur is short, soft, and silky: the best skins being brought from Russia. Sweden, and Norway, and Hudson's Bay territories. It was formerly one of the insignia of royalty, and is still used by judges. When used as linings of cloaks the black tuft from the tail is sewed to the skin at irregular distances.

Erne, Lough, a lake, Ireland, county Fermanagh, consisting of a north or lower, and a

south or upper lake, connected by a narrow, winding channel, and properly forming only expansions of the river Erne. Its entire length is about 40 mi.; average breadth 6 mi. It contains numerous small islands, and is well stocked with fish. The river Erne rises in Lough Gounagh, in the county of Longford, flows through Loughs Oughter and Erne, and falls into Donegal Bay below Ballyshannon. Length, 72 mi.

**Erosion Theory,** in geology, the theory, now held by all geologists, that valleys are due to the wearing influences of water and ice, the latter chiefly in the form of glaciers, as opposed to the theory which regards them as the result of fissures in the earth's crust produced by strains during its upheaval.

Errat'ics (or erratic blocks), in geology, boulders or large masses of angular rock which have been transported to a distance from their original mountains by the action of ice during the glacial period. Thus on the slopes of the Jura Mountains immense blocks of granite are found which have traveled 60 mi. from their original situation. Similarly masses of Scotch and Lake district granites and of Welsh rocks occur not uncommonly in the surface soil of the Midland counties of England.

Erskine, THOMAS, Lord Erskine (1750-1823), Scottish lawyer, the youngest son of the tenth earl of Buchan. He was educated partly at the high school of Edinburgh, and partly at the University of St. Andrews. After serving four years in the navy and seven in the army he commenced the study of law, and in 1778 both took his degree at Cambridge and was called to the bar. His success was immediate. In 1783 he was elected member of Parliament for Portsmouth, a seat he held till 1806, when he was raised to the peerage. In 1789 he defended Mr. Stockdale, a bookseller, for publishing what was charged as a libelous pamphlet in favor of Warren Hastings. In 1792, being em-ployed to defend Thomas Paine, when prosecuted for the second part of his Rights of Man, he declared that, waiving all personal convictions, he deemed it right, as an English advocate, to obey the call; by the maintenance of which principle he lost his office of attorney general to the Prince of Wales. In the trials of Hardy, Tooke, and others for high treason in 1794, which lasted for several weeks, the ability displayed by Erskine was acknowledged by all parties. 1802 the Prince of Wales made him keeper of his seals for the duchy of Cornwall. In 1806 he was created a peer, and raised to the dignity of lord chancellor.

**Eruptive Rocks,** in geology, those which, like lava, bassalt, granite, etc., have broken through other rocks while in a molten state.

**Eryn'go**, a genus of plants belonging to the natural order of Umbelliferæ. There are upward of 100 species found in the temperate and sub-tropical climates, but chiefly in South America. An American species is known by the name of rattlesnake weed.

**Erythræ'a**, a genus of annual herbs, of which *Centaury* is the best known species.

Erzerum (Erzeroum, or Erzeroom) (er'ze-

röm), a city of Turkish Armenia, capital of a vilayet with an area of 27,000 sq. mi., and a pop. of 582,745. The town is about 6,000 ft. above sea level, forms an important strategical center, and has become a principal frontier fortress. In addition to important manufactures, especially in copper and iron, it carries on an extensive trade, and is a chief halting place for Persian pilgrims on their way to Mecca. Pop. 38,894.

**Erzgebirge** (erts'ge-bir-ge) ("Ore Mountain"), a chain of European mountains forming a natural boundary between Saxony and Bohemia, nearly 120 mi. in length and 25 mi. broad. The highest summits, which are on the side of Saxony, rise to 3,800 or 3,900 ft. The mountains are rich in silver, iron, copper, lead, cobalt, arsenic, etc.

**E'sau**, the eldest son of Isaac, and twin brother of Jacob. 'The story of his marriage, of his loss of birthright through the craft of Rebekah and Jacob, and of his quarrel and reconciliation with Jacob, are told in the book of Genesis. He was the progenitor of the Edomites, who dwelt on Mount Seir.

**Escanaba**, Delta co., Mich., on Little Bay, 121 mi. n. of Green Bay. Railroad, C. & N. W. Industries: woodenware factory, iron foundry. Is the outlet of a mining district w. and n. and headquarters of Peninsula division C. & N. W. Ry. Was first settled in 1863 by employees of railway company and became a city in 1883. Pop. est. 1897, 8,200.

Escape'ment, the general contrivance in a timepiece by which the pressure of the wheels (which move always in one direction) and the vibratory motion of the pendulum or balancewheel are accommodated the one to the other. By this contrivance the wheelwork is made to communicate an impulse to the regulating power (which in a clock is the pendulum and in a watch the balance wheel), so as to restore to it the small portion of force which it loses in every vibration, in consequence of friction and the resistance of the air. The leading requisite of a good escapement is that the impulse communicated to the pendulum or balance wheel shall be invariable, notwithstanding any irregularity or foulness in the train of wheels. Various kinds of escapements have been contrived, some of which are shown in the accompanying figure.

Es'car (Es'kar), a late geological formation in the superficial drift, generally consisting of a long, linear ridge of sand and gravel, including pieces of considerable size. The materials are derived from the waste of till or boulderclay, and their arrangement took place probably under water over which icebergs floated, for in Sweden particularly angular, erratic blocks are often deposited on the *escar*.

**Escheat** (es-chēt), in law, a species of reversion arising from default of heirs or by forfeiture. That which falls or lapses to the original proprietor, or to the state, as lands or other property. By modern legislation there can be no escheat on failure of the whole blood wherever there are persons of the half-blood capable of inheriting.

# Escurial

**Escu'rial**, a remarkable building in Spain, comprising at once a palace, a convent, a church, and a mausoleum. It is distant from

# Esparto

oblique, and yellow and brownish skin. Sealskins, reindeer, and other furs are used as materials for dress, according to the season, as

Eskimo Winter Station, Greenland.

Madrid about 24 mi. in a northwesterly direction, and situated on the acclivity of the Sierra Guadarrama, the range of mountains which divides New from Old Castlle. It was built by Philip II, and dedicated to St. Lawrence, in commemoration of the victory of St. Quentin, fought on the festival of the saint in 1557. It is popularly considered to be built on the plan of a gridiron, from the fact that St. Lawrence is said to have been broiled alive on a sort of large gridiron. It was begun in 1563 and finished in 1584. The church is the finest portion of the whole building. The dome is 60 ft. in diameter, and its height at the center is about 320 ft. The library contains a valuable collection. The Escurial was partly burned in 1671. It was restored by Ferdinand VII, but the monks, with their revenues which supported it, have long since disappeared. In 1872 it was fired by lightning, and suffered serious damage.

**Esdrac'ion**, PLAIN OF, a plain extending across Palestine from the Mediterranean to the Jordan, and drained by the river Kishon.

**Eskimo**, a race inhabiting the Arctic coasts of North America, from Greenland to Bering's Strait, and extending into Asia. They call themselves *Inv-it*, the people; their other name is from an Algonquin word signifying eaters of raw flesh. They consist of three principal stocks—the Greenlanders; the Eskimo proper, in Labrador; and the Western Eskimo, found along Hudson's Bay, the west side of Baffin's Bay, the polar shores as far as the mouths of the Coppermine and Mackenzie rivers, and both on the American and Asiatic sides of Bering's Strait. Their leading physical peculiarities are a stunted stature, flattened nose, projecting check-bones, eyes often well as skins of otters, foxes, martens, etc. In summer they live in tents, covered with skins; in winter they may be said to burrow beneath the snow. In Greenland, houses built of stone and cemented with turf are used as permanent habita-tions. Vegetation being extremely stunted within the limits of their territories. their food consists of the flesh of whales, seals, wal-rus, etc., often eaten raw: and they show remarkable skill in fishing and hunting. Their weapons are bows and arrows, spears or lances, generally pointed with bone. but sometimes with metal. Their only domestic animal is the Eskimo dog. In in-tellect they are by no means deficient; in manners they are kind and hospitable. Their religious ideas appear

scanty, but success has attended the labors of the Danish missionaries in teaching them the Christian religion.

Eskimo Dog (or Esquiman Dog), a breed of dogs extensively spread over northern regions of America and Eastern Asia. It is rather larger than the English pointer, but appears less on account of the shortness of its legs. It

Eskimo Dog.

has oblique eyes, an elongated muzzle, and a bushy tail, which give it a wolfish appearance. The color is generally a deep dun, obscurely barred and patched with darker color. It is the only beast of burden in these latitudes, and with a team of such dogs attached to his sledge the Eskimo will cover 60 mi. a day for several successive days.

Espar'to, a plant growing in Spain and North Africa, long applied to the manufacture of cordage, matting, etc., and now er-

tensively employed for paper-making. This plant is a species of grass 2 to 4 ft. high, covering large tracts in its native regions, and also cultivated, especially in Spain. Formerly the supply of esparto was almost wholly obtained from Spain, but it is now obtained in still larger quantity from Algeria (where it is called *alfa*), and from Tripoli and Tunis. The paper made from it is excellent; it may be also reduced to a fibrous state and used for stuffing mattresses, etc.

**Espir'ito-Santo** ("Holy Spirit"), a maritime province, Brazil, bounded n. by Bahia, s. by Rio de Janeiro; length about 260 mi.; breadth, about 120 mi.; area 43,290 sq. mi.; pop. 100,-717.

**Espir' itu-Santo**, an island of the Pacific, the largest of the New Hebrides, with some 20,000 inhabitants.

**Esquimault** (es-kēmālt), a harbor and naval station on the s. e. coast of Vancouver Island, about 3 mi. from Victoria, the capital of British Columbia. The harbor is almost landlocked, and with the "Royal Roads" outside, is capable of giving safe anchorage to a fleet of vessels of the largest size.

Essen, a town of Rhenish Prussia, 18 mi. n.e. of Düsseldorf, founded in the ninth century, and adorned with a fine church dating from 873. It has recently increased with great rapidity, and is celebrated for the steel and iron works of Krupp, the most extensive in Europe, employing about 20,000 workmen. This great establishment was started in 1827, with only two workmen. The works occupy 1,000 acres, and the firm possesses coal and iron-stone mines. The rifled steel cannon made here are supplied to most of the armises of Europe. In the Krupp works there is now a steam hammer of 150 tons. Pop. 65,064.

**Essential Oils**, volatile oils usually drawn from aromatic plants by subjecting them to distillation with water, such as the oils of lavender. cloves, peppermint, etc.

**Essequibo** (es-se-kē-bō), a river of British Guiana which flows into the Atlantic by an estuary 20 mi. in width after a course of about 450 mi. The district or division of Essequibo is well cultivated and extremely fertile, producing coffee, cotton, cocoa, and sugar. Pop. 36.000.

**Essex**, a maritime county in the s.e. of England, area 987,032 acres. The soil is generally extremely fertile, and particularly well adapted for the growth of wheat. On the coast are some valuable oyster-beds, the oysters from which are exported in considerable quantities. The manufactures of the county are not very extensive, the chief being, crape, silks, straw plait, etc. The chief towns are Chelmsford, the county town, West Ham, Colchester, Malden, and Harwick. Pop. 785,399.

den. and Harwick. Pop. 785,399. Essex, ROBERT DEVEREUX, second earl of (1567-1601). In 1596 he was commander of the troops in an expedition against Spain, and distinguished himself by the capture of Cadiz. In an expedition next year he was less fortunate, and the queen, with whom he was always quarreling, received him coldly. He was appointed lord lieutenant of Ireland in 1599. Later he returned to England and was executed for treason.

Esslingen (es'ling-èn), a town of Germany, in Würtemberg, on the Neckar, 7 mi. e.s.e. of Stuttgart. It is of Roman origin, was long an imperial free town, has walls flanked with towers, a castle, and an ancient Gothic church, with a tower 230 ft. high. It has manufactures of machinery, articles of wood, cutlery, philosophical instruments, spinning and other mills, etc. Pop. 20,865.

**Este** (es'tā), one of the most ancient and illustrious families of Italy. In the eleventh century the house of Este became connected by marriage with the German Welfs, or Guelphs, and founded the German branch of the house of Este, the dukes of Brunswick and Hanover.

**Esterha'zy**, a family of Hungarian magnates, whose authentic genealogy goes back to the first half of the thirteenth century.

Esther, a Jewess who became the queen of Ahasuerus, king of Persia, and whose story is told in the book of the Old Testament called by her name. This book is supposed by some to be the composition of the uncle of the heroine. Various opinions are held regarding the time and truth of the story; but the feast of Purim which commemorates the events narrated is still observed by the Jews during the month Adar.

**Esthonia**, a maritime government of Russia. About a fourth of the surface is covered with forests of pine, birch, and alder. The crops include a little wheat, much barley and oats, and some flax, hops, and tobacco. Cattle are reared, and active fisheries are carried on. The peasantry are almost all of Finnish origin, and speak a Finnish dialect. In the tenth and twefth centuries it belonged to Denmark; it was afterward annexed by Sweden, and in 1710 was seized by Russia. Revel is the capital. Pon. 379.875.

the capital. Pop. 379,875. Estop'pel, in law, anything done by a party himself, which puts a period to an action by closing the ground of controversy.

**Esto'vers**, in law, necessaries or supplies. Common of Estorers is the liberty of taking the necessary wood for a house or farm from another's estate.

**Estremadu'ra**, a western division of Spain, consisting of the provinces of Badajoz and Caceres. It is fertile, but not cultivated to its full extent. The Tagus and Guadiana intersect it east to west. Immense flocks of sheep graze on the rich plains. The area is about 16,700 sq. mi. and the pop. 789,123.

**Estremadura**, a maritime province of Portugal, divided by the Tagus into two nearly equal parts, of which the northern is the more mountainous. Wines and olives are the principal produce. The principal city is Lisbon. Area 6,876 sq. mi.; pop. 946,472.

**Etæ** rio (Éterio), in bot. a collection of distinct indehiscent carpels, either dry upon a fleshy receptacle as the strawberry, or dry upon a dry receptacle as the ranunculus, or fleshy upon a dry receptacle as the raspberry, the parts being small drupes. Eta'wah, a town, Hindustan, N. W. Provinces, capital of the district of same name, on left bank of the Jumna, picturesquely situated among ravines, and richly planted with trees. It has some good buildings, and a considerable trade. Pop. 34,721. The district has an area of 1.694 sq. mi., and a pop. of 722,371.

Etching, the art of producing designs upon a plate of steel or copper by means of lines drawn with an *etching needle* (a fine-pointed steel tool), the lines being drawn through a coating or varnish (the ground), and bitten in by some strong acid which can only affect the plate where the varnish has been removed. See Engraving and Zincography.

See Engraving and Zincography. Etc'sian Winds, winds blowing at stated times of the year; applied especially to northerly and northeasterly winds which prevail at certain seasons in the Mediterranean regions.

Eth'elbert, king of Kent (500-616), succeeded his father and reduced all the Anglo-Saxon states, except Northumberland, to the condition of his dependents. Ethelbert'married Bertha, the daughter of Caribert, king of Paris, and a Christian princess, an event which led indirectly to the introduction of Christianity into England by St. Augustine.

**Ethelbert**, king of England, son of Ethelwulf, succeeded to the government of the eastern side of the kingdom in 857, and in 860, on the death of his brother Ethelbald, became sole king.

Eth'eired I, king of England, son of Ethelwulf, succeeded his brother Ethelbert in 866. The Danes became so formidable in his reign as to threaten the conquest of the whole kingdom.

Etheired II (968-1016), king of England, son of Edgar, succeeded his brother, Edward the Martyr, in 978, and, for his want of vigor and capacity, was surnamed *the Unready*. In his reign began the practise of buying off the Danes by presents of money. After repeated payments of tribute he effected, in 1002, a massacre of the Danes; but this led to Sweyn gathering a large force together and carrying fire and sword through the country. They were again bribed to depart; but, upon a new invasion, Sweyn obliged the nobles to swear allegiance to him as king of England; while Ethelred, in 1013, fled to Normandy. On the death of Sweyn he was invited to resume the government, and died at London in the midst of his struggle with Canute.

Eth elwulf, king of England, succeeded his father, Egbert, about 837; d. 857. His reign was in great measure occupied in repelling Danish incursions; but he is best remembered for his donation to the clergy, which is often quoted as the origin of the system of tithes.

**E** ther, a hypothetical medium of extreme tenuity and elasticity supposed to be diffused throughout all space (as well as among the molecules of which solid bodies are composed), and to be the medium of the transmission of light and heat.

**Ether,** in chem. a very light, volatile, and inflammable fluid, produced by the distillation of alcohol with sulphuric acid. It is lighter

Ethics, otherwise called Moral Philosophy or Moruls, is the science which treats of the nature and laws of the actions of intelligent beings, considered as to whether they are right or wrong, good or bad. The science is more or less closely connected with theology, psychology, politics, political economy, and jurisprudence, but what most strictly belongs to it is the investigation of the principles and basis of duty or the moral law, and an inquiry into the nature and origin of the faculty by which duty is recognized. Various answers have been given to the question why we call an action good or bad, such as that it is consistent or not with the will of God, or with the nature of things, or with the greatest happiness of the greatest number, or that an inward faculty decides it to be such or such; and a great variety of ethical systems have been proposed. The foundations of the leading systems were laid in antiquity, the names of Socrates, Plato, Aristotle, Epicurus, the Cynics and the Stoics being especially prominent. The introduc-tian of Christianity brought a new element into ethical speculation, and among Christians ethics were intimately associated with theology, and morality was regarded as based on and regulated by a definite code contained in the sacred writings. The speculations of Greeks were not, however, disregarded, and some of the ablest Christian moralists (as Augustine, Peter Lombard, Erigena, Anselm, Aquinas, etc.) endeavored to harmonize the Greek theories with the Christian dogmatics. Most modern ethical systems consider the subject as apart from theology as based on independent philosophical principles, and they fall into one of two great classes-the utilitarian systems, which recognize as the chief good, happiness, or the greatest possible satisfaction of the tendencies of our nature; and the rationalistic systems, which recognize that ideas of law and obligation can have their source only in rea-The first of the modern school in Engson. land was Hobbes (1588-1679). Among subse-quent names are those of Cudworth, Locke, Clarke, Shaftesbury, Butler, Hutcheson. Hume, Adam Smith, Reid, Paley, J. S. Mills. Butler, Hutcheson. Herbert Spencer. Another theory of ethics places the moral principle in the sentimental part of our nature, that is, in the direct sympathetic pleasure or sympathetic indignation we have with the impulses which prompt to action or expression. By means of this theory, Adam Smith explains all the phenomena of the moral consciousness. In considering the systems which recognize that the ideas of law and obligation can have their source only in reason, the question, "what is the source of the laws by which reason governs?" gives rise to a number of psychological theories, among which we may notice Clarke's view of the moral principles, as rational institutions or

axioms analogous to those of mathematics; Butler's theory of the natural authority of conscience; the position of Reid, Stewart, and other members of the later intuitional school, who conceive a moral faculty implanted in man which not only perceives the "rightness" or "moral obligation" of actions, but also impels the will to perform what is seen to be right. Very similar as far as classification goes, is the position of Kant, who holds that reason recognizes the immediate obligation of certain kinds of conduct, and that an action is only good when done from a good motive, and that this motive must be essentially different from a natural inclination of any kind.

Ethiopia (or Æthiopia), in ancient geography the country lying to the south of Egypt, and comprehending the modern Nubia, Kordofan, Abyssinia, and other adjacent districts; but its limits were not clearly defined. In ancient times its history was closely connected with that of Egypt, and about the eighth century B. C. it imposed a dynasty on Lower Egypt, and acquired a predominant influence in the valley of the Nile. In the sixth century B.C. the Persian Cambyses invaded Ethiopia; but the country maintained its independence till it became tributary to the Romans in the reign of Au-Subsequently Ethiopia came to be gustus. the designation of the country now known as Abyssinia, and the Abyssinian monarchs still call themselves rulers of Ethiopia.

The Ethiopian Language, or more accurately the Geez language, is the old official and ecclesiastical language of Abyssinia, introduced into that kingdom by settlers from South Arabia. It is a Semitic language resembling Aramaic and Hebrew as well as Arabic. It has a Christian literature of some importance. The principal work is a translation of the Bible, including the Old and New Testaments and Apocrypha. The language is to some extent represented by the modern dialects of Tigre, and by that spoken by some nomadic tribes of the Soudan.

**Ethiops Mineral**, the black sulphide of mercury, prepared by rubbing mercury and sulphur together, either hot or cold.

Ethnol'ogy and Ethnog'raphy, sciences treating of man, the former analyzing the social phenomena of mankind as shown in their customs, languages, institutions, etc.; the latter being more concerned with descriptive details and the orderly collection of facts relating to particular tribes and localities. Besides these terms there is the term Anthropology, used by some to indicate the general science or natural history of mankind, of which the other two are parts. Here we can only give a few particulars bearing on the strictly ethnological and ethnographic divisions of the subject. The unity or plurality of species of the human race is a question that has given rise to much discussion. The most common view in the past has probably been that which regards all mankind as descended from Adam and Eve, attributing the great differences exhibited by different races to climate and other causes acting for a long period of time. Many have

held that such differences were not to be so accounted for, and that the various typical races of the earth were not descended from a single pair, but were separately created in separate localities. Darwin has shown how an accumulation of differences amounting to the appearance of a distinct species may arise from the continual modifications of a single primordial form. Certainly among men the variability of the same race under different climatic conditions is very striking. Even within a comparatively small period of time physical surroundings have induced typical differences between the lithe, sparely-fleshed Yankee of New England, and the plump, rosy-cheeked Englishman; and the Boer of South Africa. with its dry climate, has developed a type as decidedly different from his original stock in moist Holland. The theory of the development of the human race from a single species demands a vast duration of time; and the flint implements discovered intermingled with remains of the mammoth and other extinct animals have proved that man was a contemporary of the mammoth, the cave-bear, and other mammalia of the geological period antecedent to our own, though how distant that period was, as measured by thousands of years, it is difficult to say. Another interesting point is in regard to the first home of the human race. This of course is quite uncertain, but probably it was either in Western Asia or in Africa, and we may naturally conclude that where the mammalia of the highest characteristics appear there was the possible birthplace and center of distribution of mankind.

When we attempt to classify mankind we can scarcely find any one physical characteristic belonging exclusively to a single race. At most we can only say that certain characteristics are the preponderant ones in certain races. In seeking racial characteristics ethnologists make use of various principles of classification. Some give the first place to the shape of the head. Camper, the Dutch anatomist, was the first who attempted to make a scientific distinction of races on this principle, taking as the basis of measurement the amount of the facial angle. But Camper's method, though it illustrates excellently the great differences which exist, between, say, the an-thropoid apes with an angle of 42<sup>-</sup>, the African negro with an angle of 70°, and the European with an angle of 80°, is without certainty, it being possible to find in the population of a single, large town as wide variations of the facial angle as exist between distinct races. Camper's method was therefore superseded by the method of Blumenbach, which is based on consideration of all the chief distinctions in the shape of the head according to which he classified the human family into five varieties: the Caucasian, Mongolian, Ethiopian, Malay, and American. These five varieties were cut down to three by Cuvier, who treated the Malay and American as subdivisions of the Mongolian; and extended by Doctor Prichard, who divided the Caucasian class into a Semitic and an Aryan, or Indo-European class. Lath-

am's classification was into 1, Mongolidæ (Chinese, Turks, Malays, American races, etc.); 2, Atlantidæ (African races, Jews and Arabs); 3, Japetidæ (Indo-Europeans). Among the latter attempts made to find a new principle of classification we may mention that of Retzius, based on the relative length and breadth of the skull, according to which mankind are divided into long-skulled and short, broad-skulled races. Later developments of craniology have introduced a third class, representing a mean between the other two. The capacity of the brain cavity is also a favorite method with some ethnologists. Here the European stands highest with 92.1 cubic in.; the Australian lowest with 81.7. The character of hair and color of skin has also been used by Huxley as the basis of his classification, which divides mankind into 1, Ulutrichi, crisp or woolly haired people with yellow or black skin, comprising Negroes, Bushmen, and Malays: 2. *Leiotrichi*, smooth-haired peo-ple, subdivided into Australioid, Mongoloid, Xanthochroic (fair whites), and Melanochroic (dark whites) groups. But many ethnologists hesitate to accept a classification which brings together nations apparently unrelated, such as the Australians, the ancient Egyptians, and the tribes of Southern India. On the other hand, the character of the hair is found to be one of the surest tests in separating neighboring races, such as the Papuan, and the Malayan, and Australian tribes. Oscar Peschel's classification, based on a number of different particulars, such as the shape of the skull, the color of the skin, the nature and color of the hair, the shape of the features,

etc., is as follows:— 1. The Australians.—Characters: skull of the "long-skulled" type, the jaws being also protruded. The nose is narrow at the root, widening greatly below. The mouth is wide and unshapely. The body is thickly covered with hair; the hair is black, elliptical in section, that on the head being frizzly, and standing out so as to form a shaggy crown. The color of the skin is dark as a rule, sometimes black, though a light copper-red also occurs.

though a light copper-red also occurs. 2. The Pupuans.—This race, which is the one most closely allied to the Australians, occupies New Guinea, New Caledonia, the Solomon Islands, New Hebrides, the Fiji Islands, etc. The most distinctive mark is their peculiarly flattened and abundant hair, growing in tufts, and forming a spreading crown round the head. The skin is always dark, the skull high and narrow; the jaws protruded; the lips fleshy and somewhat swollen; the nose hooked somewhat after the Jewish type. 3. The Mongoloid Nations.—To this race be-

3. The Mongoloid Nations.—To this race belong the Polynesian and Asiatic Malays, the people of Southeastern and Eastern Asia, the Thibetese, all the Northern Asiatics, with their kinsmen in Northern Europe, and lastly the aboriginal population of America. The common characteristics are: long, straight hair, circular in section: almost complete absence of beard and body hair; skin dark-colored, varying from leather-yellow to deep brown, sometimes inclining to red; prominent cheekbones, and eyes in general set obliquely. The various members of the Mongoloid race may be classed under the following subdivisions: (a) The Malay race, comprising the Malays of Malacca, Sumatra, Java, etc.; the inhabitants of Madagascar, the New Zealanders, the natives of the Sandwich Islands, etc. (b) Southern Asiatics with monosyllabic languages, comprising the Chinese, Indo-Chinese (Burmese, Siamese, Anamese, etc.), Thibetese, etc. (c) Coreans and Japanese. (d) Northern Mongoloids of the Old World, comprising the true Mongols, Turks, Finns, Lapps, Magyars, Bulgarians, etc., all much resembling the Chinese and Indo-Chinese group in physical characters. (c) Northern Nations of doubtful position: The Yenisei Ostiaks, the Ainos of Yesso, the inhabitants of Saghalien, etc. (f) The Bering's Nations, of which the Esquimaux, or Eskimo, are the most important. (g) The American Aborigines, or Red Indians.

4. The Dravidians, or Aborigines of India.— These tribes have the skin generally very dark, frequently quite black; their hair is long and black, not straight but crimped or curly: the hair of beard and body grows profusely. the lips are thick and fleshy, somewhat like those of the negro, but the jaws are never prominent. The Dravidians comprise the Tamuls, Telugus, Gonds, Santals, or Sonthals.

5. The Hottentots and Bushmen.—These are tribes of little importance inhabiting South Africa. They have their hair tufted and matted, the beard scanty, the body almost hairless; the lips are full, but not so much so as with the negroes; the nose is of the snub shape: the opening of the eyes is narrow but not oblique. They are slimly built, and the Bushmen in particular low in stature; their color is yellowish or yellowish-brown.

6. The Negroes.-The negroes inhabit Africa from the southern margin of the Sahara to the territory of the Hottentots and Bushmen. and from the Atlantic to the Indian Ocean. They display great variety in external characteristics, and what is popularly considered the typical negro is rarely met with. The color of the skin passes through every gradation. from ebony-black to dark brown, copper-red. olive, or yellow. In some tribes the nose is straight, in others hooked, though often broad and flat. The hair of the head is generally short, elliptic in section, and much crimped: that on the body is not plentiful; whiskers are comparatively rare. The negroes may be divided into the Bantu negroes (including the Kaffirs, Bechuanas, etc.) and the Soudan negroes, these divisions being based on differences in language. It is in the Soudan region that the most typical members of the negro race are found.

7. The Mediterranean Nations.— These include all Europeans who are not Mongoloids, the North Africans, all Western Asiatics, and the Hindus. Among them are the highest members of the human race. The northern nations have the skin quite fair; the southern

have it darker; in North Africa and Eastern Asia it becomes yellow, red, or brown. The nose has always a high bridge; protruding and prominence of the jaws and cheek-bones are rare; the lips are never intumescent, and in no other race are refined and noble features so frequent. Subdivisions are: (a) The Hamites comprising the ancient Egyptians, the Copts of Egypt, and the Nubians, the Berbers and Gallas. (b) The Semites. These comprise the Jews, Arabs, and Abyssinians, and the ancient Canaanites, Assyrians, Babylonians, and Phœnicians. (c) The Indo-European, or Aryan family. This family is divided into branches, a Euro-The European compean and an Asiatic. prises the Germanic (or Teutonic) nations (English, Germans, Dutch, Danes, Norwegians, Swedes, etc.), the Romance nations (French, Italians, Spaniards, Portuguese), the Slavonians (Russians, Bohemians, Servians, etc.), the Greeks, and lastly the Celts. The Asiatic comprises the Hindus, Afghans, Persians, Armenians, and Kurds. (d) Europeans of doubtful positions. These include the Basques of the northeast of Spain and southwest of France and various tribes in the Caucasus.

Ettenne (à-ti-àn), ST., a town of Southern France, dep. Loire, on the Furens, 32 mi. s.w. of Lyons. The town stands in the center of one of the most valuable mineral fields of France; and in addition to the extensive collieries, blast-furnaces, and other iron works in the vicinity, has manufactures of ribbons, silks, cutlery, firearms, etc. The collieries alone employ about 16,000 men. Pop. 117.875.

Etive (et'iv), Loch, an inlet of the sea on the west coast of Scotland, in the county of Argyle. The scenery of its shores is very beautiful.

Etna (or Ætna), MOUNT, the greatest volcano in Europe, a mountain in the province of Catania in Sicily; height 10,874 ft. It rises immediately from the sea, has a circumference of more than 100 mi., and dominates the whole northeast part of Sicily, having a number of towns and villages on its lower slopes. The top is covered with perpetual snow; midway down is the woody or forest region; at the foot is a region of orchards, vineyards, olive groves, etc. Etna thus presents the variety of climates common to high mountains in lower latitudes, oranges and lemons and other fruits growing at the foot, the vine rather higher up, then oaks, chestnuts, beeches, and pines, while on the loftiest or desert region vegetation is of quite a stunted character. A more or less distinct margin of cliff separates the mountain proper from the surrounding plain; and the whole mass seems formed of a series of superimposed mountains, the terminal volcano being surrounded by a number of cones, all of volcanic origin, and nearly 100 of which are of considerable size. From the summit the view presents a splendid panorama, embracing the whole of Sicily, the Lipari Islands, Malta, and Calabria. The eruptions of Etna have been numerous, and many of them destructive. That of 1169 overwhelmed Catania and buried 15,000 persons in the ruins. In 1669 the lava spread over the country for forty days, and 10,000 persons are estimated to have perished. In 1693 there was an earthquake during the eruption, when over 60,000 lives were lost. Among more recent eruptions are those of 1832, 1865, 1874, 1879. An eruption is ordinarily preceded by premonitory symptoms of longer or shorter duration. The pop. of the district of Etna is about 300,000.

Etru'ria, (Greek, Tyrrhenia), the name anciently given to that part of Italy which corresponded partly with the modern Tuscany. and was bounded by the Mediterranean, the Apennines, the river Magra, and the Tiber. The name of Tusci or Etrusci was used by the Romans to designate the race of people anciently inhabiting this country, but the name by which they called themselves was Rasena (or perhaps more correctly Ta-rasena). Etruria proper was in a flourishing condition before the foundation of Rome, 753 B. c. It was known very early as a confederation of twelve great cities, each of which formed a republic of itself. After a long struggle with Rome the Etruscan power was completely broken by the Romans in a series of victories, from the fall of Veii in 396 B. c. to the battle at the Vadimonian Lake (283 B. c.). The Etruscans had attained a high state of civilization. They carried on a flourishing commerce, and at one time were powerful at sea. They were less warlike than most of the nations around them. and had the custom of hiring mercenaries for their armies.

Etruscan art was in the main borrowed from Greece. For articles in terra cotta. a material which they used mainly for ornamental tiles, sarcophagi, and statues, Etruscans were especially celebrated. In the manufacture of pottery they had made great advances; but most of the painted vases popularly known as Etruscan are undoubtedly productions of Greek workmen.

**Etruria**, kingdom of, in Italy, founded by Napoleon I in 1801. Its capital was Florence. In 1807 Napoleon incorporated it with the French Empire.

Etruscan Vases, a class of beautiful ancient painted vases made in Etruria, but not strictly speaking a product of Etruscan art, since they were really the productions of a ripe are of Greek art, the workmanship, subjects, style, and inscriptions being all Greek. They are elegant in form and enriched with bands of beautiful foliage and other ornaments, figures and similar subjects of a highly artistic character. One class has black figures and ornaments on a red ground - the natural color of the clay; another has the figures left of the natural color and the ground painted black. The former class belong to a date about G(t)B. c., the latter date about a century later, and extend over a period of about 300 or 350 years. when the manufacture seems to have ceased. During this period there was much variety in the form and ornamentation, gold and other colors beside the primitive ones of black and red being frequently made use of in their embellishment.

Etty, WILLIAM (1787-1849), an English painter. He studied at the Royal Academy. His principal works are: a series of three pictures (1827-31) illustrating the Deliverance of Bethulin by Judith, Benaiah one of David's Mighty Men, Woman Interceding for the Vanquished.

Etymol'ogy, a term applied, 1, to that part of grammar which treats of the various inflec-tions and modifications of words, and shows how they are formed from simple roots; 2, to that branch of philology which traces the history of words from their origin to their latest form and meaning. Etymology in this latter sense, or the investigation of the origin and growth of words, is among the oldest of studies. Plato and other Greek philosophers, the Alexandrian grammarians, the scholiasts, the Roman Varro, and others wrote much on this subject. It was not till recent times, and particularly since the study of Sanskrit, that etymology has been scientifically studied. Languages then began to be properly classed in groups and families, and words were studied by a comparison of their growth and relationship in different languages. It was recognized that the development of language is not an arbitrary or accidental matter, but proceeds ac-cording to general laws. The result was a great advance in etymological knowledge and the formation of a new science of philology (which see).

Eubce'a, formerly called Negropont, a Greek island, the second largest island of the Ægean It is 90 mi. in length; 30 in greatest Sea. breadth, reduced at one point to 4 mi. It is separated from the mainland of Greece by the narrow channels of Egripo and Talanta. It is connected with the Bootian shore by a bridge. There are several mountain peaks over 2,000 ft. and one over 7,000 ft. The island is well wooded and remarkably fertile. Wine is a staple product, and cotton, wool, pitch, and turpentine are exported. The chief towns are Chalcis and Karysto. With some small islands it forms a modern nomarchy, with a pop. of 95,136.

Eucalyp'tus, a genus of trees, mostly natives of Australia, and remarkable for their gigantic size, some of them attaining the height of 480 or 500 ft. In the Australian colonies they are known by the name of gumtrees, from the gum which exudes from their trunks; and some of them have also such names as "stringy bark," "iron bark," etc. The wood is excellent for shipbuilding and such purposes. The blue gum yields an essential oil which is valuable as a febrifuge, antiasthmatic, and antispasmodic; the medicinal properties of this tree also make it useful as a disinfectant, and as an astringent in affections of the respiratory passages, being employed in the form of an infusion, a decoction, or an extract, and cigarettes made of the leaves being also smoked. E. globulus and the E. amygdalina are found to have an excellent sanitary effect when planted in malarious districts such as the Roman Campagna, parts of which have already been reclaimed by their use. This result is partly brought about by the drainage of

the soil (the trees absorbing great quantities of moisture), partly perhaps by the balsamic

Eucalyptus.

odor given out. E. mannifera and others yield a sweet secretion resembling manna.

**Euclid** (Eucleides), of Alexandria, a distinguished Greek mathematician, who flourished about 300 B. c. His *Elements of Geometry* in thirteen books are still extant, and form the most usual introduction to the study of geometry. The severity and accuracy of his methods of demonstration have as a whole never been surpassed. Besides the *Elements*, some other works are attributed to Euclid.

Eudiom'eter, an instrument originally designed for ascertaining the purity of the air or the quantity of oxygen it contains, but now employed generally in the analysis of gaseous mixtures. It consists of a graduated glass tube, either straight or bent in the shape of the letter U, hermetically sealed at one end and open at the other. Two platinum wires, intended for the conveyance of electric sparks through any mixture of gases, are inserted through the glass near the closed end of the tube, and approach but do not touch each The electric spark causes chemical other. combination to take place between the oxygen in the gas to be analyzed, and hydrogen which has been introduced into the tube, and the nature and proportion of the constituents of gaseous mixture are determined by the diminution in volume after the passing of the spark. Certain substances, such as caustic, potash, pyrogallic acid, etc., may be introduced into the closed tube in order to absorb the gases present one by one.

Eufala, Barbour co., Ala., on Chattahoochee River, 80 mi. s.e. of Montgomery. Railroads: Montgomery & Eufala; Eufala & Ozark; and South Western. Industries: two cotton mills, carriage factory, planing mills, and canning factory. Surrounding country agricultural. Pop. est. 1897, 8,000.

**Eugene**  $(\bar{u}$ -jēn') (or François Eugène) (1663-1736), Prince of Savoy, fifth son of Eugène

## Eugénie

Maurice, duke of Savoy-Carignan, and Olympia Mencini, a niece of Cardinal Mazarin, was born at Paris. Offended with Louis XIV he entered the Austrian service in 1683, serving his first campaign as a volunteer against the Turks. At the end of the war he was sent as commander-in-chief to Hungary. The Spanish War of Succession brought Eugene again into the field. In 1703 he commanded the imperial army in Germany, and in co-operation with Marlborough frustrated the plans of France and her allies. In the battle of Höchstadt, or Blenheim, Eugene and Marlborough defeated the French and Bavarians under Marshal Tallard, Aug. 13, 1704. Next year Eugene, returning to Italy, forced the French to raise the siege of Turin, and in one month drove them out of Italy. During the following years he fought on the Rhine, took Lille, and, in conjunction with Marlborough defeated the French at Oudenarde (1708), and Malplaquet (1709), where he himself was dan-gerously wounded. After the recall of Marl-borough, which Eugene opposed in person at London without success, and the defection of England from the alliance against France, his farther progress was in a great measure checked. In the war with Turkey, in 1716, Eugene defeated two superior armies at Peterwaraden and Temesvar, and, in 1717, took Belgrade, after having gained a decisive victory over a third army that came to its relief. During fifteen years of peace which followed, Eugene served Austria as faithfully in the cabinet as he had done in the field. He died in Vienna. He was one of the great generals of modern times.

Eugénie (eu-zhā-nē), MARIE DE GUZMAN, exempress of the French, b. at Granada, in Spain, in 1826. Her father, the Count de Montijo, was of a noble Spanish family; her mother was of Scotch extraction, maiden name Kirkpat-rick. On Jan. 29, 1853, she became the wife of Napoleon III and empress of the French. On March 16, 1856, a son was born of the marriage. When the war broke out with Germany she was appointed regent (July 27, 1870) during the absence of the emperor, but on September 4 the revolution forced her to flee from France. She went to England, where she was joined by the prince imperial and afterward by the emperor. Camden House, Chiselhurst, became the residence of the imperial exiles. On Jan. 9, 1873, the emperor died, and six years later the prince imperial was slain while serving with the English army in Africa, in the Zulu War. In 1881 the empress transferred her residence to Farnborough, in Hampshire.

**Eulenspiegel** (oi'len-spē-gl), TILL, a name which has become associated in Germany with all sorts of wild, whimsical frolics, and with many amusing stories. Some such popular hero of tradition and folk-lore seems to have really existed in Germany, probably in the first half of the fourteenth century, and a collection of popular tales of a frolicsome character, originally written in Low German, purports to contain his adventures.

## Euphrates

Eupato'rium, a genus of plants chiefly natives of America, belonging to the natural order Compositæ. Their roots are perennial, possessing a rough, bitter or aromatic taste: the flowers are small, white, reddish, or bluish, in corymbs.

Eupho'nium, a brass bass instrument, generally introduced into military bands, and frequently met with in the orchestra as a substitute for the bass trombone, from which, however, it is very different in tone. It is tuned on C or on N

Hemp Agrimony.

is tuned on C or on B flat, and is furnished with three or four valves or pistons.

Euphorbia'ceæ, the spurgeworts, a natural order of herbaceous plants, shrubs, or ver

Caper Spurge.

large trees, which occur in all regions of the globe. Most of them have an acrid, milky juice, and diclinous or monectious flowers. The fruit is dry or slightly fleshy, and threelobed.

**Euphra'tes** (or El Frat), a celebrated river of Western Asia, in Asiatic Turkey, having a double source in two streams rising in the Anti-Taurus Range. Its total length is about 1.750mi., and the area of its basin 260,000 sq. mi. It flows mainly in a southeasterly course through the great alluvial plains of Babylonia and Chaldæa till it falls into the Persian Gulf by several mouths, of which only one in Persian territory is navigable. About 100 mi. from its mouth it is joined by the Tigris, when the

## Euphulsm

united streams take the name of Shatt-el-Arab. It is navigable for about 1,200 mi., but navigation is somewhat impeded by rapids and shallows. The melting of snow in the Taurus and Anti-Taurus causes a flooding in spring. The water is highest in May and June, when the current, which rarely exceeds 3 mi. an hour, rises to 5 mi. an hour.

Eu'phuism, an affected style of speech which distinguished the conversation and writings of many of the wits of the court of Queen Elizabeth. The name and the style were derived from the Euphues, the Anatomy of Wit (about 1580), and the Euphues and his England (about 1582), of John Lyly.

**Eura**' sians (syncopated from Europ-Asians), a name sometimes given to the "half-castes" of India. the offspring of European fathers and Indian mothers. They are particularly common in the three presidential capitals— Calcutta, Madras, and Bombay. They generally receive a European education, and the young men are often engaged in government or mercantile offices. The girls in spite of their dark tint are generally very pretty, and often marry Europeans.

Eure (cur), a river of n.w. France, which rises in the department of the Orne, and falls into the Seine after a course of 124 mi., being navigable for about half the distance. It gives its name to a department in the n.w. of France, forming part of Normandy; area 2,300 sq. mi. Apples, pears, plums, and cherries form important crops, and a little wine is produced. The mining and manufacturing industries are extensive, and the department has a considerable trade in woolen cloth, linen and cotton fabrics, carpets, leather, paper, glass. Evreux is the capital. Pop. 358,829.

**Eure-et-Loir** (eur-è-lwär), a department in the n.w. of France, forming part of the old provinces of Orléannais and Ile-de-France; area 2.267 sq. mi. A considerable portion is occupied by orchards and vineyards, but the greater part is devoted to cereal crops. The department is essentially agricultural, and has few manufactures. The capital is Chartres. Pop. 283,719.

**Eure** 'ka("I have found it"), the exclamation of Archimedes, when, after long study, he discovered a method of detecting the amount of alloy in King Hiero's crown. Hence the word is used as an expression of triumph at a discovery or supposed discovery.

**Eureka**, Humboldt co., Cal., on Humboldt Bay, 225 mi. n. of San Francisco. Railroads: E. R. & E.; K. & E.; E. & M. R. Industries: lumber and shingle mills, two iron foundries, tannery, sash and door, and farm implement factories. Surrounding country agricultural and grazing. The town was first settled in 1850, and became a city in 1870. Pop. est. 1890, about 8,000.

Eurip' ides (- $d\bar{e}z$ ) (B. c. 485-406), a celebrated Athenian tragedian. He studied under Prodicus and Anaxagoras, and is said to have begun to write tragedies at the age of eighteen, although his first published play, the *Peliades*, **appeared** only in 455 B. c. He was not successful in gaining the first prize till the year 441 B. C., and he continued to exhibit till 408 B. C., when he exhibited the Orestes. According to a tradition he was killed by hounds. Euripides is a master of tragic situations and pathos, and shows much knowledge of human nature and skill in grouping characters, but his works lack the artistic completeness and the sublime earnestness that characterize Æschylus and Sophocles. Euripides is said to have composed seventy-five, or, according to another authority, ninety-two tragedies. Of these eighteen (or nineteen, including the Rhesus) are extant: viz., Alcestis, Medea, Hippolytus, Heruba, Herachida, Supplices, Ion, Hereules Furens, Andromache, Troades, Electro, Helena, Iphigenia in Tauris, Orestes, Pharmane, Bacches, Iphigenia in Aulis, and Cyclops,

**Euro' pa**, in Greek mythology, the daughter of Agënor, king of the Phœnicians, and the sister of Cadmus. The fable relates that sine was abducted by Jupiter, who for that occasion had assumed the form of a bull, and swam with his prize to the island of Crete.

**Europe**, the smallest of the great continents, but the most important in the history of civilization for the last two thousand years. It forms a huge peninsula projecting from Asia, and is bounded on the north by the Arctic Ocean; on the west by the Atlantic Ocean; on the south by the Mediterranean, the Black Sea, and the Caucasus Range; on the east by the Caspian Sea, the Ural River, and the Ural Mountains. The most northerly point on the mainland is Cape Nordkyn, in Lapland, in lat. 71° 6'; the most southerly points are Punta da Tarifa, lat.  $36^{\circ}$  n., in the Strait of Gibraltar. and Cape Matapan, lat. 360 17', which terminates Greece. The most westerly point is Cape Roca, in Portugal, in lon. 9° 28' w., while Ekaterinburg is in lon. 60° 35' e. From Cape Matapan to North Cape is a direct distance of 2,400 mi., from Cape St. Vincent to Ekaterinburg n. e. by e., 3,400 mi.; area of the conti-nent about 3,800,000 sq. mi. Great Britain and Ireland, Iceland, Nova Zembla, Corsica, Sardinia, Sicily, Malta, Crete, the Ionian and the Balearic Islands are the chief islands of Europe. The shores are very much indented, giving Europe an immense length of coastline (estimated at nearly 50,000 mi.). The chief seas or arms of the sea are: the White Sea on the north; the North Sea, or German Ocean, on the west, from which branches off the great gulf or inland sea known as the Baltic; the English Channel, between England and France; the Mediterranean, communicating with the Atlantic by the Strait of Gibraltar (at one point only 19 mi. wide); the Adriatic and Archipelago, branching off from the Mediterranean; and the Black Sea, connected with the Archipelago through the Hellespont, Sea

of Marmora, and Bosphorus. Surface.—The mountains form several distinct groups or systems of very different geological dates, the loftiest mountain masses being in the south central region. The Scandinavian mountains in the northwest, to which the great northern peninsula owes its form. extend above 900 mi. from the Polar Sea to the south point of Norway. The highest sum-mits are about 8,000 ft. The Alps, the highest mountains in Europe (unless Mount Elbruz in the Caucasus is claimed as European), extend from the Mediterranean first in a northerly and then in an easterly direction, and attain their greatest elevation in Mont Blanc (15,781 ft.), Monte Rosa, and other summits. Branching off from the Alps, though not geologically connected with them, are the Apennines, which run southeast through Italy, constituting the central ridge of the peninsula. The highest summit is Monte Corno (9,541 ft.). Mount Vesuvius, the celebrated volcano in the south of the peninsula, is quite distinct from the Apennines. By southeastern extensions the Alps are connected with the Balkan and the Despoto-Dagh of the southeastern peninsula of Europe. Among the mountains of Southwestern Europe are several massive chains, the loftiest summits being in the Pyrenees, and in the Sierra Nevada in the south of the Iberian Peninsula. The highest point in the former. La Maladetta, or Mont Maudit, has an elevation of 11,165 ft.; Mulahacen, in the latter, is 11,703 ft., and capped by per-petual snow. West and northwest of the Alps are the Cevennes, Jura, and Vosges; north and northeast, the Harz, the Thuringerwald Mountains, the Fichtelgebirge, the Erzgebirge, and Böhmerwaldgebirge. Further to the east the Carpathian chain encloses the great plain of Hungary, attaining an elevation of 8,000 or 8,500 ft. The Ural Mountains between Europe and Asia reach the height of 5,540 ft. Besides Vesuvius, two other volcanoes are Etna in Sicily, and Hecla in Iceland. A great part of northern and eastern Europe is level. The great plain of North Europe occupies part of France, Western and Northern Belgium, Hol-land, the northern provinces of Germany, and the greater part of Russia. A large portion of this plain, extending through Holland and North Germany, is a low sandy level protected from inroads of the sea only by means of strong dikes. The other great plains of Europe are the plain of Lombardy (the most fertile district in Europe) and the plain of Hungary. Part of Southern and Southeastern Russia consists of steppes.

Rivers and Lakes.—The main European watershed runs in a winding direction from southwest to northeast, at its northeastern extremity, being of very slight elevation. From the Alps descend some of the largest of the European rivers, the Rhine, the Rhone, and the Po, while the Danube, a still greater stream, rises in the Black Forest north of the Alps. The Volga, which enters the Caspian Sea, an inland sheet without outlet, is the longest of European rivers, having a direct length of nearly 1.700 mi. including windings 2.400 miles. Into the Mediterranean, flow the Ebro, the Rhone, and the Po; into the Black Sea, the Danube, Dnieper, Dniester, and Don (through the Sea of Azov); into the Atlantic, the Guadalquivir, the Guadiana, the Tagus, and Loire; into the English Channel, the Seine; into the North Sea, the Rhine, Elbe: into the Baltic, the Oder, the Vistula, and the Duna; into the Arctic Ocean the Ibwina. The lakes of Europe may be divided into two groups, the southern and the northern. The former run along both sides of the Alps, and among them, on the north side, are the lakes of Geneva, Neuchátel, Thun, Lucerne, Zürich, and Constance; on the south side, Lago Maggiore, and the lakes of Como, Lugano, Iseo, and Garda. The northern lakes extend across Sweden from west to east, and on the east side of the Baltic a number of lakes, stretching in the same direction across Finland on the borders of Russia, mark the continuation of the line of depression. It is in Russia that the largest European lakes are found—Lakes Ladoga and Onega.

Geology.—The geological features of Europe are exceedingly varied. The older formations prevail in the northern part as compared with the southern half and the middle region. North of the latitude of Edinburgh and Moscow there is very little of the surface of more recent origin than the strata of the Upper Jura belonging to the Mesozoic period, and there are vast tracts occupied either by eruptive rocks or one or other of the older sedimentary formations. Denmark and the portions of Germany adjoining belong to the Cretaceous period, as does also a large part of Russia between the Volga and the basin of the Dnieper. Middle and Eastern Germany, with Poland and the valley of the Dnieper present on the surface Eocene formations of the Tertiary period. The remainder of Europe is remarkable for the great diversity of its superficial structure. rocks and deposits belonging to all periods being found within it, and having for the most part no great superficial extent. Europe possesses abundant stores of those minerals which are of most importance to man, such as coal and iron, Britain being particularly favored in this respect. Coal and iron are also ob-tained in France, Belgium, and Germany. Gold is found to an unimportant extent, and silver is widely spread in small quantities. The richest silver ores are in Norway. Spain, the Erzgebirge, and the Harz Mountains. Spain is also rich in quicksilver. Copper ores are abundant in the Ural Mountains, Thuringia. Cornwall, and Spain. Tin ores are found in Cornwall, the Erzgebirge, and Brittany.

Climate.—Several circumstances concur to give Europe a climate peculiarly genial, such as its position almost wholly within the temperate zone, and the great extent of its maritime boundaries. Much benefit is also derived from the fact that its shores are exposed to the warm marine currents and warm winds from the southwest, which prevent the formation of ice on most of its northern shores. The eastern portion has a less favorable ciimate than the western. The extremes of temperature are greater, the summer being hotter and the winter colder, while the lines of equal mean temperature decline south as we go east. The same advantages of mild and genial temperature which Western has over Eastern

Europe, the continent collectively has over the rest of the Old World. The diminution of mean temperature, as well as the intensity of the opposite seasons, increases as we go east. Peking, in lat  $40^{\circ}$  n., has as severe a winter as St. Petersburg in lat.  $60^{\circ}$ .

Vegetable Productions .- With respect to the vegetable kingdom Europe may be divided into four zones. The first, or most northern, is that of fir and birch. The birch reaches almost to North Cape; the fir ceases a degree farther south. The cultivation of grain extends farther north than might be supposed. Barely ripens even under the 70th parallel of north latitude; wheat ceases at  $64^{\circ}$  in Norway,  $62^{\circ}$  in Sweden. Within this zone, the southern limit of which extends from lat. 64° in Norway to lat. 62° in Russia, agriculture has little importance, its inhabitants being chiefly occupied with the care of reindeer or cattle, and in fishing. The next zone, which may be called that of the oak and beech, and cereal produce, extends from the limit above mentioned to the 48th parallel. The Alps, though beyond the limit, by reason of their elevation belon; to this zone, in the moister parts of which cattle husbandry has been brought to perfection. Next we find the zone of the chestnut and vine, occupying the space between the 48th parallel and the mountain chains of Southern Europe. Here the oak still flourishes, but the pine species become rarer. Rye, which characterizes the preceding zone on the continent, gives way to wheat, and in the southern portion of it to maize also. The fourth zone, comprehending the southern peninsulas, is that of the olive and evergreen woods. The orange flourishes in the southern portion of it, and rice is cultivated in a few spots in Italy and Spain.

Animals.—As regards animals the reindeer and polar bears are peculiar to the north. Bears and wolves still inhabit the forests and mountains; but, in general, cultivation and population have expelled wild animals. The domesticated animals are nearly the same throughout. The ass and mule lose their size and beauty north of the Pyrenees and Alps. The Mediterranean Sea has many species of fish, but no great fishery; the northern seas, on the other hand, are annually filled with countless shoals of a few species, chiefly the herring, mackerel, cod, and salmon.

Inhabitants.-Europe is occupied by several different peoples or races, in many parts now greatly intermingled. The Celts once possessed the west of Europe from the Alps to the British Islands. But the Celtic nationalities were broken by the wave of Roman conquest, and the succeeding invasions of the Germanic tribes completed their political ruin. At the present day the Celtic language is spoken only in the Scotch Highlands (Gaelic), in some parts of Ireland (Irish), in Wales (Cymric), and in Brittany (Armorican). Next to the Celtic comes the Teutonic race, comprehending the Germanic and Scandinavian branches. **The** former includes the Germans, the Dutch, and the English. The Scandinavians are divided

into Danes, Swedes, and Norwegians. To the east, in general, of the Teutonic race, though sometimes mixed with it, come the Slavonians, that is, the Russians, the Poles, the Czechs, or Bohemians, the Servians, Croatians, etc. In the south and southeast of Europe are the Greek and Latin peoples, the latter comprising the Italians, French, Spanish, and Portuguese. All the above peoples are regarded as belonging to the Indo-European or Aryan stock. To the Mongolian stock belong the Turks, Finns, Lapps, and Magyars, or Hungarians, all immigrants into Europe in comparatively recent The Basques, at the western extremity times. of the Pyrenees, are a people whose affinities have not been determined. The total population of Europe is about 330,000,000; nine tenths speak the languages of the Indo-European family, the Teutonic group numbering about 108,000,000, the Slavonic and Latin over 95,-000,000 each. The prevailing religion is the Christian, embracing the Roman Catholic Church, which is the most numerous, the various sects of Protestants (Lutheran, Calvinistic, Anglican, Baptists, Methodists, etc.), and the Greek Church. A part of the inhabitants profess the Jewish, a part the Mohammedan religion.

Political Divisions.—The states of Europe are as follows: Austria-Hungary, Liechtenstein, Bosnia, Herzegovina, etc.; Belgium; Denmark, Faroe, and Iceland; France: Germany; Britain; Greece; Netherlands, Luxemburg; Italy; Montenegro; Portugal; Roumania; Russia; Servia; Spain; Sweden; Norway; Switzerland: Turkey, Bulgaria, Eastern Roumelia.

*History.*—Europe was probably first peopled from Asia, but at what date we know not. The first authentic history begins in Greece at about 776 B.C. Greek civilization was at its most flourishing period about 430 B.C. After Greece came Rome, which, by the early part of the Christian era, had conquered Spain, Greece, Gaul, Helvetia, Germany between the Danube and the Alps, Illyria, Dacia, etc. Improved laws and superior arts of life spread with the Roman empire throughout Europe. and the unity of government was also extremely favorable to the extension of Christianity. With the decline of the Roman Empire a great change in the political constitution of Europe was produced by the universal migration of the northern nations. The Ostrogoths and Lombards settled in Italy, the Franks in France, the Visigoths in Spain, and the Anglo-Saxons in South Britain, reducing the inhabitants to subjection, or becoming incorporated with them. Under Charlemagne (771-814) a great Germanic empire was established, so extensive that the kingdoms of France, Germany, Italy, Burgundy, Lorraine. and Navarre were afterward formed out of it. About this time the northern and eastern nations of Europe began to exert an influence in the affairs of Europe. The Slavs, or Slavonians, founded kingdoms in Bohemia, Poland, Russia, and the north of Germany; the Magyars appeared in Hungary, and the Normans agitated all Europe, founding kingdoms and

principalities in England, France, Sicily, and the East. The Crusades and the growth of the Ottoman power are among the principal events which influenced Europe from the twelfth to the fifteenth century. The conquest of Con-stantinople by the Turks (1453) by driving the learned Greeks from this city, gave a new impulse to letters in Western Europe, which was carried onward by the invention of printing, and the Reformation. The discovery of America was followed by the temporary preponderance of Spain in Europe, and next of France. Subsequently Prussia and Russia gradually in-creased in territory and strength. The French Revolution (1789) and the Napoleonic wars had a profound effect on Europe, the dissolution of the old German Empire being one of the results. Since then the most important events in European history have been the establishment of the independence of Greece; the disappearance of Poland as a separate state; the unification of Italy under Victor Emmanuel; the Franco-German War, resulting in the consolidation of Germany into an empire under the leadership of Prussia; the partial dismemberment of the Turkish Empire, and the war between Turkey and Greece (1897).

**Eurydice** (ū-rid'i-sē), in Greek mythology, the wife of Orpheus.

**Eustis**, JAMES BIDDLE, soldier and statesman, b. 1834 in New Orleans, La. He graduated at Harvard Law School in 1854 and practised law until the war broke out. He served on the staff of Gen. J. E. Johnson till the close of the war. He was elected a member of the state legislature in 1872 and served in the U.S. Senate 1877-1879. He was again elected senator in 1884. President Cleveland appointed him minister to France.

**Euter'pe**, 1, one of the Muses, considered as presiding over lyric poetry, the invention of the flute being ascribed to her. She is usually represented as a virgin crowned with flowers, having a flute in her hand. 2. In botany, a genus of palms, natives of South America, sometimes nearly 100 ft. in height.

Ev'ans, OLIVER (1755-1819), b. in Newport, Del., was the inventor of the automatic flour mill and the high-pressure steam engine. He is also said to have invented the first steam road carriage ever worked in America.

**Evanston**, a suburb of Chicago, Cook co., Ill., situated 12 mi. n. of Chicago, on Lake Michigan. Railroads: Chicago & Northwestern, and Chicago, Milwaukee & St. Paul. It has good streets and many fine residences, also numerous churches, a city hall, and waterworks. The Northwestern University, the Garrett Biblical Institute, a college for young women, and other educational institutions are located here. Evanston is connected with Chicago by an electric street railroad. Pop. est. 1897, 14,000.

**Evansville**, Vanderburg co., Ind., on Ohio River, 163 mi. n.e. of St. Louis. Railroads: E. & T. H.; E. & L.; E. & R.; P. D. & E.; L. E. & St. L.; L. & N.; O. V.; L. H. & St. L.; E. S. &. N.; E. belt line. Industries: cotton mill. seven flouring mills, thirteen iron foundries, twenty-four furniture factories, three breweries, three sawmills, and a number of other industries. The town was first settled in 1812 by Hugh McGary and became a city in 1847, named after General Evans. Pop. est. 1897, 67,000.

**Evaporation**, the conversion of a liquid or solid by heat into vapor or steam, which becomes dissipated in the atmosphere in the manner of an elastic fluid. The process of evaporation is constantly going on at the surface of the earth, but principally at the surface of the sea, of lakes, rivers, and pools. The vapor thus formed, being specifically lighter than atmospheric air, rises to considerable heights above the earth's surface; and afterward, by a partial condensation, forms clouds, and finally descends in rain.

Evarts, W.M. M., wasb. in Boston, Feb. 6, 1818; graduated at Yale (1837), studied law at Harvard and was admitted to the bar in New York city in 1841. He was assistant district attorney in New York City from 1849 to 1853. In 1808 was counsel for President Johnson in the impeachment trial. In 1872 was counsel for the U. S. in the Alabama claims. His fees have amounted to \$50,000 for a single opinion. He served as secretary of state under President Hayes; visited Paris, in 1881, as a delegate to the international monetary conference and was elected U. S. senator in March, 1885.

**Evening-star** (or Hesperus), the name given to the planet Venus when visible in the evening. See *Venus*.

Ev'erett, ALEXANDER HILL (1792-1847), an American diplomatist. After studying at Harvard, in 1809 he accompanied John Quincy Adams to St. Petersburg as secretary of legation. He afterward filled successive diplomatic posts in the Netherlands. Spain, and elsewhere. He is the author, among other works, of Europe, or a General Survey of the Present Situation of the Principal Powers (1822): and a similar work on America.

Everett, EDWARD (1794-1865), an American statesman and author, brother of the preceding. After traveling for some years in Germany and England he returned to America in 1819 to occupy the chair of Greek literature at Harvard. He became editor of the North American Review, and entering the political world became successively member of Congress, governor of Massachusetts, and minister plenipotentiary in England (1840). In 1845 he was appointed president of Harvard College, and in 1852 secretary of state. Shortly after he retired into private life.

Everett, Middlesex co., Mass., on Charles and Malden rivers. Railroad, Boston & Maine. Industries: chemical works, iron foundry, furniture, shoe, bicycle, glove, pickle, lead, and varnish factories. Oil in vicinity. The town was first settled in 1634 as a part of Malden. incorporated as a town in 1870 and became a city in 1893. Pop. est. 1897, 22,000. Everglades, a low marshy tract of country

**Everglades,** a low marshy tract of country in Southern Florida, inundated with water and interspersed with patches or portions covered with high grass and trees. They are 160 mi. long and 60 broad.

#### Evergreen

**Evergreen**, a plant that retains its verdure through all the seasons, as the fir, the holly, the laurel, the cedar, the cypress, the juniper,

the holm-oak, and many Evergreens shed others. their old leaves in the spring or summer, after the new foliage has been formed, and consequently are verdant through all the winter season. They form a considerable part of the shrubs commonly cultivated in gardens, and are beautiful at all seasons of the year.

Everlasting-flowers, a name applied to certain plants which, when dried, suffer little change in their appearance. The plants to which this name is peculiarly applied belong to the genus Helichrysum, but it is also given to members

of allied genera, such as Everlasting-flower. Antennaria, Gnaphalium, etc.

Evolution.-Upon every developing mind, whether infantile or consciously philosophic, there presses at times the question of the origin of things. The attempt to answer this is to construct a cosmogony; and is alike the earliest and latest extension of our common-sense account of things into complete and more orderly form as science. This philosophy of things is not only incapable of being grasped by the highest effort of the intellect, but is incessantly contradicted by experience; it has hence never gained any real acceptance from the simplest common sense, much less any confirmation from science. The alternative then arises of drawing an explanation of the origin of things from our experience not of permanence, but of change. Here it is naturally the most changeful phenomena, the most marked and sudden contrasts, which first and most deeply arouse our attention, and this not only in nature, but still more in human life and affairs. The hypothesis of a sudden and unexplained, of a mysterious appearance or creation of things, thus next presents itself; and the subsequent explanation of this as an act of external will is rendered easy by our personal consciousness. Phenomena are becoming classified and interconnected in larger and larger groups, with which a higher anthropomorphism can henceforth associate a conception of detailed design. The older view only remains provisionally so far as order is not yet apparent. Human affairs become more and more obviously interpretable than of old, and there arises in their place the characteristically modern ideas of progress. Natural science has become meanwhile more active, the very astronomical and geological phenomena from which our ideas of permanence were most derived are seen to be in process of change. The idea of the present as the product of the past also becomes extended to the

# Evolution

world of organic life. The details, the general mechanism and direction of the processes of change, thus become inquiries of paramount interest. It is admitted on all hands that the evolution theory only supersedes those cruder anthropomorphisms of arbitrary creation and of mechanical contrivance which presented the universe as a mere aggregate of finished products, without excluding that higher and more unified teleology which interprets it as the orderly unfolding of a cosmic drama.

Evolution in the Physical Sciences-Astronomy. Here, as in other sciences, early conceptions of the universe agree in viewing it as being, as far as possible, in permanence and at rest, and not in change and motion. Such static views may be only tacitly implied, but are more usually directly avowed: thus the earth was long viewed as a plane stably supported, and until very recently the stars were viewed as fixed. But as the static universe of the an-cient astronomer passed into that of Copernicus and Kepler, Galileo and Newton, Herschel and Leverrier, dynamic, or more accurately kinetic, conceptions have henceforward an assured prominence in at least one science, and that the one most obviously concerned with the universe as a whole. For although evolutionary speculations of more or less vagueness seem to have arisen once and again in almost every science, the first well-developed theory of evolution which has attempted to cope with the observed facts of any science must be credited to astronomy in the famous Nebular Hypothesis, of which the suggestiveness to all other departments of science must be freely admitted. For the mind which has once fully grasped the conception of stellar and planetary evolution cannot readily stop there.

Evolution in Geology .- That the last century mineralogist was here and there already widening his interest to the rocks and even meditating as to their nature and origin is well evidenced by the penetrating speculation of Linnæus: "It may be that the solid rocks are not primeval, but the daughters of time." As subsequent generations of research have shown us, this solid rock is the product of igneous and that of aqueous action, here reaching back to an incalculable antiquity, or there evolved within the period of human occupancy; while others consist in great part, or even completely, of the remains of extinct animals or plants. These are conceptions now so familiar that it is difficult to realize their once revolutionary appearance and effect. More detailed studies, too, would be of no little service to our general theories; note, for instance, how the geologist takes from the astronomer, now a stellar evolutionist, the cooling planet, and outlines its primeval surroundings of land and sea, its wrinkling hills and vales, how he proves that the pulse of the ocean is but the dying ripple of a once fiftyfold mightier tidal wave, or how the glacial period is the inexorably recurrent winter of a year of ages. The mineralogist no longer merely measures and analyzes, but deciphers the origin and transmutation of min-

eral species, and of the rocks they form under the forces of the environment; and the typically changeful phenomena of climate and atmosphere are rendered the subject of a typically dynamic sub-science.

Modal Explanation of Physical Evolution.-We must sooner or later inquire whether any general principle can be found to verify and rationalize the process of evolution in the physical world, and to this the answer has been specially elaborated by Herbert Spencer. His essential principle, or *Law of Evolution*, must be stated in his own words: "Evolution is an integration of matter and concomitant dissipation of motion during which the matter passes from an indefinite, incoherent heterogeneity to a definite, coherent homogeneity, and during which the retained motion under-goes a parallel transformation." And although the student who seeks to follow Mr. Spencer in grappling with the riddle of evolution in higher orders of phenomena may not admit that his uncompromising applications of the principles of physical evolution to higher categories is so exhaustive and satisfactory as he claims, there can be no doubt that his general treatment has been on the whole amply justified, so far as it goes, alike in unifying the sciences, and in the separate organization of these.

Evolution in Biology. - This portion of the subject demands special attention and fullest outline for many reasons. Not only is the transition from static to evolutionary conceptions of comparatively recent, indeed almost contemporary interest; but the progress of the doctrine of evolution as a general theory of the universe has been most closely connected with progress in biology. And while we can at best merely speculate as to the direct continuity of evolution from the inorganic to the organic world, we are constantly impressed by the fundamental unity of the process in the simplest and most complex forms of life, and by the thoroughness with which the same principles may be traced into the highest "superorganic" phenomena of mind and society. The general argument for evolution appended by Darwin to the classic statement of his theory of Natural Selection in the Origin of Species has been already summarized under Daricinian Theory. Only the briefest reference to these need here be made. We must keep, for instance, in view the conceptions of the actual evolution of the individual which have become systematized in the sub-science of embryology (see Embryology). Suffice it, however, here to recall that, although it is in this connection that the term evolution first makes its appearance, it is used along with development, in a sense diametrically opposed to its present significance, as the mere enlargement and unfolding of a form and structure in all essential respects a perfect miniature of that of the adult.

Without recording or analyzing the various conceptions of species, it is sufficient again to note how the belief in their objective constancy and practical definableness is shaken by

such facts as 1, that pre-evolutionary systematists differ hopelessly upon the number and limits of the species of all the more variable groups of plants and animals; 2, that the mere numerical increase of the number of specimens in our museums is constantly compelling us to recognize that great numbers, sometimes even scores or hundreds, of "type specimens" of irreproachably described "species" are but so many individual members of a series linked by the most infinitesimal gradations, yet of which the extremes differ by characters of specific, it may be even generic rank. And when, 3, the assumption of the general sterility of hybrids is proved experimentally to be an exaggeration, it becomes, to say the least, increasingly difficult seriously to support the dogma of the constancy of species.

Leaving the general external form with which the species maker is mainly concerned, we must accompany the anatomist through each level of his deepening analyses and comparisons, through organ systems and organs, tissues and cells, to the ultimate protoplasm itself. To realize how fully this analysis re-sults in the demonstration of an unsuspected unity of structure not only between species and genera, but far larger groups, some actual study of the concrete facts is indispensable; as also to appreciate the same beautiful unity of type in individual structures so differentiated as the appendages of a lobster, or the parts of a flower. Yet here again we have an instance of the tenacity of static conceptions; for although it could not be actually denied that the hypothesis of descent from common ancestors at least might explain the structural unity observable under classification, as from a simpler ancestor, that observable under the individual structure, the conception of conformity to a purely ideal "archetype," was long maintained. Rudimentary organs, such as the teeth of fostal whales, were thus explained not as reduced survivals of structures ancestrally useful, but as purely intellectual necessities of this arbitrary "conformity to type." This ingenious revival of Platonic ideas in conjunction with scholastic nominalism could not, however, very long survive the demonstration of the frequent absence of rudiments necessary for archetypal purposes; and the alternative evolutionary explanation has thus inevitably succeeded to its place.

It is much to learn from the taxonomist that his classification of species and genera, even the whole world of plants or animals, assumes the form of a vast genealogical tree; and it is no small confirmation of the evolutionary view to note how every new fossil trove throws some fresh light upon the order in which the branches or branchlets of this tree have historically developed. With all the missing links we can imagine or desire between the modern horse and his simple five-toed ancestor, not to speak of other examples, we have indeed evidence which may well satisfy us of the historic fact of evolution; but this brings us no nearer comprehending the rationale of the process. Leaving the morphological sciences, we must

\_\_\_\_

pass with Darwin to the study of what we may call the higher physiology. Assuming what is known of the functions of the individual, we must note not only the relations of the species unit (in higher forms usually of course the pair), and so familiarize ourselves with the phenomena of reproduction of sex, of heredity and variation, breeding and relation to offspring, the results of intercrossing, the modification by environment, etc., we must also consider the wider relations among the members of the same species, between allied species, and finally between practically unrelated ones, whether here of struggle or there of adaptation. He thus introduces us to this vast and practically new field, and gives us a glimpse of the living, whole nature in that magistral series of volumes, which we may as it were group into a Vita Natura, complementary to the static Systema Natura, and no less epoch-making for our day than was that of Linnæus for his.

It is necessary to refer more precisely to the history of opinion both as regards the fact of evolution and the factors in the process. The history of the two questions-of the empirical fact, and of the actual mechanism of evolution-can hardly be separated, though it is of course well known that the former was virtually settled by the demonstrations of Spencer, Darwin, Wallace, Haeckel, and others soon after the middle of this century, while we are still in the midst of keen debate as to the relative importance of the diverse factors. The history of the theory of evolution, so far as the organic world is concerned, is essentially modern; for in spite of vague hints and a priori speculations from Empedoeles onward, it was not till the eighteenth century that evolution began to be very definitely suggested as a modal explanation of the origin of our fauna and flora, or that inquiry began to be seriously directed to what we now call the etiology of organisms.

What was for so long only a germ idea at length took shape in the mind of Buffon (1749), who sought to show how new conditions evoked new functions, how these in turn reacted upon the structure of the organism, and how, most directly of all, altered climate, food, and other elements of the environment might be the external conditions of internal change, whether for progress or the reverse. Erasmus Darwin (1794), with a truly living conception of nature, emphasized the organism's inherent power of self-improvement, the molding influence of new needs, desires, and exertions, and the indirect action of the environment in evoking To Treviranus (1802-31) organisms apthese. peared almost indefinitely plastic, especially, however, under the direct influence of external forces, nor did his analysis of possible factors fail to recognize what Brooks, Weismann, and others have recently elaborated, that the union of diverse sexual elements in fertilization was in itself a foundation of change. Among the philosophers, especially in the minds of those who had been disciplined in physical or historical investigations, the speculations of the ancients were ever taking fresh form, gaining moreover in concreteness; witness the contributions of Kant and Herder. In Goethe's epic of evolution the adaptive influence of the environment is clearly recognized, while the misty theories of his contemporary, Oken, chiefly interpret the organic progress in terms of action and reaction between the organism and its surroundings. In France, Geoffroy and Isidore St. Hilaire, father and son, supported the thesis of definite variation under direct environmental influence. And before reaching even the contemporaries of Darwin a complete history would have to take account of the conclusions of many naturalists, such as Von Buch, Von Baer, Schleiden, Naudin, and Wagner. The environmental factor was subsequently recognized with greater clearness and with less exclusiveness by Spencer; while Darwin and Wallace, recognizing some truth in most of the above positions, but believing them wholly insufficient, left the problem of the origin of variations alone, and devoted their strength to establishing the theory of the origin of species by means of natural selection, a view which emphasizes the destructive, or eliminating, and the conservative, or selective, action of the animate and inanimate environment in the struggle for existence.

Even from the above brief sketch of representative conclusions, it will be seen that successive authors accent diverse factors in the evolutionary process; in the view of one the organism has a motor power of variation inherent in its very constitution, or gained by the intermingling of sex elements from which the individual life starts; to another the molding power of changed function, the perfecting influence of exercise, the degenerating nemesis of disuse are all important; while to a third organisms seem to have been hammered from one shape into another by the action of that complex series of external influences which we briefly term the environment. Among modern naturalists we find champions of each of these three positions respectively emphasizing (a)the organism itself, (b) its function, and (c) its environment; a few remain more or less exclusive Natural Selectionists, with or without theories of the origin of the variations which they postulate; while the majority more and more incline to an eclectic but not yet synthetic view, differing chiefly in regard to the relative importance of the various factors recognized.

Modul Explanation of Organic Evolution.—The conception thus reached of the measure of evolution of a species being expressible in terms of the progress of its (a) self-maintaining and (b) species-maintaining functions is equally capable of statement in biological, psychological, sociological, or indeed also, as moralists are now agreeing, in ethical terms; what are termed egoistic or altruistic actions being respectively self-maintaining or species-maintaining ones, of course at different levels of evolution. Here, then, we have a basis for the required inquiry as to the mechanism of the evolutionary processes. The evolutionist at any rate will not dispute this parallelism be-

#### Evolution

tween the non-ethical aspects of organic evolution, nor deny that the results and processes of evolution in their highest manifestations may be of service in elucidating or criticising the similar ones which must be supposed to exist in less developed forms. Hence he would be in some respects even better justified in tracing the evolutionary process down from the highest aspects to the more simple ones, and from the human species to humbler ones, than conversely. A classical statement of the central difficulty, of which the Darwinism and the morals are alike unexceptionable, and the resultant dualism therefore clearly set forth, may be quoted from Huxley: "From the point of view of the naturalist, the world is on about the same level as a gladiator's show. We must say that its governing principle is intellectual, and not moral, that it is a materialized, logical process accompanied by pleasures and pains. Society differs from nature in having a definite moral object. The ethical man tries to escape from his place in the animal world founded on the free development of the principle of non-moral evolution, and to found a kingdom of man, governed upon the principle of moral evolution. For society not only has a moral end, but, in its perfection, social life is embodied morality. But the effort of the ethical man to work to a moral end, by no means abolished, perhaps has hardly modified, the deep-seated organic impulses which impel the natural man to follow his non-moral course." The general drift of the contemporary discussion is beginning to be apparent; all theories and criticisms have hitherto started with the individual as a unit, and the origin and differentiation of the self-maintaining structures and functions as the primary problem; after which the origin and differentiation of reproductive and species regarding proc-esses have been left only a secondary and sub-sequent place. This method of approach, however natural to the individual thinker, is artificial as respects nature. The correspond-ing progress in the historic and individual world from sex and family up to tribe or city, nation and race, and ultimately to the conception of humanity itself, also becomes increas-ingly apparent. Competition and survival of the fittest are never wholly eliminated, but reappear on each new plane to work out the predominance of the higher, the more inte-grated and associated type. But this service no longer compels us to regard these agencies as the essential mechanism of progress, to the practical exclusion of the associative factor upon which the victory depends. For we see that it is possible to interpret the ideals of ethical progress, through love and sociality, cooperation and sacrifice, not as mere utopias contradicted by experience, but as the highest expressions of the central evolutionary process of the natural world.

**Evolution**, in mathematics, the process of extracting the roots of numbers or quantities. **Ewell**, BENJAMIN STODDERT (1810–), Ameri-

**Ewell**, BENJAMIN STODDERT (1810–), American mathematician, b. in Washington, D. C., June 10; graduated at West Point twenty-two

#### Exchange

years later and served there until 1836 as professor of mathematics and philosophy. He afterward became professor, successively, at Hampden-Sidney, Washington College, and William and Mary, and of the latter college he was elected president in 1854. He served in the Confederate army until the close of the war, when he was again elected president of William and Mary College. He was made an honorary member of the Royal Historical Society of Great Britain in 1880, and Hobart College conferred upon him the degree of LL.D. in 1874. His brother, RICHARD STODDERT (1817-1872), b. in Georgetown, D. C., and educated at West Point. He served in the Mexican War and against the Apaches in New Mexico. He entered the Confederate army in 1861, where he was soon made major general. While serving under Jackson's death. He took part in the battles fought at Winchester. at Gettysburg, and in the Wilderness, but was defeated and captured with his whole command by Sheridan, April 6, 1865.

**Ewing**, THOMAS (1789-1871), an American statesman, b. in Va. In 1831 and 1850 was elected to the U. S. Senate. In 1841 appointed secretary of the treasury. He was the first man to hold the office of secretary of the interior, to which office he was appointed by Fillmore in 1849 and which he held until 1850. In the U. S. supreme court ranked among the foremost lawyers of the nation.

**Exchange**, a place in large commercial towns where merchants, agents, bankers, brokers, and others concerned in commercial affairs meet at certain times for the transaction of business. The institution of exchanges dates from the sixteenth century. They originated in the important trading cities of Italy, Germany, and the Netherlands, from which last-named country they were introduced into England, and from thence to the United States. In some exchanges only a special class of business is transacted. Thus there are stock exchanges, corn exchanges, coal exchanges, cotton exchanges, etc.

Exchange, in commerce, that species of transactions by which the debts of individuals residing at a distance are canceled by order. draft. or bill of exchange, without the trans-mission of specie. Thus, a merchant in Chicago who owes for \$500 worth of goods in New York, gives a bill or order for that amount which can be negotiated through banking agencies or otherwise against similar debts owing by other parties in New York who have pay-ments to make in Chicago. The creditor in New York is thus paid by the debtor in Chicago, and this contrivance obviates the expense and risk of transmitting money. The process of liquidating obligations between different nations is carried on in the same way by an exchange of foreign bills. When all the accounts of one country correspond in value with those of another, so that there is an even balance, the exchange between the countries will be at par, that is, the sum for which the bill is drawn in the one country will be the ex-

## **Excito-motor Action**

act value of it in the other. Exchange is said to be at par when, for instance, a bill drawn in New York for the payment of £100 sterling in London can be purchased there for £100. If it can be purchased for less, exchange is under par and is against London. If the purchaser is obliged to give more, exchange is above par and in favor of London. Although the thousand circumstances which incessantly affect the state of debit and credit prevent the ordinary course of exchange from ever being precisely at par, its fluctuations are confined within narrow limits, and if direct exchange is unfavorable between two countries, this can often be obviated by the interposition of bills drawn on other countries where an opposite state of matters prevails.

**Excl'to-motor Action**, the action of nerves distributed to muscular organs the stimulation of which leads to movement. Thus, irritation of a nerve supplying a muscle will lead to contraction of the muscle by excito-motor action, and irritation of certain nerves distributed to blood-vessels will lead to contraction of the vessel by acting on its muscular coat.

**Exe**, a river of England which rises in Exmoor, in the county of Somerset, and after a southerly course of about 50 miles falls into the English Channel at Exmouth.

**Executive,** that branch of the government of a country by which the laws are carried into effect or the enforcement of them superintended. The term is used in distinction from the *legislatire* and the *judicial* departments, and includes the supreme magistrate, whether emperor, king, president, or governor, his cabinet or ministers, and a host of minor officials.

Exec'utor, in law, is one appointed by a man's last will to carry its provisions into execution after the testator's death. The testator may, by the common law, appoint any person of sound mind and discretion, though otherwise under some legal disabilities as to contracting and transacting business in general, such as a married woman or a minor. The duties of executors and of administrators are, in general, the same, the difference of the two depending mostly on the mode of appointment, the executor being nominated by the . testator, the administrator being appointed by the judge of probate. An executor is liable for any loss occurring to the estate through negligence; for paying legatees before all debts are discharged.

**Exegesis** ( $-j\bar{e}$ 'sis), the exposition or interpretation of the Scriptures. The science which lays down the principles of the art of sacred interpretation is called *exegetics* or *hermeneutics*.

Exeter, a city, river-port, and parliamentary and municipal borough of England, in the county of Devon, on the left bank of the Exe, 10 mi. n.w. from its outlet in the English Channel. Among the objects of interest are the cathedral (founded 1112), the remains of the castle of Rougemont, the Guildhall, the Albert Memorial Museum, St. Michael's Church, etc. Exeter has iron foundries, 'manufactories of agricultural implements, paper mills, etc., and "Honiton" lace is also made. By means of a canal vessels of 300 tons can reach the city. Excter is a place of remote antiquity, having been a British settlement long prior to the invasion of the Romans, by whom it was called *lsea Damnoniorum*. Pop. 37.580.

called Isca Damoniorum. Pop. 37,580. Exeter College, Oxford, a college, originally called Stapledon Hall, founded in 1314 by Walter de Stapledon, bishop of Exeter, who made a foundation for a rector and twelve fellows. In 1404 Edmund Stafford, bishop of Exeter, added two fellowships and obtained leave to give the college its present name.

Exhibition, INDUSTRIAL, an exhibition of works of industry and art for the purpose of exciting public interest and promoting trade and manufactures. In 1798 an industrial exhibition of the products of French industry was held at Paris, and proved so successful that in 1802, during the consulate of Napoleon, another was held. The beneficial effects of these exhibitions were so obvious that a series of them was held at intervals, the eleventh and last being held at Paris in 1849. In Britain exhibitions of a more or less local nature had been held in Dublin (1829), Manchester, Liverpool, and Birmingham, and annually in London in the premises of the Society of Arts. In 1855 the first French Exposition Universelle was opened in Paris. The buildings were erected in the Champs Elysées, and covered about 24 acres. There were in all about 24,000 exhibitors. This was followed by the national exhibitions of the Dutch at Haarlem and the Belgians at Brussels, both in 1861, and the following year by the second great international exhibition held in London. The second French International Exhibition was opened on April 1, 1867, and closed on November 3. It was erected on the Champ de Mars, and covered about 37 acres. The exhibitors numbered nearly 50,000, the visitors about 10,000,000. A great exhibition was held at Philadelphia in 1876 upon the occasion of the centennial festival of the American Declaration of Independ-It occupied 60 acres, and had nearly 000 visitors. A third French Interence. 10,000,000 visitors. national Exhibition was held at Paris in 1878, the area occupied amounting in all to 140 acres, the visitors numbering about 17,000,000. A fourth was held in 1889, the latter being partly intended to commemorate the centenary of the French Revolution. One of the features in connection with it is the famous Eiffel Tower of iron, 984 ft. high, and thus more than 400 ft. higher than any other structure. In 1883 a series of exhibitions began at South Kensington, London, where the exhibits were confined to articles having relation to a special department. To this series belonged The Fisheries Exhibition of 1883, the Health Exhibition of 1884, the Exhibition of Inventions in 1885, and the Exhibition of Colonial and Indian products in 1886. This latter was visited by 5,550,749 persons. Besides these Edinburgh had an International Exhibition of Industry Science, and Arts in 1886, visited by 2,769,632 persons. In 1887 a Royal Jubilee Exhibition of Arts and Manufactures was opened at Man-

51

chester and visited by 4,765,000 persons. In the following year a great International Exhibition of Industry, Science, and Art was held at Glasgow, and attracted during the season 5,748,379 visitors. In 1892-93 an International Exhibition of majestic proportions was held in Chicago, Ill., to commemorate the 400th anniversary of the discovery of America. See World's Columbian Exposition.

Exogenous Plants (eks-oj'e-nus) (or Exogens), those plants whose stems are formed by successive additions to the outside. The exogens are the largest primary class of plants in the vegetable kingdom, and their increase by annual additions of new layers to the outside of their stems, formed in the cambium between the wood and the bark, is a feature in which they differ essentially from endogens, whose wood is formed by successive augmen-tations from the inside. The concentric circles thus annually formed, distinguishable even in the oldest trees, aid in computing the age of the tree. The stem and branches also exhibit a central pith and medullary rays extending outward to the bark. All the trees of cold climates, and the principal part of those in hot, are exogenous, and are readily distinguished from those that are endogenous by the reticulated venation of their leaves, and by their seeds having two cotyledons (di-cotyledonous). The parts of the flower are generally in fours or fives.

**Ex'orcism**, the casting out of evil spirits by certain forms of words or ceremonies. An opinion prevailed in the ancient church that certain persons, those particularly who were afflicted with certain diseases, especially madness and epilepsy, were possessed by evil spirits. Over such persons forms of conjuration were pronounced, and this act was called *exorcism*. There were even certain men who made this a regular profession, and were called *exorcist*. Exorcism still makes a part of the beliefs of some churches.

Expansion, in physics, is the enlargement or increase in the bulk of bodies, in consequence of a change in their temperature. This is one of the most general effects of heat, being common to all bodies whatever, whether solid or fluid. The expansion of fluids varies considerably, but, in general, the denser the fluid the less the expansion; thus water expands more than mercury, and spirits of wine more than water; and, commonly, the greater the heat the greater the expansion; but this is not universal, for there are cases in which expansion is produced, not by an increase, but by a diminution of temperature. Water, in cooling, ceases to contract at  $42^{\circ}$  F.; and has its maximum density at  $30.2^{\circ}$  F. Just before it most the foregine  $R_{12}$  being the foregine it reaches the freezing point (32<sup>o</sup>). it begins to expand again, and expands more and more rapidly as the freezing point is reached. This expansion is about one-eleventh of its bulk, and accounts for the bursting of pipes, etc., when water is freezing in them.

**Expectation,** in the doctrine of chances, the value of any prospect of prize or property depending upon the happening of some uncertain

#### Extension

event. A sum of money in expectation upon a certain event has a determinate value before that event happens. If the chances of receiving or not receiving a hundred dollars, when an event arrives, are equal; then, before the arrival of the event the expectation is worth half the money. Expectation of life, the probable duration of the life of individuals of any given age. A rough estimate of any one's expectation of life is made by calculating two-thirds of the difference between his or her present age and eighty.

present age and eighty. **Exper'iments**, an operation designed to discover some unknown truth, principle, or effect, or to establish it when discovered. It differs from observation in the fact that the phenomena observed are, to a greater or less extent, controlled by human agency. Experiment distinguishes the modern method of investigating nature, and to it we owe the rapid strides made in chemistry, physics, etc.

ł

strides made in chemistry, physics, etc. Exploits', RIVER OF, a river of Newfoundland. It is about 150 mi. long.

**Explo'sion**, a sudden bursting, generally due to the rapid production of gaseous matter from solids or liquids. Thus the explosion of gunpowder is due to the sudden formation and expansion of gases into which the powder is converted by chemical agency. Explosions are often caused by the elastic force of steam confined in boilers, etc.

Explo'sives are compounds practically available in war, in mining, and in general use for the sudden development of immense force. They comprise gunpowder, gun cotton, nitroglycerine with its compounds, dynamite, lithofracteur, etc.

**Expo'nent,** in algebra, the number or figure which, placed above a root at the right hand, denotes how often that root is repeated, or how many multiplications are necessary to produce the power. Thus  $a^a$  denotes the second power of the root a, that is, a multiplied by a;  $a^4$  denotes the fourth power. The figure is the *exponent* or index of the power. To express the roots of quantities fractional exponents are used: thus,  $a^{14}$ ,  $a^{14}$ , and denote the square root, the cubic root, and the n<sup>th</sup> root of a.

Ex Post Facto, in law, by something done after and bearing upon something previously done; thus, a law is said to be *ex post facto*, or retrospective, when it is enacted to punish an offense committed before the passing of the law.

**Extension**, 1, In physics and metaphysics, that property of a body by which it occupies a portion of space. Extension is an essential as well as a general property of matter, for it is impossible to form a conception of matter, however minute may be the particle, without connecting with it the idea of its having a certain bulk and occupying a certain quantity of space. Every body, however small, must have length, breadth, and thickness: that is, it must possess the property of extension. Figure or form is the result of extension, for we cannot conceive that a body has length, breadth, and thickness, without its having some kind of figure, however irregular. 2,

### Extract

In logic, extension is the extent of the application of a general term, that is, the objects collectively which are included under it; thus, the word figure is more extensive than triangle, circle, parallelogram, etc; European more extensive than French, Frenchman, German, etc. Matter and mind are the most extensive terms of which any definite conception can be formed. Extension is contrasted with comprehension or intension.

Ex'tract, a term to denote all that can be dissolved out of a substance by a specified menstruum, such as water, alcohol, ether, etc. In modern pharmacy the term is applied to two kinds of preparation from vegetables. One is got by digesting the plant in water or other solvent, and evaporating or distilling away the excess of solvent until the extracted matter is sufficiently inspissated. The other is got by bruising the plant in a mortar, separating the juice, warming it until the green coloring matter separates, and filtering it off. The juice is next heated until the albumen coagulates, and again filtered. The juice is now evaporated to a syrup, the green coloring matter added and well mixed, and the evaporation is thereafter continued until the required concentration is attained. Extracts must be capable of being redissolved, so as to form a solution like that from which they were derived. Extracts are used in cookery, medicine, and the manufacture of perfumery. See Beef, extract of; Vanilla; Lemon.

Extravasa tion, an escape of some fluid, as blood or urine, from the vessel containing it. *Blood extracasation*, in contusions and other accidents, is when blood-vessels are ruptured by the injury, and the blood finds its way into the neighboring tissues. In some accidents to the urethra and bladder extravasation of urine is a very serious occurrence.

**Extremities,** the limbs, as distinguishing them from the other divisions of the animal, the head and trunk. The extremities are four in number, in man named upper and lower; in other animals anterior and posterior.

**Exu'ma,** GREAT and LITTLE, two of the Bahama Islands. The former is 30 mi. long and 3 mi. wide, and has a good harbor. Pop. 2,300.

Eyck (Ik), HUBERT (1366-1426) and JAN VAN

(1390-1441), brothers, famous painters of the old Flemish school, b. at Maaseyck. They lived first at Bruges, whence the younger brother is called John of Bruges, and afterward at Ghent, to which they removed about 1420. Here they executed the celebrated Adoration of the Lamb for the cathedral of 1420. Ghent; a painting which, in its different parts, contains above three hundred figures, and is a masterpiece. It was in two horizontal divisions, comprising ten panels, of which only the two central ones remain at Ghent, the others being at Berlin. Jan finished the work in 1432, and returned to Bruges, where he remained till his death. His reputation became very great even during his lifetime, by his share in the introduction of oil painting: the original invention of which has been incorrectly ascribed to him by many. Jan van Eyck also introduced improvements in linear and aerial perspective, and in painting upon glass.

**Eye**, the visual apparatus of animals, consisting in man of the globe of the eye, the muscles which move it, and of its appendages, which are the eyelids and eyebrows, and the lachrymal apparatus. See Anatomy.

Eyre (år), EDWARD JOHN (1815-), Australian explorer and colonial governor. He went to Australia in 1833. In 1839 he discovered Lake Torrens, and in 1840 explored its eastern shores and the adjacent Flinders Range. He then commenced his perilous journey along the shores of the Great Australian Bight, and reached King George's Sound, in Western Australia, a distance of 1,200 mi., with a single native boy, having left Adelaide more than a year before. In 1845 he published Discoveries in Uentral Australia.

**Ezra**, a celebrated Jewish scribe and priest. Under his guidance the second expedition of the Jews set out from Babylon to Palestine under the reign of Artaxerxes I, about 458 B.C. The important services rendered by Ezra to his countrymen on that occasion, and also in arranging, and in some measure, it is believed, settling the canon of Scripture, are specially acknowledged by the Jews, and he has even been regarded as the second founder of the nation. Josephus states that he d. in Jerusalem; others assert that he returned to Babylon, and d. there at the age of 120 years.
