Iterate through dataset in beforeClose script [message #360628]   Thu, 14 February 2008 03:34

Originally posted by: dean.kosko.blackrock.com

Hi all,
I have a need to search my dataset before displaying the rows on a report. I
have to check to see if 2 rows have offestting values, and if they do, I
need to exclude them from the report. I was thinking that I can set a column
to "N" or something like that, for the rows I want to hide, then filter them
out
I am using a scripted data set, and my basic idea was to loop through all of
the rows retrieved in the 'beforeClose' event, secrching for the ones I do
not want to show on the report.
Does anyone know if this is possible, or will work? Can I loop through the
dataset as kind of a "pre-process" to clean up the data?
Any other ideas would be greaty appreciated.
Many thanks
Dean

right click menu has extra menu item

Read data once - create two (or more) reports
