**Application for System Testing: DVS1902**  
**OMB Control #3265-0004**

Form EAC 002C

This form provides manufacturers with the means to apply for a certification of a voting system. Completion of a voting system application is a required step in the EAC Voting System Testing and Certification Program. This form is prescribed by Section 4.3 of the Manual. For more information on registration requirements please see Section 4.3.

This form is generally self-explanatory, however the numbers and the instructions below correspond to the numbered sections of the form.

1. Manufacturer Name: Full legal name of the manufacturer.
2. Manufacturer Code: The three letter identification code provided by the EAC upon manufacturer registration.
3. Version of Standards to be Used for Testing: Select the version of the EAC approved voting system standards to which the candidate system or modification is to be tested and certified.
- 4-5. Provide information as requested.
6. EAC Accredited VSTL: Provide the name of the EAC accredited voting system test laboratory that will perform testing on the candidate system.
7. Requested EAC Certification Number: Provide the certification number to be carried by the candidate system following certification. This number must begin with the three letter manufacturer identification code and be unique only to the specific candidate voting system. The number may be alpha-numeric and contain no more than 20 characters.
8. Configuration: A complete list of each configuration of the system's components which could be fielded as the certified voting system.
9. Coding Convention Declaration: Each voting system component is to have a single coding convention selected for every programming language used in the candidate voting system. This information shall include system component, language used, convention declared, and source of convention.
10. Brief Description of the System or System Modification: Describe the system, carefully listing all components submitted for certification. Include whether this application is for a new system or a modification to a previously EAC certified system.
11. Implementation Statement: The Manufacturer must submit with the application form a copy of the voting system's Implementation Statement, which must meet the requirements of the VVSG (VVSG 2005 - Version 1.0, Vol. I, Section 1.6.4). If an existing system is being submitted with a modification, the Manufacturer must submit a copy of a revised Implementation Statement.

12. **Functional Diagram:** The Manufacturer must submit with the application form a high-level Functional Diagram of the voting system which includes all of its components. The diagram must portray how the various components relate and interact.
13. **System Overview:** The Manufacturer must submit with the application form a copy of the voting system's System Overview documentation submitted to the VSTL as a part of the Technical Data Package. This document must meet the requirements of the VVSG (VVSG 2005 - Version 1.0, Vol. II, Section 2.2).

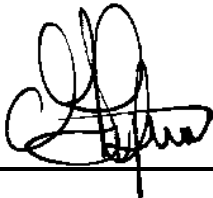

**Submitted info:**

1. **Manufacturer Name:** Dominion Voting Systems
2. **Manufacturer Code:** DVS
3. **Version of Standards to be Used for Testing:** VVSG2005
4. **Voting System Name:** Democracy Suite
5. **System Model/Version Number:** 5.5-B
6. **EAC Accredited VSTL:** ProV&V
7. **Requested EAC Certification number:** DVS-DemSuite5.5-B
8. **Configuration:** See attached *Component List (D-Suite 5.5-B).pdf*
9. **Coding Convention Declaration:** N/A
10. **Brief Description of System or System Modification:**

The Dominion Democracy Suite 5.5-B Voting System is a modification to the certified Democracy Suite 5.5 Voting System. The purpose of this modification is to provide the changes described below:

- Addition of ImageCast Evolution
- Addition of InoTec HiPro 821 scanner
- Addition of Canon DR-M260 scanner
- Addition of ImageCast Precinct 2 (PCOS-330A)

11. **Implementation Statement:** See attached *Implementation Statement (D-Suite 5.5-B).pdf*
12. **Functional Diagram:** See attached *Functional Diagram (D-Suite 5.5-B).png*
13. **System Overview:** See attached *2.02 Democracy Suite System Overview-5.5-B.pdf*

14. **Signature:**  \_\_\_\_\_

## 1.0 INTRODUCTION

The purpose of this Test Plan is to document the procedures that Pro V&V, Inc. will follow to perform certification testing during a system modification campaign for the Dominion Voting Systems Democracy Suite (D-Suite) 5.5-B Voting System to the requirements set forth for voting systems in the U.S. Election Assistance Commission (EAC) 2005 Voluntary Voting System Guidelines (VVSG), Version 1.0. Prior to submitting the voting system for testing, Dominion Voting Systems submitted an application package to the EAC for certification of the D-Suite 5.5-B Voting System. The application was accepted by the EAC and the project was assigned the unique Project Number of DVS-DemSuite5.5-B.

At test conclusion, the results of all testing performed as part of this test campaign will be submitted to the EAC in the form of a national certification test report.

### 1.1 Description and Overview of EAC Certified System Being Modified

*The EAC Certified System that is the baseline for the submitted modification is described in the following subsections. All information presented was derived from the previous Certification Test Report, the EAC Certificate of Conformance and/or the System Overview.*

The D-Suite 5.5-B Voting System is a paper-based optical scan voting system with a hybrid paper/DRE option consisting of the following major components: The Election Management System (EMS), the ImageCast Central (ICC), the ImageCast Precinct (ICP and ICP2), the ImageCast X (ICX) DRE w/ Reports Printer, ImageCast X (ICX) DRE w/VVPAT, the ImageCast Evolution (ICE), and the ImageCast X (ICX) BMD. The D-Suite 5.5-B Voting System configuration is a modification from the EAC approved D-Suite 5.5 system configuration.

The following subsections describe the baselined D-Suite 5.5 Voting System.

#### **Election Management System (EMS)**

The D-Suite 5.5 EMS consists of various components running as either a front-end/client application or as a back-end/server application. A listing of the applications and a brief description of each is presented below.

Front-end/Client applications:

- **EMS Adjudication:** Represents the client component responsible for adjudication, including reporting and generation of adjudicated result files from ImageCast Central tabulators and adjudication of write-in selections from ImageCast Precinct and ImageCast Central tabulators. This client component is installed on both the server and the client machines.
- **EMS Audio Studio:** A client application that represents an end-user helper application used to record audio files for a given election project. As such, it is utilized during the pre-voting phase of the election cycle.

- EMS Election Data Translator: End-user application used to export election data from election project and import election data into election project.
- EMS Election Event Designer: A client application that integrates election definition functionality together with ballot styling capabilities and represents a main pre-voting phase end-user application
- ImageCast Voter Activation: An application, installed on a workstation or laptop at the polling place, which allows the poll workers to program smart cards for voters. The smart cards are used to activate voting sessions on ImageCast X.
- EMS Results Tally and Reporting: A client application that integrates election results acquisition, validation, tabulation, reporting, and publishing capabilities and represents the main post-voting phase end-user application.

Back-end/Server applications:

- EMS Adjudication Service: Represents a server side application which provides ballot information such as contests, candidates and their coordinates from EMS to the Adjudication application.
- EMS Application Server: Represents a server side application responsible for executing long running processes, such as rendering ballots, generating audio files and election files, etc.
- EMS Database Server: Represents a server side RDBMS repository of the election project database which holds all the election project data, including pre-voting and post-voting data.
- EMS Data Center Manager: A server application that represents a system level configuration application used in EMS back-end data center configuration.
- EMS File System Service: A back-end application that acts as a stand-alone service that runs on client machines, enabling access to low level operating system API for partitioning CF cards, reading raw partition on ICP CF card, etc.
- EMS NAS Server: Represents a server side file repository of the election project file based artifacts, such as ballots, audio files, reports, log files, election files, etc.
- Smart Card Helper Service: A service that is installed on a workstation or laptop at the polling place, and provides required data format for programming smart cards for ImageCast devices, or, for jurisdiction's voting registration system in case of integration.

### **ImageCast Precinct (ICP)**

The ICP device is a hybrid precinct optical scan paper/DRE ballot counter designed to provide six major functionalities: ballot scanning, second chance voting, accessible voting, ballot review, tabulation, and poll worker functions.

For ballot scanning functionality the ICP scans marked paper ballots, interprets voter marks on the paper ballots and stores the ballots for tabulation when the polls are closed.

Second Chance voting refers to scenarios in which an error has been detected on the voter's paper ballot (e.g., blank ballot, undervoted ballot, overvoted ballot, misread ballot, cross-over voted ballot), and the ICP notifies the voter by displaying a message or providing an audio visual cue, that one of these situations has been detected, and offers the voter an opportunity to reject and fix their ballot, or to cast the ballot as-is.

Accessible voting allows voters with disabilities to listen to an audio representation of a ballot and use a hand held controller called an Audio Tactile Interface (ATI) to make vote selections, which are then saved directly to the ICP when the voter casts their Accessible Voting ballot.

The Ballot Review feature allows a voter to review their vote selections using an audio or visual representation, which displays or presents the voter with a complete listing of all contests contained on the ballot and an indication of the results which will be recorded for each contest once the voter's ballot is cast.

The Tabulation of paper ballots and Accessible Voting ballots cast by voters is performed when the polls are closed on the ICP unit and the unit tabulates the results, generates results files for aggregation into RTR, and prints a results report containing the results of the ballots cast.

For poll worker functions the ICP contains a small touch-screen LCD to allow the poll worker to initiate polling place activities, diagnostics and reports.

### **ImageCast Central (ICC) Count Scanner**

The ICC is a high-speed, central ballot scan tabulator based on Commercial off the Shelf (COTS) hardware, coupled with the custom-made ballot processing application software. It is used for high speed scanning and counting of paper ballots.

### **ImageCast X (ICX)**

The Democracy Suite ImageCast X (ICX) consists exclusively of COTS available hardware and operating system, while the applications installed on top customize its behavior to turn it into a Ballot Marking Device (BMD) or a Direct-Recording Electronic (DRE) device with or without a Voter Verifiable Paper Audit Trail (VVPAT). ICX application is the application that verifies voter's session eligibility, using the smart card and then presents the appropriate ballot to the voter. When a voter is satisfied with choices selected, ICX application verifies them and produces an Electronic Mobile Ballot or stores the votes onto a memory device. The ICX is designed to perform the following functions:

- Ballot marking and printing of electronic mobile ballots (in BMD mode)
- Ballot review and second chance voting
- Accessible voting and ballot marking
- Saving voting results (in DRE mode)
- Printing votes on a voter verifiable paper audit trail device (when VVPAT is in use)

### 1.1.1 Baseline Certified System

The baseline system for this modification is the D-Suite 5.5 Voting System. The tables below describe the certified equipment and firmware versions. Detailed descriptions of the D-Suite 5.5 test campaign are contained in Pro V&V Report No. TR-01-01-DVS-2017-02.01 Rev. B, which is available for viewing on the EAC's website at [www.eac.gov](http://www.eac.gov).

*This subsection lists the proprietary and COTS software to be provided by the manufacturer as part of the test campaign.*

### 1.1.2 Description of Modification

The Dominion Democracy Suite 5.5-B Voting System is a modified voting system configuration that includes upgrades to the components of the D-Suite 5.5 Voting System. The list below includes changes between this system and the baseline of the Democracy Suite 5.5 Voting System:

#### GENERAL MODIFICATIONS

- Addition of ImageCast Evolution (ICE), a precinct-level, optical scan, ballot counter (tabulator) designed to perform three major functions: ballot scanning and tabulation, ballot review and second chance voting, and accessible voting and ballot marking. *Submitted version: ICE firmware version 5.5.6.1, hardware version PCOS 410A.*
- Addition of InoTec HiPro 821 Scanner as a component for the ImageCast Central Count (ICC). *Submitted version: ICC software application version 5.5.4.1, HiPro 821 Scanner hardware version 1.1.0.8.*
- Addition of Canon imageFORMULA DR-M260 Scanner as a component for the ImageCast Central Count (ICC). *Submitted version: ICC software application version 5.5.4.1, DR-M260 Scanner hardware version 1.0 SP4.*
- Addition of ImageCast Precinct 2 (ICP2) optical ballot counter. The ICP2 is a precinct-based optical scan ballot tabulator that is used in conjunction with ImageCast compatible ballot storage boxes. *Submitted version: ICP2 firmware version 5.5.1.1, hardware version PCOS-330A.*

### 1.1.3 Initial Assessment

Testing from the previous test campaign was used to establish the baseline. The focus of this test campaign is the addition of the ImageCast Evolution (ICE) optical ballot hybrid precinct-based scanner and BMD, the InoTec HiPro 821 Scanner, the ImageCast Precinct 2 (ICP2) optical ballot scanner, and the Canon imageFORMULA DR-M260 Scanner. It was determined the following tasks would be required to verify compliance of the modifications:

- Source Code Review, Compliance Build, Trusted Build, and Build Document Review
- System Integration Testing
- Technical Documentation Package (TDP) Review
- Functional Configuration Audit (FCA)
- System Loads & Hardening
- Physical Configuration Audit (PCA)
- Security Testing

- Hardware Testing
- Usability & Accessibility Testing
- Volume & Stress Testing
- Accuracy Testing

#### **1.1.4 Regression Test**

Regression testing for this test campaign will consist of the execution of the System Integration Testing.

### **1.3 Terms and Abbreviations**

*This subsection lists terms and abbreviations relevant to the hardware, the software, or this Test Plan.*

“ADA” – Americans with Disabilities Act 1990

“BMD” – Ballot Marking Device

“CM” – Configuration Management

“COTS” – Commercial Off-The-Shelf

“DRE” – Direct Record Electronic

“EAC” – United States Election Assistance Commission

“EMS” – Election Management System

“FCA” – Functional Configuration Audit

“HAVA” – Help America Vote Act

“ICC” – ImageCast Central

“ICE” – ImageCast Evolution

“ICP” – ImageCast Precinct

“ICX” – ImageCast X

“ISO” – International Organization for Standardization

“NOC” – Notice of Clarification

“PCA” – Physical Configuration Audit

“QA” – Quality Assurance

“RFI” – Request for Interpretation

“TDP” – Technical Data Package

“UPS” – Uninterruptible Power Supply

“VSTL” – Voting System Test Laboratory

“VVPAT” – Voter Verifiable Paper Audit Trail

“VVSG” – Voluntary Voting System Guidelines

#### **1.4 Project Schedule**

The Project Schedule for the test campaign is located in Appendix A. The dates on the schedule are not firm dates but planned estimates based on the anticipated project work flow.

## 1.5 Scope of Testing

The scope of testing focused on the addition of the ImageCast Evolution (ICE) optical ballot hybrid precinct-based scanner and BMD, the ICP2 optical ballot counter, the InoTec HiPro 821 Scanner, and the Canon imageFORMULA DR-M260 Scanner. To evaluate the D-Suite 5.5-B test requirements, the submitted modifications were evaluated against each section of the EAC 2005 VVSG to determine the applicable tests to be performed.

Based on this assessment, it was determined that multiple areas within the EAC 2005 VVSG would be evaluated to encompass the required tests. A breakdown of the areas and associated tests is listed below:

- EAC 2005 VVSG Volume 1, Section 2: Functional Requirements
  - System Integration Testing
  - Functional Configuration Audit (FCA)
  - Physical Configuration Audit (PCA), including System Loads & Hardening
  - Technical Documentation Package (TDP) Review
  - Volume & Stress Testing
  - Accuracy Testing
- EAC 2005 VVSG Volume 1, Section 3: Usability & Accessibility
  - Usability & Accessibility Testing
  - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 4: Hardware Requirements
  - Hardware Testing
  - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 5: Software Requirements
  - Source Code Review, Compliance Build, Trusted Build, and Build Document Review
  - Technical Documentation Package (TDP) Review
  - Functional Configuration Audit (FCA)
- EAC 2005 VVSG Volume 1, Section 7: Security Requirements
  - Security Testing

- Technical Documentation Package (TDP) Review
- Functional Configuration Audit (FCA)

### 1.5.1 Block Diagram

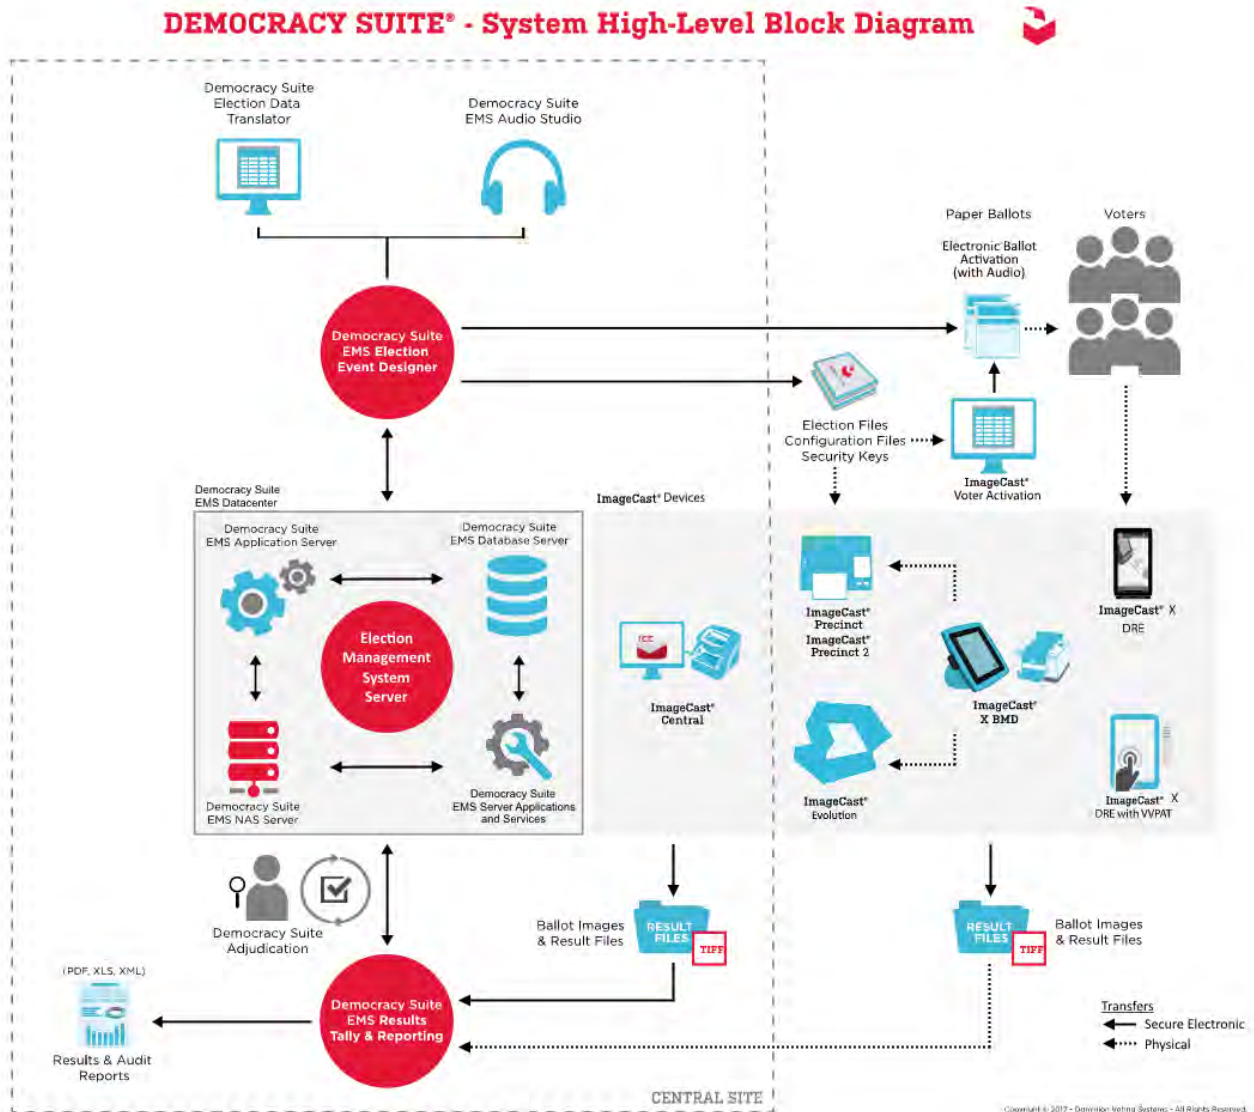

Figure 1-1. D-Suite 5.5-B System Overview

## 1.5.2 System Limits

The system limits that Dominion Voting Systems has stated to be supported by the D-Suite 5.5-B are provided in the table below.

**Table 1-22. D-Suite 5.5-B System Limits by Configuration**

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Landscape Ballot Orientation			
Ballot positions	292	292	*22-inch Landscape Ballot (240 candidates + 24 write-ins + 28 Yes/No choices)
Precincts in an election	1000	250	Memory
Contests in an election	1000	250	Memory
Candidates/Counters in an election	10000	2500	Memory
Candidates/Counters in a precinct	240	240	*22-inch Ballot
Candidates/Counters in a tabulator	10000	2500	Memory
Ballot Styles in an election	3000	750	Memory
Contests in a ballot style	38	38	*22-inch Landscape Ballot (24 candidacy contests + 14 Propositions)
Candidates in a contest	240	240	*22-inch Ballot
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	Memory
“Vote for” in a contest	24	24	*22-inch Landscape Ballot
Supported languages in an election	5	5	Memory
Number of write-ins	24	24	*22-inch Landscape Ballot
Portrait Ballot Orientation			
Ballot positions	462	462	*22-inch Portrait Ballot
Precincts in an election	1000	250	Memory
Contests in an election	1000	250	Memory
Candidates/Counters in an election	10000	2500	Memory
Candidates/Counters in a precinct	462	462	*22-inch Portrait Ballot
Candidates/Counters in a tabulator	10000	2500	Memory
Ballot Styles in an election	3000	750	Memory
Contests in a ballot style	156	156	*22-inch Portrait Ballot

**Table 1-22. D-Suite 5.5-B System Limits by Configuration** *(continued)*

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Candidates in a contest	231	231	*22-inch Portrait Ballot (Column Span 3)
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	No Limitation
“Vote for” in a contest	30	30	No Limitation
Supported languages in an election	5	5	Memory
Number of write-ins	462	462	*22-inch Portrait Ballot

\*The 22-inch Ballot length applies only to hand-marked paper ballots.

### 1.5.3 Supported Languages

The following languages are supported by the D-Suite 5.5-B System:

**Table 1-23. D-Suite 5.5-B Supported Languages**

Language	ICE	ICP	ICX
Alaska Native	Yes, if using Latin alphabet	Yes	No
Apache	Audio only	Audio only	No
Bengali	Yes	Yes	Yes
Chinese	Yes	Yes	Yes
English	Yes	Yes	Yes
Eskimo	Yes, if using Latin alphabet	Yes	No
Filipino	Yes, if using Latin alphabet	Yes	No
French	Yes	Yes	Yes
Hindi	Yes	Audio only	Yes
Japanese	Yes	Yes	Yes
Jicarilla	Audio only	Audio only	No
Keres	Audio only	Audio only	No
Khmer	Yes	Audio only	No
Korean	Yes	Yes	Yes
Navajo	Audio only	Audio only	No
Seminole	Audio only	Audio only	No
Spanish	Yes	Yes	Yes
Tagalog	No	No	Yes
Thai	Yes	Audio only	Yes
Towa	Audio only	Audio only	No
Ute	Audio only	Audio only	No
Vietnamese	Yes	Yes	Yes
Yuman	Audio only	Audio only	No

Support for all stated languages will be verified; however, only English and Spanish language ballots will be cast during the performance of functional testing. Additionally, one character based language (Chinese) will be tested during System Integration Testing.

For the character based language, the ballot will be created by Pro V&V and voted utilizing both paper ballots and ADA voting devices along with all applicable peripherals. The Chinese Language for the ballot will be created using a readily available online translation tool. The translated language text will be entered into the Election Event Designer Application. A ballot preview will be generated in the EED application. The Chinese characters displayed in the ballot preview will be compared to the characters generated by the online translation tool, to ensure that the characters match. The ballots will then be generated and printed, and the election loaded onto the tabulators and the BMD units. The Chinese characters displayed on both the printed ballots and displayed on the BMD units will be compared to the original Chinese Characters generated by the online translation tool to verify that the characters match.

#### **1.5.4 Supported Functionality**

The D-Suite 5.5-B is designed to support the following voting variations:

- General Election
- Closed Primary
- Open Primary
- Early Voting
- Partisan/Non-Partisan Offices
- Write-In Voting
- Primary Presidential Delegation Nominations
- Split Precincts
- Vote for N of M
- Ballot Rotation
- Provisional or Challenged Ballots

#### **1.5.5 VVSG**

The D-Suite 5.5-B Voting System shall be evaluated against the relevant requirements contained in the EAC 2005 VVSG, Version 1.0.

#### **1.5.6 RFIs**

There are no RFIs released by the EAC as of the date of this Test Plan that pertain to this test campaign that were not in effect at the time of the baseline system certification.

### **1.5.7 NOCs**

There are no NOCs released by the EAC as of the date of this Test Plan that pertain to this test campaign that were not in effect at the time of the baseline system certification.

## **2.0 PRE-CERTIFICATION TESTING AND ISSUES**

This section describes previous testing performed prior to submitting the voting system to the EAC.

### **2.1 Evaluation of Prior VSTL Testing**

Pro V&V evaluated to the published Final Test Report for the D-Suite 5.5 System in order to baseline the current system under test. It was determined that Accuracy and Hardware Testing for the following components would be re-used to satisfy requirements for this test campaign: ICX BMD, ICX DRE, ICP, and ICX DRE w/VVPAT.

### **2.2 Evaluation of Prior Non-VSTL Testing**

No prior non-VSTL testing of the D-Suite 5.5 modifications were considered for this test campaign.

### **2.3 Known Field Issues**

D-Suite 5.5-B is a modification to a previously certified system and has not been fielded.

## **3.0 MATERIALS REQUIRED FOR TESTING**

*The following sections list all materials needed to enable the test engagement to occur.*

The materials required for testing of the D-Suite 5.5-B System include all materials to enable the test campaign to occur. This includes the applicable hardware and software as well as the TDP, test support materials, and deliverable materials, as described in the following subsections.

### **3.1 Software**

*This subsection lists the proprietary and COTS software to be provided by the manufacturer as part of the test campaign.*

In addition to the baseline system software identified in Section 1.1.1 of this Test Plan, the following software is required for test performance: ICC Software application version 5.5.4.1, which has been updated from the baseline version, and ICE firmware version 5.5.6.1.

Pro V&V will perform a comparison on the submitted source code against the previously certified versions. Regression testing will be performed to verify successful implementation of changes.

### 3.2 Equipment

*This subsection lists the proprietary and COTS equipment to be provided by the manufacturer as part of the test campaign.*

For COTS equipment, every effort will be made to verify that the COTS equipment has not been modified for use. This will be accomplished by performing research using the COTS equipment manufacturer's websites based on the serial numbers and service tag numbers for each piece of equipment. Assigned test personnel will evaluate COTS hardware, system software and communications components for proven performance in commercial applications other than voting. For PCs, laptops, and servers, the service tag information will be compared to the system information found on each machine. Physical external and internal examination will also be performed when the equipment is easily accessible without the possibility of damage. Hard drives, RAM memory, and other components will be examined to verify that the components match the information found on the COTS equipment manufacturer's websites.

All hardware required for testing is identified in Section 1.1 of this test plan.

### 3.3 Test Materials

*This subsection lists the test materials required to execute the required tests throughout the test campaign.*

**Table 3-1. Required Test Materials**

Material	Description(s)
Tamper Proof Security Seals	Adhesive tamper proof security seal, Novavision Part# XSG21-08RESN
Printer Cartridges	HP LaserJet CF226X
Smart Cards	Programmable Smart Cards
ImageCast Precinct Cleaning Sheets	Cleaning Sheets for ImageCast Precinct tabulator Part# CSHT-100B
Stereo Breakout Cable	3.5mm stereo male plug to dual 3.5mm mono female plugs
3.5mm Stereo Cable	3.5mm stereo male plug to 3.5mm stereo female plug
Compact Flash Cards	SanDisk Ultra 4Gb and Centon 16GB Compact Flash Cards
iButton Security Tokens	iButton Security Token with lanyards
Permanent Markers	Fine Tip Sharpie Permanent Markers
Ethernet Cables	Cat5e Ethernet Cables
ICE Paper Rolls	Replacement Thermal Paper Rolls for the ImageCast Evolution tabulator
ICP Paper Rolls	Replacement Thermal Paper Rolls for the ImageCast Precinct tabulator
Sip & Puff Disposable Straws	Disposable straws for use with the Sip & Puff input device
Ballot Stock	Ballot Paper Stock for printing ballots

**Table 3-1. Required Test Materials** *(continued)*

<b>Material</b>	<b>Description(s)</b>
A/C Power Cables	3-Prong A/C Power Cables
USB Thumb drives	4 GB, 8 GB, and 16 GB USB Thumb drives

### **3.4 Proprietary Data**

All data and documentation considered by the manufacturer to be proprietary will be identified and documented in an independent submission along with a Notice of Protected Information.

## **4.0 TEST SPECIFICATIONS**

Certification testing of the Dominion D-Suite 5.5-B Voting System submitted for evaluation will be performed to ensure the applicable requirements of the EAC 2005 VVSG and the EAC Testing and Certification Program Manual, Version 2.0 are met. Additionally, all EAC Request for Interpretations (RFI) and Notices of Clarification (NOC) relevant to the system under test will be incorporated in the test campaign. A complete listing of the EAC RFIs and NOCs is available on the EAC website.

### **4.1 Requirements (Strategy of Evaluation)**

To evaluate the D-Suite 5.5-B test requirements, the submitted modifications were evaluated against each section of the EAC 2005 VVSG to determine the applicable tests to be performed. Based on this assessment, it was determined the following evaluations would be required to verify compliance of the modifications:

#### Technical Documentation Package (TDP) Review

A TDP Review will be performed to ensure that all submitted modifications are accurately documented and that the documents meet the requirements of the EAC 2005 VVSG. The preliminary TDP is performed to gather information concerning the system under test and its capabilities or design intentions. Additionally, a TDP review will be performed throughout the test campaign. The TDP Review includes the Initial Review, the Regulatory/Compliance Review, and the Final Review. This review is conducted to determine if the submitted technical documentation meets the regulatory, customer-stated, or end-user requirements and includes reviewing the documents for stated functionality review and verification.

#### Section 2: Functional Requirements

The requirements in this section shall be tested during the FCA and System Integration Test. This evaluation will utilize baseline test cases as well as specifically designed test cases and will include predefined election definitions for the input data.

The FCA targets the specific functionality claimed by the manufacturer to ensure the product functions as documented. This testing uses both positive and negative test data to test the robustness of the system. The FCA encompasses an examination of manufacturer tests, and the

conduct of additional tests, to verify that the system hardware and software perform all the functions described in the manufacturer's documentation submitted in the TDP (such as system operations, voter manual, maintenance, and diagnostic testing manuals). It includes a test of system operations in the sequence in which they would normally be performed. These system operations and functional capabilities are categorized as follows by the phase of election activity in which they are required:

- Overall System Capabilities: These functional capabilities apply throughout the election process. They include security, accuracy, integrity, system audit ability, election management system, vote tabulation, ballot counters, telecommunications, and data retention.
- Pre-voting Capabilities: These functional capabilities are used to prepare the voting system for voting. They include ballot preparation, the preparation of election-specific software (including firmware), the production of ballots, the installation of ballots and ballot counting software (including firmware), and system and equipment tests.
- Voting System Capabilities: These functional capabilities include all operations conducted at the polling place by voters and officials including the generation of status messages.
- Post-voting Capabilities: These functional capabilities apply after all votes have been cast. They include closing the polling place; obtaining reports by voting machine, polling place, and precinct; obtaining consolidated reports; and obtaining reports of audit trails.
- Maintenance, Transportation and Storage Capabilities: These capabilities are necessary to maintain, transport, and store voting system equipment.

The system integration testing addresses the integration of the hardware and software. This testing focuses on the compatibility of the voting system software components and subsystems with one another and with other components of the voting system. During test performance, the system is configured as would be for normal field use.

### Section 3: Usability and Accessibility Requirements

The requirements in this section shall be tested during the Usability and Accessibility Testing. This evaluation will utilize baseline test cases as well as specifically designed test cases and will include predefined election definitions for the input data.

The usability testing focuses on the usability of the system being tested. Usability is defined generally as a measure of the effectiveness, efficiency, and satisfaction achieved by a specified set of users with a given product in the performance of specified tasks. In the context of voting, the primary user is the voter, the product is the voting system, and the task is the correct recording of the voter ballot selections. Additional requirements for task performance are independence and privacy: the voter should normally be able to complete the voting task without assistance from others, and the voter selections should be private. Accessibility evaluates the requirements for accessibility. These requirements are intended to address HAVA 301 (a) (3) (B).

#### Section 4: Hardware Requirements

The hardware tests specified in the VVSG are divided into two categories: non-operating and operating. The non-operating tests apply to the elements of the system that are intended for use at poll site locations and are intended to simulate the storage and transport of equipment between the storage facility and the polling location. The Operating tests apply to the entire system, including hardware components that are used as part of the voting system telecommunications capability, and are intended to simulate conditions that the voting system may encounter during operation. Prior to and immediately following each required non-operating and operating test, the system shall be subjected to an operational status check.

The requirements in this section shall be tested and/or evaluated by personnel verified by Pro V&V to be qualified to perform the testing.

#### Section 5: Software Requirements

The requirements in this section shall be tested utilizing a combination of review and functional testing during the source code review, TDP review, and FCA. Trusted builds from previously certified versions will be used as the baseline for testing. The ICE and ICP2 components will be subjected to the full suite of testing.

To perform the source code review, Pro V&V will review the submitted source code to the EAC 2005 VVSG and the manufacturer-submitted coding standards. Prior to initiating the software review, Pro V&V shall verify that the submitted documentation is sufficient to enable: (1) a review of the source code and (2) Pro V&V to design and conduct tests at every level of the software structure to verify that design specifications and performance guidelines are met. The source code review includes a compliance build and a trusted build of the submitted source code.

#### Section 7: Security Requirements

The requirements in this section shall be tested during the source code review, security tests, and FCA.

To evaluate the integrity of the system, Pro V&V will develop specifically designed test cases in an attempt to defeat the access controls and security measures documented in the system TDP as well verifying compliance to EAC RFI 2012-05. A threat matrix will be created to determine the risks and vulnerabilities. An evaluation of the system will be accomplished by utilizing a combination of functional testing, source code review, and static code analyzers.

During the security testing, the system shall be inspected for various controls and measures that are in place to meet the objectives of the security standards which include: protection of the critical elements of the voting system; establishing and maintaining controls to minimize errors; protection from intentional manipulation, fraud and malicious mischief; identifying fraudulent or erroneous changes to the voting system; and protecting the secrecy in the voting process.

#### 4.1.1 Rationale for 'Not Applicable' Requirements

[ NOTE: This table contains ALL false statements per the State of Wisconsin testing (and common knowledge) delineating threat protection, off-the-shelf COTS wired and wireless functions, telecom modems & ethernet connections for wired and wireless FTP, SMTP and NET connections and telecom providers for Dominion machines in their reliance on Internet Information Services (IIS)

All requirements that were excluded from the previous test campaign (D-Suite 5.5) were also deemed not applicable to this test campaign due to the submitted modifications not impacting the specific requirements. These requirements are identified below:

- Volume I, Section 6.2.6 (Telecommunications Requirements: Integrity)
- Volume I, Section 7.5.2-7.5.4 (Security: Protection Against External Threats, Monitoring and Responding to External Threats, and Shared Operating Environment )
- Volume I, Section 7.6 (Use of Public Communications Networks)
- Volume I, Section 7.7 (Wireless Communications)

The rationale for not evaluating the D-Suite 5.5-B to the indicated sections is described in following table. Specific requirements that are excluded from this test campaign are identified in the EAC spreadsheet.

**Table 4-1. Not Applicable Requirements**

EAC 2005 VVSG Version 1 Volume I, Section	Rationale for 'Not Applicable'
6.2.6	These requirements are written for use of public networks. The D-Suite 5.5-B does not utilize public networks.
7.5.2-7.5.4	These requirements are written for use of public networks. The D-Suite 5.5-B does not utilize public networks.
7.6	D-Suite 5.5-B does not support transmission over public networks.
7.7	No wireless technology is utilized in this system.

No vulnerability tests are performed on the Microsoft Internet Information Services (IIS) server software used. ]

#### 4.2 Hardware Configuration and Design

The hardware configuration and design for the modification has changed from the baseline system. The ImageCast Evolution (ICE) has been added to the system configuration. Also, the InoTec HiPro 821 Scanner and the Canon imageFORMULA DR-M260 Scanner are newly introduced COTS document scanners for use with the ICC. Additionally, the ICP2 has been added to this configuration.

#### 4.3 Software System Functions

The software system functions for the previously certified voting system (D-Suite 5.5) remain unchanged for the submitted modifications. An update to the ICC was presented for evaluation, along with the ICE and ICPs firmware applications, which are new to this configuration.

#### 4.4 Test Case Design

Test cases are designed based on the manufacturer's design specifications and the relevant technical requirements set forth by the VVSG. Test cases shall be based on the following aspects of the voting system:

- Hardware qualitative examination design
- Hardware environmental test case design
- Software module test case design and data
- Software functional test case design
- System level test case design

Test cases shall provide information regarding the sequence of actions to be performed for the execution of a test, the requirements being met, the test objective, test configuration, equipment needed, special requirements, assumptions, and pass/fail criteria. Once the test cases are finalized, they will be validated and published for use in the test campaign. The validation of the test case will be accomplished by technical review and approval. This validation will include the following: confirmation of adequate test coverage of all requirements; confirmation that test case results are not ambiguous and gave objective pass/fail criteria; and confirmation that any automated test suites will produce valid results.

#### **4.4.1 Hardware Qualitative Design**

Previous hardware examinations were performed on the certified baseline system (D-Suite 5.5). The ICX BMD, ICX DRE, ICP, ICP2, and the ICX DRE with VVPAT hardware testing will be re-used from the previous certification test campaign (D-Suite 5.5-B). The full suite of hardware and electrical testing (as listed below) will be performed on the ICE and ICP2 components of the D-Suite 5.5-B System. The Canon M260 and InoTec HiPro Scanner components will be subjected to Temperature-Power Variation Testing only.

##### **Electrical Tests:**

- Electrical Power Disturbance
- Electromagnetic Radiation
- Electrostatic Disruption
- Electromagnetic Susceptibility
- Electrical Fast Transient
- Lightning Surge
- Conducted RF Immunity
- Magnetic Fields Immunity
- Electrical Supply

##### **Environmental Tests:**

- Bench Handling

- Vibration
- Low Temperature
- High Temperature
- Humidity
- Temperature Power Variation
- Acoustic

#### **4.4.2 Hardware Environmental Test Case Design**

The voting system hardware shall be subjected to the tests specified in Section 4.4.1. Testing will be performed by personnel verified by Pro V&V to be qualified to perform the test. Pro V&V will utilize third-party test facilities for performance of the electrical and environmental tests. Environmental and Electrical will be performed at the NTS Longmont facility located in Longmont, Colorado. All pre and post operational status checks shall be conducted by Pro V&V personnel.

#### **4.4.3 Software Module Test Case Design and Data**

Pro V&V shall review the manufacturer's program analysis, documentation, and module test case design and shall evaluate the test cases for each module with respect to flow control parameters and entry/exit data. As needed, Pro V&V shall design additional test cases to satisfy the coverage criteria specified in Volume II, Section 7.2.1.

Component Level Testing will be implemented during the FCA for each component and subcomponent. During the Source Code Review, Compliance Builds, and Security Testing, Pro V&V will utilize limited structural-based techniques (white-box testing). Additionally, specification-based techniques (black-box testing) will be utilized for the individual software components.

Pro V&V shall define the expected result for each test and the ACCEPT/REJECT criteria for certification. If the system performs as expected, the results will be accepted.

If the system does not perform as expected, an analysis will be performed to determine the cause. The test will be repeated in an attempt to reproduce the results. If the failure can be reproduced and the expected results are not met, the system will have failed the test. If the results cannot be reproduced, the test will continue. All errors encountered will be documented and tracked through resolution.

#### **4.4.4 Software Functional Test Case Design and Data**

Pro V&V shall review the manufacturer-submitted test plans and data to verify that the individual performance requirements specified in the EAC 2005 VVSG and the TDP are reflected in the software. As part of this process, Pro V&V shall review the manufacturer's test case design and prepare a detailed matrix of system functions and the test cases that exercise them. Pro V&V shall also prepare a test procedure describing all test ballots, operator procedures, and the data content

of output reports. Pro V&V shall define abnormal input data and operator actions and then design test cases to verify that the system is able to handle and recover from these abnormal conditions. During this review, emphasis shall be placed on those functions where the manufacturer data on module development, such as the system release notes and comments within the source code, reflects significant debugging problems, and on functional tests that resulted in high error rates.

Pro V&V shall define the expected result for each test and the ACCEPT/REJECT criteria for certification. If the system performs as expected, the results will be accepted.

If the system does not perform as expected, an analysis will be performed to determine the cause. The test will be repeated in an attempt to reproduce the results. If the failure can be reproduced and the expected results are not met, the system will have failed the test. If the results cannot be reproduced, the test will continue. All errors encountered will be documented and tracked through resolution.

#### **4.4.5 System-Level Test Case Design**

System Level testing will be implemented to evaluate the complete system. This testing will include all proprietary components and COTS components (software, hardware, and peripherals) in a configuration of the system's intended use. For software system tests, the tests shall be designed according to the stated design objective without consideration of its functional specification. The system level hardware and software test cases shall be prepared independently to assess the response of the hardware and software to a range of conditions.

#### **4.5 Security Functions**

The objective of the Security Testing is to evaluate the effectiveness of the voting system in detecting, preventing, recording, reporting, and recovering from security threats. To evaluate the integrity of the system, Pro V&V shall develop specifically designed test cases in an attempt to defeat the access controls and security measures documented in the system TDP. The submitted threat matrix identifying the system's risks and vulnerabilities shall be evaluated for completeness and to determine that mitigating controls are adequately implemented.

An evaluation of the system shall be accomplished by utilizing a combination of functional testing and source code review. All findings will be reported to the EAC and DVS. The test methods for performing the Security Testing are execution and review. Prior to performance of Security testing, the examiner will verify that security hardening scripts have been properly applied to system components per the system documentation. The examiner will review the submitted TDP to verify that documented access and physical controls are in place. Following the documented procedures, the examiner will configure the voting system for use and functionality to verify that the documented controls are in place and adequate and meet the stated requirements.

Physical Security will be tested by setting up the system as described in the TDP and then examining the effectiveness and comprehensiveness of physical security measures. Administrative Security will be tested by examining the system's documented security instructions and procedures for effectiveness and breadth. Logical security will be tested as part

of FCA testing by a recognized security expert who not only will review the physical and administrative testing outcomes, but will perform the following tests on system components: Vulnerability Scans, SCAP Scans, and Physical Bypass Attempts. Logical security testing will assess the effectiveness of the security hardening scripts applied during the system setup and install process.

#### 4.6 TDP Evaluation

In order to determine compliance of the modified TDP documents with the EAC 2005 VVSG, a limited TDP review shall be conducted. This review will focus on TDP documents that have been modified since the certification of the baseline system. The review will consist of a compliance review to determine if each regulatory, state, or manufacturer-stated requirement has been met based on the context of each requirement. Results of the review of each document will be entered on the TDP Review Checklist and reported to the manufacturer for disposition of any anomalies. This process will be ongoing until all anomalies are resolved.

Any revised documents during the TDP review process will be compared with the previous document revision to determine changes made, and the document will be re-reviewed to determine whether subject requirements have been met. A listing of all documents contained in the D-Suite 5.5-B TDP is provided in Table 4-2.

#### **4.7 Source Code Review**

Pro V&V will review the submitted source code to the EAC 2005 VVSG and the manufacturer-submitted coding standards. Prior to initiating the software review, Pro V&V shall verify that the submitted documentation is sufficient to enable: (1) a review of the source code and (2) Pro V&V to design and conduct tests at every level of the software structure to verify that design specifications and performance guidelines are met.

For the ICE software, a combination of Automated Source Code Review and Manual Source Code Review methods will be used to review the source code. For all other components, the submitted source code will be compared to the previously certified Democracy Suite 5.5 voting system versions to determine the changes, if any. A combination of Automated Source Code Review and Manual Source Code Review methods will then be used to review the changes in the source code. In addition, 10% of the source code comments will be manually reviewed.

#### **4.8 QA and CM System Review**

The Dominion Voting Systems Quality and Configuration Management Manuals shall be reviewed for their fulfillment of Volume I, Sections 8 and 9, and the requirements specified in Volume II, Section 2. The requirements for these sections establish the quality assurance and configuration standards for voting systems to which manufacturers must conform and require voting system manufacturers to implement a quality assurance and configuration management program that is conformant with recognized ISO standards. As part of the review process, the Dominion TDP documents will be reviewed to determine if the stated policies are being followed.

#### **4.9 Physical Configuration Audit (PCA)**

The Physical Configuration Audit (PCA) compares the voting system components submitted for qualification to the manufacturer's technical documentation, and shall include the following activities:

- Establish a configuration baseline of software and hardware to be tested; confirm whether manufacturer's documentation is sufficient for the user to install, validate, operate, and maintain the voting system
- Verify software conforms to the manufacturer's specifications; inspect all records of manufacturer's release control system; if changes have been made to the baseline version, verify manufacturer's engineering and test data are for the software version submitted for certification

- If the hardware is non-COTS, Pro V&V shall review drawings, specifications, technical data, and test data associated with system hardware to establish system hardware baseline associated with software baseline
- Review manufacturer's documents of user acceptance test procedures and data against system's functional specifications; resolve any discrepancy or inadequacy in manufacturer's plan or data prior to beginning system integration functional and performance tests
- Subsequent changes to baseline software configuration made during testing, as well as system hardware changes that may produce a change in software operation are subject to re-examination

#### **4.10 Functional Configuration Audit (FCA)**

The Functional Configuration Audit (FCA) encompasses an examination of manufacturer's tests, and the conduct of additional tests, to verify that the system hardware and software perform all the functions described in the manufacturer's documentation submitted in the TDP. In addition to functioning according to the manufacturer's documentation tests will be conducted to ensure all applicable EAC 2005 VVSG requirements are met.

#### **4.11 Accuracy**

The accuracy test ensures that each component of the voting system can each process 1,549,703 consecutive ballot positions correctly within the allowable target error rate. The Accuracy test is designed to test the ability of the system to "capture, record, store, consolidate and report" specific selections and absences of a selection. The required accuracy is defined as an error rate. This rate is the maximum number of errors allowed while processing a specified volume of data.

In an effort to achieve this and to verify the proper functionality of the units under test, the following methods will be used to test components of the voting system:

For paper-based voting systems the ballot positions on a paper ballot must be scanned to detect selections for individual candidates and contests and the conversion of those selections detected on the paper ballot converted into digital data. The accuracy requirements for the ICE and the ICC units will be met by the execution of the standard accuracy test utilizing pre-marked and hand-marked ballots of each ballot length supported by the system, and ballots produced by the ICX BMD.

The ICE and ICC units will be tested by utilizing a combination of hand marked (70%) and pre-marked (30%) ballots to achieve an accuracy rate greater than 1,549,703 correct ballot positions.

The ICX BMD, ICX DRE, ICP, and the ICX DRE with VVPAT Accuracy test will be reused from the Dominion 5.5 EAC Campaign

#### **4.12 Volume & Stress**

Tests to investigate the system's response to conditions that tend to overload the system's capacity to process, store, and report data. The test parameters will focus on the system's stated limits and the ballot logic for areas such as the maximum number of active voting positions, maximum number of ballot styles, maximum candidates, maximum contests, and stated limits within the EMS. This test will be utilized to ensure the system can achieve the manufacturer's TDP claims of what the system can support. Testing will be performed by exercising an election definition and test cases developed specifically to test for volume and stress conditions of the system being tested.

#### **4.13 System Integration**

System Integration is a system level test for the integrated operation of both hardware and software. It evaluates the compatibility of the voting system software components or subsystems with one another, and with other components of the voting system environment. This is determined through functional tests integrating the voting system software with the remainder of the system. During this area of testing, the system shall be configured exactly as it would for normal field use. This includes connecting all supporting equipment and peripherals including ballot boxes, voting booths (regular and accessible), and any physical security equipment such as locks and ties.

Pro V&V personnel shall properly configure and test the system by following the procedures detailed in the D-Suite 5.5-B voting system technical documentation.

### **5.0 TEST DATA**

The following subsections provide information concerning test data recording, criteria, and reduction.

#### **5.1 Test Data Recording**

All equipment utilized for test data recording shall be identified in the test data package. The output test data shall be recorded in an appropriate manner as to allow for data analysis. For source code and TDP reviews, results shall be compiled in reports and submitted to Dominion for resolution.

#### **5.2 Test Data Criteria**

The D-Suite 5.5-B Voting System shall be evaluated against all applicable requirements contained in the EAC 2005 VVSG. The acceptable range for system performance and the expected results for each test case shall be derived from the manufacturer-submitted technical documentation and the EAC 2005 VVSG.

### **6.0 TEST PROCEDURE AND CONDITIONS**

The following subsections detail the facility requirements, test setup conditions, and sequence of testing.

## **6.1 Facility Requirements**

Unless otherwise annotated, all testing shall be conducted at the Pro V&V test facility located in Huntsville, AL, by personnel verified by Pro V&V to be qualified to perform the test.

Unless otherwise specified herein, testing shall be performed at the following standard ambient conditions and tolerances:

- Temperature: 68-75° F ( $\pm 3.6^\circ\text{F}$ )
- Relative Humidity: Local Site Humidity
- Atmospheric Pressure: Local Site Pressure
- Time Allowable Tolerance:  $\pm 5\%$

Testing performed at third-party laboratories will be subjected to the test parameters and tolerances defined by the test facility and will be reported in the final Test Report.

## **6.2 Test Set-up**

All voting system equipment shall be received and documented using Pro V&V proper QA procedures. Upon receipt of all hardware, an inspection will be performed to verify that the equipment received is free from obvious signs of damage and/or degradation that may have occurred during transit. If present, this damage shall be recorded, photographed, and reported to the Dominion Representative. Additionally, a comparison shall be made between the recorded serial numbers/part numbers and those listed on shipper's manifest and any discrepancies shall be reported to the Dominion Representative. TDP items and all source code received shall be inventoried and maintained by Pro V&V during the test campaign.

During test performance, the system shall be configured as it would be for normal field use. This includes connecting all supporting equipment and peripherals.

## **6.3 Test Sequence**

The D-Suite 5.5-B Voting System will be evaluated against all applicable requirements in the EAC 2005 VVSG. There is no required sequence for test performance.

## **6.4 Test Operations Procedure**

Pro V&V will identify PASS/FAIL criteria for each executed test case. The PASS/FAIL criteria will be based on the specific expected results of the system. In the case of an unexpected result that deviates from what is considered standard, normal, or expected, a root cause analysis will be performed.

Pro V&V will evaluate every EAC 2005 VVSG requirement applicable to the Democracy Suite 5.5-B voting system. Any deficiencies noted will be reported to the EAC and the manufacturer. If it is determined that there is insufficient data to determine compliance, this test plan will be altered and additional testing will be performed.

**(Sent via e-mail)**

**RE: Approval of Dominion DVS 5.5-B Test Plan**

Dear Mr. Medlock,

This letter is to inform you that Rev. 1.0 of the test plan submitted by Pro V&V for the testing of Dominion DVS 5.5-B voting system has been reviewed and approved. Per section 4.6.4.3 of the EAC's Testing and Certification Program Manual ("Program Manual") a test plan is approved based on the information submitted. Test plan approval indicates the following:

- Approval simply signifies that the tests proposed, if performed properly, appear to be sufficient to fully test the system. A final determination of the sufficiency of the testing is a global evaluation based on the test plan, test cases, and test report reviews, as well as the EAC's Quality Monitoring Process outlined in Chapter 8 of the Program Manual.
- Approval allows the test laboratory to begin test case development, testing, and test report submittal.
- A test plan is approved based on information submitted. It is not known if relevant information was omitted that would affect the testing campaign.
- The test plan is a living document and is expected to change and be updated during various phases of the testing life cycle. A final version that reflects all of the testing completed (e.g. TDP, Hardware, and Software) should be submitted to the EAC at the completion of testing. If this final "as run" test plan does not reflect all the testing required, the EAC reserves the right to request further updates to the test plan and possibly additional testing.

I also want to take this opportunity to remind you of the EAC's requirements following approval of a test plan. Section 4.5 of the Program Manual requires VSTLs to report any changes to a voting system or an approved test plan directly to the EAC. Under this section, Manufacturers are required to enable VSTLs to report all test failures or anomalies directly to the EAC. In addition, for further guidance on this matter, please refer to Section 4.5.1 for information regarding the reporting requirements for changes to a system or test plan during testing, and Section 4.5.2 for information regarding the reporting requirements for anomalies or failures found during testing.

Section 4.6 of the Program Manual lays out the various requirements for the submission and approval of a test report.

If you should have any questions regarding the approval of the test plan referenced above, or the rest of the EAC's certification process please contact me.

Sincerely,

A handwritten signature in black ink, appearing to read "Jerome Lovato". The signature is fluid and cursive, with a large initial "J" and a stylized "L".

Jerome Lovato  
Director, Voting System Testing and Certification

## 1.0 INTRODUCTION

The purpose of this Test Plan is to document the procedures that Pro V&V, Inc. will follow to perform certification testing during a system modification campaign for the Dominion Voting Systems Democracy Suite (D-Suite) 5.5-B Voting System to the requirements set forth for voting systems in the U.S. Election Assistance Commission (EAC) 2005 Voluntary Voting System Guidelines (VVSG), Version 1.0. Prior to submitting the voting system for testing, Dominion Voting Systems submitted an application package to the EAC for certification of the D-Suite 5.5-B Voting System. The application was accepted by the EAC and the project was assigned the unique Project Number of DVS-DemSuite5.5-B.

At test conclusion, the results of all testing performed as part of this test campaign will be submitted to the EAC in the form of a national certification test report.

### 1.1 Description and Overview of EAC Certified System Being Modified

*The EAC Certified System that is the baseline for the submitted modification is described in the following subsections. All information presented was derived from the previous Certification Test Report, the EAC Certificate of Conformance and/or the System Overview.*

The D-Suite 5.5-B Voting System is a paper-based optical scan voting system with a hybrid paper/DRE option consisting of the following major components: The Election Management System (EMS), the ImageCast Central (ICC), the ImageCast Precinct (ICP and ICP2), the ImageCast X (ICX) DRE w/ Reports Printer, ImageCast X (ICX) DRE w/VVPAT, the ImageCast Evolution (ICE), and the ImageCast X (ICX) BMD. The D-Suite 5.5-B Voting System configuration is a modification from the EAC approved D-Suite 5.5 system configuration.

The following subsections describe the baselined D-Suite 5.5 Voting System.

#### **Election Management System (EMS)**

The D-Suite 5.5 EMS consists of various components running as either a front-end/client application or as a back-end/server application. A listing of the applications and a brief description of each is presented below.

Front-end/Client applications:

- **EMS Adjudication:** Represents the client component responsible for adjudication, including reporting and generation of adjudicated result files from ImageCast Central tabulators and adjudication of write-in selections from ImageCast Precinct and ImageCast Central tabulators. This client component is installed on both the server and the client machines.
- **EMS Audio Studio:** A client application that represents an end-user helper application used to record audio files for a given election project. As such, it is utilized during the pre-voting phase of the election cycle.

- EMS Election Data Translator: End-user application used to export election data from election project and import election data into election project.
- EMS Election Event Designer: A client application that integrates election definition functionality together with ballot styling capabilities and represents a main pre-voting phase end-user application
- ImageCast Voter Activation: An application, installed on a workstation or laptop at the polling place, which allows the poll workers to program smart cards for voters. The smart cards are used to activate voting sessions on ImageCast X.
- EMS Results Tally and Reporting: A client application that integrates election results acquisition, validation, tabulation, reporting, and publishing capabilities and represents the main post-voting phase end-user application.

Back-end/Server applications:

- EMS Adjudication Service: Represents a server side application which provides ballot information such as contests, candidates and their coordinates from EMS to the Adjudication application.
- EMS Application Server: Represents a server side application responsible for executing long running processes, such as rendering ballots, generating audio files and election files, etc.
- EMS Database Server: Represents a server side RDBMS repository of the election project database which holds all the election project data, including pre-voting and post-voting data.
- EMS Data Center Manager: A server application that represents a system level configuration application used in EMS back-end data center configuration.
- EMS File System Service: A back-end application that acts as a stand-alone service that runs on client machines, enabling access to low level operating system API for partitioning CF cards, reading raw partition on ICP CF card, etc.
- EMS NAS Server: Represents a server side file repository of the election project file based artifacts, such as ballots, audio files, reports, log files, election files, etc.
- Smart Card Helper Service: A service that is installed on a workstation or laptop at the polling place, and provides required data format for programming smart cards for ImageCast devices, or, for jurisdiction's voting registration system in case of integration.

### **ImageCast Precinct (ICP)**

The ICP device is a hybrid precinct optical scan paper/DRE ballot counter designed to provide six major functionalities: ballot scanning, second chance voting, accessible voting, ballot review, tabulation, and poll worker functions.

For ballot scanning functionality the ICP scans marked paper ballots, interprets voter marks on the paper ballots and stores the ballots for tabulation when the polls are closed.

Second Chance voting refers to scenarios in which an error has been detected on the voter's paper ballot (e.g., blank ballot, undervoted ballot, overvoted ballot, misread ballot, cross-over voted ballot), and the ICP notifies the voter by displaying a message or providing an audio visual cue, that one of these situations has been detected, and offers the voter an opportunity to reject and fix their ballot, or to cast the ballot as-is.

Accessible voting allows voters with disabilities to listen to an audio representation of a ballot and use a hand held controller called an Audio Tactile Interface (ATI) to make vote selections, which are then saved directly to the ICP when the voter casts their Accessible Voting ballot.

The Ballot Review feature allows a voter to review their vote selections using an audio or visual representation, which displays or presents the voter with a complete listing of all contests contained on the ballot and an indication of the results which will be recorded for each contest once the voter's ballot is cast.

The Tabulation of paper ballots and Accessible Voting ballots cast by voters is performed when the polls are closed on the ICP unit and the unit tabulates the results, generates results files for aggregation into RTR, and prints a results report containing the results of the ballots cast.

For poll worker functions the ICP contains a small touch-screen LCD to allow the poll worker to initiate polling place activities, diagnostics and reports.

### **ImageCast Central (ICC) Count Scanner**

The ICC is a high-speed, central ballot scan tabulator based on Commercial off the Shelf (COTS) hardware, coupled with the custom-made ballot processing application software. It is used for high speed scanning and counting of paper ballots.

### **ImageCast X (ICX)**

The Democracy Suite ImageCast X (ICX) consists exclusively of COTS available hardware and operating system, while the applications installed on top customize its behavior to turn it into a Ballot Marking Device (BMD) or a Direct-Recording Electronic (DRE) device with or without a Voter Verifiable Paper Audit Trail (VVPAT). ICX application is the application that verifies voter's session eligibility, using the smart card and then presents the appropriate ballot to the voter. When a voter is satisfied with choices selected, ICX application verifies them and produces an Electronic Mobile Ballot or stores the votes onto a memory device. The ICX is designed to perform the following functions:

- Ballot marking and printing of electronic mobile ballots (in BMD mode)
- Ballot review and second chance voting
- Accessible voting and ballot marking
- Saving voting results (in DRE mode)
- Printing votes on a voter verifiable paper audit trail device (when VVPAT is in use)

### 1.1.1 Baseline Certified System

The baseline system for this modification is the D-Suite 5.5 Voting System. The tables below describe the certified equipment and firmware versions. Detailed descriptions of the D-Suite 5.5 test campaign are contained in Pro V&V Report No. TR-01-01-DVS-2017-02.01 Rev. B, which is available for viewing on the EAC's website at [www.eac.gov](http://www.eac.gov).

*This subsection lists the proprietary and COTS software to be provided by the manufacturer as part of the test campaign.*

### 1.1.2 Description of Modification

The Dominion Democracy Suite 5.5-B Voting System is a modified voting system configuration that includes upgrades to the components of the D-Suite 5.5 Voting System. The list below includes changes between this system and the baseline of the Democracy Suite 5.5 Voting System:

#### GENERAL MODIFICATIONS

- Addition of ImageCast Evolution (ICE), a precinct-level, optical scan, ballot counter (tabulator) designed to perform three major functions: ballot scanning and tabulation, ballot review and second chance voting, and accessible voting and ballot marking. *Submitted version: ICE firmware version 5.5.6.5, model number PCOS 410A.*
- Addition of InoTec HiPro 821 Scanner as a component for the ImageCast Central Count (ICC). *Submitted version: ICC software application version 5.5.32.5, HiPro 821 Scanner driver version 1.2.3.17.*
- Addition of Canon imageFORMULA DR-M260 Scanner as a component for the ImageCast Central Count (ICC). *Submitted version: ICC software application version 5.5.32.5, DR-M260 Scanner driver version 1.1 SP2.*
- Addition of ImageCast Precinct 2 (ICP2) optical ballot counter. The ICP2 is a precinct-based optical scan ballot tabulator that is used in conjunction with ImageCast compatible ballot storage boxes. *Submitted version: ICP2 firmware version 5.5.1.8, model number PCOS-330A.*

### 1.1.3 Initial Assessment

Testing from the previous test campaign was used to establish the baseline. The focus of this test campaign is the addition of the ImageCast Evolution (ICE) optical ballot hybrid precinct-based scanner and BMD, the InoTec HiPro 821 Scanner, the ImageCast Precinct 2 (ICP2) optical ballot scanner, and the Canon imageFORMULA DR-M260 Scanner. It was determined the following tasks would be required to verify compliance of the modifications:

- Source Code Review, Compliance Build, Trusted Build, and Build Document Review
- System Integration Testing
- Technical Documentation Package (TDP) Review
- Functional Configuration Audit (FCA)
- System Loads & Hardening
- Physical Configuration Audit (PCA)
- Security Testing

- Hardware Testing
- Usability & Accessibility Testing
- Volume & Stress Testing
- Accuracy Testing

#### **1.1.4 Regression Test**

Regression testing for this test campaign will consist of the execution of the System Integration Testing.

### **1.3 Terms and Abbreviations**

*This subsection lists terms and abbreviations relevant to the hardware, the software, or this Test Plan.*

“ADA” – Americans with Disabilities Act 1990

“BMD” – Ballot Marking Device

“CM” – Configuration Management

“COTS” – Commercial Off-The-Shelf

“DRE” – Direct Record Electronic

“EAC” – United States Election Assistance Commission

“EMS” – Election Management System

“FCA” – Functional Configuration Audit

“HAVA” – Help America Vote Act

“ICC” – ImageCast Central

“ICE” – ImageCast Evolution

“ICP” – ImageCast Precinct

“ICX” – ImageCast X

“ISO” – International Organization for Standardization

“NOC” – Notice of Clarification

“PCA” – Physical Configuration Audit

“QA” – Quality Assurance

“RFI” – Request for Interpretation

“TDP” – Technical Data Package

“UPS” – Uninterruptible Power Supply

“VSTL” – Voting System Test Laboratory

“VVPAT” – Voter Verifiable Paper Audit Trail

“VVSG” – Voluntary Voting System Guidelines

#### **1.4 Project Schedule**

The Project Schedule for the test campaign is located in Appendix A. The dates on the schedule are not firm dates but planned estimates based on the anticipated project work flow.

## 1.5 Scope of Testing

The scope of testing focused on the addition of the ImageCast Evolution (ICE) optical ballot hybrid precinct-based scanner and BMD, the ICP2 optical ballot counter, the InoTec HiPro 821 Scanner, and the Canon imageFORMULA DR-M260 Scanner. To evaluate the D-Suite 5.5-B test requirements, the submitted modifications were evaluated against each section of the EAC 2005 VVSG to determine the applicable tests to be performed.

Based on this assessment, it was determined that multiple areas within the EAC 2005 VVSG would be evaluated to encompass the required tests. A breakdown of the areas and associated tests is listed below:

- EAC 2005 VVSG Volume 1, Section 2: Functional Requirements
  - System Integration Testing
  - Functional Configuration Audit (FCA)
  - Physical Configuration Audit (PCA), including System Loads & Hardening
  - Technical Documentation Package (TDP) Review
  - Volume & Stress Testing
  - Accuracy Testing
- EAC 2005 VVSG Volume 1, Section 3: Usability & Accessibility
  - Usability & Accessibility Testing
  - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 4: Hardware Requirements
  - Hardware Testing
  - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 5: Software Requirements
  - Source Code Review, Compliance Build, Trusted Build, and Build Document Review
  - Technical Documentation Package (TDP) Review
  - Functional Configuration Audit (FCA)
- EAC 2005 VVSG Volume 1, Section 7: Security Requirements
  - Security Testing

- Technical Documentation Package (TDP) Review
- Functional Configuration Audit (FCA)

### 1.5.1 Block Diagram

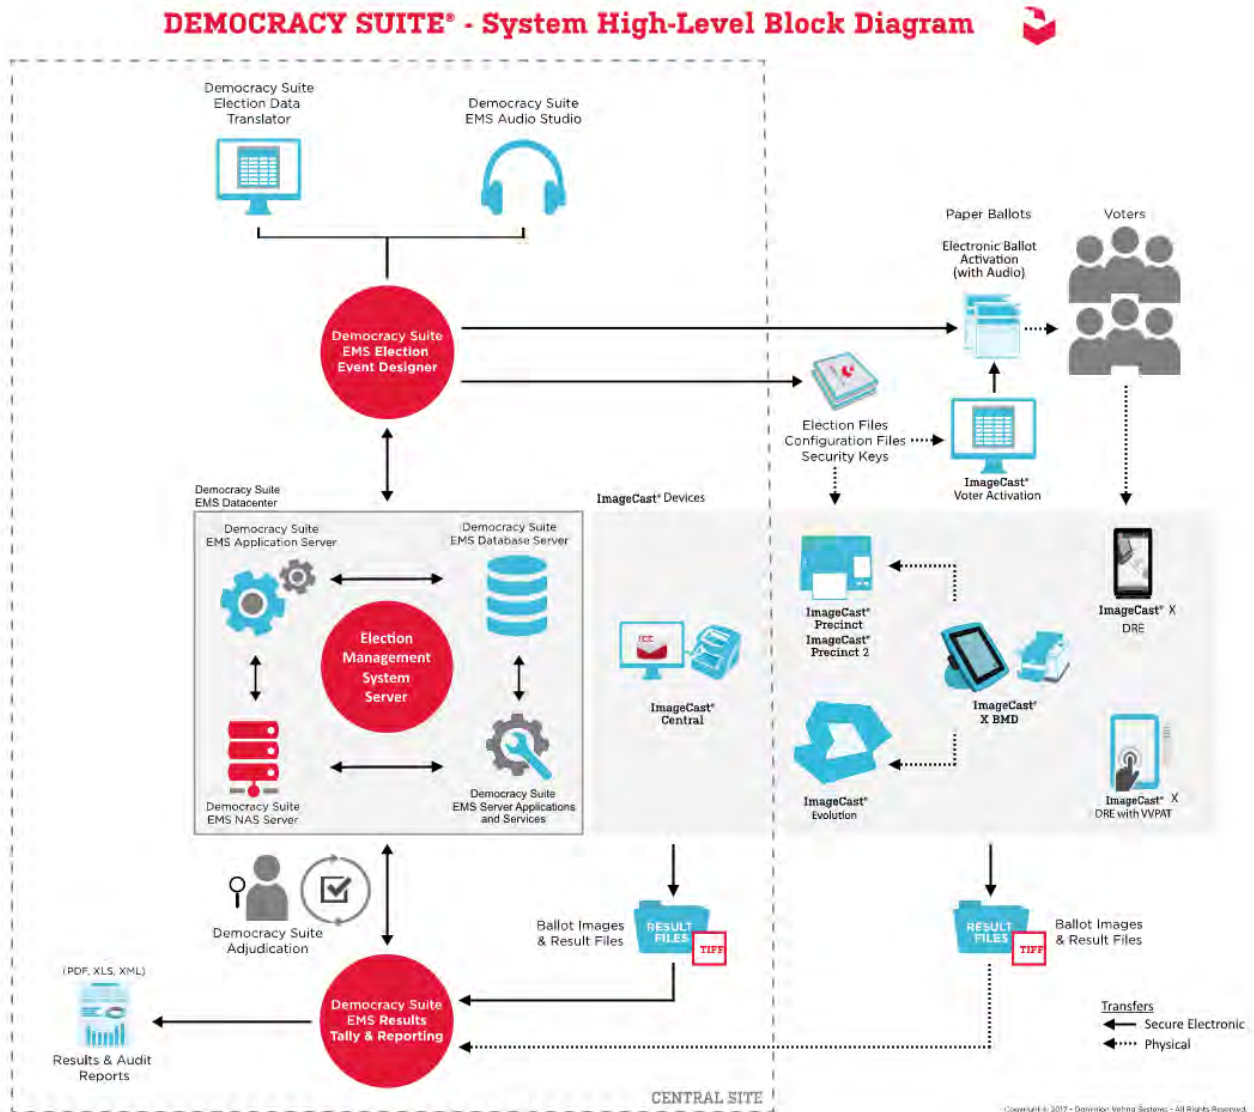

Figure 1-1. D-Suite 5.5-B System Overview

## 1.5.2 System Limits

The system limits that Dominion Voting Systems has stated to be supported by the D-Suite 5.5-B are provided in the table below.

**Table 1-22. D-Suite 5.5-B System Limits by Configuration**

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Landscape Ballot Orientation			
Ballot positions	292	292	*22-inch Landscape Ballot (240 candidates + 24 write-ins + 28 Yes/No choices)
Precincts in an election	1000	250	Memory
Contests in an election	1000	250	Memory
Candidates/Counters in an election	10000	2500	Memory
Candidates/Counters in a precinct	240	240	*22-inch Ballot
Candidates/Counters in a tabulator	10000	2500	Memory
Ballot Styles in an election	3000	750	Memory
Contests in a ballot style	38	38	*22-inch Landscape Ballot (24 candidacy contests + 14 Propositions)
Candidates in a contest	240	240	*22-inch Ballot
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	Memory
“Vote for” in a contest	24	24	*22-inch Landscape Ballot
Supported languages in an election	5	5	Memory
Number of write-ins	24	24	*22-inch Landscape Ballot
Portrait Ballot Orientation			
Ballot positions	462	462	*22-inch Portrait Ballot
Precincts in an election	1000	250	Memory
Contests in an election	1000	250	Memory
Candidates/Counters in an election	10000	2500	Memory
Candidates/Counters in a precinct	462	462	*22-inch Portrait Ballot
Candidates/Counters in a tabulator	10000	2500	Memory
Ballot Styles in an election	3000	750	Memory
Contests in a ballot style	156	156	*22-inch Portrait Ballot

**Table 1-22. D-Suite 5.5-B System Limits by Configuration** *(continued)*

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Candidates in a contest	231	231	*22-inch Portrait Ballot (Column Span 3)
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	No Limitation
“Vote for” in a contest	30	30	No Limitation
Supported languages in an election	5	5	Memory
Number of write-ins	462	462	*22-inch Portrait Ballot

**\*The 22-inch Ballot length applies only to hand-marked paper ballots.**

### 1.5.3 Supported Languages

The following languages are supported by the D-Suite 5.5-B System:

**Table 1-23. D-Suite 5.5-B Supported Languages**

Language	ICE	ICP	ICX
Alaska Native	Yes, if using Latin alphabet	Yes	No
Apache	Audio only	Audio only	No
Bengali	Yes	Yes	Yes
Chinese	Yes	Yes	Yes
English	Yes	Yes	Yes
Eskimo	Yes, if using Latin alphabet	Yes	No
Filipino	Yes, if using Latin alphabet	Yes	No
French	Yes	Yes	Yes
Hindi	Yes	Audio only	Yes
Japanese	Yes	Yes	Yes
Jicarilla	Audio only	Audio only	No
Keres	Audio only	Audio only	No
Khmer	Yes	Audio only	No
Korean	Yes	Yes	Yes
Navajo	Audio only	Audio only	No
Seminole	Audio only	Audio only	No
Spanish	Yes	Yes	Yes
Tagalog	No	No	Yes
Thai	Yes	Audio only	Yes
Towa	Audio only	Audio only	No
Ute	Audio only	Audio only	No
Vietnamese	Yes	Yes	Yes
Yuman	Audio only	Audio only	No

Support for all stated languages will be verified; however, only English and Spanish language ballots will be cast during the performance of functional testing. Additionally, one character based language (Chinese) will be tested during System Integration Testing.

For the character based language, the ballot will be created by Pro V&V and voted utilizing both paper ballots and ADA voting devices along with all applicable peripherals. The Chinese Language for the ballot will be created using a readily available online translation tool. The translated language text will be entered into the Election Event Designer Application. A ballot preview will be generated in the EED application. The Chinese characters displayed in the ballot preview will be compared to the characters generated by the online translation tool, to ensure that the characters match. The ballots will then be generated and printed, and the election loaded onto the tabulators and the BMD units. The Chinese characters displayed on both the printed ballots and displayed on the BMD units will be compared to the original Chinese Characters generated by the online translation tool to verify that the characters match.

#### **1.5.4 Supported Functionality**

The D-Suite 5.5-B is designed to support the following voting variations:

- General Election
- Closed Primary
- Open Primary
- Early Voting
- Partisan/Non-Partisan Offices
- Write-In Voting
- Primary Presidential Delegation Nominations
- Split Precincts
- Vote for N of M
- Ballot Rotation
- Provisional or Challenged Ballots

#### **1.5.5 VVSG**

The D-Suite 5.5-B Voting System shall be evaluated against the relevant requirements contained in the EAC 2005 VVSG, Version 1.0.

#### **1.5.6 RFIs**

There are no RFIs released by the EAC as of the date of this Test Plan that pertain to this test campaign that were not in effect at the time of the baseline system certification.

### **1.5.7 NOCs**

There are no NOCs released by the EAC as of the date of this Test Plan that pertain to this test campaign that were not in effect at the time of the baseline system certification.

## **2.0 PRE-CERTIFICATION TESTING AND ISSUES**

This section describes previous testing performed prior to submitting the voting system to the EAC.

### **2.1 Evaluation of Prior VSTL Testing**

Pro V&V evaluated to the published Final Test Report for the D-Suite 5.5 System in order to baseline the current system under test. It was determined that Accuracy and Hardware Testing for the following components would be re-used to satisfy requirements for this test campaign: ICX BMD, ICX DRE, ICP, and ICX DRE w/VVPAT.

### **2.2 Evaluation of Prior Non-VSTL Testing**

No prior non-VSTL testing of the D-Suite 5.5 modifications were considered for this test campaign.

### **2.3 Known Field Issues**

D-Suite 5.5-B is a modification to a previously certified system and has not been fielded.

## **3.0 MATERIALS REQUIRED FOR TESTING**

*The following sections list all materials needed to enable the test engagement to occur.*

The materials required for testing of the D-Suite 5.5-B System include all materials to enable the test campaign to occur. This includes the applicable hardware and software as well as the TDP, test support materials, and deliverable materials, as described in the following subsections.

### **3.1 Software**

*This subsection lists the proprietary and COTS software to be provided by the manufacturer as part of the test campaign.*

In addition to the baseline system software identified in Section 1.1.1 of this Test Plan, the following software is required for test performance: ICC Software application version 5.5.4.1, which has been updated from the baseline version, and ICE firmware version 5.5.6.1.

Pro V&V will perform a comparison on the submitted source code against the previously certified versions. Regression testing will be performed to verify successful implementation of changes.

### 3.2 Equipment

*This subsection lists the proprietary and COTS equipment to be provided by the manufacturer as part of the test campaign.*

For COTS equipment, every effort will be made to verify that the COTS equipment has not been modified for use. This will be accomplished by performing research using the COTS equipment manufacturer's websites based on the serial numbers and service tag numbers for each piece of equipment. Assigned test personnel will evaluate COTS hardware, system software and communications components for proven performance in commercial applications other than voting. For PCs, laptops, and servers, the service tag information will be compared to the system information found on each machine. Physical external and internal examination will also be performed when the equipment is easily accessible without the possibility of damage. Hard drives, RAM memory, and other components will be examined to verify that the components match the information found on the COTS equipment manufacturer's websites.

All hardware required for testing is identified in Section 1.1 of this test plan.

### 3.3 Test Materials

*This subsection lists the test materials required to execute the required tests throughout the test campaign.*

**Table 3-1. Required Test Materials**

Material	Description(s)
Tamper Proof Security Seals	Adhesive tamper proof security seal, Novavision Part# XSG21-08RESN
Printer Cartridges	HP LaserJet CF226X
Smart Cards	Programmable Smart Cards
ImageCast Precinct Cleaning Sheets	Cleaning Sheets for ImageCast Precinct tabulator Part# CSHT-100B
Stereo Breakout Cable	3.5mm stereo male plug to dual 3.5mm mono female plugs
3.5mm Stereo Cable	3.5mm stereo male plug to 3.5mm stereo female plug
Compact Flash Cards	SanDisk Ultra 4Gb and Centon 16GB Compact Flash Cards
iButton Security Tokens	iButton Security Token with lanyards
Permanent Markers	Fine Tip Sharpie Permanent Markers
Ethernet Cables	Cat5e Ethernet Cables
ICE Paper Rolls	Replacement Thermal Paper Rolls for the ImageCast Evolution tabulator
ICP Paper Rolls	Replacement Thermal Paper Rolls for the ImageCast Precinct tabulator
Sip & Puff Disposable Straws	Disposable straws for use with the Sip & Puff input device
Ballot Stock	Ballot Paper Stock for printing ballots

**Table 3-1. Required Test Materials** *(continued)*

<b>Material</b>	<b>Description(s)</b>
A/C Power Cables	3-Prong A/C Power Cables
USB Thumb drives	4 GB, 8 GB, and 16 GB USB Thumb drives

### **3.4 Proprietary Data**

All data and documentation considered by the manufacturer to be proprietary will be identified and documented in an independent submission along with a Notice of Protected Information.

## **4.0 TEST SPECIFICATIONS**

Certification testing of the Dominion D-Suite 5.5-B Voting System submitted for evaluation will be performed to ensure the applicable requirements of the EAC 2005 VVSG and the EAC Testing and Certification Program Manual, Version 2.0 are met. Additionally, all EAC Request for Interpretations (RFI) and Notices of Clarification (NOC) relevant to the system under test will be incorporated in the test campaign. A complete listing of the EAC RFIs and NOCs is available on the EAC website.

### **4.1 Requirements (Strategy of Evaluation)**

To evaluate the D-Suite 5.5-B test requirements, the submitted modifications were evaluated against each section of the EAC 2005 VVSG to determine the applicable tests to be performed. Based on this assessment, it was determined the following evaluations would be required to verify compliance of the modifications:

#### Technical Documentation Package (TDP) Review

A TDP Review will be performed to ensure that all submitted modifications are accurately documented and that the documents meet the requirements of the EAC 2005 VVSG. The preliminary TDP is performed to gather information concerning the system under test and its capabilities or design intentions. Additionally, a TDP review will be performed throughout the test campaign. The TDP Review includes the Initial Review, the Regulatory/Compliance Review, and the Final Review. This review is conducted to determine if the submitted technical documentation meets the regulatory, customer-stated, or end-user requirements and includes reviewing the documents for stated functionality review and verification.

#### Section 2: Functional Requirements

The requirements in this section shall be tested during the FCA and System Integration Test. This evaluation will utilize baseline test cases as well as specifically designed test cases and will include predefined election definitions for the input data.

The FCA targets the specific functionality claimed by the manufacturer to ensure the product functions as documented. This testing uses both positive and negative test data to test the robustness of the system. The FCA encompasses an examination of manufacturer tests, and the

conduct of additional tests, to verify that the system hardware and software perform all the functions described in the manufacturer's documentation submitted in the TDP (such as system operations, voter manual, maintenance, and diagnostic testing manuals). It includes a test of system operations in the sequence in which they would normally be performed. These system operations and functional capabilities are categorized as follows by the phase of election activity in which they are required:

- Overall System Capabilities: These functional capabilities apply throughout the election process. They include security, accuracy, integrity, system audit ability, election management system, vote tabulation, ballot counters, telecommunications, and data retention.
- Pre-voting Capabilities: These functional capabilities are used to prepare the voting system for voting. They include ballot preparation, the preparation of election-specific software (including firmware), the production of ballots, the installation of ballots and ballot counting software (including firmware), and system and equipment tests.
- Voting System Capabilities: These functional capabilities include all operations conducted at the polling place by voters and officials including the generation of status messages.
- Post-voting Capabilities: These functional capabilities apply after all votes have been cast. They include closing the polling place; obtaining reports by voting machine, polling place, and precinct; obtaining consolidated reports; and obtaining reports of audit trails.
- Maintenance, Transportation and Storage Capabilities: These capabilities are necessary to maintain, transport, and store voting system equipment.

The system integration testing addresses the integration of the hardware and software. This testing focuses on the compatibility of the voting system software components and subsystems with one another and with other components of the voting system. During test performance, the system is configured as would be for normal field use.

### Section 3: Usability and Accessibility Requirements

The requirements in this section shall be tested during the Usability and Accessibility Testing. This evaluation will utilize baseline test cases as well as specifically designed test cases and will include predefined election definitions for the input data.

The usability testing focuses on the usability of the system being tested. Usability is defined generally as a measure of the effectiveness, efficiency, and satisfaction achieved by a specified set of users with a given product in the performance of specified tasks. In the context of voting, the primary user is the voter, the product is the voting system, and the task is the correct recording of the voter ballot selections. Additional requirements for task performance are independence and privacy: the voter should normally be able to complete the voting task without assistance from others, and the voter selections should be private. Accessibility evaluates the requirements for accessibility. These requirements are intended to address HAVA 301 (a) (3) (B).

#### Section 4: Hardware Requirements

The hardware tests specified in the VVSG are divided into two categories: non-operating and operating. The non-operating tests apply to the elements of the system that are intended for use at poll site locations and are intended to simulate the storage and transport of equipment between the storage facility and the polling location. The Operating tests apply to the entire system, including hardware components that are used as part of the voting system telecommunications capability, and are intended to simulate conditions that the voting system may encounter during operation. Prior to and immediately following each required non-operating and operating test, the system shall be subjected to an operational status check.

The requirements in this section shall be tested and/or evaluated by personnel verified by Pro V&V to be qualified to perform the testing.

#### Section 5: Software Requirements

The requirements in this section shall be tested utilizing a combination of review and functional testing during the source code review, TDP review, and FCA. Trusted builds from previously certified versions will be used as the baseline for testing. The ICE and ICP2 components will be subjected to the full suite of testing.

To perform the source code review, Pro V&V will review the submitted source code to the EAC 2005 VVSG and the manufacturer-submitted coding standards. Prior to initiating the software review, Pro V&V shall verify that the submitted documentation is sufficient to enable: (1) a review of the source code and (2) Pro V&V to design and conduct tests at every level of the software structure to verify that design specifications and performance guidelines are met. The source code review includes a compliance build and a trusted build of the submitted source code.

#### Section 7: Security Requirements

The requirements in this section shall be tested during the source code review, security tests, and FCA.

To evaluate the integrity of the system, Pro V&V will develop specifically designed test cases in an attempt to defeat the access controls and security measures documented in the system TDP as well verifying compliance to EAC RFI 2012-05. A threat matrix will be created to determine the risks and vulnerabilities. An evaluation of the system will be accomplished by utilizing a combination of functional testing, source code review, and static code analyzers.

During the security testing, the system shall be inspected for various controls and measures that are in place to meet the objectives of the security standards which include: protection of the critical elements of the voting system; establishing and maintaining controls to minimize errors; protection from intentional manipulation, fraud and malicious mischief; identifying fraudulent or erroneous changes to the voting system; and protecting the secrecy in the voting process.

#### 4.1.1 Rationale for ‘Not Applicable’ Requirements

All requirements that were excluded from the previous test campaign (D-Suite 5.5) were also deemed not applicable to this test campaign due to the submitted modifications not impacting the specific requirements. These requirements are identified below:

- Volume I, Section 6.2.6 (Telecommunications Requirements: Integrity)
- Volume I, Section 7.5.2-7.5.4 (Security: Protection Against External Threats, Monitoring and Responding to External Threats, and Shared Operating Environment )
- Volume I, Section 7.6 (Use of Public Communications Networks)
- Volume I, Section 7.7 (Wireless Communications)

The rationale for not evaluating the D-Suite 5.5-B to the indicated sections is described in following table. Specific requirements that are excluded from this test campaign are identified in the EAC spreadsheet.

**Table 4-1. Not Applicable Requirements**

<b>EAC 2005 VVSG Version 1 Volume I, Section</b>	<b>Rationale for ‘Not Applicable’</b>
6.2.6	These requirements are written for use of public networks. The D-Suite 5.5-B does not utilize public networks.
7.5.2-7.5.4	These requirements are written for use of public networks. The D-Suite 5.5-B does not utilize public networks.
7.6	D-Suite 5.5-B does not support transmission over public networks.
7.7	No wireless technology is utilized in this system.

#### 4.2 Hardware Configuration and Design

The hardware configuration and design for the modification has changed from the baseline system. The ImageCast Evolution (ICE) has been added to the system configuration. Also, the InoTec HiPro 821 Scanner and the Canon imageFORMULA DR-M260 Scanner are newly introduced COTS document scanners for use with the ICC. Additionally, the ICP2 has been added to this configuration.

#### 4.3 Software System Functions

The software system functions for the previously certified voting system (D-Suite 5.5) remain unchanged for the submitted modifications. An update to the ICC was presented for evaluation, along with the ICE and ICPs firmware applications, which are new to this configuration.

#### 4.4 Test Case Design

Test cases are designed based on the manufacturer’s design specifications and the relevant technical requirements set forth by the VVSG. Test cases shall be based on the following aspects of the voting system:

- Hardware qualitative examination design
- Hardware environmental test case design
- Software module test case design and data
- Software functional test case design
- System level test case design

Test cases shall provide information regarding the sequence of actions to be performed for the execution of a test, the requirements being met, the test objective, test configuration, equipment needed, special requirements, assumptions, and pass/fail criteria. Once the test cases are finalized, they will be validated and published for use in the test campaign. The validation of the test case will be accomplished by technical review and approval. This validation will include the following: confirmation of adequate test coverage of all requirements; confirmation that test case results are not ambiguous and gave objective pass/fail criteria; and confirmation that any automated test suites will produce valid results.

#### **4.4.1 Hardware Qualitative Design**

Previous hardware examinations were performed on the certified baseline system (D-Suite 5.5). The ICX BMD, ICX DRE, ICP, ICP2, and the ICX DRE with VVPAT hardware testing will be re-used from the previous certification test campaign (D-Suite 5.5-B). The full suite of hardware and electrical testing (as listed below) will be performed on the ICE and ICP2 components of the D-Suite 5.5-B System. The Canon M260 and InoTec HiPro Scanner components will be subjected to Temperature-Power Variation Testing only.

##### **Electrical Tests:**

- Electrical Power Disturbance
- Electromagnetic Radiation
- Electrostatic Disruption
- Electromagnetic Susceptibility
- Electrical Fast Transient
- Lightning Surge
- Conducted RF Immunity
- Magnetic Fields Immunity
- Electrical Supply

##### **Environmental Tests:**

- Bench Handling

- Vibration
- Low Temperature
- High Temperature
- Humidity
- Temperature Power Variation
- Acoustic

#### **4.4.2 Hardware Environmental Test Case Design**

The voting system hardware shall be subjected to the tests specified in Section 4.4.1. Testing will be performed by personnel verified by Pro V&V to be qualified to perform the test. Pro V&V will utilize third-party test facilities for performance of the electrical and environmental tests. Environmental and Electrical will be performed at the NTS Longmont facility located in Longmont, Colorado. All pre and post operational status checks shall be conducted by Pro V&V personnel.

#### **4.4.3 Software Module Test Case Design and Data**

Pro V&V shall review the manufacturer's program analysis, documentation, and module test case design and shall evaluate the test cases for each module with respect to flow control parameters and entry/exit data. As needed, Pro V&V shall design additional test cases to satisfy the coverage criteria specified in Volume II, Section 7.2.1.

Component Level Testing will be implemented during the FCA for each component and subcomponent. During the Source Code Review, Compliance Builds, and Security Testing, Pro V&V will utilize limited structural-based techniques (white-box testing). Additionally, specification-based techniques (black-box testing) will be utilized for the individual software components.

Pro V&V shall define the expected result for each test and the ACCEPT/REJECT criteria for certification. If the system performs as expected, the results will be accepted.

If the system does not perform as expected, an analysis will be performed to determine the cause. The test will be repeated in an attempt to reproduce the results. If the failure can be reproduced and the expected results are not met, the system will have failed the test. If the results cannot be reproduced, the test will continue. All errors encountered will be documented and tracked through resolution.

#### **4.4.4 Software Functional Test Case Design and Data**

Pro V&V shall review the manufacturer-submitted test plans and data to verify that the individual performance requirements specified in the EAC 2005 VVSG and the TDP are reflected in the software. As part of this process, Pro V&V shall review the manufacturer's test case design and prepare a detailed matrix of system functions and the test cases that exercise them. Pro V&V shall also prepare a test procedure describing all test ballots, operator procedures, and the data content

of output reports. Pro V&V shall define abnormal input data and operator actions and then design test cases to verify that the system is able to handle and recover from these abnormal conditions. During this review, emphasis shall be placed on those functions where the manufacturer data on module development, such as the system release notes and comments within the source code, reflects significant debugging problems, and on functional tests that resulted in high error rates.

Pro V&V shall define the expected result for each test and the ACCEPT/REJECT criteria for certification. If the system performs as expected, the results will be accepted.

If the system does not perform as expected, an analysis will be performed to determine the cause. The test will be repeated in an attempt to reproduce the results. If the failure can be reproduced and the expected results are not met, the system will have failed the test. If the results cannot be reproduced, the test will continue. All errors encountered will be documented and tracked through resolution.

#### **4.4.5 System-Level Test Case Design**

System Level testing will be implemented to evaluate the complete system. This testing will include all proprietary components and COTS components (software, hardware, and peripherals) in a configuration of the system's intended use. For software system tests, the tests shall be designed according to the stated design objective without consideration of its functional specification. The system level hardware and software test cases shall be prepared independently to assess the response of the hardware and software to a range of conditions.

#### **4.5 Security Functions**

The objective of the Security Testing is to evaluate the effectiveness of the voting system in detecting, preventing, recording, reporting, and recovering from security threats. To evaluate the integrity of the system, Pro V&V shall develop specifically designed test cases in an attempt to defeat the access controls and security measures documented in the system TDP. The submitted threat matrix identifying the system's risks and vulnerabilities shall be evaluated for completeness and to determine that mitigating controls are adequately implemented.

An evaluation of the system shall be accomplished by utilizing a combination of functional testing and source code review. All findings will be reported to the EAC and DVS. The test methods for performing the Security Testing are execution and review. Prior to performance of Security testing, the examiner will verify that security hardening scripts have been properly applied to system components per the system documentation. The examiner will review the submitted TDP to verify that documented access and physical controls are in place. Following the documented procedures, the examiner will configure the voting system for use and functionality to verify that the documented controls are in place and adequate and meet the stated requirements.

Physical Security will be tested by setting up the system as described in the TDP and then examining the effectiveness and comprehensiveness of physical security measures. Administrative Security will be tested by examining the system's documented security instructions and procedures for effectiveness and breadth. Logical security will be tested as part

of FCA testing by a recognized security expert who not only will review the physical and administrative testing outcomes, but will perform the following tests on system components: Vulnerability Scans, SCAP Scans, and Physical Bypass Attempts. Logical security testing will assess the effectiveness of the security hardening scripts applied during the system setup and install process.

#### 4.6 TDP Evaluation

In order to determine compliance of the modified TDP documents with the EAC 2005 VVSG, a limited TDP review shall be conducted. This review will focus on TDP documents that have been modified since the certification of the baseline system. The review will consist of a compliance review to determine if each regulatory, state, or manufacturer-stated requirement has been met based on the context of each requirement. Results of the review of each document will be entered on the TDP Review Checklist and reported to the manufacturer for disposition of any anomalies. This process will be ongoing until all anomalies are resolved.

Any revised documents during the TDP review process will be compared with the previous document revision to determine changes made, and the document will be re-reviewed to determine whether subject requirements have been met. A listing of all documents contained in the D-Suite 5.5-B TDP is provided in Table 4-2.

#### **4.7 Source Code Review**

Pro V&V will review the submitted source code to the EAC 2005 VVSG and the manufacturer-submitted coding standards. Prior to initiating the software review, Pro V&V shall verify that the submitted documentation is sufficient to enable: (1) a review of the source code and (2) Pro V&V to design and conduct tests at every level of the software structure to verify that design specifications and performance guidelines are met.

For the ICE software, a combination of Automated Source Code Review and Manual Source Code Review methods will be used to review the source code. For all other components, the submitted source code will be compared to the previously certified Democracy Suite 5.5 voting system versions to determine the changes, if any. A combination of Automated Source Code Review and Manual Source Code Review methods will then be used to review the changes in the source code. In addition, 10% of the source code comments will be manually reviewed.

#### **4.8 QA and CM System Review**

The Dominion Voting Systems Quality and Configuration Management Manuals shall be reviewed for their fulfillment of Volume I, Sections 8 and 9, and the requirements specified in Volume II, Section 2. The requirements for these sections establish the quality assurance and configuration standards for voting systems to which manufacturers must conform and require voting system manufacturers to implement a quality assurance and configuration management program that is conformant with recognized ISO standards. As part of the review process, the Dominion TDP documents will be reviewed to determine if the stated policies are being followed.

#### **4.9 Physical Configuration Audit (PCA)**

The Physical Configuration Audit (PCA) compares the voting system components submitted for qualification to the manufacturer's technical documentation, and shall include the following activities:

- Establish a configuration baseline of software and hardware to be tested; confirm whether manufacturer's documentation is sufficient for the user to install, validate, operate, and maintain the voting system
- Verify software conforms to the manufacturer's specifications; inspect all records of manufacturer's release control system; if changes have been made to the baseline version, verify manufacturer's engineering and test data are for the software version submitted for certification

- If the hardware is non-COTS, Pro V&V shall review drawings, specifications, technical data, and test data associated with system hardware to establish system hardware baseline associated with software baseline
- Review manufacturer's documents of user acceptance test procedures and data against system's functional specifications; resolve any discrepancy or inadequacy in manufacturer's plan or data prior to beginning system integration functional and performance tests
- Subsequent changes to baseline software configuration made during testing, as well as system hardware changes that may produce a change in software operation are subject to re-examination

#### **4.10 Functional Configuration Audit (FCA)**

The Functional Configuration Audit (FCA) encompasses an examination of manufacturer's tests, and the conduct of additional tests, to verify that the system hardware and software perform all the functions described in the manufacturer's documentation submitted in the TDP. In addition to functioning according to the manufacturer's documentation tests will be conducted to ensure all applicable EAC 2005 VVSG requirements are met.

#### **4.11 Accuracy**

The accuracy test ensures that each component of the voting system can each process 1,549,703 consecutive ballot positions correctly within the allowable target error rate. The Accuracy test is designed to test the ability of the system to "capture, record, store, consolidate and report" specific selections and absences of a selection. The required accuracy is defined as an error rate. This rate is the maximum number of errors allowed while processing a specified volume of data.

In an effort to achieve this and to verify the proper functionality of the units under test, the following methods will be used to test components of the voting system:

For paper-based voting systems the ballot positions on a paper ballot must be scanned to detect selections for individual candidates and contests and the conversion of those selections detected on the paper ballot converted into digital data. The accuracy requirements for the ICE and the ICC units will be met by the execution of the standard accuracy test utilizing pre-marked and hand-marked ballots of each ballot length supported by the system, and ballots produced by the ICX BMD.

The ICE and ICC units will be tested by utilizing a combination of hand marked (70%) and pre-marked (30%) ballots to achieve an accuracy rate greater than 1,549,703 correct ballot positions.

The ICX BMD, ICX DRE, ICP, and the ICX DRE with VVPAT Accuracy test will be reused from the Dominion 5.5 EAC Campaign

#### **4.12 Volume & Stress**

Tests to investigate the system's response to conditions that tend to overload the system's capacity to process, store, and report data. The test parameters will focus on the system's stated limits and the ballot logic for areas such as the maximum number of active voting positions, maximum number of ballot styles, maximum candidates, maximum contests, and stated limits within the EMS. This test will be utilized to ensure the system can achieve the manufacturer's TDP claims of what the system can support. Testing will be performed by exercising an election definition and test cases developed specifically to test for volume and stress conditions of the system being tested.

#### **4.13 System Integration**

System Integration is a system level test for the integrated operation of both hardware and software. It evaluates the compatibility of the voting system software components or subsystems with one another, and with other components of the voting system environment. This is determined through functional tests integrating the voting system software with the remainder of the system. During this area of testing, the system shall be configured exactly as it would for normal field use. This includes connecting all supporting equipment and peripherals including ballot boxes, voting booths (regular and accessible), and any physical security equipment such as locks and ties.

Pro V&V personnel shall properly configure and test the system by following the procedures detailed in the D-Suite 5.5-B voting system technical documentation.

### **5.0 TEST DATA**

The following subsections provide information concerning test data recording, criteria, and reduction.

#### **5.1 Test Data Recording**

All equipment utilized for test data recording shall be identified in the test data package. The output test data shall be recorded in an appropriate manner as to allow for data analysis. For source code and TDP reviews, results shall be compiled in reports and submitted to Dominion for resolution.

#### **5.2 Test Data Criteria**

The D-Suite 5.5-B Voting System shall be evaluated against all applicable requirements contained in the EAC 2005 VVSG. The acceptable range for system performance and the expected results for each test case shall be derived from the manufacturer-submitted technical documentation and the EAC 2005 VVSG.

### **6.0 TEST PROCEDURE AND CONDITIONS**

The following subsections detail the facility requirements, test setup conditions, and sequence of testing.

## **6.1 Facility Requirements**

Unless otherwise annotated, all testing shall be conducted at the Pro V&V test facility located in Huntsville, AL, by personnel verified by Pro V&V to be qualified to perform the test.

Unless otherwise specified herein, testing shall be performed at the following standard ambient conditions and tolerances:

- Temperature: 68-75° F ( $\pm 3.6^\circ\text{F}$ )
- Relative Humidity: Local Site Humidity
- Atmospheric Pressure: Local Site Pressure
- Time Allowable Tolerance:  $\pm 5\%$

Testing performed at third-party laboratories will be subjected to the test parameters and tolerances defined by the test facility and will be reported in the final Test Report.

## **6.2 Test Set-up**

All voting system equipment shall be received and documented using Pro V&V proper QA procedures. Upon receipt of all hardware, an inspection will be performed to verify that the equipment received is free from obvious signs of damage and/or degradation that may have occurred during transit. If present, this damage shall be recorded, photographed, and reported to the Dominion Representative. Additionally, a comparison shall be made between the recorded serial numbers/part numbers and those listed on shipper's manifest and any discrepancies shall be reported to the Dominion Representative. TDP items and all source code received shall be inventoried and maintained by Pro V&V during the test campaign.

During test performance, the system shall be configured as it would be for normal field use. This includes connecting all supporting equipment and peripherals.

## **6.3 Test Sequence**

The D-Suite 5.5-B Voting System will be evaluated against all applicable requirements in the EAC 2005 VVSG. There is no required sequence for test performance.

## **6.4 Test Operations Procedure**

Pro V&V will identify PASS/FAIL criteria for each executed test case. The PASS/FAIL criteria will be based on the specific expected results of the system. In the case of an unexpected result that deviates from what is considered standard, normal, or expected, a root cause analysis will be performed.

Pro V&V will evaluate every EAC 2005 VVSG requirement applicable to the Democracy Suite 5.5-B voting system. Any deficiencies noted will be reported to the EAC and the manufacturer. If it is determined that there is insufficient data to determine compliance, this test plan will be altered and additional testing will be performed.

**APPENDIX A**  
**PROJECT SCHEDULE**

<b>Task Name</b>	<b>Start Date</b>	<b>End Date</b>	<b>Duration</b>
<b>TDP</b>	<b>02/11/19</b>	<b>06/03/19</b>	<b>80d</b>

## 1.0 INTRODUCTION

The purpose of this Test Report is to document the procedures that Pro V&V, Inc. followed to perform certification testing during a system modification campaign for the Dominion Voting Systems Democracy Suite (D-Suite) 5.5-B Voting System to the requirements set forth for voting systems in the U.S. Election Assistance Commission (EAC) 2005 Voluntary Voting System Guidelines (VVSG), Version 1.0. Certification testing of D-Suite 5.5-B was performed to ensure the applicable requirements of the EAC VVSG 1.0 and the EAC Testing and Certification Program Manual, Version 2.0 were met. Additionally, all EAC Request for Interpretations (RFI) and Notices of Clarification (NOC) relevant to the system under test were incorporated in the test campaign.

Prior to submitting the voting system for testing, Dominion Voting Systems submitted an application package to the EAC for certification of the D-Suite 5.5-B Voting System. The application was accepted by the EAC and the project was assigned the unique Project Number of DVS-DemSuite5.5-B.

### 1.1 Description and Overview of EAC Certified System Being Modified

*The EAC Certified System that is the baseline for the submitted modification is described in the following subsections. All information presented was derived from the previous Certification Test Report, the EAC Certificate of Conformance and/or the System Overview.*

The D-Suite 5.5-B Voting System is a paper-based optical scan voting system with a hybrid paper/DRE option consisting of the following major components: The Election Management System (EMS), the ImageCast Central (ICC), the ImageCast Precinct (ICP and ICP2), the ImageCast X (ICX) DRE w/ Reports Printer, ImageCast X (ICX) DRE w/VVPAT, the ImageCast Evolution (ICE), and the ImageCast X (ICX) BMD. The D-Suite 5.5-B Voting System configuration is a modification from the EAC approved D-Suite 5.5 system configuration.

The following subsections describe the baselined D-Suite 5.5 Voting System.

#### **Election Management System (EMS)**

The D-Suite 5.5 EMS consists of various components running as either a front-end/client application or as a back-end/server application. A listing of the applications and a brief description of each is presented below.

Front-end/Client applications:

- **EMS Adjudication:** Represents the client component responsible for adjudication, including reporting and generation of adjudicated result files from ImageCast Central tabulators and adjudication of write-in selections from ImageCast Precinct and ImageCast Central tabulators. This client component is installed on both the server and the client machines.

- EMS Audio Studio: A client application that represents an end-user helper application used to record audio files for a given election project. As such, it is utilized during the pre-voting phase of the election cycle.
- EMS Election Data Translator: End-user application used to export election data from election project and import election data into election project.
- EMS Election Event Designer: A client application that integrates election definition functionality together with ballot styling capabilities and represents a main pre-voting phase end-user application
- ImageCast Voter Activation: An application, installed on a workstation or laptop at the polling place, which allows the poll workers to program smart cards for voters. The smart cards are used to activate voting sessions on ImageCast X.
- EMS Results Tally and Reporting: A client application that integrates election results acquisition, validation, tabulation, reporting, and publishing capabilities and represents the main post-voting phase end-user application.

Back-end/Server applications:

- EMS Adjudication Service: Represents a server side application which provides ballot information such as contests, candidates and their coordinates from EMS to the Adjudication application.
- EMS Application Server: Represents a server side application responsible for executing long running processes, such as rendering ballots, generating audio files and election files, etc.
- EMS Database Server: Represents a server side RDBMS repository of the election project database which holds all the election project data, including pre-voting and post-voting data.
- EMS Data Center Manager: A server application that represents a system level configuration application used in EMS back-end data center configuration.
- EMS File System Service: A back-end application that acts as a stand-alone service that runs on client machines, enabling access to low level operating system API for partitioning CF cards, reading raw partition on ICP CF card, etc.
- EMS NAS Server: Represents a server side file repository of the election project file based artifacts, such as ballots, audio files, reports, log files, election files, etc.
- Smart Card Helper Service: A service that is installed on a workstation or laptop at the polling place, and provides required data format for programming smart cards for ImageCast devices, or, for jurisdiction's voting registration system in case of integration.

### **ImageCast Precinct (ICP)**

The ICP device is a hybrid precinct optical scan paper/DRE ballot counter designed to provide six major functionalities: ballot scanning, second chance voting, accessible voting, ballot review, tabulation, and poll worker functions.

For ballot scanning functionality the ICP scans marked paper ballots, interprets voter marks on the paper ballots and stores the ballots for tabulation when the polls are closed.

Second Chance voting refers to scenarios in which an error has been detected on the voter's paper ballot (e.g., blank ballot, undervoted ballot, overvoted ballot, misread ballot, cross-over voted ballot), and the ICP notifies the voter by displaying a message or providing an audio visual cue, that one of these situations has been detected, and offers the voter an opportunity to reject and fix their ballot, or to cast the ballot as-is.

Accessible voting allows voters with disabilities to listen to an audio representation of a ballot and use a hand held controller called an Audio Tactile Interface (ATI) to make vote selections, which are then saved directly to the ICP when the voter casts their Accessible Voting ballot.

The Ballot Review feature allows a voter to review their vote selections using an audio or visual representation, which displays or presents the voter with a complete listing of all contests contained on the ballot and an indication of the results which will be recorded for each contest once the voter's ballot is cast.

The Tabulation of paper ballots and Accessible Voting ballots cast by voters is performed when the polls are closed on the ICP unit and the unit tabulates the results, generates results files for aggregation into RTR, and prints a results report containing the results of the ballots cast.

For poll worker functions the ICP contains a small touch-screen LCD to allow the poll worker to initiate polling place activities, diagnostics and reports.

### **ImageCast Central (ICC) Count Scanner**

The ICC is a high-speed, central ballot scan tabulator based on Commercial off the Shelf (COTS) hardware, coupled with the custom-made ballot processing application software. It is used for high speed scanning and counting of paper ballots.

### **ImageCast X (ICX)**

The Democracy Suite ImageCast X (ICX) consists exclusively of COTS available hardware and operating system, while the applications installed on top customize its behavior to turn it into a Ballot Marking Device (BMD) or a Direct-Recording Electronic (DRE) device with or without a Voter Verifiable Paper Audit Trail (VVPAT). ICX application is the application that verifies voter's session eligibility, using the smart card and then presents the appropriate ballot to the voter. When a voter is satisfied with choices selected, ICX application verifies them and produces an Electronic Mobile Ballot or stores the votes onto a memory device. The ICX is designed to perform the following functions:

- Ballot marking and printing of electronic mobile ballots (in BMD mode)
- Ballot review and second chance voting
- Accessible voting and ballot marking
- Saving voting results (in DRE mode)
- Printing votes on a voter verifiable paper audit trail device (when VVPAT is in use)

### 1.1.1 Baseline Certified System

The baseline system for this modification is the D-Suite 5.5 Voting System. The tables below describe the certified equipment and firmware versions. Detailed descriptions of the D-Suite 5.5 test campaign are contained in Pro V&V Report No.TR-01-01-DVS-2017-02.01 Rev. B, which is available for viewing on the EAC's website at [www.eac.gov](http://www.eac.gov).

*This subsection lists the proprietary and COTS software to be provided by the manufacturer as part of the test campaign.*

## 1.3 Terms and Abbreviations

*This subsection lists terms and abbreviations relevant to the hardware, the software, or this Test Plan.*

“ADA” – Americans with Disabilities Act 1990

“BMD” – Ballot Marking Device

“CM” – Configuration Management

“COTS” – Commercial Off-The-Shelf

“DRE” – Direct Record Electronic

“EAC” – United States Election Assistance Commission

“EMS” – Election Management System

“FCA” – Functional Configuration Audit

“HAVA” – Help America Vote Act

“ICC” – ImageCast Central

“ICE” – ImageCast Evolution

“ICP” – ImageCast Precinct

“ICX” – ImageCast X

“ISO” – International Organization for Standardization

“NOC” – Notice of Clarification

“PCA” – Physical Configuration Audit

“QA” – Quality Assurance

“RFI” – Request for Interpretation

“TDP” – Technical Data Package

“UPS” – Uninterruptible Power Supply

“VSTL” – Voting System Test Laboratory

“VVPAT” – Voter Verifiable Paper Audit Trail

“VVSG” – Voluntary Voting System Guidelines

## 2.0 CERTIFICATION TEST BACKGROUND

The D-Suite 5.5-B system is a modification of a previously certified system (D-Suite 5.5). Pro V&V performed an evaluation of results from the previous test campaign to determine the scope of testing required for certification of the D-Suite 5.5-B. Based on this evaluation, Pro V&V determined that testing from the previous test campaign would establish the baseline and that the focus of this test campaign would be on the documented system updates.

## 2.1 Revision History

The table below details the version history of the D-Suite 5.5-B System:

**Table 2-1. D-Suite 5.5-B System Revision History**

System Version	Certification Type	Baseline System	Certification Number
D-Suite 5.0	New System	--- (Original System)---	DVS-DemSuite5.0
D-Suite 5.5	Modification	D-Suite 5.0	DVS-DemSuite5.5
D-Suite 5.5-B	Modification	D-Suite 5.5	DVS-DemSuite5.5-B *

\*Upon grant of certification by the EAC

## 2.2 Scope of Testing

The scope of testing focused on the addition of the ImageCast Evolution (ICE) optical ballot hybrid precinct-based scanner and BMD, the ICP2 optical ballot counter, the InoTec HiPro 821 Scanner, and the Canon imageFORMULA DR-M260 Scanner. To evaluate the D-Suite 5.5-B test requirements, the submitted modifications were evaluated against each section of the EAC 2005 VVSG to determine the applicable tests to be performed.

Based on this assessment, it was determined that multiple areas within the EAC 2005 VVSG would be evaluated to encompass the required tests. A breakdown of the areas and associated tests is listed below:

- EAC 2005 VVSG Volume 1, Section 2: Functional Requirements
  - System Integration Testing
  - Functional Configuration Audit (FCA)
  - Physical Configuration Audit (PCA), including System Loads & Hardening
  - Technical Documentation Package (TDP) Review
  - Volume & Stress Testing
  - Accuracy Testing
- EAC 2005 VVSG Volume 1, Section 3: Usability & Accessibility
  - Usability & Accessibility Testing
  - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 4: Hardware Requirements
  - Hardware Testing
  - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 5: Software Requirements
  - Source Code Review, Compliance Build, Trusted Build, and Build Document Review
  - Technical Documentation Package (TDP) Review
  - Functional Configuration Audit (FCA)
- EAC 2005 VVSG Volume 1, Section 7: Security Requirements
  - Security Testing
  - Technical Documentation Package (TDP) Review
  - Functional Configuration Audit (FCA)

## 2.2.1 Modification Overview

The Dominion Democracy Suite 5.5-B Voting System is a modified voting system configuration that includes upgrades to the components of the D-Suite 5.5 Voting System. Section 2.2.1.1 details changes between this system and the baseline of the Democracy Suite 5.5 Voting System.

To verify the modifications were successfully addressed throughout the test campaign, each modification was tracked and verified to be addressed during the execution of the relevant test area. For example, source code changes were verified during the source code review. Modifications requiring functional test verification were evaluated by executing the standard Accuracy Test, the System Integration Test, or during performance of the FCA. Modifications that were not adequately evaluated during the performance of these tests were subjected to specifically designed test cases. Additionally, Pro V&V functionally verified that any corrected issues from the baseline system were not present in the modified system and that all enhancements implemented did not adversely impact system performance.

### 2.2.1.1 Detailed List of Changes

#### General Modifications

- Addition of ImageCast Evolution (ICE), a precinct-level, optical scan, ballot counter (tabulator) designed to perform three major functions: ballot scanning and tabulation, ballot review and second chance voting, and accessible voting and ballot marking. *Submitted version: ICE firmware version 5.5.6.5, model number PCOS 410A.*
- Addition of InoTec HiPro 821 Scanner as a component for the ImageCast Central Count (ICC). *Submitted version: ICC software application version 5.5.32.5, HiPro 821 Scanner driver version 1.2.3.17.*
- Addition of Canon imageFORMULA DR-M260 Scanner as a component for the ImageCast Central Count (ICC). *Submitted version: ICC software application version 5.5.32.5, DR-M260 Scanner driver version 1.1 SP2.*
- Addition of ImageCast Precinct 2 (ICP2) optical ballot counter. The ICP2 is a precinct-based optical scan ballot tabulator that is used in conjunction with ImageCast compatible ballot storage boxes. *Submitted version: ICP2 firmware version 5.5.1.8, model number PCOS-330A.*

#### EMS Election Event Designer

- Added support for Ballot ID creation by Precinct Portion

#### ICC

- Corrected drop-out of red colored ovals when using the HiPro scanner

## **ICP**

- Added support for the new election file revision number of 0x0307 which increased the field size of the 'Number of Ballots' field in the VIF ELECTION.DVD file from an unsigned short (2 bytes) to an unsigned integer (4 bytes)

## **ICX**

- Corrected discrepancy between Total Ballots Cast and Report Tape after results are deleted manually from the ICX
- Corrected issue where the application was not providing a warning for low paper amount on VVPAT tape

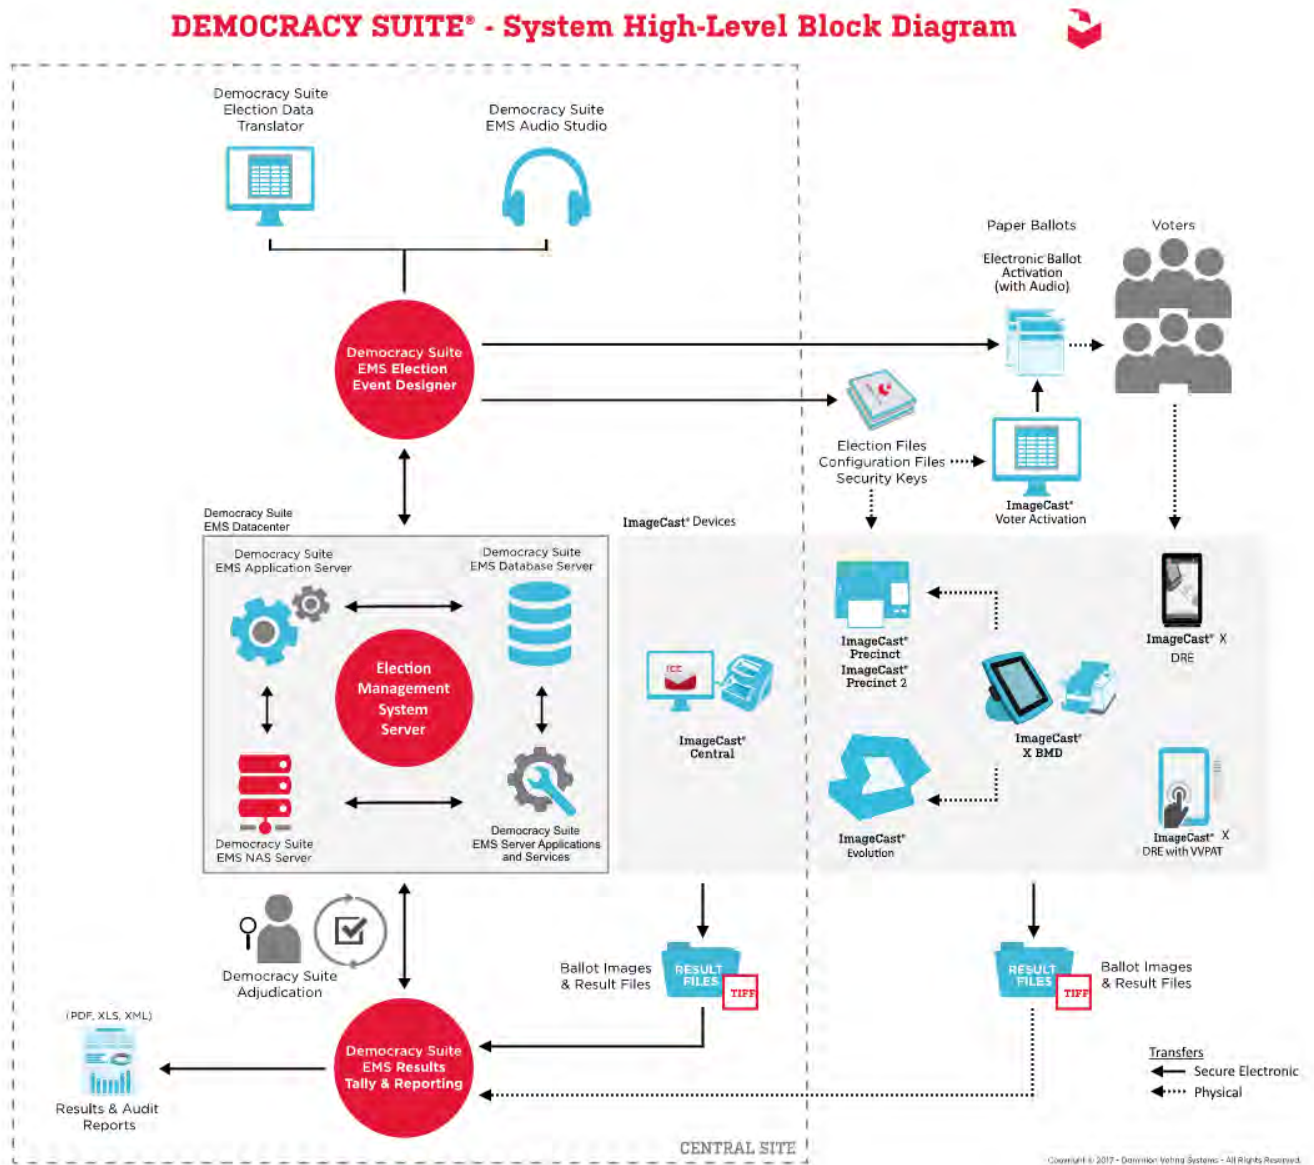

### **2.2.1.2 ECO Assessment**

Since certification of previous versions of D-Suite systems that are relevant to the D-Suite 5.5-B configuration, DVS has implemented various Engineering Change Orders (ECOs), each of which were evaluated and determined to be De Minimis in nature. Although testing was not warranted during implementation of these ECOs, they are either included as part of the D-Suite 5.5-B system test campaign or may be applied to the D-Suite 5.5-B system. A listing of these ECOs, along with a brief description is provided below:

- ECO 100503 - Adding a COTS collapsible ballot box to AVL for use with the ICP
- ECO 100521 - Added DELL P2419H monitor as a display device for server and client workstations
- ECO 100527 - Added DELL Latitude 3490 computer with updated i3-8130U processor (Dual Core, 4MB Cache, 2.2GHz) to DVS PN 190-000061 (a client workstation)
- ECO 100543 - Update to the DR-G1130 Scanner LCD Panel User Interface
- ECO 100588 - Added new models of VVPAT printer for use with the D-Suite ICX workstation due to previous model becoming commercially unavailable
- ECO 100596 - Added DELL Latitude 3400 computer as a client workstation due to the DELL Latitude 3490 computer becoming commercially unavailable for purchase
- ECO 100597 - Added DELL PowerEdge R640 computer with new processor and RAM as an AVL to the existing R640 server computer configurations
- ECO 100602 - Added DELL Precision 3431 computer in an EMS Express Server and EMS Client Workstation configuration due to the DELL Precision 3430 computer becoming commercially unavailable for purchase
- ECO 100603 - Added DELL P2418HT monitor as a display device for ICC HiPro scanner workstation configuration due to the Lenovo 10QXPAR1US monitor becoming commercially unavailable for purchase

*Note: The ECOs listed above were approved by the EAC prior to the issue date of this final test report.*

## 2.2.2 Block Diagram

**Figure 1-1. D-Suite 5.5-B System Overview**

### 2.2.3 System Limits

The system limits verified to be supported by the D-Suite 5.5-B System during this test campaign or during testing of the baselined system are provided in the table below.

**Table 2-2. D-Suite 5.5-B System Limits by Configuration**

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Portrait Ballot Orientation			
Ballot positions	462	462	*22-inch Portrait Ballot
Precincts in an election	1000	250	Memory
Contests in an election	1000	250	Memory
Candidates/Counters in an election	10000	2500	Memory
Candidates/Counters in a precinct	462	462	*22-inch Portrait Ballot
Candidates/Counters in a tabulator	10000	2500	Memory
Ballot Styles in an election	3000	750	Memory
Contests in a ballot style	156	156	*22-inch Portrait Ballot
Candidates in a contest	231	231	*22-inch Portrait Ballot (Column Span 3)
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	No Limitation
“Vote for” in a contest	30	30	No Limitation
Supported languages in an election	5	5	Memory
Number of write-ins	462	462	*22-inch Portrait Ballot
Landscape Ballot Orientation			
Ballot positions	292	292	*22-inch Landscape Ballot (240 candidates + 24 write-ins + 28 Yes/No choices)
Precincts in an election	1000	250	Memory
Contests in an election	1000	250	Memory
Candidates/Counters in an election	10000	2500	Memory
Candidates/Counters in a precinct	240	240	*22-inch Ballot
Candidates/Counters in a tabulator	10000	2500	Memory
Ballot Styles in an election	3000	750	Memory
Contests in a ballot style	38	38	*22-inch Landscape Ballot (24 candidacy contests + 14 Propositions)

**Table 2-2. D-Suite 5.5-B System Limits by Configuration** *(continued)*

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Candidates in a contest	240	240	*22-inch Ballot
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	Memory
“Vote for” in a contest	24	24	*22-inch Landscape Ballot
Supported languages in an election	5	5	Memory
Number of write-ins	24	24	*22-inch Landscape Ballot

**\*The 22-inch Ballot length applies only to hand-marked paper ballots.**

#### 2.2.4 Supported Languages

Support for the following languages was verified during this test campaign or during testing of the baselined system:

**Table 2-3. D-Suite 5.5-B Supported Languages**

Language	ICE	ICP	ICX
Alaska Native	Yes, if using Latin alphabet	Yes	No
Apache	Audio only	Audio only	No
Bengali	Yes	Yes	Yes
Chinese	Yes	Yes	Yes
English	Yes	Yes	Yes
Eskimo	Yes, if using Latin alphabet	Yes	No
Filipino	Yes, if using Latin alphabet	Yes	No
French	Yes	Yes	Yes
Hindi	Yes	Audio only	Yes
Japanese	Yes	Yes	Yes
Jicarilla	Audio only	Audio only	No
Keres	Audio only	Audio only	No
Khmer	Yes	Audio only	No
Korean	Yes	Yes	Yes
Navajo	Audio only	Audio only	No
Seminole	Audio only	Audio only	No
Spanish	Yes	Yes	Yes
Tagalog	No	No	Yes
Thai	Yes	Audio only	Yes
Towa	Audio only	Audio only	No
Ute	Audio only	Audio only	No
Vietnamese	Yes	Yes	Yes
Yuman	Audio only	Audio only	No

Support for all stated languages was verified; however, only English and Spanish language ballots were cast during the performance of functional testing. Additionally, one character based language (Chinese) was tested during System Integration Testing.

For the character based language, the ballot was created by Pro V&V and voted utilizing both paper ballots and ADA voting devices along with all applicable peripherals. The Chinese Language for the ballot was created using a readily available online translation tool. The translated language text was entered into the Election Event Designer Application. A ballot preview was generated in the EED application. The Chinese characters displayed in the ballot preview were compared to the characters generated by the online translation tool, to ensure that the characters matched. The ballots were then generated and printed, and the election loaded onto the tabulators and the BMD units. The Chinese characters displayed on both the printed ballots and displayed on the BMD units were compared to the original Chinese Characters generated by the online translation tool to verify that the characters matched.

### **2.2.5 Supported Functionality**

The D-Suite 5.5-B was verified to support the following voting variations:

- General Election
- Closed Primary
- Open Primary
- Early Voting
- Partisan/Non-Partisan Offices
- Write-In Voting
- Primary Presidential Delegation Nominations
- Split Precincts
- Vote for N of M
- Ballot Rotation
- Provisional or Challenged Ballots

### **2.2.6 VVSG**

The D-Suite 5.5-B Voting System was evaluated against the relevant requirements contained in the EAC 2005 VVSG, Version 1.0.

### **2.2.7 RFIs**

There are no RFIs released by the EAC as of the date of this Test Report that pertain to this test campaign that were not in effect at the time of the baseline system certification.

### **2.2.8 NOCs**

There are no NOCs released by the EAC as of the date of this Test Report that pertain to this test campaign that were not in effect at the time of the baseline system certification.

## **3.0 TEST FINDINGS AND RECOMMENDATION**

The D-Suite 5.5-B Voting System was evaluated against the relevant requirements contained in the EAC 2005 VVSG, Volumes I and II. The focus of this test campaign is the addition of the ImageCast Evolution (ICE) optical ballot hybrid precinct-based scanner and BMD, the ICP2 optical ballot counter, the InoTec HiPro 821 Scanner, and the Canon imageFORMULA DR-M260 Scanner. The summary findings and recommendations for each area of testing are provided in the following sections.

### **3.1 Summary Findings and Recommendation**

Summary findings for the System Level Testing (System Integration Testing, Accuracy Test, Volume & Stress Testing, and FCA), Hardware Testing, Usability & Accessibility Testing, Security Testing, and Source Code Review are detailed in the relevant sections of this report. In addition to these areas of testing, a PCA (including System Loads & Hardening), a TDP Review, and a QA & CM System Review were performed, as described below.

#### **3.1.1 Physical Configuration Audit (PCA)**

The Physical Configuration Audit (PCA) compares the voting system components submitted for qualification to the manufacturer's technical documentation, and shall include the following activities:

- Establish a configuration baseline of software and hardware to be tested; confirm whether manufacturer's documentation is sufficient for the user to install, validate, operate, and maintain the voting system
- Verify software conforms to the manufacturer's specifications; inspect all records of manufacturer's release control system; if changes have been made to the baseline version, verify manufacturer's engineering and test data are for the software version submitted for certification
- If the hardware is non-COTS, Pro V&V shall review drawings, specifications, technical data, and test data associated with system hardware to establish system hardware baseline associated with software baseline
- Review manufacturer's documents of user acceptance test procedures and data against system's functional specifications; resolve any discrepancy or inadequacy in manufacturer's plan or data prior to beginning system integration functional and performance tests

- Subsequent changes to baseline software configuration made during testing, as well as system hardware changes that may produce a change in software operation are subject to re-examination

#### Summary Findings

During execution of the PCA, the components of the D-Suite 5.5-B were documented by component name, model, serial number, major component, and any other relevant information needed to identify the component. For COTS equipment, every effort was made to verify that the COTS equipment had not been modified for use. Additionally, each technical document submitted in the TDP was recorded by document name, description, document number, revision number, and date of release. At the conclusion of the test campaign, test personnel verified that any changes made to the software, hardware, or documentation during the test process were fully and properly documented.

### **3.1.2 TDP Review**

In order to determine compliance of the modified TDP documents with the EAC 2005 VVSG, a limited TDP review was conducted. This review focused on TDP documents that have been modified since the certification of the baseline system. The review consisted of a compliance review to determine if each regulatory, state, or manufacturer-stated requirement had been met based on the context of each requirement. Results of the review of each document were entered on the TDP Review Checklist and reported to the manufacturer for disposition of any anomalies. This process was ongoing until all anomalies were resolved.

#### Summary Findings

The submitted TDP was determined to be in compliance with the requirements set forth in the EAC 2005 VVSG. A listing of all documents contained in the D-Suite 5.5-B TDP is provided in Table 3-1.

**Table 3-1. TDP Documents**

### 3.1.3 QA & CM System Review

The Dominion Voting Systems Quality and Configuration Management Manuals were reviewed for their fulfillment of Volume I, Sections 8 and 9, and the requirements specified in Volume II, Section 2. The requirements for these sections establish the quality assurance and configuration standards for voting systems to which manufacturers must conform and require voting system manufacturers to implement a quality assurance and configuration management program that is conformant with recognized ISO standards. As part of the review process, the Dominion Voting Systems TDP documents were reviewed to determine if the stated policies were being followed.

#### Summary Findings

This testing utilized the TDP Review in conjunction with the PCA to determine compliance to the EAC 2005 VVSG requirements and the requirements stated in the Dominion Voting Systems technical documentation. The review of the Quality Assurance and Configuration Management documentation focused on the Dominion Voting Systems' adherence to its stated QA and CM processes. No discrepancies were noted during the reviews.

### 3.1.4 Source Code Review, Compliance Build, Trusted build, and Build Documentation Review

Pro V&V reviewed the submitted source code to the EAC 2005 VVSG and the manufacturer-submitted coding standards. Prior to initiating the software review, Pro V&V verified that the submitted documentation was sufficient to enable: (1) a review of the source code and (2) Pro V&V to design and conduct tests at every level of the software structure to verify that design specifications and performance guidelines are met.

For the ICE software, a combination of Automated Source Code Review and Manual Source Code Review methods was used to review the source code. For all other components, the submitted source code was compared to the previously certified Democracy Suite 5.5 voting system versions to determine the changes, if any. A combination of Automated Source Code Review and Manual Source Code Review methods was used to review the changes in the source code. In addition, 10% of the source code comments were manually reviewed.

### Summary Findings

- Automated Source Code Review: The Automated Source Code Review was performed to review the changes in the source code from the previously certified voting system. No source code issues were found during the Automated Source Code review.
- Manual Source Code Review: The Manual Source Code review was performed on 10% of the comments for compliance to VVSG Volume 1 Section 5.2.7. No source code issues were found during the Manual Source Code review.
- Compliance Build: The compliance build was performed following the compliance review. Once the compliance review was performed and the source was deemed stable enough to proceed with testing, the source code and all additional packages were compiled into a Compliance Build.

Trusted Build: The trusted build consisted of inspecting customer submitted source code, COTS, and Third Party software products and combining them to create the executable code. This inspection followed the documented process from the “United States Election Assistance Commission Voting System Testing and Certification Program Manual” Section 5.5 – 5.7. Performance of the trusted build includes the build documentation review. The Trusted Build was performed following the completion of the Functional Configuration Audit.

### **3.1.5 Security Testing**

A complete security evaluation was performed on a previously certified version of the D-Suite System. The submitted modifications were evaluated during the source code review, security tests, and FCA.

To evaluate the integrity of the system, Pro V&V developed specifically designed test cases in an attempt to defeat the access controls and security measures documented in the system TDP as well verifying compliance to EAC RFI 2012-05. During the security testing, the system was inspected for various controls and measures that were in place to meet the objectives of the security standards which included: protection of the critical elements of the voting system; establishing and maintaining controls to minimize errors; protection from intentional manipulation, fraud and malicious mischief; identifying fraudulent or erroneous changes to the voting system; and protecting the secrecy in the voting process.

### Summary Findings

As a result of the Security Testing, it was determined that the D-Suite 5.5-B met the requirements of the security review. Any deficiencies encountered during testing were successfully resolved.

### **3.1.6 System Level Testing**

System Level testing was implemented to evaluate the complete system. This testing included all proprietary components and COTS components (software, hardware, and peripherals) in a configuration of the system’s intended use. For software system tests, the tests were designed

according to the stated design objective without consideration of its functional specification. The system level hardware and software test cases were prepared independently to assess the response of the hardware and software to a range of conditions. Pro V&V reviewed the manufacturer's program analysis, documentation, and module test case design and evaluated the test cases for each module with respect to flow control parameters and entry/exit data.

System Level Testing included the evaluations of the following test areas FCA, Accuracy Testing, Volume & Stress, and System Integration Testing. Each of these areas is reported in detail in the subsections that follow.

Component Level Testing was implemented during the FCA for each component and subcomponent. During the source code review, compliance builds, and security testing, Pro V&V utilized limited structural-based techniques (white-box testing). Additionally, specification-based techniques (black-box testing) were utilized for the individual software components.

Pro V&V defined the expected result for each test and the ACCEPT/REJECT criteria for certification. If the system performed as expected, the results were accepted. If the system did not perform as expected, an analysis was performed to determine the cause. If needed, the test was repeated in an attempt to reproduce the results. If the failure could be reproduced and the expected results were not met, the system was determined to have failed the test. If the results could not be reproduced, the test continued. Any errors encountered were documented and tracked through resolution.

To verify the modifications were successfully addressed throughout the test campaign, each modification was tracked and verified to be addressed during the execution of the relevant test area. For example, source code changes were verified during the source code review. Modifications requiring functional test verification were evaluated by executing the standard Accuracy Test, the System Integration Test, or during performance of the FCA. Modifications that were not adequately evaluated during the performance of these tests were subjected to specifically designed test cases.

#### **3.1.6.1 Functional Configuration Audit (FCA)**

The functional configuration audit encompasses an examination of manufacturer's tests, and the conduct of additional tests, to verify that the system hardware and software perform all the functions described in the manufacturer's documentation submitted in the TDP.

In addition to functioning according to the manufacturer's documentation, tests will be conducted to insure all applicable EAC 2005 VVSG requirements are met.

For this campaign FCA testing included several exhaustive paths applied in concert:

- FCA-VVSG Testing: Each component of the system was evaluated against a standardized test-case suite centered upon requirements stated in the VVSG and administered through a test-management software tool. All applicable tests-cases were performed while any non-applicable test-cases were logged as "n/a" for substantiation. The system operations and functional

capabilities were categorized in the tool as follows by the phase of election activity in which they are required:

- Pre-voting Capabilities: These functional capabilities are used to prepare the voting system for voting. They include ballot preparation, the preparation of election-specific software (including firmware), the production of ballots, the installation of ballots and ballot counting software (including firmware), and system and equipment tests.
- Voting System Capabilities: These functional capabilities include all operations conducted at the polling place by voters and officials including the generation of status messages.
- Post-voting Capabilities: These functional capabilities apply after all votes have been cast. They include closing the polling place; obtaining reports by voting machine, polling place, and precinct; tabulation of paper ballots at the central location; accumulation of results from all voting methods; obtaining consolidated reports; and obtaining reports of audit trails.
- FCA-Claims Testing: System user instructions and procedures found in the TDP were followed to verify their accuracy and completeness. In addition any functional claims discovered in the TDP that were not specifically examined in other areas or that were items of interest were also tested.
- FCA-Mapping: Any modified functional paths (buttons, dropdowns, etc.) were mapped by qualified VSTL personnel, to help ensure all functional options had been noted and exercised. Any items of interest were examined and/or tested.

All issues (if any) found during these efforts are detailed in Section 3.3. Any issues noted were tracked using an issue tracking software program and issue tracking spreadsheets.

#### Summary Findings

All functional tests were successfully executed. During execution of the test procedure, it was verified that the D-Suite 5.5-B System successfully completed the system level integration tests with all actual results obtained during test execution matching the expected results.

### **3.1.6.2 Volume & Stress**

The Volume & Stress Tests are utilized to investigate the system's response to conditions that tend to overload the system's capacity to process, store, and report data.

The test parameters focused on the system's stated limits and the ballot logic for areas such as the maximum number of active voting positions, maximum number of ballot styles, maximum candidates, maximum contests, and stated limits within the EMS. This test is utilized to ensure the system could achieve the manufacturer's TDP claims of what the system can support. Testing was performed by exercising multiple election definitions and test cases developed specifically to test for volume and stress conditions of the system being tested.

### Summary Findings

During the performance of the Volume and Stress Test, the ICC configured with the Canon DR-M260 scanner encountered a significant number of double feeds when casting 22" ballots. To address the issue Dominion Voting Systems provided a "T" shaped support to provide support for these long ballots, as well as advised that smaller batches of ballots were used when scanning. These changes were documented and addressed the double feed issue and the ICC configured with the Canon DR-M260 scanner successfully completed the Volume and Stress Test. Volume and stress testing was successfully performed on the D-Suite 5.5-B System.

#### **3.1.6.3 Accuracy**

The accuracy test ensures that each component of the voting system can each process 1,549,703 consecutive ballot positions correctly within the allowable target error rate. The Accuracy test is designed to test the ability of the system to "capture, record, store, consolidate and report" specific selections and absences of a selection. The required accuracy is defined as an error rate. This rate is the maximum number of errors allowed while processing a specified volume of data. For paper-based voting systems the ballot positions on a paper ballot must be scanned to detect selections for individual candidates and contests and the conversion of those selections detected on the paper ballot converted into digital data.

### Summary Findings

The accuracy requirements for the ICE, ICP2, and the ICC units were met by the execution of the standard accuracy test utilizing hand-marked ballots of each ballot length supported by the system, and ballots produced by the ICX BMD, to achieve an accuracy rate greater than 1,549,703 correct ballot positions.

The ICX BMD, ICX DRE, ICP, and the ICX DRE with VVPAT Accuracy test were reused from the Dominion 5.5 EAC Campaign.

#### **3.1.6.4 System Integration**

System Integration is a system level test for the integrated operation of both hardware and software. System Integration evaluates the compatibility of the voting system software components or subsystems with one another, and with other components of the voting system environment. This compatibility was determined through functional tests integrating the voting system software with the remainder of the system. During test performance, the system was configured exactly as it would for normal field use. This included connecting all supporting equipment and peripherals including ballot boxes, voting booths (regular and accessible), and any physical security equipment such as locks and ties.

### Summary Findings

During System Integration testing, three General Elections and three Primary Elections were successfully exercised on the voting system, as described below:

Three general elections with the following breakdowns:

- General Election GEN-01: A basic election held in 4 precincts, one of which is a split precinct. This election contains 19 contests compiled into 4 ballot styles. 5 of the contests are in all 4 ballot styles. The other 15 contests are split between at least 2 of the precincts with a maximum of 4 different contest spread across the 4 precincts.
- General Election GEN-02: A basic election held in 3 precincts. This election contains 15 contests compiled into 3 ballot styles. 10 of the contests are in all 3 ballot styles with the other five split across the 3 precincts.
- General Election GEN-03: A basic election held in 2 precincts. This election contains 8 contests and compiled into 2 ballot styles. 4 of the contests are in both ballot styles. The other 4 contests are split between the two precincts. This election is designed to functionally test the handling of multiple ballot styles, support for at least three languages including a character-based language, support for common voting variations, and audio support for at least three languages and an ADA binary input device.

Three primary elections with the following breakdowns:

- Primary Election PRIM-01: Open Primary Election in two precincts. This election contained thirty contests compiled into five ballot styles. Each ballot style contains 6 contests.
- Primary Election PRIM-02: Open Primary Election held in two precincts. This election contained thirteen contests compiled into three ballot styles. One contest is in all three ballot styles; all other contests are independent.
- Primary Election PRIM-03: A basic election held in 2 precincts. This election contains 10 contests and is compiled into 2 ballot styles. 2 of the contests are in both ballot styles. The other 8 contests are split between the two parties' ballots. This Primary Election is designed to functionally test the handling of multiple ballot styles, support for at least three languages including a character-based language, support for common voting variations, and audio support for at least three languages and an ADA binary input device.

The D-Suite 5.5-B System successfully passed the System Integration Test. During execution of the test procedure, it was verified that the D-Suite 5.5-B System successfully completed the system level integration tests with all actual results obtained during test execution matching the expected results.

### **3.1.7 Usability and Accessibility Testing**

Usability & Accessibility testing was performed to evaluate the D-Suite 5.5-B System to the applicable requirements. Testing specifically focused on the modifications implemented since the certification of the baseline system.

Usability was defined generally as a measure of the effectiveness, efficiency, and satisfaction achieved by a specified set of users with a given product in the performance of specified tasks.

The Accessibility portion of testing evaluated the requirements for accessibility. These requirements are intended to address HAVA 301 (a) (3) (B).

During test performance, the D-Suite 5.5-B System was configured as per the Dominion Voting Systems TDP. The configured system was tested to the VVSG 1.0 requirements utilizing TestLink which maintains all applicable test cases. Utilization of both negative and positive inputs were entered into the system and documented into TestLink to allow for traceability and reproducibility. All components were evaluated for applicable requirements in which all deficiencies were documented within TestLink and Mantis for tracking purposes. Regression testing was performed on all identified issues to ensure resolution and compliance to the requirements.

#### Summary Findings

The D-Suite 5.5-B System successfully met the requirements of the Usability and Accessibility evaluation. Any deficiencies encountered during testing were successfully resolved.

### **3.1.8 Hardware Testing**

The ICX BMD, ICX DRE, ICP, the ICX DRE with Report Printer, and the ICX DRE with VVPAT hardware testing were re-used from the previous certification test campaign (D-Suite 5.5). The components added to the modified system required the full suite of hardware and electrical testing as detailed in the 2005 VVSG. These tests are listed below:

#### **Electrical Tests:**

- Electrical Power Disturbance
- Electromagnetic Radiation
- Electrostatic Disruption
- Electromagnetic Susceptibility
- Electrical Fast Transient
- Lightning Surge
- Conducted RF Immunity
- Magnetic Fields Immunity
- Electrical Supply

#### **Environmental Tests:**

- Bench Handling
- Vibration
- Low Temperature
- High Temperature

- Humidity
- Temperature Power Variation
- Acoustic

Pro V&V utilized third party testing during the performance of hardware testing. All electrical hardware testing was performed at the TUV SUD Canada, Inc. facility located in Ontario, Canada. All testing at the TUV SUD Canada, Inc. facility was witnessed on-site by Pro V&V personnel. All environmental hardware testing was performed at the NTS Longmont facility located in Longmont, Colorado. All testing at the NTS Longmont facility was witnessed on-site by Pro V&V personnel, with the exception of Temperature Power Variation in which Pro V&V qualified staff executed all testing.

#### Summary Findings

Electrical Testing was performed on the ICE and ICP2 components of the D-Suite 5.5-B System. The procedures and results for this testing are included in the following TUV SUD Canada, Inc. reports:

- Report File #: 7169005633E-00, presented in Attachment A-1
- Report File #: 7169006118E-00, presented in Attachment A-2

The test results from this testing are summarized below:

**Table 3-2. Electrical Hardware Test Results**

Standard/Method	Description	Criteria	Class/Level	Result
FCC 15.107 ICES-003 VVSG Vol. 1 4.1.2.9	Power Line Conducted Emissions	Normal Operation & No Data Loss	Class B	Pass
FCC 15.109 ICES-003 VVSG Vol. 1 4.1.2.9	Radiated Emissions	Normal Operation & No Data Loss	Class B	Pass
EN61000-4-11 VVSG Vol. 1 4.1.2.5	Electrical Power Disturbance	Normal Operation & No Data Loss	Various	Pass
EN61000-4-4 VVSG Vol. 1 4.1.2.6	Electrical Fast Transient	Normal Operation & No Data Loss	±2kV - Mains	Pass
EN61000-4-5 VVSG Vol. 1 4.1.2.7	Lightning Surge	Normal Operation & No Data Loss	±2kV Line - Line ±2kV Line - Ground	Pass
EN61000-4-2 VVSG Vol. 1 4.1.2.8	Electrostatic Disruption	Normal Operation & No Data Loss	±8kV Contact ±15kV Air	Pass
EN61000-4-3 VVSG Vol. 1 4.1.2.10	Electromagnetic Susceptibility	Normal Operation & No Data Loss	10 V/m, 80 MHz – 1 GHz	Pass

**Table 3-2. Electrical Hardware Test Results (continued)**

Standard/Method	Description	Criteria	Class/Level	Result
EN61000-4-6 VVSG Vol. 1 4.1.2.11	Conducted RF Immunity	Normal Operation & No Data Loss	10 Vrms, 150 kHz – 80 MHz	Pass
EN61000-4-8 VVSG Vol. 1 4.1.2.12	Magnetic Immunity	Normal Operation & No Data Loss	30 A/m	Pass

Environmental Testing was performed on the ICE and ICP2 components of the D-Suite 5.5-B System. The Canon M260 and InoTec HiPro Scanner components were subjected to Temperature-Power Variation Testing only.

The procedures and results for this testing are included in the following NTS Test reports:

- Test Report No. PR094223, presented in Attachment A-3 (*ICE*)
- Test Report No. PR097523, presented in Attachment A-4 (*InoTec HiPro Scanner and ICP2*)

The test results from this testing are summarized below:

**Table 3-3. Environmental Hardware Test Results**

Standard/Method	Description	Criteria	Result
MIL-STD-810D, 516.3, I-3.8 VVSG Vol. 1 4.1.2.14, VVSG Vol. 2 4.6.2	Shock – Bench Handling	Normal Operation & No Data Loss	Pass
MIL-STD-810D, 514.3, I-3.2.1 VVSG Vol. 1 4.1.2.14, VVSG Vol 2 4.6.3	Vibration - Basic Transportation	Normal Operation & No Data Loss	Pass
MIL-STD-810D, 502.2, II-3 VVSG Vol 1 4.1.2.14, VVSG Vol 2 4.6.4	Low Temperature - Storage	Normal Operation & No Data Loss	Pass
MIL-STD-810D, 501.2, I-3.2 VVSG Vol 1 4.1.2.14, VVSG Vol 2 4.6.5	High Temperature - Storage	Normal Operation & No Data Loss	Pass
MIL-STD-810D, 507.2, I-3.2 VVSG Vol 1 4.1.2.14, VVSG Vol 2 4.6.5	Humidity – Hot/Humid	Normal Operation & No Data Loss	Pass
MIL-STD-810D, 501.2/502.2 VVSG Vol 1 4.1.2.13, 4.3.3, VVSG Vol 2 4.7.1	Reliability, Temp-Power Variation Testing	Normal Operation & No Data Loss	Pass
VVSG Vol. 1 3.1.7.1, 3.2.2.2 (c)	Acoustic Noise Level Test	Normal Operation & No Data Loss	Pass
VVSG Vol. 1 4.1.2.4	Electrical Supply	Normal Operation & No Data Loss	Pass
VVSG Vol. 1 4.7.2	Maintainability	Ease of Maintenance	Pass

### 3.2 Anomalies and Resolutions

When a result is encountered during test performance that deviates from what is standard or expected, a root cause analysis is performed. Pro V&V considers it an anomaly if no root cause can be determined. In instances in which a root cause is established, the results are then considered deficiencies.

#### Summary Findings

There were no anomalies encountered during this test campaign.

### 3.3 Deficiencies and Resolutions

Any violation of the specified requirement or a result encountered during test performance that deviates from what is standard or expected in which a root cause is established was considered to be a deficiency. Any deficiencies encountered were logged throughout the test campaign into the Pro V&V tracking system (Mantis) for disposition and resolution. In each instance, if applicable, the resolutions were verified to be resolved through all required means of testing (regression testing, source code review, and TDP update) as needed. Table 3.4 details the noted deficiencies.

**Table 3-4. Noted Deficiencies**

ID#	Test Category	Deficiency	Resolution
476	Volume and Stress	A significant number of double feeds occurred while scanning 22" ballots on the ICC configured with the Canon DR-M260 scanner.	Dominion supplied a "T" shaped support to provide support for long ballots, as well as advised that smaller batch sizes be used when scanning.
477	System Loads and Hardening	An error occurred when restarting an ICP2 unit after installing the 5.5.1.1 firmware on the unit. Running the installation process a second time addresses the issue.	This issue was addressed in the 5.5.1.8 release of the ICP2 firmware.
479	General	Using the ATI to vote a ballot caused the ICX application ver. 5.5.13.2 to crash and restart.	This issue was caused by the incorrect build resources being supplied to the VSTL. The correct build resources were supplied and the ICX application version 5.5.13.2 was rebuilt.

## 4.0 RECOMMENDATION FOR CERTIFICATION

The D-Suite 5.5-B Voting System, as presented for testing, successfully met the requirements set forth for voting systems in the U.S. Election Assistance Commission (EAC) 2005 Voluntary Voting System Guidelines (VVSG), Version 1.0. Additionally, Pro V&V, Inc. has determined

that the D-Suite 5.5-B functioned as a complete system during System Integration Testing. Based on the test findings, Pro V&V recommends the EAC grant the D-Suite 5.5-B System, as identified in Tables 4-1 through 4-29, certification to the EAC 2005 VVSG.

## Report Scope

This report addresses the EMC verification testing and test results of the **Image Cast Evolution**, Model: **PCOS-410A** herein referred to as EUT (Equipment Under Test). The EUT was tested for emissions and immunity compliance against the following standards:

2015 VVSG Volume I; Version 1.1

2015 VVSG Volume II; Version 1.1

Power line conducted emissions, radiated emissions, harmonics emissions, flicker emissions, and immunity testing was evaluated on the EUT. Test procedures, results, justifications, and engineering considerations, if any, follow later in this report.

For a more detailed list of the standards and the revision used, see the "Applicable Standards, Specifications and Methods" section of this report.

This report does not imply product endorsement by any government, accreditation agency, or TÜV SÜD Canada Inc.

Opinions or interpretations expressed in this report, if any, are outside the scope of TÜV SÜD Canada Inc. accreditations. Any opinions expressed do not necessarily reflect the opinions of TÜV SÜD Canada Inc., unless otherwise stated.

## Summary

The results contained in this report relate only to the item(s) tested.

Equipment Under Test (EUT)	<b>Image Cast Evolution</b> Model: <b>PCOS-410A</b>
EUT passed all tests performed	Yes
Testing conducted by	Marty McLear

For testing dates, see 'Testing Environmental Conditions and Dates'.

Client	<b>Pro V&amp;V Inc.</b>	
Product	<b>Image Cast Evolution</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

## Test Results Summary

Standard/ Method	Description	Criteria	Class / Level	Result
2015 VVSG Vol. I, Ver. 1.1	Power Line Conducted Emissions	N/A	Class B	Pass
2015 VVSG Vol. I, Ver. 1.1	Radiated Emissions	N/A	Class B	Pass
2015 VVSG Vol. I, Ver. 1.1	Electrical Power Disturbance	Normal Operation & No Data Loss	Various	Pass
2015 VVSG Vol. I, Ver. 1.1	Electrical Fast Transient	Normal Operation & No Data Loss	±2kV - Mains	Pass
2015 VVSG Vol. I, Ver. 1.1	Lightning Surge	Normal Operation & No Data Loss	±2kV Line - Line ±2kV Line - Ground	Pass
2015 VVSG Vol. I, Ver. 1.1	Electrostatic Disruption	Normal Operation & No Data Loss	±8kV Contact ±15kV Air	Pass
2015 VVSG Vol. I, Ver. 1.1	Electromagnetic Susceptibility	Normal Operation & No Data Loss	10 V/m, 80 MHz – 1 GHz	Pass
2015 VVSG Vol. I, Ver. 1.1	Conducted RF Immunity	Normal Operation & No Data Loss	10 Vrms, 150 kHz – 80 MHz	Pass
2015 VVSG Vol. I, Ver. 1.1	Magnetic Fields Immunity	Normal Operation & No Data Loss	30 A/m	Pass
<b>Overall Result</b>				<b>Pass</b>

If the product as tested complies with the specification or requirement, the EUT is deemed to comply and is issued a 'PASS' grade. If not, 'FAIL' grade is issued.

Product	<b>Image Cast Evolution</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### ***Notes, Justifications, or Deviations***

The following justifications for tests not performed or deviations from the above listed specifications apply:

No Electrical Fast Transients or Conducted RF Immunity tests were performed on any of the I/O cables of the EUTs. All cables are less than 3m.

The manufacturer presented the EUT representative of the main function(s) performed in the application for which it is intended. During measurement, the EUT is operational with a comprehensive working load and program to demonstrate typical operating conditions.

Modifications to the EUT were implemented during immunity testing to pass Electrical Fast Transients / Bursts, 2015 VVSG Volume I; Version 1.0 limits. Refer to Appendix A - Modifications for Compliance.

The EUT includes an external power supply converter.

Manufacturer: FranMar

Model: STD-19063

A later revision of the standard may have been substituted in place of the previous dated referenced revision. The year of the specification used is listed under applicable standards. Using the later revision accomplishes the goal of ensuring compliance to the intent of the previous specification, while allowing the laboratory to incorporate the extensions and clarifications made available by a later revision.

### ***Sample Calculation(s)***

#### **Radiated Emission Test**

Margin = Limit – (Received Signal + Antenna Factor + Cable Loss – Pre-Amp Gain)

Margin = 50dB $\mu$ V/m – (50dB $\mu$ V + 10dB + 2.5dB – 20dB)

Margin = 7.5 dB (pass)

#### **Power Line Conducted Emission Test**

Margin = Limit – (Received Signal + Attenuation Factor + Cable Loss + LISN Factor)

Margin = 73.0dB $\mu$ V – (50dB $\mu$ V + 10dB + 2.5dB + 0.5dB)

Margin = 10.0 dB (pass)

#### **Milligauss to A/m Conversion (Magnetic Immunity)**

1A/m = 12.57 mG

3A/m = 3\*12.57 = 37.7 mG

## Definitions and Acronyms

The following definitions and acronyms are applicable in this report.  
See also ANSI C63.14.

**AM** – Amplitude Modulation  
**CDN** – Coupling Decoupling Network  
**EFT** – Electrical Fast Transients  
**ESD** – Electro-Static Discharge  
**HCP** – Horizontal Coupling Plane  
**VCP** – Vertical Coupling Plane  
**LISN** – Line Impedance Stabilization Network  
**NCR** – No Calibration Required  
**NSA** – Normalized Site Attenuation  
**N/A** – Not Applicable  
**RF** – Radio Frequency

**AE** – Associated Equipment. Equipment needed to exercise and/or monitor the operation of the EUT.

**Class A Device** – A device that is marketed for use in a commercial, industrial or business environment. A 'Class A' device should not be marketed for use by the general public. A 'Class A' device should contain a warning notice in the user manual stating that it could cause radio interference. For example: "**Warning:** Operation of this equipment in a residential environment could cause radio interference."

**Class B Device** – A device that is marketed for use in a residential environment and may also be used in a commercial, business or industrial environments. NOTE: A residential environment is an environment where the use of broadcast radio and television receivers may be expected within a distance of 10m of the device concerned.

**EMC** – Electro-Magnetic Compatibility. The ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable electromagnetic disturbances to anything in that environment.

**EMI** – Electro-Magnetic Immunity. The ability to maintain a specified performance when the equipment is subjected to disturbance (unwanted) signals of specified levels.

**EUT** – Equipment Under Test. A device or system being evaluated for compliance that is representative of a product to be marketed.

Client	<b>Pro V&amp;V Inc.</b>	
Product	<b>Image Cast Evolution</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

**ITE** – Information Technology Equipment. Has a primary function of entry, storage, display, retrieval, transmission, processing, switching, or control of data and/or telecommunication messages and which may be equipped with one or more ports typically for information transfer.

**Antenna Port** – Port, other than a broadcast receiver tuner port, for connection of an antenna used for intentional transmission and/or reception of radiated RF energy.

**Broadcast Receiver Tuner Port** – Port intended for the reception of a modulated RF signal carrying terrestrial, satellite and/or cable transmissions of audio and/or video broadcast and similar services.

**Optical Fiber Port** – Port at which an optical fiber is connected to an equipment.

**Signal/Control Port** – Port intended for the interconnection of components of a EUT, or between a EUT and local AE and used in accordance with relevant functional specifications (for example for the maximum length of cable connected to it). (Examples include: RS-232, USB, HDMI, Fire Wire)

**Wired Network Port** – Point of connection for voice, data and signaling transfers intended to interconnect widely dispersed systems by direct connection to a single-user or multi-user communication network. (Examples include: CATV, PSTN, ISDN, xDSL, LAN and similar networks)

**EMC Test Plan** – An EMC test plan established prior to testing. See 'Appendix A – EUT & Client Provided Details'.

## Testing Facility

Testing for EMC on the EUT was carried out at TÜV SÜD Canada testing lab near Toronto, Ontario. The testing lab has a calibrated 3m semi-anechoic chamber which allows measurements on a EUT that has a maximum width or length of up to 2m and a height of up to 3m. The chamber is equipped with a turntable that is capable of testing devices up to 3300lb in weight. This facility is capable of testing products that are rated for 120Vac and 240Vac single phase, or devices that are rated for a 208Vac 3 phase input. DC capability is also available for testing. The chamber is equipped with a mast that controls the polarization and height of the antenna. Control of the mast occurs in the control room adjoining the shielded chamber. Radiated emission measurements are performed using a BiLog antenna and a Horn antenna where applicable. Conducted emissions, unless otherwise stated, are performed using a LISN and using the Vertical Ground plane if applicable.

### Calibrations and Accreditations

The 3m semi-anechoic chamber is registered with Federal Communications Commission (FCC, CA6844), Industry Canada (IC, 6844A-3) and Voluntary Control Council for Interference (VCCI, R-4023, G-506, C-4498, and T-1246). This chamber was calibrated for Normalized Site Attenuation (NSA) using test procedures outlined in ANSI C63.4 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The chamber is lined with ferrite tiles and absorption cones to minimize any undesired reflections. The NSA data is kept on file at TÜV SÜD Canada. For radiated susceptibility testing, a 16 point field calibration has been performed on the chamber. The field uniformity data is kept on file at TÜV SÜD Canada. TÜV SÜD Canada Inc. is accredited to ISO 17025 by A2LA with Testing Certificate #2955.02. The laboratory's current scope of accreditation listing can be found as listed on the A2LA website. All measuring equipment is calibrated on an annual or bi-annual basis as listed for each respective test.

## **Power Line Conducted Emissions – 4.1.2.9**

### **Purpose**

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT's power line does not exceed the limits listed below as defined in the applicable test standard and measured from a LISN. This helps protect lower frequency radio services such as AM radio, shortwave radio, amateur radio, maritime radio, CB radio, and so on, from unwanted interference.

### **Limits & Method**

The method is as defined in ANSI C63.4. The limits are as defined in FCC Part 15 Section 15.107:

#### **CLASS B**

Average Limits		Quasi-Peak Limits	
150 kHz – 500 kHz	56 to 46* dB $\mu$ V	150 kHz – 500 kHz	66 to 56* dB $\mu$ V
500 kHz – 5 MHz	46 dB $\mu$ V	500 kHz – 5 MHz	56 dB $\mu$ V
5 MHz – 30 MHz	50 dB $\mu$ V	5 MHz – 30 MHz	60 dB $\mu$ V

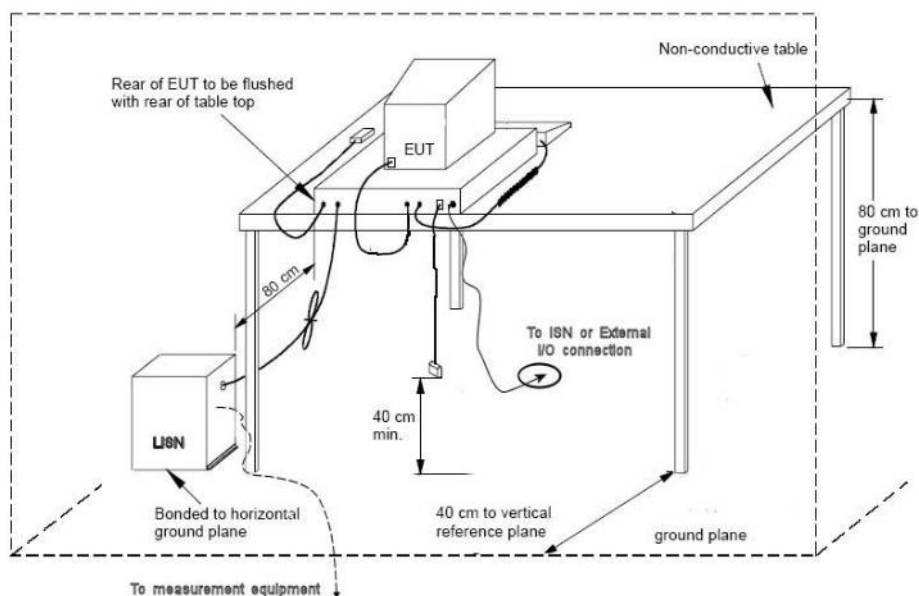

\* Decreases linearly with the logarithm of the frequency

Both Quasi-Peak and Average limits are applicable, and each is specified as being measured with a resolution bandwidth of 9 kHz. For Quasi-Peak, a video bandwidth at least three times greater than the resolution bandwidth is used.

Based on ANSI C63.4 Section 4.2, if the Peak or Quasi-Peak detector measurements do not exceed the Average limits, then the EUT is deemed to have passed the requirements.

Client	Pro V&V Inc.	
Product	Image Cast Evolution	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Setup Diagram

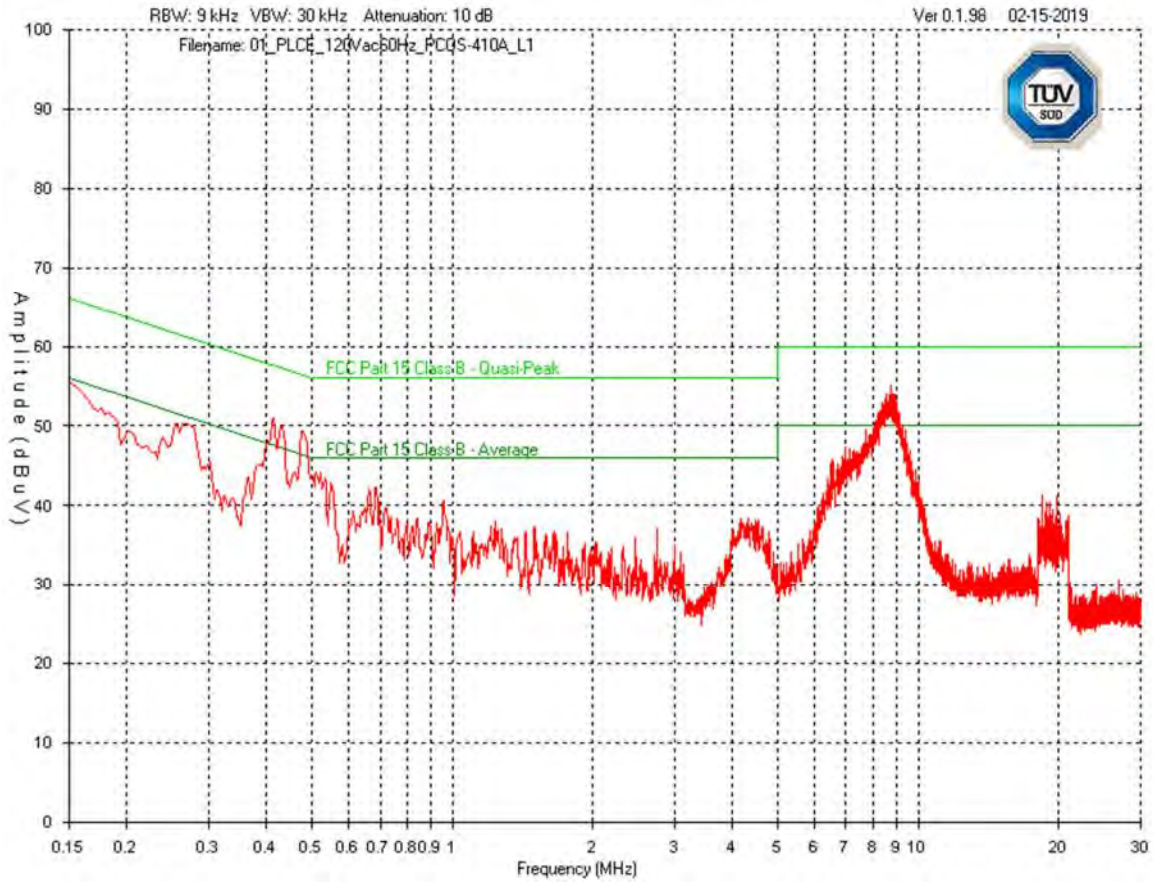

### Measurement Uncertainty

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is  $\pm 2.73\text{dB}$  with a 'k=2' coverage factor and a 95% confidence level.

### Preliminary Graphs

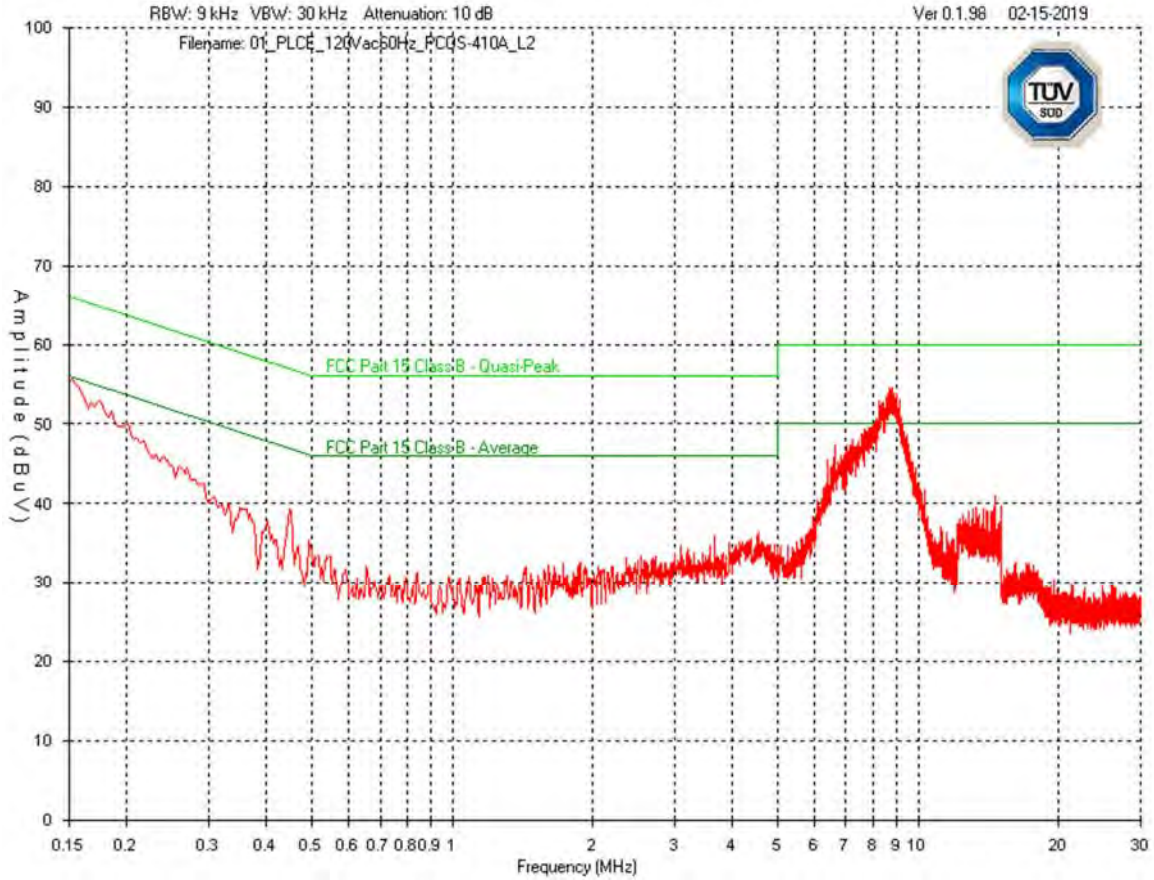

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

## Radiated Emissions – 4.1.2.9

### Purpose

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT does not exceed the limits listed below as defined in the applicable test standard and measured from a receiving antenna. This helps protect broadcast radio services such as television, FM radio, pagers, cellular telephones, emergency services, and so on, from unwanted interference.

### Limit(s)

The method is as defined in ANSI C63.4:2014. The limits are as defined in FCC Part 15 Section 15.109:

#### CLASS B

FCC Part 15, Subpart B Limits - 30MHz – 1GHz

Frequency Range <sup>a</sup>	Quasi-Peak Limits - 3m <sup>b</sup>
30 MHz – 88 MHz	40 dB $\mu$ V/m
88 MHz – 216 MHz	43.5 dB $\mu$ V/m
216 MHz – 960 GHz	46 dB $\mu$ V/m
960 MHz – 1 GHz	54 dB $\mu$ V/m

Frequency Range <sup>a</sup>	Average Limit - 3m <sup>c</sup>	Peak Limit - 3m <sup>d</sup>
1 GHz and Up	54 dB $\mu$ V/m	74 dB $\mu$ V/m

<sup>a</sup>The frequency range scanned is in accordance to FCC Part 15 Section 15.33(b).

<sup>b</sup>Limit is with a resolution bandwidth of 120 kHz, a video bandwidth at least three times greater than the resolution bandwidth, and using a Quasi-Peak detector.

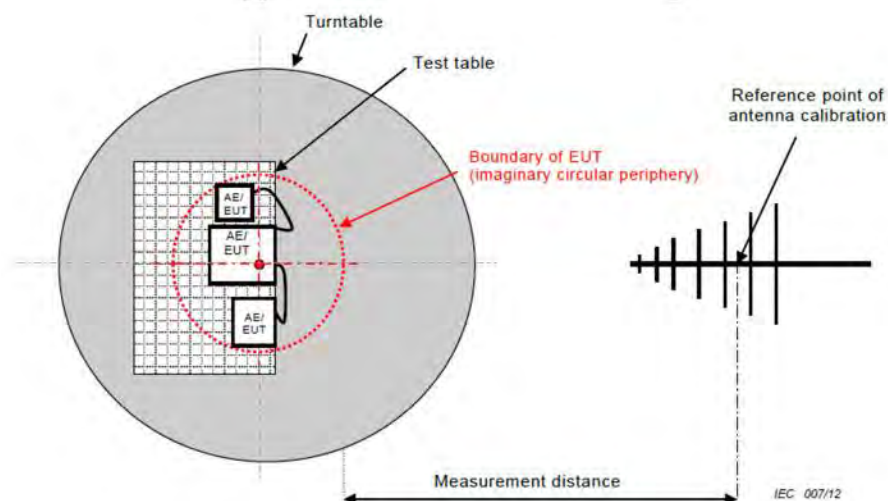

<sup>c</sup>Limit is with a resolution bandwidth of 1 MHz and using an Average detector.

<sup>d</sup>Limit is with a resolution bandwidth of 1 MHz, a video bandwidth at least three times greater than the resolution bandwidth, and using a Peak detector.

Based on ANSI C63.4 Section 4.2, if the Peak detector measurements do not exceed the Quasi-Peak limits, where defined, then the EUT is deemed to have passed the requirements.

Client	Pro V&V Inc.	
Product	Image Cast Evolution	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Radiated Emissions Setup

Note: In accordance with FCC Part 15, section 15.31(f)(1), testing was performed at a 3 meter test distance and an extrapolation factor, if applicable, of 20 dB/decade was applied. For example, an extrapolation of 10m to 3m is  $20\log(10/3) = 10.5$  dB.

### Measurement Uncertainty

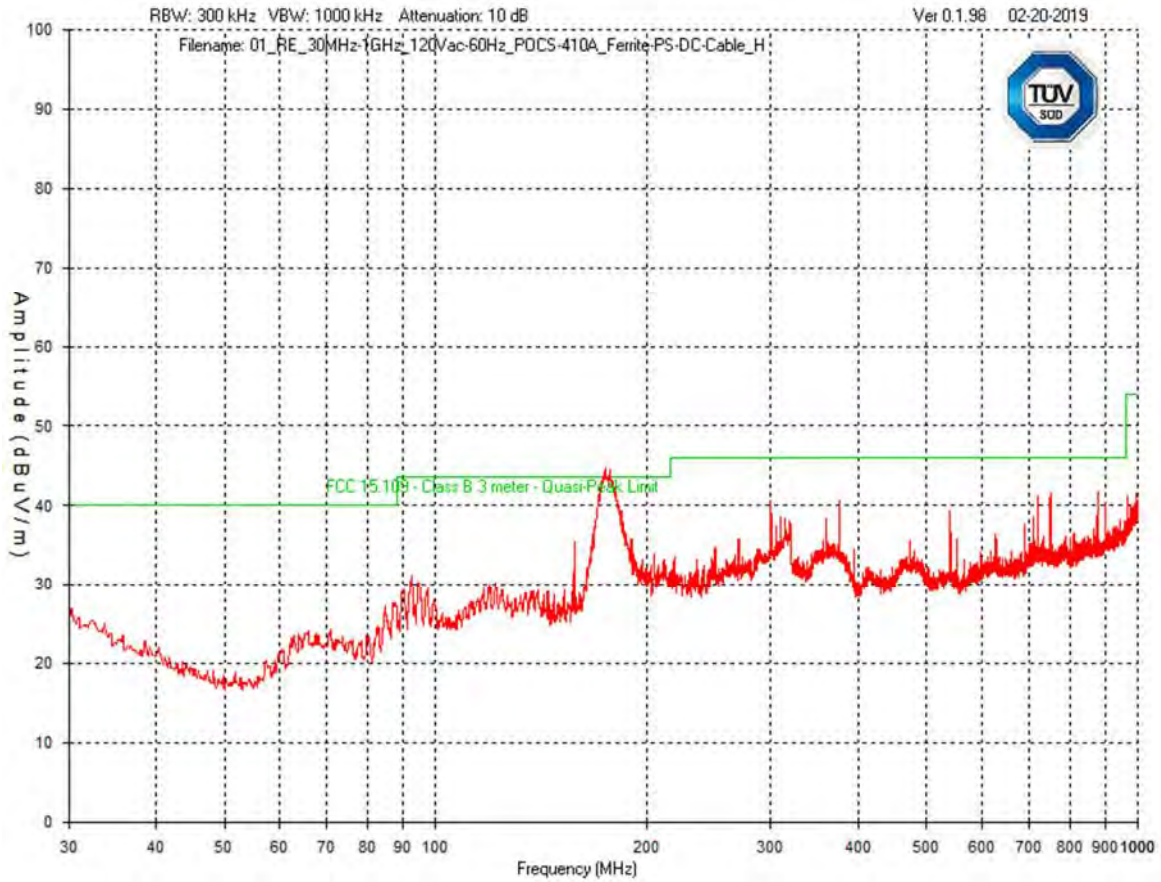

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is  $\pm 5.04$ dB for 30MHz – 1GHz and  $\pm 4.93$ dB for 1GHz – 18GHz with a 'k=2' coverage factor and a 95% confidence level.

### Preliminary Graphs

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector over a full 0-360°. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

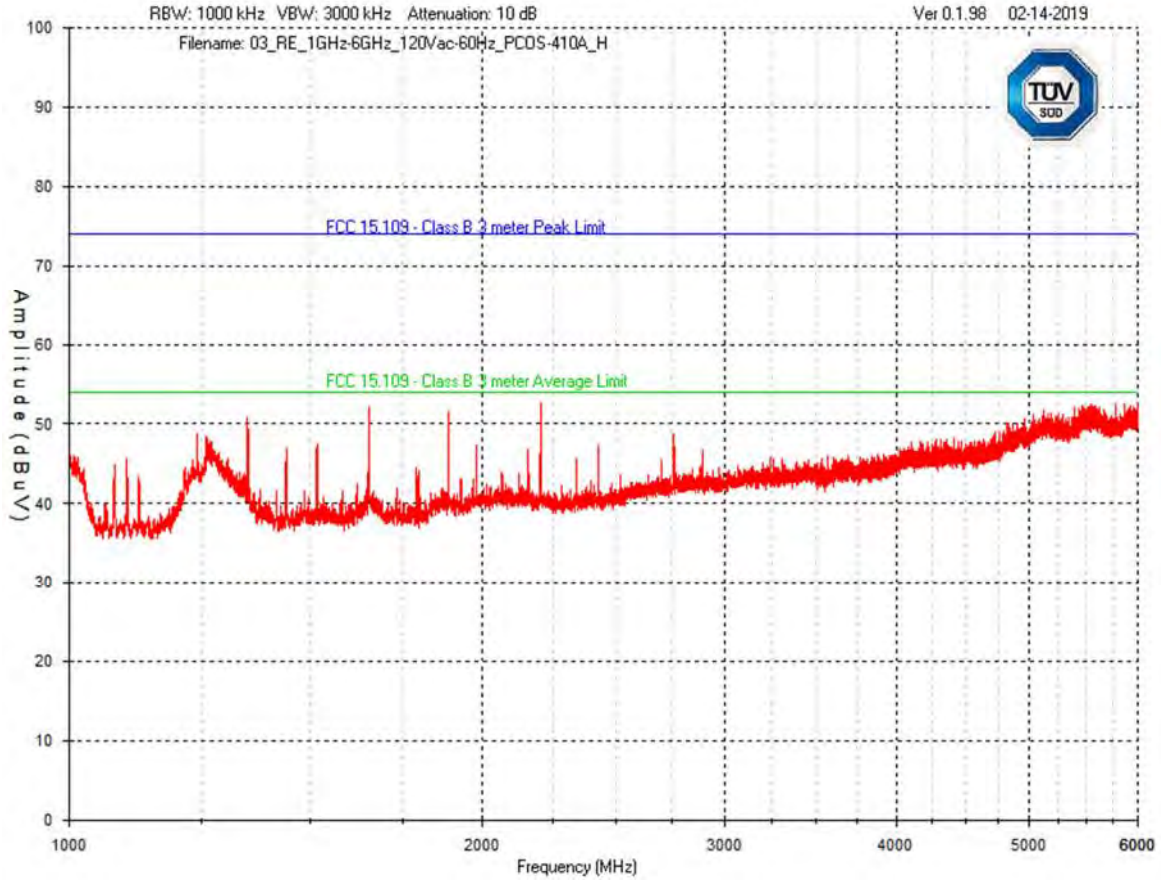

In accordance with FCC Part 15, Subpart B, Section 15.33, the device was scanned to a minimum of a 1 GHz. For devices containing clocks higher than 108 MHz, they were scanned above 1 GHz to meet the requirements of FCC Part 15, Section 15.33.

## **Electrical Power Disturbance – 4.1.2.5**

### **Purpose**

An AC powered device may be subjected to voltage dips, short interruptions or other voltage variations in the power line. Such conditions are mainly caused by faults or changes in the network due to sudden large changes in load, or when a brown out or a black out condition occurs. These voltage dips can also occur with power supplies that are not well regulated such as emergency diesel AC generators. This test simulates the occurrence of these conditions and subjects the EUT to this phenomenon.

### **Application Level Requirements**

This test is performed in accordance with the methodology defined in IEC 61000-4-11. As per VVSG 1.0 (2005) Vol. 1, the following dip and interruption levels apply:

Voltage Dip Level	Duration	Duration @ 60Hz [Cycles]
30% (36 Vac)	0.01s	0.6
60% (72 Vac)	0.1s / 1.0s	6 / 60
100% (120 Vac)	0.5	300

Voltage Surge Level	Duration	Duration @ 60Hz [Cycles]
85% (102 Vac)	4 hours	14400
115% (138 Vac)	4 hours	14400

Surges of +15% line variations of nominal line voltage and electrical power increases of 7.5% and reductions of 12.5% of nominal specified power supply for a period of up to four hours at each level.

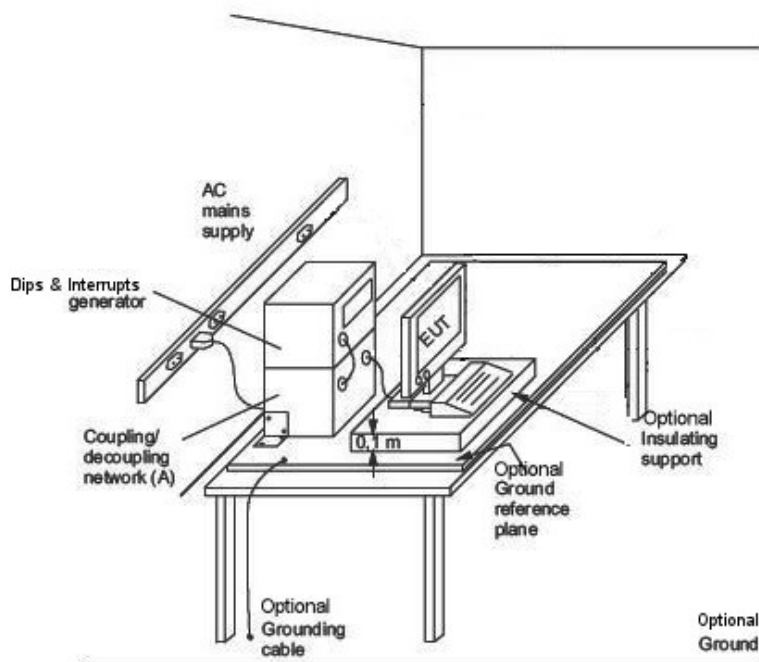

The voltage level in brackets is the residual voltage of the voltage dip applied and presumes a normal operating voltage of 120 Vac and a frequency of 60Hz.

The test is carried out at phase angles of 0°, 90°, and 270° of the AC with 5 repetitions applied at each of the dips and interrupts listed in the table above.

No disruption of normal operation or loss of data is applied to this test.

Client	<b>Pro V&amp;V Inc.</b>	
Product	<b>Image Cast Evolution</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-11, the voltage must be  $\pm 5\%$  of the voltage stated to be applied. The frequency must be kept within  $\pm 2\%$  of the stated frequency.

Client	<b>Pro V&amp;V Inc.</b>	
Product	<b>Image Cast Evolution</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

## Test Results

The EUTs passed the requirements. The EUTs met the criteria's listed above in the application level requirements.

No anomalies were observed for the surges and no disruption to operation or data loss occurred.

## ***Electrical Fast Transients / Bursts – 4.1.2.6***

### **Purpose**

Electrical Fast Transients is a series of bursts consisting of a number of fast transients, which in a typical application environment, can be coupled into the supply and onto the I/O lines of the EUT. These transient signals usually arise from nearby switching circuitry such as a light switch, relay bounces, electric motor noise, interruption of inductive loads, etc. This test is to verify that the EUT is immune to such transient disturbances based on the applicable test levels. This test, however, does not guarantee that the EUT will not experience higher level burst impulses during its operation, which may cause the EUT to fail.

### **Application Level Requirement**

This test is performed in accordance with the methodology defined in IEC 61000-4-4. The voltage waveform applied has the following characteristics:

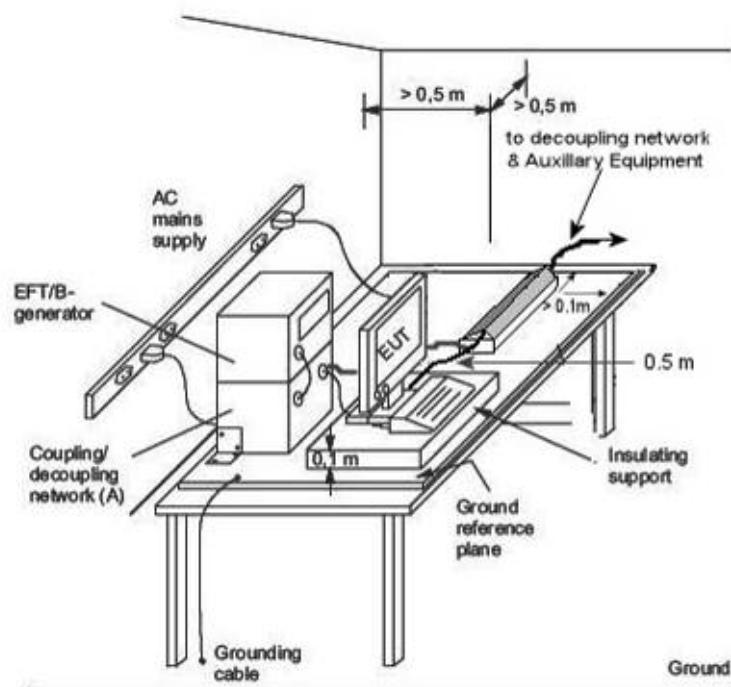

- Pulse rise time:  $5\text{ns} \pm 30\%$
- Pulse duration (to 50% value):  $50\text{ns} \pm 30\%$
- Pulse repetition frequency 100kHz
- Burst duration should be  $15\text{ms} \pm 20\%$
- Burst period should be  $300\text{ms} \pm 20\%$

Bursts are applied for 1 minute each at the positive and the negative polarity to the mains power input (common mode) and to each applicable I/O line.

A test level of  $\pm 2\text{kV}$  is applied to the power supply port(s) via a coupling and decoupling network and  $\pm 1\text{kV}$  to each applicable I/O line via a Capacitive Coupling Clamp. No disruption of normal operation or loss of data is to occur during the performance of this test.

Product	<b>Image Cast Evolution</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

## Test Results

The EUT's second USB monitor experienced a shutdown during the test and did not self-recover. The manufacturer installed a ferrite on the USB to pass the test. Refer to Appendix A - Modifications for Compliance. No additional anomalies were observed.

After the ferrite install on the USB cable, the EUT passed the requirements. The EUT met Criteria B as defined in "Appendix A – EUT & Client Provided Details".

Test Voltage	Repetition Rate	Coupling Lines	Result
±2kV	100kHz	L – N – PE	Pass

## ***Lightning Surge – 4.1.2.7***

### **Purpose**

Surge occurs when a high energy disturbance takes place on the power lines, or less frequently, I/O lines and can cause significant temporary increase in current and/or voltage. These disturbances can arise during a nearby lightning strike, circuit trips, short-circuits on the same power line that the equipment is connected to, etc. The sudden rise in voltage over a very short period of time could cause damage to the components of the EUT and this test assesses the immunity of the EUT to such transient waves. This test differs from Electrical Fast Transients / Bursts in that this waveform, characterized by the rapid increase of current and/or voltage followed by a slower decrease, has a longer wave duration that could allow damage to the EUT. This test does not guarantee that the EUT will not be exposed to a higher level of surge energy during its operation, which may cause the EUT to fail. This test also does not ensure operation of the EUT in the presence of direct lightning effects.

### **Application Level Requirement**

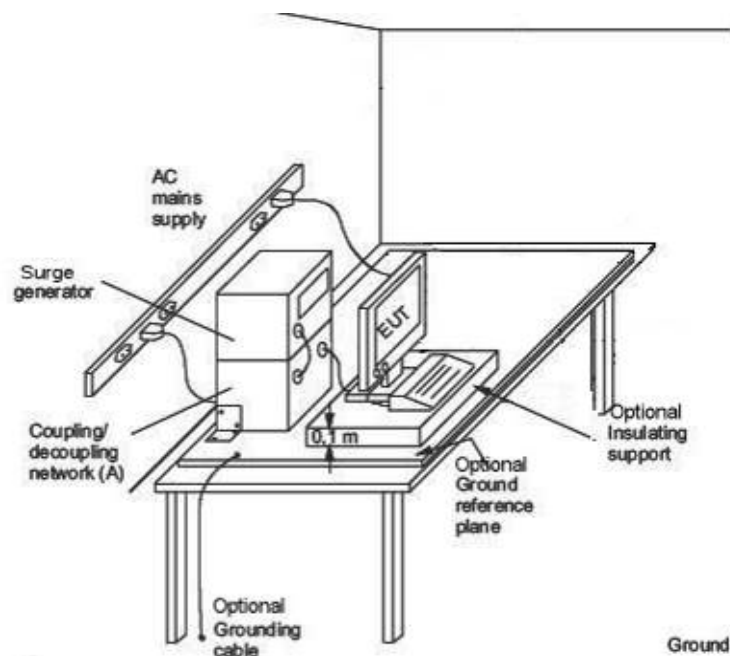

This test is performed in accordance with the methodology defined in IEC 61000-4-5. Surges are simulated using a waveform generator and the characteristics of the waveform generated are as follows:

- Rise time of 1.2 $\mu$ s and wave duration of 50 $\mu$ s (to 50% value) into an open circuit.
- Rise time of 8 $\mu$ s and wave duration of 20 $\mu$ s (to 50% value) into a short circuit.
- Dwell time of 60 seconds between each surge.
- 5 surges in the positive and 5 surges in the negative polarity.
- For AC systems, the surge pulses are applied at 0°, 90°, 180° and 270°.
- For AC systems, Line to Ground is performed at the same amount as the Line to Line voltage.

For AC mains supply, a test level of  $\pm 2$ kV Line to Line and  $\pm 2$ kV Line to Ground is applied to the power supply port(s) via a coupling and decoupling network. Lower test levels are evaluated first before applying the required test level. No disruption of normal operation or data loss is allowed as applied to this test.

Client	Pro V&V Inc.	 Canada
Product	Image Cast Evolution	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-5, the level is specified as being within  $\pm 10\%$  for open circuit voltage calibration or  $\pm 10\%$  for short circuit current calibration. The EUTs input impedance, or whether Line – PE or Line – Line is being performed, combined with the calibrated generators output impedance, will affect the timing and voltage/current of the waveform applied to the EUT.

Client	Pro V&V Inc.

## Electrostatic Disruption – 4.1.2.8

### Purpose

The purpose of this immunity test is to apply a static electricity discharge from the operator to the EUT or create a nearby discharge field. An example of this discharge can be seen in low humidity conditions when a person touches an object and creates a small spark. This spark could potentially be harmful to the operation of the EUT. The contact method, with related reduced voltages, has been shown to be roughly equivalent to air discharges in severity and due to its reproducibility, contact is the preferred test method. Air discharge is used where contact discharge cannot be applied since the discharge point is significantly insulated and the insulation cannot be easily broken through. This test ensures a minimum level of immunity which is likely to occur in a normal usage environment. This test does not guarantee that the EUT will not be exposed to higher discharge levels which could cause it to fail.

### Application Level Requirement

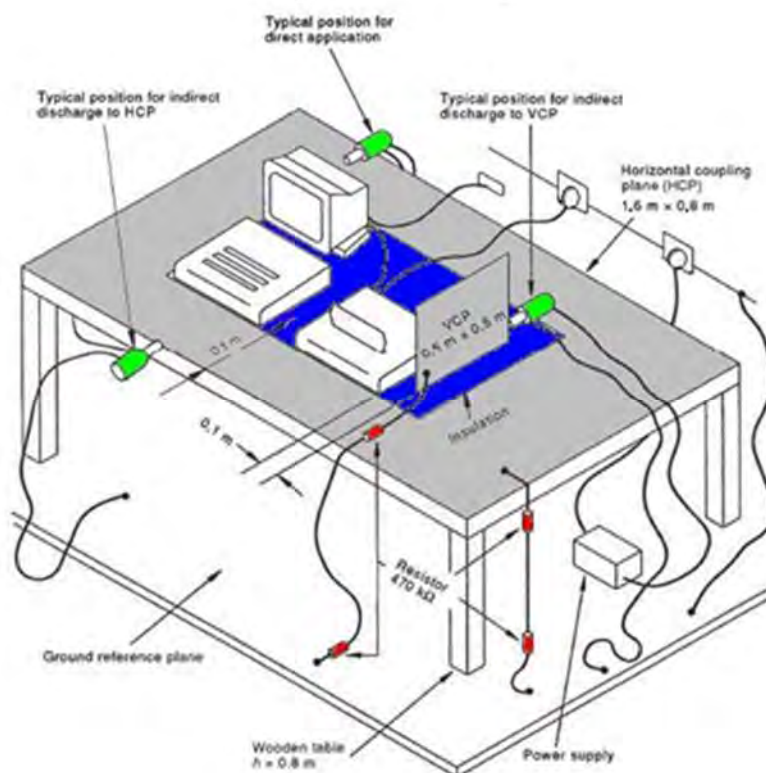

This test is performed in accordance with the methodology defined in IEC 61000-4-2. Ten hits in the positive and negative polarity are applied at each defined discharge point on the EUT. These are called direct discharges, regardless of contact or air being applied. Horizontal Coupling Plane (HCP) and Vertical Coupling Plane (VCP) discharges are also applied and these are called indirect discharges. A typical test setup representation is shown on the following page. A photograph of the actual test setup is shown in Appendix B. See the results table under Test Results for the actual EUT discharge points.

A level of  $\pm 8\text{kV}$  contact or  $\pm 15\text{kV}$  air, where applicable, is applied to each defined discharge point. For air discharge testing, the test is applied at the lower test levels first. No disruption to normal operation or loss of data is applied to this test. However, all anomalies, if any, are noted.

## Electromagnetic Susceptibility – 4.1.2.10

### Purpose

The EUT will likely be exposed to intentional sources of electromagnetic radiation during its regular application. Sources of such radiation can be cellular phones, FM radio, television, remote car alarms, garage door openers, and other broadcast transmissions. These sources of radiation are licensed or certified for broadcast and therefore, the EUT should be immune to their RF energy. This test assesses the immunity of the EUT to the applicable field strength test level. This test, however, does not guarantee that the EUT will not be exposed to higher level fields during its operation, which may cause it to fail.

### Application Level Requirement

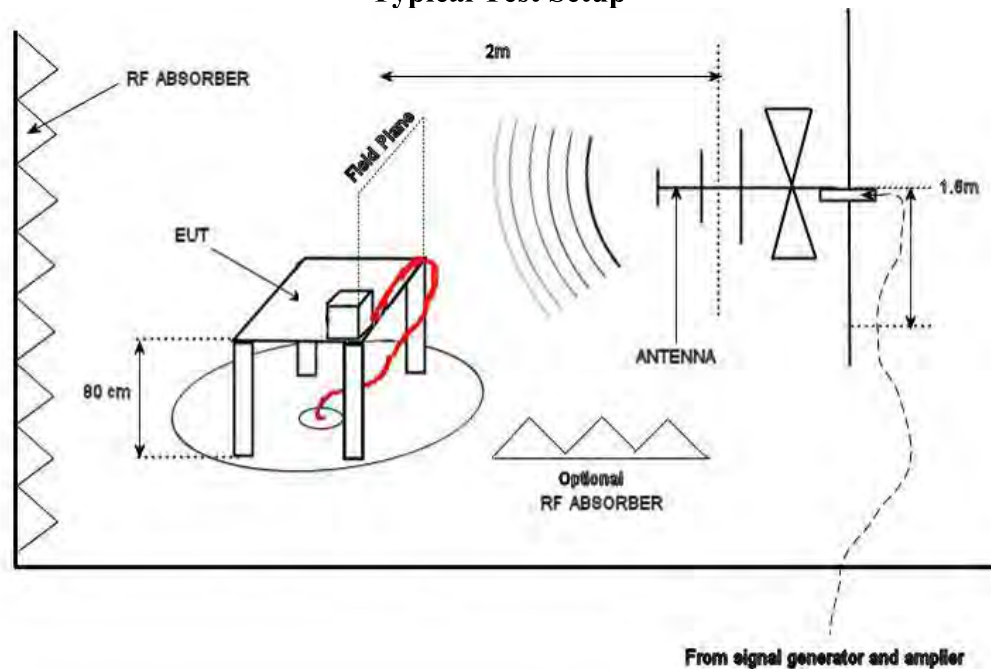

This test is performed in accordance with the methodology defined in IEC 61000-4-3. The immunity test is performed over the frequency range of 80MHz to 1.0GHz. As the frequency range is swept incrementally, the step size used is calculated at 1% of the preceding frequency value, rounded down to the nearest kHz. Known clock frequencies, local oscillators, etc. are analyzed separately, where applicable, and these are defined in "Appendix A – EUT & Client Provided Details". The field uniformity is calibrated at 10V/m and a modulation of 80% AM 1kHz sine wave is applied during the application of the RF energy at each frequency.

The RF field is applied in both horizontal and vertical antenna polarization and four sides of the EUT are subjected to this RF field. The dwell time used for each frequency is 3 seconds. Forward power is monitored and records are kept on file at TÜV SÜD Canada Inc. An isotropic field probe is also placed in near proximity of the EUT to verify the application of the RF field. Performance Criteria level A as defined in "Appendix A – EUT & Client Provided Details" is applied to this test.

Client	Pro V&V Inc.	
Product	Image Cast Evolution	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-3, the RF field is specified as 0dB to +6dB for at least 12 of the 16 calibration points. For a 10 V/m field, this allows for the EUT to be subjected to a field of 10 V/m to 20 V/m with at least 75% coverage at this level.

## Conducted RF Immunity – 4.1.2.11

### Purpose

The EUT will likely be exposed, in some way, to low frequency intentional sources of RF energy during its regular application. Sources of such radiations can be AM radio, shortwave radio, CB transmissions, and other low frequency broadcast transmissions. These sources of radiations are licensed or certified for broadcast and therefore, the EUT should be immune to their RF energy. Due to the properties of radio, the power or I/O lines on the EUT would likely be the passive receiving antenna that induces the disturbance to the EUT. Since this is the main method of coupling at this frequency range, the direct application of the RF energy to the line being tested is used. At this frequency range and level, this method is easier to produce and reproduce in a laboratory environment than subjecting the EUT to an equivalent RF field.

### Application Level Requirement

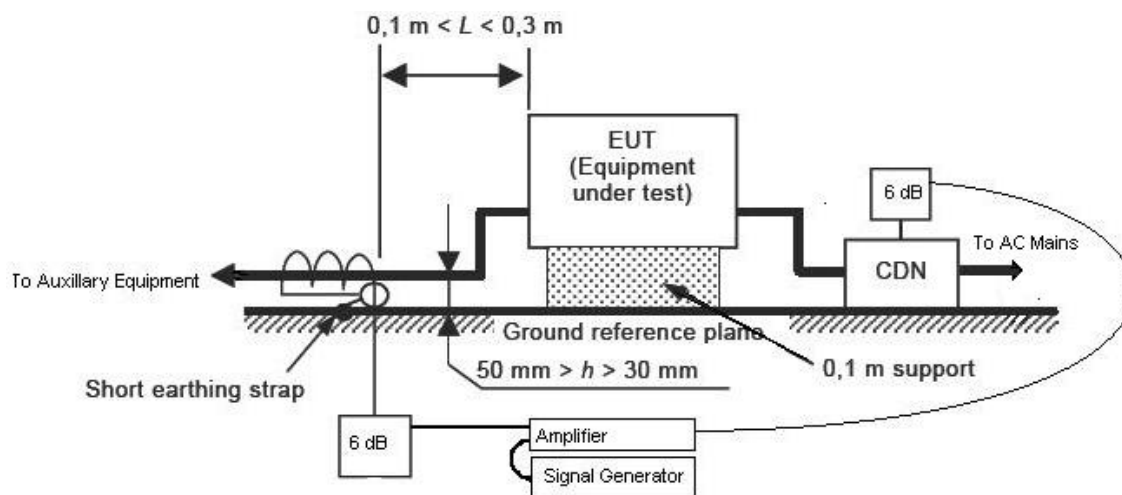

This test is performed in accordance with the methodology defined in IEC 61000-4-6. I/O cables are tested using a bulk current injection probe and power lines are tested using a coupling and decoupling network. The immunity test is performed over the frequency range of 150kHz to 80MHz. As the frequency range is swept incrementally, the step size used is calculated at 1% of the preceding frequency value, rounded down to the nearest kHz. Known clock frequencies, local oscillators, etc. are analyzed separately, where applicable, and these are defined in "Appendix A – EUT & Client Provided Details". The test level is calibrated at 10Vrms and a modulation of 80% AM 1kHz sine wave is applied during the application of the RF energy at each frequency.

The dwell time used for each frequency is 3 seconds. A current probe is placed between the coupling device and the EUT to verify the application of the RF energy. No disruption to normal operation or data loss allowed is applied to this test.

Client	Pro V&V Inc.	
Product	Image Cast Evolution	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-6, the CDN must meet a common mode impedance  $|Z_{CE}| = 150\Omega \pm 20\Omega$  for 150kHz to 26MHz and  $|Z_{CE}| = 150\Omega + 60\Omega$  or  $150\Omega - 45\Omega$  for 26MHz to 80MHz. During tests using the bulk current injection probe, the impedance of each cable will affect the current injected and therefore, current was monitored. The calibration is performed according to IEC 61000-4-6 which allows for  $\pm 2\text{dB}$ .

Product	<b>Image Cast Evolution</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

## Test Results

The EUTs passed the requirements. The EUTs met Criteria A as defined in "Appendix A – EUT & Client Provided Details". No anomalies were observed.

<b>Input Voltage and Frequency</b>	120Vac 60Hz
<b>Frequency Range and Signal Strength</b>	150kHz - 80MHz 10Vrms (80% AM)
<b>Sweep Step</b>	1% of Fundamental
<b>Dwell Time</b>	3 sec.
<b>AC Mains</b>	Pass
<b>Result</b>	<b>Pass</b>

## ***Magnetic Fields Immunity – 4.1.2.12***

### **Purpose**

A magnetic field with the frequency of the power line is generated around the EUT. In practice, the EUT will be subjected to power frequency magnetic fields from nearby power lines, transformers, or devices such as televisions or monitors. Since the EUT is usually used in conjunction with other electrical equipment, it is subjected to the steady state magnetic fields. These are magnetic fields that the device is exposed to under normal operating conditions. These fields have lower field strengths compared to typical transient magnetic fields.

### **Application Level Requirement**

This test is performed in accordance with the methodology defined in IEC 61000-4-8. Three orthogonal axis of the EUT are subjected to the field within the magnetic loop. The transient magnetic field, if applicable, is tested for 1 minute while the steady state magnetic field is tested for 15 minutes. The frequency applied is 60 Hz. A magnetic field strength of 30 A/m is applied to the EUT in each orthogonal axis. No disruption to normal operation or loss of data is applied to this test.

**Typical Setup Diagram**

### **Application Level Accuracy**

As per IEC 61000-4-8, the field over the area that the EUT occupies within the loop must be calibrated to be within  $\pm 3\text{dB}$ . For a field strength of 3 A/m, this means that the empty calibrated field strength can be between 2.1 A/m and 4.2 A/m over the area that the EUT occupies.

### **Test Results**

The EUT passed the requirements. The EUT did not encounter any disruption of normal operation or loss of data. No anomalies were observed.

When a 60 Hz field was applied, the EUTs were powered at 120 Vac 60 Hz, battery mode and the field strength at 30 A/m.

## EUT Functional Description

Voting Ballot Tabulator.

## EUT Configuration

Please see Appendix B for a picture of the unit running in normal conditions.

- Cables and earthing were connected as per manufacturer's specification.
- All cables are less than 3m

## Operational Setup

Peripheral devices were attached to the EUT for its test operation. However, this report does not represent compliance of these peripheral device(s) in any way.

- Turn on device, enter test mode using voter and admin cards

## Modifications for Compliance

The following modifications were made during testing for the sample to achieve compliance with the testing requirements:

A ferrite bead installed on the USB cable which connects to the second USB monitor signal cable. See Appendix B - EUT, Peripherals, and Test Setup Photos.

Würth Elektronik ferrite P/N: 742 712 22

## Product Marking

### Products marketed in the US:

For products that are not intentional radiators and are subject to the 'verification' procedure in the US, according to the FCC, the product shall bear the following statement in a conspicuous location on the device:

*This device complies with Part 15 of the FCC Rules.  
Operation is subject to the following two conditions:  
(1) this device may not cause harmful interference, and  
(2) this device must accept any interference received, including  
interference that may cause undesired operation.*

Where a device is constructed in two or more sections connected by wires and marketed together, the statement specified is required to be affixed only to the main control unit.

When the device is so small or for such use that it is not practicable to place the statement specified on it, the information required by this paragraph shall be placed in a prominent location in the instruction manual or pamphlet supplied to the user or, alternatively, shall be placed on the container in which the device is marketed.

In this case, the following statement may accompany the product:

*"This device complies with Part 15 of the FCC Rules. See manual for details"*

Also, the FCC identifier or other unique identifier such as a model number and serial number, as appropriate, must be displayed on the device.

### Products marketed within Canada:

According to Industry Canada, the following statement shall be permanently affixed to the ITE or displayed electronically and its text must be clearly legible. If the dimensions of the device are too small or if it is not practical to place the label on the device and electronic labeling has not been implemented, the label shall be, upon agreement with Industry Canada, placed in a prominent location in the user manual supplied with the ITE.

*CAN ICES-3 (\*)/NMB-3(\*)*

\* Insert either "A" or "B" but not both to identify the applicable Class of ITE.

## Report Scope

This report addresses the EMC verification testing and test results of the **ICP2 V1**, Model: **PCOS-330A** herein referred to as EUT (Equipment Under Test). The EUT was tested for emissions and immunity compliance against the following standards:

2015 VVSG Volume I; Version 1.1

2015 VVSG Volume II; Version 1.1

Power line conducted emissions, radiated emissions and immunity testing was evaluated on the EUT. Test procedures, results, justifications, and engineering considerations, if any, follow later in this report.

For a more detailed list of the standards and the revision used, see the "Applicable Standards, Specifications and Methods" section of this report.

This report does not imply product endorsement by any government, accreditation agency, or TÜV SÜD Canada Inc.

Opinions or interpretations expressed in this report, if any, are outside the scope of TÜV SÜD Canada Inc. accreditations. Any opinions expressed do not necessarily reflect the opinions of TÜV SÜD Canada Inc., unless otherwise stated.

### ***Notes, Justifications, or Deviations***

The following justifications for tests not performed or deviations from the above listed specifications apply:

All Ethernet and USB ports are service ports and is not used in normal operation. Therefore, these ports are not loaded during testing.

The manufacturer presented the EUT representative of the main function(s) performed in the application for which it is intended. During measurement, the EUT is operational with a comprehensive working load and program to demonstrate typical operating conditions.

The EUT includes an external power supply converter.

Manufacturer: FranMar

Model: ATS090-P190

The two documents referenced in the scope of work are custom test plans (or standard test procedures) which is not part of TUV SUD Canada's Scope of Accreditation; however, all individual EMC tests are in TUV SUD Canada's Scope of Accreditation.

A later revision of the standard may have been substituted in place of the previous dated referenced revision. The year of the specification used is listed under applicable standards. Using the later revision accomplishes the goal of ensuring compliance to the intent of the previous specification, while allowing the laboratory to incorporate the extensions and clarifications made available by a later revision.

### ***Sample Calculation(s)***

#### **Radiated Emission Test**

Margin = Limit – (Received Signal + Antenna Factor + Cable Loss – Pre-Amp Gain)

Margin = 50dBμV/m – (50dBμV + 10dB + 2.5dB – 20dB)

Margin = 7.5 dB (pass)

#### **Power Line Conducted Emission Test**

Margin = Limit – (Received Signal + Attenuation Factor + Cable Loss + LISN Factor)

Margin = 73.0dBμV – (50dBμV + 10dB + 2.5dB + 0.5dB)

Margin = 10.0 dB (pass)

#### **Milligauss to A/m Conversion (Magnetic Immunity)**

1A/m = 12.57 mG

3A/m = 3\*12.57 = 37.7 mG

## Definitions and Acronyms

The following definitions and acronyms are applicable in this report.  
See also ANSI C63.14.

**AM** – Amplitude Modulation  
**CDN** – Coupling Decoupling Network  
**EFT** – Electrical Fast Transients  
**ESD** – Electro-Static Discharge  
**HCP** – Horizontal Coupling Plane  
**VCP** – Vertical Coupling Plane  
**LISN** – Line Impedance Stabilization Network  
**NCR** – No Calibration Required  
**NSA** – Normalized Site Attenuation  
**N/A** – Not Applicable  
**RF** – Radio Frequency

**AE** – Associated Equipment. Equipment needed to exercise and/or monitor the operation of the EUT.

**Class A Device** – A device that is marketed for use in a commercial, industrial or business environment. A 'Class A' device should not be marketed for use by the general public. A 'Class A' device should contain a warning notice in the user manual stating that it could cause radio interference. For example: "**Warning:** Operation of this equipment in a residential environment could cause radio interference."

**Class B Device** – A device that is marketed for use in a residential environment and may also be used in a commercial, business or industrial environments. NOTE: A residential environment is an environment where the use of broadcast radio and television receivers may be expected within a distance of 10m of the device concerned.

**EMC** – Electro-Magnetic Compatibility. The ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable electromagnetic disturbances to anything in that environment.

**EMI** – Electro-Magnetic Immunity. The ability to maintain a specified performance when the equipment is subjected to disturbance (unwanted) signals of specified levels.

**EUT** – Equipment Under Test. A device or system being evaluated for compliance that is representative of a product to be marketed.

Client	<b>Pro V&amp;V Inc.</b>	
Product	<b>ICP2 V1</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

**ITE** – Information Technology Equipment. Has a primary function of entry, storage, display, retrieval, transmission, processing, switching, or control of data and/or telecommunication messages and which may be equipped with one or more ports typically for information transfer.

**Antenna Port** – Port, other than a broadcast receiver tuner port, for connection of an antenna used for intentional transmission and/or reception of radiated RF energy.

**Broadcast Receiver Tuner Port** – Port intended for the reception of a modulated RF signal carrying terrestrial, satellite and/or cable transmissions of audio and/or video broadcast and similar services.

**Optical Fiber Port** – Port at which an optical fiber is connected to an equipment.

**Signal/Control Port** – Port intended for the interconnection of components of a EUT, or between a EUT and local AE and used in accordance with relevant functional specifications (for example for the maximum length of cable connected to it). (Examples include: RS-232, USB, HDMI, Fire Wire)

**Wired Network Port** – Point of connection for voice, data and signaling transfers intended to interconnect widely dispersed systems by direct connection to a single-user or multi-user communication network. (Examples include: CATV, PSTN, ISDN, xDSL, LAN and similar networks)

**EMC Test Plan** – An EMC test plan established prior to testing. See 'Appendix A – EUT & Client Provided Details'.

## Testing Facility

Testing for EMC on the EUT was carried out at TÜV SÜD Canada testing lab near Toronto, Ontario. The testing lab has a calibrated 3m semi-anechoic chamber which allows measurements on a EUT that has a maximum width or length of up to 2m and a height of up to 3m. The chamber is equipped with a turntable that is capable of testing devices up to 3300lb in weight. This facility is capable of testing products that are rated for 120Vac and 240Vac single phase, or devices that are rated for a 208Vac 3 phase input. DC capability is also available for testing. The chamber is equipped with a mast that controls the polarization and height of the antenna. Control of the mast occurs in the control room adjoining the shielded chamber. Radiated emission measurements are performed using a BiLog antenna and a Horn antenna where applicable. Conducted emissions, unless otherwise stated, are performed using a LISN and using the Vertical Ground plane if applicable.

### Calibrations and Accreditations

The 3m semi-anechoic chamber is registered with Federal Communications Commission (FCC, CA6844), Industry Canada (IC, 6844A-3) and Voluntary Control Council for Interference (VCCI, R-4023, G-506, C-4498, and T-1246). This chamber was calibrated for Normalized Site Attenuation (NSA) using test procedures outlined in ANSI C63.4 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The chamber is lined with ferrite tiles and absorption cones to minimize any undesired reflections. The NSA data is kept on file at TÜV SÜD Canada. For radiated susceptibility testing, a 16 point field calibration has been performed on the chamber. The field uniformity data is kept on file at TÜV SÜD Canada. TÜV SÜD Canada Inc. is accredited to ISO 17025 by A2LA with Testing Certificate #2955.02. The laboratory's current scope of accreditation listing can be found as listed on the A2LA website. All measuring equipment is calibrated on an annual or bi-annual basis as listed for each respective test.

## ***Power Line Conducted Emissions – 4.1.2.9***

### **Purpose**

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT's power line does not exceed the limits listed below as defined in the applicable test standard and measured from a LISN. This helps protect lower frequency radio services such as AM radio, shortwave radio, amateur radio, maritime radio, CB radio, and so on, from unwanted interference.

### **Limits & Method**

The method is as defined in ANSI C63.4. The limits are as defined in FCC Part 15 Section 15.107:

#### **CLASS B**

Average Limits		Quasi-Peak Limits	
150 kHz – 500 kHz	56 to 46* dB $\mu$ V	150 kHz – 500 kHz	66 to 56* dB $\mu$ V
500 kHz – 5 MHz	46 dB $\mu$ V	500 kHz – 5 MHz	56 dB $\mu$ V
5 MHz – 30 MHz	50 dB $\mu$ V	5 MHz – 30 MHz	60 dB $\mu$ V

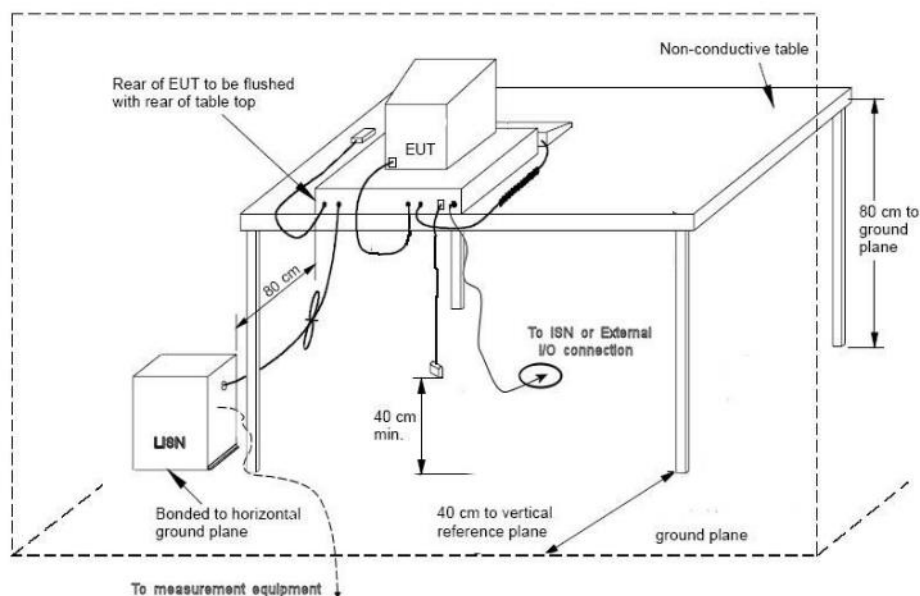

\* Decreases linearly with the logarithm of the frequency

Both Quasi-Peak and Average limits are applicable, and each is specified as being measured with a resolution bandwidth of 9 kHz. For Quasi-Peak, a video bandwidth at least three times greater than the resolution bandwidth is used.

Based on ANSI C63.4 Section 4.2, if the Peak or Quasi-Peak detector measurements do not exceed the Average limits, then the EUT is deemed to have passed the requirements.

Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Setup Diagram

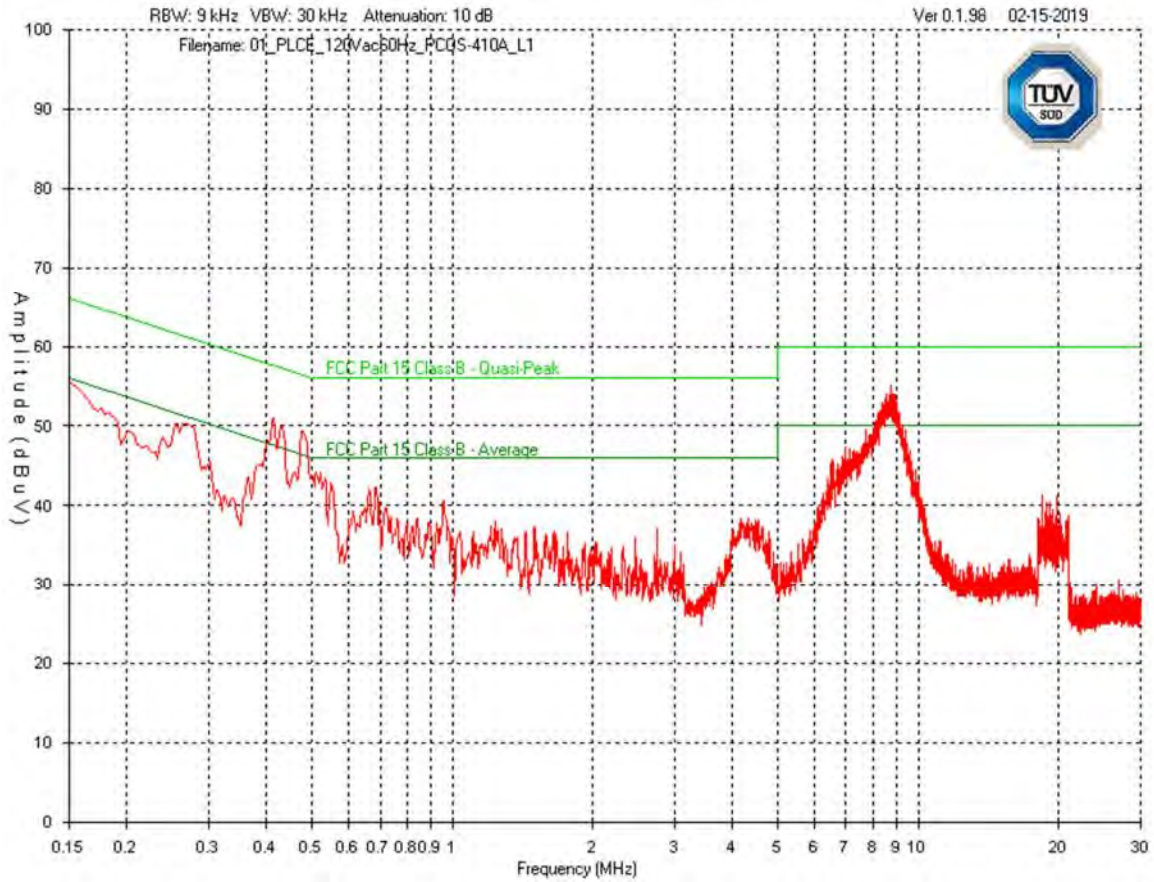

### Measurement Uncertainty

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is  $\pm 2.73\text{dB}$  with a 'k=2' coverage factor and a 95% confidence level.

### Preliminary Graphs

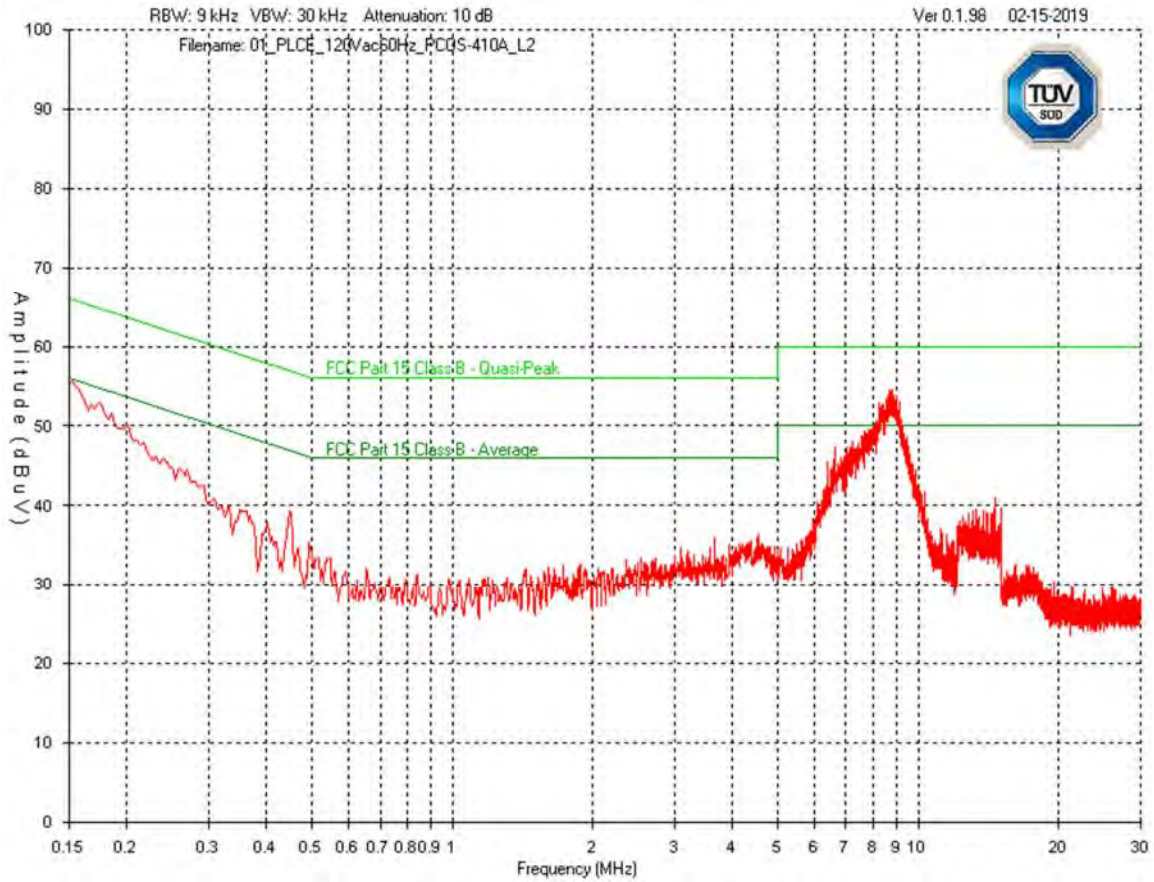

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

## ***Radiated Emissions – 4.1.2.9***

### **Purpose**

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT does not exceed the limits listed below as defined in the applicable test standard and measured from a receiving antenna. This helps protect broadcast radio services such as television, FM radio, pagers, cellular telephones, emergency services, and so on, from unwanted interference.

### **Limit(s)**

The method is as defined in ANSI C63.4:2014. The limits are as defined in FCC Part 15 Section 15.109:

#### **CLASS B**

FCC Part 15, Subpart B Limits - 30MHz – 1GHz

Frequency Range <sup>a</sup>	Quasi-Peak Limits - 3m <sup>b</sup>
30 MHz – 88 MHz	40 dB $\mu$ V/m
88 MHz – 216 MHz	43.5 dB $\mu$ V/m
216 MHz – 960 GHz	46 dB $\mu$ V/m
960 MHz – 1 GHz	54 dB $\mu$ V/m

Frequency Range <sup>a</sup>	Average Limit - 3m <sup>c</sup>	Peak Limit - 3m <sup>d</sup>
1 GHz and Up	54 dB $\mu$ V/m	74 dB $\mu$ V/m

<sup>a</sup>The frequency range scanned is in accordance to FCC Part 15 Section 15.33(b).

<sup>b</sup>Limit is with a resolution bandwidth of 120 kHz, a video bandwidth at least three times greater than the resolution bandwidth, and using a Quasi-Peak detector.

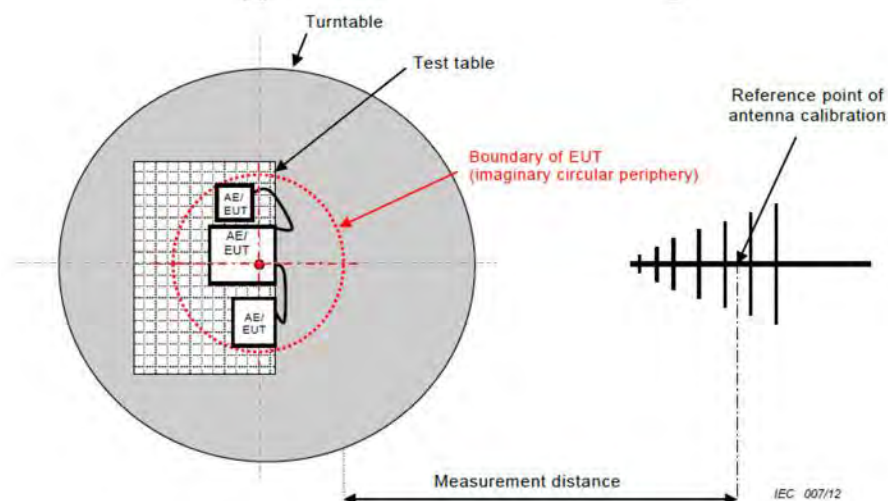

<sup>c</sup>Limit is with a resolution bandwidth of 1 MHz and using an Average detector.

<sup>d</sup>Limit is with a resolution bandwidth of 1 MHz, a video bandwidth at least three times greater than the resolution bandwidth, and using a Peak detector.

Based on ANSI C63.4 Section 4.2, if the Peak detector measurements do not exceed the Quasi-Peak limits, where defined, then the EUT is deemed to have passed the requirements.

Client	Pro V&V Inc.	
Product	ICP2 V1	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Radiated Emissions Setup

Note: In accordance with FCC Part 15, section 15.31(f)(1), testing was performed at a 3 meter test distance and an extrapolation factor, if applicable, of 20 dB/decade was applied. For example, an extrapolation of 10m to 3m is  $20\log(10/3) = 10.5$  dB.

### Measurement Uncertainty

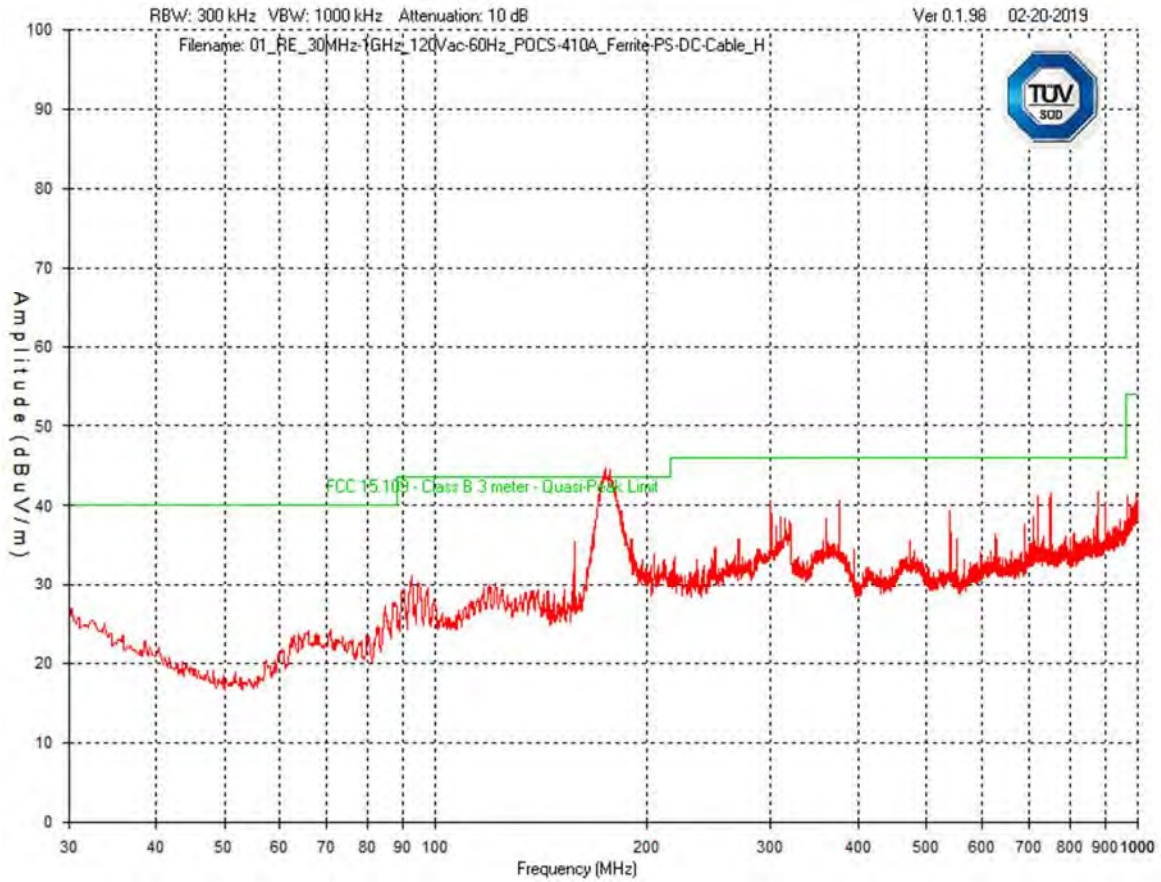

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is  $\pm 5.04$ dB for 30MHz – 1GHz and  $\pm 4.93$ dB for 1GHz – 18GHz with a 'k=2' coverage factor and a 95% confidence level.

### Preliminary Graphs

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector over a full 0-360°. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

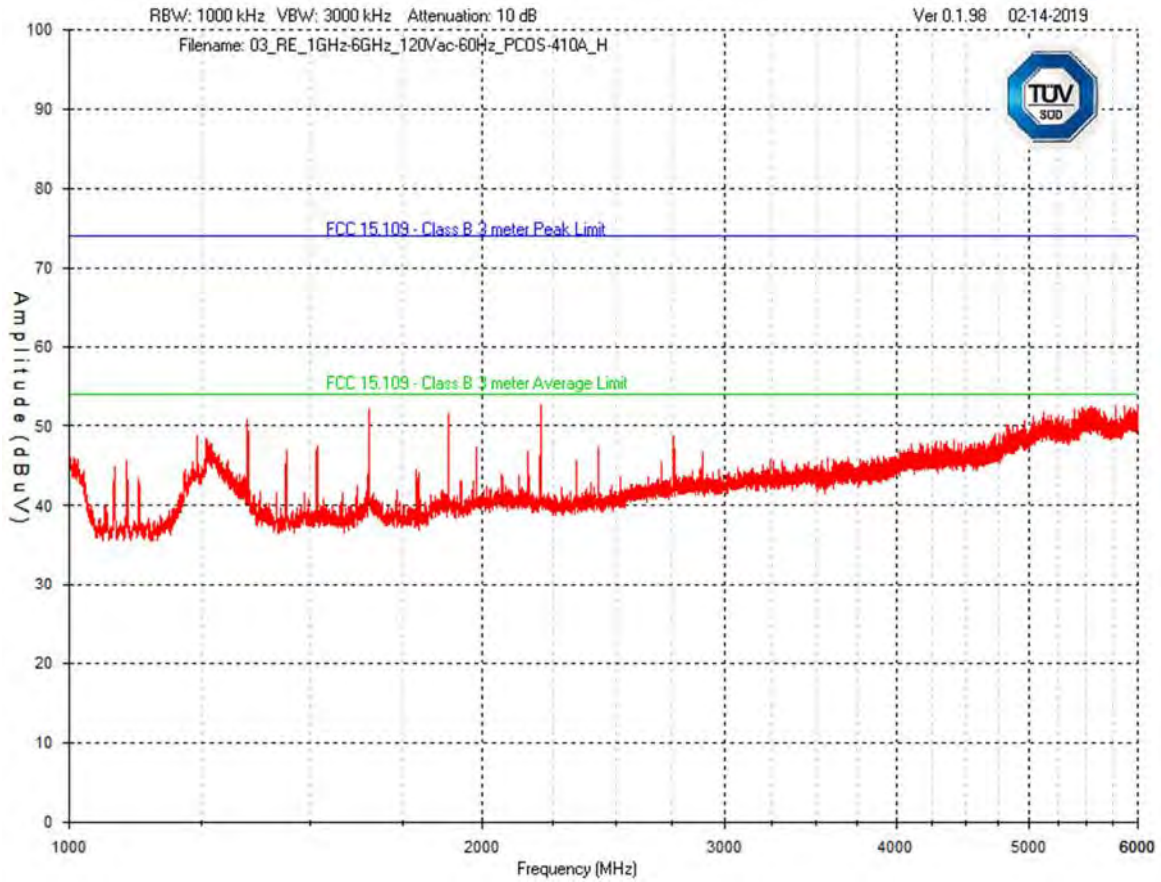

In accordance with FCC Part 15, Subpart B, Section 15.33, the device was scanned to a minimum of a 1 GHz. For devices containing clocks higher than 108 MHz, they were scanned above 1 GHz to meet the requirements of FCC Part 15, Section 15.33.

## **Electrical Power Disturbance – 4.1.2.5**

### **Purpose**

An AC powered device may be subjected to voltage dips, short interruptions or other voltage variations in the power line. Such conditions are mainly caused by faults or changes in the network due to sudden large changes in load, or when a brown out or a black out condition occurs. These voltage dips can also occur with power supplies that are not well regulated such as emergency diesel AC generators. This test simulates the occurrence of these conditions and subjects the EUT to this phenomenon.

### **Application Level Requirements**

This test is performed in accordance with the methodology defined in IEC 61000-4-11. As per VVSG 1.0 (2005) Vol. 1, the following dip and interruption levels apply:

Voltage Dip Level	Duration	Duration @ 60Hz [Cycles]
30% (36 Vac)	0.01s	0.6
60% (72 Vac)	0.1s / 1.0s	6 / 60
100% (120 Vac)	0.5	300

Voltage Surge Level	Duration	Duration @ 60Hz [Cycles]
85% (102 Vac)	4 hours	14400
115% (138 Vac)	4 hours	14400

Surges of +15% line variations of nominal line voltage and electrical power increases of 7.5% and reductions of 12.5% of nominal specified power supply for a period of up to four hours at each level.

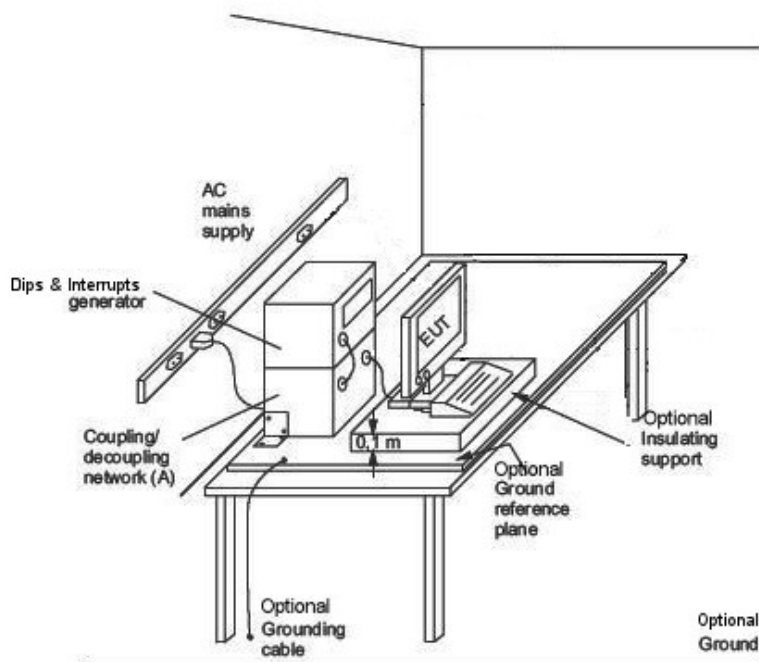

The voltage level in brackets is the residual voltage of the voltage dip applied and presumes a normal operating voltage of 120 Vac and a frequency of 60Hz.

The test is carried out at phase angles of 0°, 90°, and 270° of the AC with 5 repetitions applied at each of the dips and interrupts listed in the table above.

No disruption of normal operation or loss of data is applied to this test.

Product	ICP2 V1	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-11, the voltage must be  $\pm 5\%$  of the voltage stated to be applied. The frequency must be kept within  $\pm 2\%$  of the stated frequency.

Client	<b>Pro V&amp;V Inc.</b>	
Product	<b>ICP2 V1</b>	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

## Test Results

The EUTs passed the requirements. The EUTs met the criteria's listed above in the application level requirements.

No anomalies were observed for the surges and no disruption to operation or data loss occurred.

## ***Electrical Fast Transients / Bursts – 4.1.2.6***

### **Purpose**

Electrical Fast Transients is a series of bursts consisting of a number of fast transients, which in a typical application environment, can be coupled into the supply and onto the I/O lines of the EUT. These transient signals usually arise from nearby switching circuitry such as a light switch, relay bounces, electric motor noise, interruption of inductive loads, etc. This test is to verify that the EUT is immune to such transient disturbances based on the applicable test levels. This test, however, does not guarantee that the EUT will not experience higher level burst impulses during its operation, which may cause the EUT to fail.

### **Application Level Requirement**

This test is performed in accordance with the methodology defined in IEC 61000-4-4. The voltage waveform applied has the following characteristics:

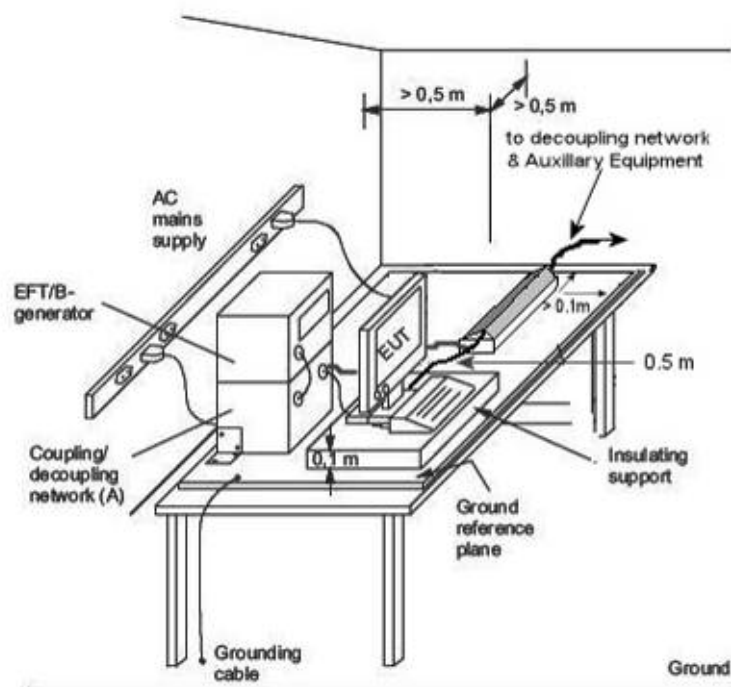

- Pulse rise time:  $5\text{ns} \pm 30\%$
- Pulse duration (to 50% value):  $50\text{ns} \pm 30\%$
- Pulse repetition frequency 100kHz
- Burst duration should be  $15\text{ms} \pm 20\%$
- Burst period should be  $300\text{ms} \pm 20\%$

Bursts are applied for 1 minute each at the positive and the negative polarity to the mains power input (common mode) and to each applicable I/O line.

A test level of  $\pm 2\text{kV}$  is applied to the power supply port(s) via a coupling and decoupling network and  $\pm 1\text{kV}$  to each applicable I/O line via a Capacitive Coupling Clamp. No disruption of normal operation or loss of data is to occur during the performance of this test.

Client	Pro V&V Inc.	
Product	ICP2 V1

## ***Lightning Surge – 4.1.2.7***

### **Purpose**

Surge occurs when a high energy disturbance takes place on the power lines, or less frequently, I/O lines and can cause significant temporary increase in current and/or voltage. These disturbances can arise during a nearby lightning strike, circuit trips, short-circuits on the same power line that the equipment is connected to, etc. The sudden rise in voltage over a very short period of time could cause damage to the components of the EUT and this test assesses the immunity of the EUT to such transient waves. This test differs from Electrical Fast Transients / Bursts in that this waveform, characterized by the rapid increase of current and/or voltage followed by a slower decrease, has a longer wave duration that could allow damage to the EUT. This test does not guarantee that the EUT will not be exposed to a higher level of surge energy during its operation, which may cause the EUT to fail. This test also does not ensure operation of the EUT in the presence of direct lightning effects.

### **Application Level Requirement**

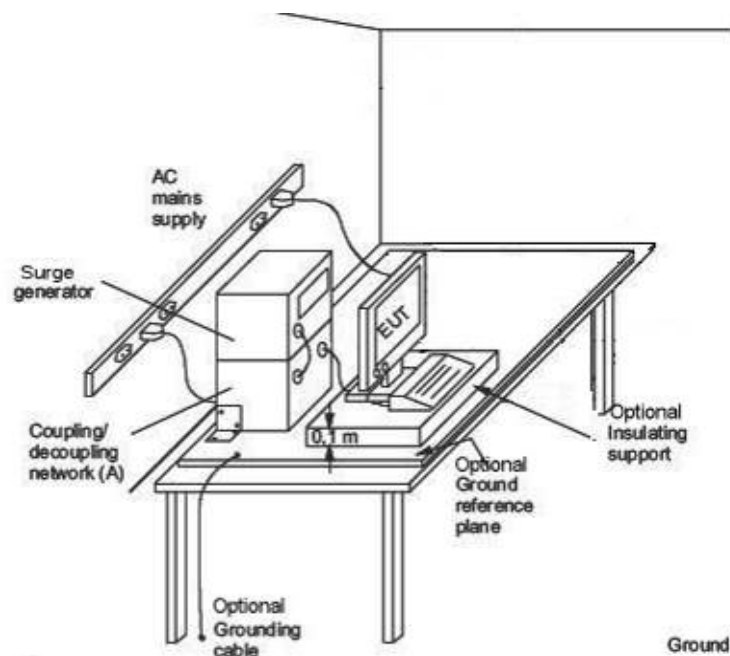

This test is performed in accordance with the methodology defined in IEC 61000-4-5. Surges are simulated using a waveform generator and the characteristics of the waveform generated are as follows:

- Rise time of 1.2 $\mu$ s and wave duration of 50 $\mu$ s (to 50% value) into an open circuit.
- Rise time of 8 $\mu$ s and wave duration of 20 $\mu$ s (to 50% value) into a short circuit.
- Dwell time of 60 seconds between each surge.
- 5 surges in the positive and 5 surges in the negative polarity.
- For AC systems, the surge pulses are applied at 0°, 90°, 180° and 270°.
- For AC systems, Line to Ground is performed at the same amount as the Line to Line voltage.

For AC mains supply, a test level of  $\pm 2$ kV Line to Line and  $\pm 2$ kV Line to Ground is applied to the power supply port(s) via a coupling and decoupling network. Lower test levels are evaluated first before applying the required test level. No disruption of normal operation or data loss is allowed as applied to this test.

Client	Pro V&V Inc.	 Canada
Product	ICP2 V1	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-5, the level is specified as being within  $\pm 10\%$  for open circuit voltage calibration or  $\pm 10\%$  for short circuit current calibration. The EUTs input impedance, or whether Line – PE or Line – Line is being performed, combined with the calibrated generators output impedance, will affect the timing and voltage/current of the waveform applied to the EUT.

## ***Electromagnetic Susceptibility – 4.1.2.10***

### **Purpose**

The EUT will likely be exposed to intentional sources of electromagnetic radiation during its regular application. Sources of such radiation can be cellular phones, FM radio, television, remote car alarms, garage door openers, and other broadcast transmissions. These sources of radiation are licensed or certified for broadcast and therefore, the EUT should be immune to their RF energy. This test assesses the immunity of the EUT to the applicable field strength test level. This test, however, does not guarantee that the EUT will not be exposed to higher level fields during its operation, which may cause it to fail.

### **Application Level Requirement**

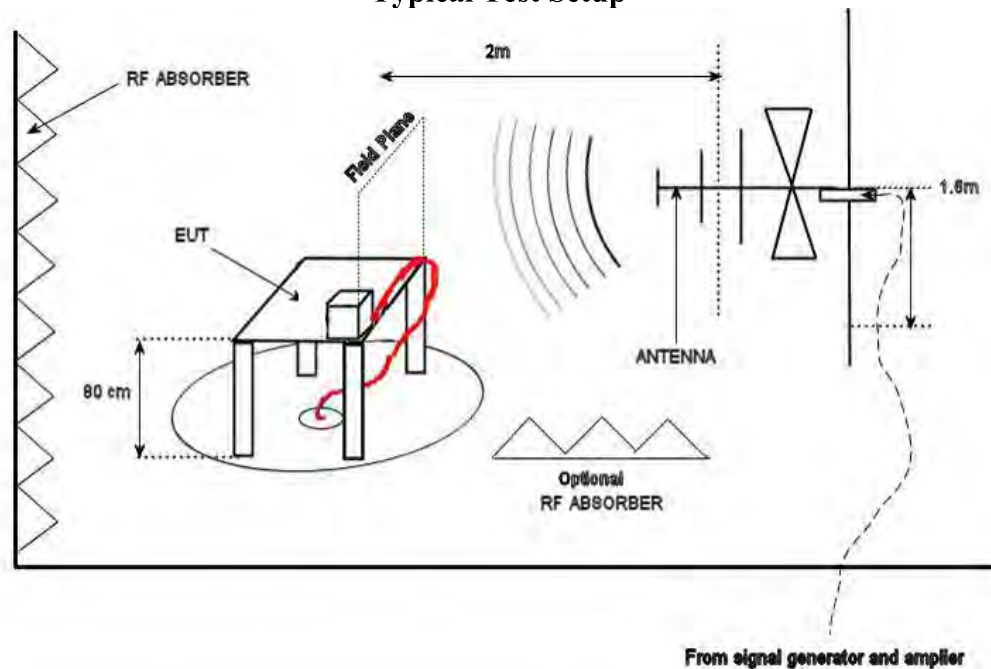

This test is performed in accordance with the methodology defined in IEC 61000-4-3. The immunity test is performed over the frequency range of 80MHz to 1.0GHz. As the frequency range is swept incrementally, the step size used is calculated at 1% of the preceding frequency value, rounded down to the nearest kHz. Known clock frequencies, local oscillators, etc. are analyzed separately, where applicable, and these are defined in "Appendix A – EUT & Client Provided Details". The field uniformity is calibrated at 10V/m and a modulation of 80% AM 1kHz sine wave is applied during the application of the RF energy at each frequency.

The RF field is applied in both horizontal and vertical antenna polarization and four sides of the EUT are subjected to this RF field. The dwell time used for each frequency is 3 seconds. Forward power is monitored and records are kept on file at TÜV SÜD Canada Inc. An isotropic field probe is also placed in near proximity of the EUT to verify the application of the RF field. Performance Criteria level A as defined in "Appendix A – EUT & Client Provided Details" is applied to this test.

Client	Pro V&V Inc.	
Product	ICP2 V1	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-3, the RF field is specified as 0dB to +6dB for at least 12 of the 16 calibration points. For a 10 V/m field, this allows for the EUT to be subjected to a field of 10 V/m to 20 V/m with at least 75% coverage at this level.

## Conducted RF Immunity – 4.1.2.11

### Purpose

The EUT will likely be exposed, in some way, to low frequency intentional sources of RF energy during its regular application. Sources of such radiations can be AM radio, shortwave radio, CB transmissions, and other low frequency broadcast transmissions. These sources of radiations are licensed or certified for broadcast and therefore, the EUT should be immune to their RF energy. Due to the properties of radio, the power or I/O lines on the EUT would likely be the passive receiving antenna that induces the disturbance to the EUT. Since this is the main method of coupling at this frequency range, the direct application of the RF energy to the line being tested is used. At this frequency range and level, this method is easier to produce and reproduce in a laboratory environment than subjecting the EUT to an equivalent RF field.

### Application Level Requirement

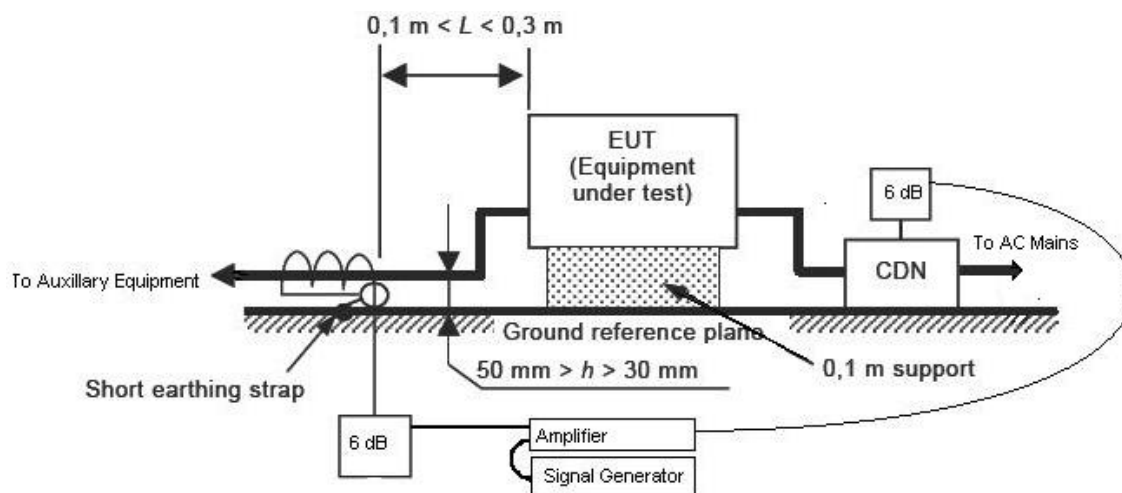

This test is performed in accordance with the methodology defined in IEC 61000-4-6. I/O cables are tested using a bulk current injection probe and power lines are tested using a coupling and decoupling network. The immunity test is performed over the frequency range of 150kHz to 80MHz. As the frequency range is swept incrementally, the step size used is calculated at 1% of the preceding frequency value, rounded down to the nearest kHz. Known clock frequencies, local oscillators, etc. are analyzed separately, where applicable, and these are defined in "Appendix A – EUT & Client Provided Details". The test level is calibrated at 10Vrms and a modulation of 80% AM 1kHz sine wave is applied during the application of the RF energy at each frequency.

The dwell time used for each frequency is 3 seconds. A current probe is placed between the coupling device and the EUT to verify the application of the RF energy. No disruption to normal operation or data loss allowed is applied to this test.

Client	Pro V&V Inc.	
Product	ICP2 V1	
Standard(s)	2015 VVSG Volume I; Version 1.1 2015 VVSG Volume II; Version 1.1	

### Typical Test Setup

### Application Level Accuracy

As per IEC 61000-4-6, the CDN must meet a common mode impedance  $|Z_{CE}| = 150\Omega \pm 20\Omega$  for 150kHz to 26MHz and  $|Z_{CE}| = 150\Omega + 60\Omega$  or  $150\Omega - 45\Omega$  for 26MHz to 80MHz. During tests using the bulk current injection probe, the impedance of each cable will affect the current injected and therefore, current was monitored. The calibration is performed according to IEC 61000-4-6 which allows for  $\pm 2\text{dB}$ .

## ***Magnetic Fields Immunity – 4.1.2.12***

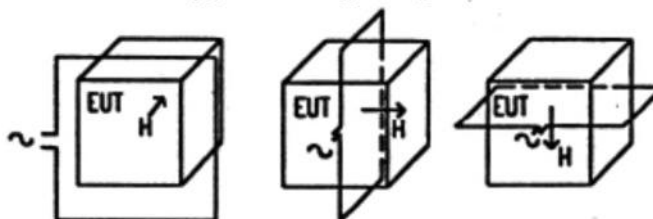

### **Purpose**

A magnetic field with the frequency of the power line is generated around the EUT. In practice, the EUT will be subjected to power frequency magnetic fields from nearby power lines, transformers, or devices such as televisions or monitors. Since the EUT is usually used in conjunction with other electrical equipment, it is subjected to the steady state magnetic fields. These are magnetic fields that the device is exposed to under normal operating conditions. These fields have lower field strengths compared to typical transient magnetic fields.

### **Application Level Requirement**

This test is performed in accordance with the methodology defined in IEC 61000-4-8. Three orthogonal axis of the EUT are subjected to the field within the magnetic loop. The transient magnetic field, if applicable, is tested for 1 minute while the steady state magnetic field is tested for 15 minutes. The frequency applied is 60 Hz. A magnetic field strength of 30 A/m is applied to the EUT in each orthogonal axis. No disruption to normal operation or loss of data is applied to this test.

**Typical Setup Diagram**

### **Application Level Accuracy**

As per IEC 61000-4-8, the field over the area that the EUT occupies within the loop must be calibrated to be within  $\pm 3\text{dB}$ . For a field strength of 3 A/m, this means that the empty calibrated field strength can be between 2.1 A/m and 4.2 A/m over the area that the EUT occupies.

### **Test Results**

The EUT passed the requirements. The EUT did not encounter any disruption of normal operation or loss of data. No anomalies were observed.

When a 60 Hz field was applied, the EUTs were powered at 120 Vac 60 Hz, battery mode and the field strength at 30 A/m.

## EUT Functional Description

Voting Ballot Tabulator.

## EUT Configuration

Please see Appendix B for a picture of the unit running in normal conditions.

- Cables and earthing were connected as per manufacturer's specification.

## Operational Setup

Peripheral devices were attached to the EUT for its test operation. However, this report does not represent compliance of these peripheral device(s) in any way.

- Turn on device, enter test mode using voter and admin cards

## Modifications for Compliance

No modifications were made during testing for the sample to achieve compliance with the testing requirements.

## Product Marking

### Products marketed in the US:

For products that are not intentional radiators and are subject to the 'verification' procedure in the US, according to the FCC, the product shall bear the following statement in a conspicuous location on the device:

*This device complies with Part 15 of the FCC Rules.  
Operation is subject to the following two conditions:  
(1) this device may not cause harmful interference, and  
(2) this device must accept any interference received, including  
interference that may cause undesired operation.*

Where a device is constructed in two or more sections connected by wires and marketed together, the statement specified is required to be affixed only to the main control unit.

When the device is so small or for such use that it is not practicable to place the statement specified on it, the information required by this paragraph shall be placed in a prominent location in the instruction manual or pamphlet supplied to the user or, alternatively, shall be placed on the container in which the device is marketed.

In this case, the following statement may accompany the product:

*"This device complies with Part 15 of the FCC Rules. See manual for details"*

Also, the FCC identifier or other unique identifier such as a model number and serial number, as appropriate, must be displayed on the device.

### Products marketed within Canada:

According to Industry Canada, the following statement shall be permanently affixed to the ITE or displayed electronically and its text must be clearly legible. If the dimensions of the device are too small or if it is not practical to place the label on the device and electronic labeling has not been implemented, the label shall be, upon agreement with Industry Canada, placed in a prominent location in the user manual supplied with the ITE.

*CAN ICES-3 (\*)/NMB-3(\*)*

\* Insert either "A" or "B" but not both to identify the applicable Class of ITE.

- A. TEST: Environmental Hardware Testing
- B. TEST ITEMS: Dominion ICE  
See page 4 for Test Item Identification
- C. SPECIFICATIONS:
1. Quotation Number OP0512325-0
  2. MIL-STD-810D
  3. ISO 17025:2005 (NTS Quality)
- D. RESULTS:

This is to certify that the Dominion ICE Voting System was subjected to testing according to the above specifications.

See Page 4 for Summary of Test Results. The test sample was returned to Pro V&V for post-tests and final evaluation.

Test data, an equipment list, and photographs are attached.

## **SUMMARY OF TEST RESULTS**

Upon completion of testing, the test sample was removed from the test fixture and subjected to a visual inspection. The Test Sample was returned to Pro V&V, Inc.

### **Environmental and Vibration Testing**

Testing was started on 19 February 2019 and completed on 14 March 2019 by exposing two (2) test samples to testing in accordance with Quotation Number OP0512325-0 and MIL-STD-810D. The table below describes the test program. Testing was performed as indicated in the Test Log on the following page.

Test	Description	Dates
Low Temperature	MIL-810D Method 501.2 non-operating at -4F	04-05 March 2019
High Temperature	MIL-810D Method 502.2 non-operating at +140F	05-06 March 2019
Humidity	MIL-810D Method 507.2 non-operating for (10) 24-hr humidity cycles	19 February – 04 March 2019
Bench Handling	MIL-810D Method 516.3 Procedure VI. (6) 4" drops on each edge for 24 drops. Repeat for 2 sample configurations.	06 March 2019
Transportation Vibration	MIL-810D Method 514.3 Category 1 Basic Transportation Vibration per Figures 514.3-1 through 514.3-3 using suggested common carrier profiles and durations of 1 hour per axis along each of 3 axes.	07 March 2019
Temperature/Power Variation	24-hr operation with power cycled accordingly over 85 hours with NTS support provided 24-hrs daily for first 85 hours per Method 502.2 and 501.2.	11-14 March 2019

**SUMMARY OF TEST RESULTS**

Upon completion of testing, the test sample was removed from the test fixture and subjected to a visual inspection. The Test Samples were returned to Pro V&V, Inc.

**Power Variation Testing**

Testing was started on 29 April 2019 and completed on 03 May 2019 by exposing four (4) test samples to testing in accordance with Quotation Number OP0517642-0 and MIL-STD-810G, as described in the table below. Testing was performed as indicated in the Test Log on the following page.

Test	Description
Temperature/Power Variation	24-hr operation with power cycled accordingly over 85 hours with NTS support provided 24-hrs daily for first 85 hours per Method 502.2 and 501.2.

Ian Piper, Director of Certification  
Dominion Voting Systems  
1201 18th Street, Suite 210  
Denver, CO 80202

**Re: Initial Decision on Certification**

Dear Mr. Piper,

This correspondence is to inform you that the Dominion Democracy Suite 5.5-B voting system completed the initial step towards receipt of an EAC certification. This Initial Decision on Certification represents an EAC acknowledgement that Democracy Suite 5.5-B has successfully completed conformance testing to the *Voluntary Voting System Guidelines version 1.0*.

However, as provided in §5.9 of the EAC's *Voting System Testing and Certification Program Manual* (Certification Manual), for an Initial Decision to become final and to issue a certification number and a Certificate of Conformance, a manufacturer must provide documentation to the Program Director verifying that the trusted build has been performed, software has been deposited in an approved repository, and system identification tools are available to election officials. A manufacturer must submit a letter, signed by both its management representative and an SLI Compliance official, stating (under penalty of law) that it has:

1. Performed a trusted build consistent with the requirements of §5.6 of the EAC's Certification Manual;
2. Deposited software consistent with §5.7 of the EAC's Certification Manual;
3. Created and made available system identification tools consistent with §5.8 of the EAC's Certification Manual (a copy and description of the system identification tool developed must be provided with the letter); and
4. Upon a final decision to grant certification, the manufacturer accepts the certification and all conditions placed on the certification.

Upon receipt of documentation demonstrating the successful completion of the requirements above and recommendation of the Program Director, I will issue an Agency Decision granting certification and provide Dominion Democracy Suite 5.5-B with a certification number and Certificate of Conformance.

If you have any questions or need further information, please do not hesitate to contact Jerome Lovato at your earliest convenience. I thank you in advance for your time and attention to this matter.

Sincerely,

A handwritten signature in blue ink, appearing to read "BDN", with a stylized flourish at the end.

**Re: Agency Decision – Grant of Certification**

Dear Mr. Piper,

As required under §5.9 of the EAC's Voting System Testing and Certification Program Manual, Dominion Voting Systems and Pro V&V have provided the necessary documentation for the Dominion Democracy Suite 5.5-B voting system verifying that 1) the trusted build has been performed, 2) software has been deposited in an approved repository, 3) system identification tools are available to election officials, and 4) signed a letter stating, under penalty of law, that you have:

1. Performed a trusted build consistent with the requirements of §5.6 of the EAC's Certification Manual;
2. Deposited software consistent with §5.7 of the EAC's Certification Manual;
3. Created and made available system identification tools consistent with §5.8 of the EAC's Certification Manual (a copy and description of the system identification tool developed must be provided with the letter); and
4. Upon a final decision to grant certification, the manufacturer accepts the certification and all conditions placed on the certification.

Based on the review of the documentation above and the fact that the Dominion Democracy Suite 5.5-B voting system successfully completed conformance testing to the 2005 Voluntary Voting System Guidelines (2005 VVSG), the Voting System Testing & Certification Program Director has recommended EAC certification of this system.

I have reviewed all of the documentation and concur with the Program Director's recommendation. As such, I hereby grant EAC Certification to the Dominion Democracy Suite 5.5-B voting system to the 2005 Voluntary Voting System Guidelines.

The EAC certification number issued for this system is: **DVS-DemSuite5.5-B**. In addition, a Certificate of Conformance shall be provided to Dominion Voting Systems as evidence of the EAC certification of the Dominion Democracy Suite 5.5-B voting system. The Certificate of Conformance shall be provided to Dominion Voting Systems no later than five business days from the date of this letter, and it shall be posted on the EAC's Web site.

As stated in §5.11 of the EAC's Certification Manual, the EAC certification and certificate apply only to the specific voting system configuration(s) identified, submitted, and evaluated under the Certification Program. Any modification to the system not authorized by the EAC shall void the certificate.

If you have any questions or need further information, please do not hesitate to contact Jerome Lovato at your earliest convenience. I thank you in advance for your time and attention to this matter and congratulate on this achievement.

Sincerely,

---

## Certificate of Conformance

---

### **Dominion Voting Systems Democracy Suite 5.5-B**

The voting system identified on this certificate has been evaluated at an accredited voting system testing laboratory for conformance to the *Voluntary Voting System Guidelines Version 1.0 (VMSG 1.0)*. Components evaluated for this certification are detailed in the attached Scope of Certification document. This certificate applies only to the specific version and release of the product in its evaluated configuration. The evaluation has been verified by the EAC in accordance with the provisions of the EAC *Voting System Testing and Certification Program Manual* and the conclusions of the testing laboratory in the test report are consistent with the evidence adduced. This certificate is not an endorsement of the product by any agency of the U.S. Government and no warranty of the product is either expressed or implied.

## Scope of Certification

---

This document describes the scope of the validation and certification of the system defined above. Any use, configuration changes, revision changes, additions or subtractions from the described system are not included in this evaluation.

### Significance of EAC Certification

An EAC certification is an official recognition that a voting system (in a specific configuration or configurations) has been tested to and has met an identified set of Federal voting system standards. An EAC certification is **not**:

- An endorsement of a Manufacturer, voting system, or any of the system's components.
- A Federal warranty of the voting system or any of its components.
- A determination that a voting system, when fielded, will be operated in a manner that meets all HAVA requirements.
- A substitute for State or local certification and testing.
- A determination that the system is ready for use in an election.
- A determination that any particular component of a certified system is itself certified for use outside the certified configuration.

### Representation of EAC Certification

Manufacturers may not represent or imply that a voting system is certified unless it has received a Certificate of Conformance for that system. Statements regarding EAC certification in brochures, on Web sites, on displays, and in advertising/sales literature must be made solely in reference to specific systems. Any action by a Manufacturer to suggest EAC endorsement of its product or organization is strictly prohibited and may result in a Manufacturer's suspension or other action pursuant to Federal civil and criminal law.

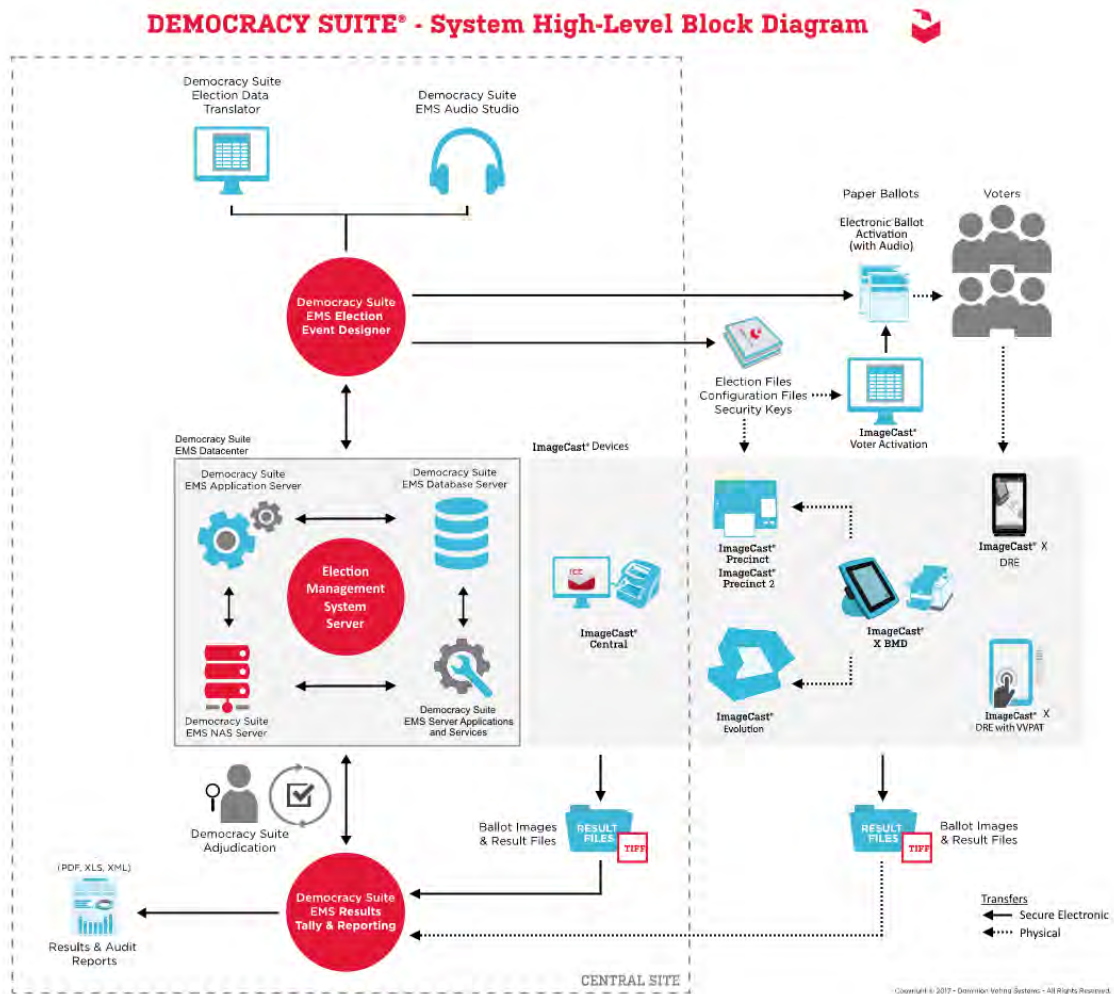

### System Overview:

The D-Suite 5.5-B Voting System is a paper-based optical scan voting system with a hybrid paper/DRE option consisting of the following major components: The Election Management System (EMS), the ImageCast Central (ICC), the ImageCast Precinct (ICP and ICP2), the ImageCast Evolution (ICE), the ImageCast X (ICX) DRE w/ Reports Printer, ImageCast X (ICX) DRE w/ voter-verifiable paper audit trail (VVPAT), and the ImageCast X ballot marking device (BMD). The D-Suite 5.5-B Voting System configuration is a modification from the EAC approved D-Suite 5.5 system configuration.

## Language capability:

System supports Alaska Native, Apache, Bengali, Chinese, English, Eskimo, Filipino, French, Hindi, Japanese, Jicarilla, Keres, Khmer, Korean, Navajo, Seminole, Spanish, Thai, Towa, Ute, Vietnamese, and Yuman.

## System Limitations

This table depicts the limits the system has been tested and certified to meet.

Characteristic	Limiting Component	Limit	Comment
Ballot positions	Ballot	292*/462**	Landscape Ballot: 240 candidates + 24 write-ins + 28 Yes/No choices.
Precincts in an election	EMS	1000; 250	Standard; Express
Contests in an election	EMS	1000; 250	Standard; Express
Candidates/Counters in an election	EMS	10000; 2500	Standard; Express
Candidates/Counters in a precinct	Ballot	240*/462**	Both
Candidates/Counters in a tabulator	Tabulator	10000; 2500	Standard; Express
Ballot Styles in an election	Tabulator	3000; 750	Standard; Express
Ballot IDs in a tabulator	Tabulator	200	Both
Contests in a ballot style	Ballot	38*/156**	Both
Candidates in a contest	Ballot	240*/231**	Both
Ballot styles in a precinct	Tabulator	5	Both
Number of political parties	Tabulator	30	Both
"vote for" in a contest	Ballot	24*/30**	Both
Supported languages in an election	Tabulator	5	Both
Number of write-ins	Ballot	24*/462**	Both

\* Reflects the system limit for a ballot printed in landscape.

\*\* Reflects the system limit for a ballot printed in portrait.

## Functionality

### 2005 VVSG Supported Functionality Declaration

Feature/Characteristic	Yes/No	Comment
Voter Verified Paper Audit Trails		
VVPAT	YES	
Accessibility		
Forward Approach	YES	
Parallel (Side) Approach	YES	
Closed Primary		
Primary: Closed	YES	
Open Primary		
Primary: Open Standard (provide definition of how supported)	YES	
Primary: Open Blanket (provide definition of how supported)	YES	
Partisan & Non-Partisan:		
Partisan & Non-Partisan: Vote for 1 of N race	YES	
Partisan & Non-Partisan: Multi-member ("vote for N of M") board races	YES	
Partisan & Non-Partisan: "vote for 1" race with a single candidate and write-in voting	YES	
Partisan & Non-Partisan "vote for 1" race with no declared candidates and write-in voting	YES	
Write-In Voting:		
Write-in Voting: System default is a voting position identified for write-ins.	YES	
Write-in Voting: Without selecting a write in position.	NO	
Write-in: With No Declared Candidates	YES	
Write-in: Identification of write-ins for resolution at central count	YES	
Primary Presidential Delegation Nominations & Slates:		
Primary Presidential Delegation Nominations: Displayed delegate slates for each presidential party	YES	
Slate & Group Voting: one selection votes the slate.	YES	
Ballot Rotation:		
Rotation of Names within an Office; define all supported rotation methods for location on the ballot and vote tabulation/reporting	YES	Equal time rotation
Straight Party Voting:		
Straight Party: A single selection for partisan races in a general election	YES	
Straight Party: Vote for each candidate individually	YES	
Straight Party: Modify straight party selections with crossover votes	YES	
Straight Party: A race without a candidate for one party	YES	
Straight Party: "N of M race (where "N">1)	YES	
Straight Party: Excludes a partisan contest from the straight party selection	YES	

Feature/Characteristic	Yes/No	Comment
<b>Cross-Party Endorsement:</b>		
Cross party endorsements, multiple parties endorse one candidate.	YES	
<b>Split Precincts:</b>		
Split Precincts: Multiple ballot styles	YES	
Split Precincts: P & M system support splits with correct contests and ballot identification of each split	YES	
Split Precincts: DRE matches voter to all applicable races.	YES	
Split Precincts: Reporting of voter counts (# of voters) to the precinct split level; Reporting of vote totals is to the precinct level	YES	
<b>Vote N of M:</b>		
Vote for N of M: Counts each selected candidate, if the maximum is not exceeded.	YES	
Vote for N of M: Invalidates all candidates in an overvote (paper)	YES	
<b>Recall Issues, with options:</b>		
Recall Issues with Options: Simple Yes/No with separate race/election. (Vote Yes or No Question)	YES	
Recall Issues with Options: Retain is the first option, Replacement candidate for the second or more options (Vote 1 of M)	NO	
Recall Issues with Options: Two contests with access to a second contest conditional upon a specific vote in contest one. (Must vote Yes to vote in 2nd contest.)	NO	
Recall Issues with Options: Two contests with access to a second contest conditional upon any vote in contest one. (Must vote Yes to vote in 2nd contest.)	NO	
<b>Cumulative Voting</b>		
Cumulative Voting: Voters are permitted to cast, as many votes as there are seats to be filled for one or more candidates. Voters are not limited to giving only one vote to a candidate. Instead, they can put multiple votes on one or more candidate.	NO	
<b>Ranked Order Voting</b>		
Ranked Order Voting: Voters can write in a ranked vote.	NO	
Ranked Order Voting: A ballot stops being counting when all ranked choices have been eliminated	NO	
Ranked Order Voting: A ballot with a skipped rank counts the vote for the next rank.	NO	
Ranked Order Voting: Voters rank candidates in a contest in order of choice. A candidate receiving a majority of the first choice votes wins. If no candidate receives a majority of first choice votes, the last place candidate is deleted, each ballot cast for the deleted candidate counts for the second choice candidate listed on the ballot. The process of eliminating the last place candidate and recounting the ballots continues until one candidate receives a majority of the vote	NO	

Feature/Characteristic	Yes/No	Comment
Ranked Order Voting: A ballot with two choices ranked the same, stops being counted at the point of two similarly ranked choices.	NO	
Ranked Order Voting: The total number of votes for two or more candidates with the least votes is less than the votes of the candidate with the next highest number of votes, the candidates with the least votes are eliminated simultaneously and their votes transferred to the next-ranked continuing candidate.	NO	

Feature/Characteristic	Yes/No	Comment
<b>Provisional or Challenged Ballots</b>		
Provisional/Challenged Ballots: A voted provisional ballots is identified but not included in the tabulation, but can be added in the central count.	YES	
Provisional/Challenged Ballots: A voted provisional ballots is included in the tabulation, but is identified and can be subtracted in the central count	NO	
Provisional/Challenged Ballots: Provisional ballots maintain the secrecy of the ballot.	YES	
<b>Overvotes (must support for specific type of voting system)</b>		
Overvotes: P & M: Overvote invalidates the vote. Define how overvotes are counted.	YES	Overvotes cause a warning to the voter and can be configured to allow voter to override.
Overvotes: DRE: Prevented from or requires correction of overvoting.	YES	
Overvotes: If a system does not prevent overvotes, it must count them. Define how overvotes are counted.	YES	If allowed via voter override, overvotes are tallied separately.
Overvotes: DRE systems that provide a method to data enter absentee votes must account for overvotes.	N/A	
<b>Undervotes</b>		
Undervotes: System counts undervotes cast for accounting purposes	YES	
<b>Blank Ballots</b>		
Totally Blank Ballots: Any blank ballot alert is tested.	YES	Precinct voters receive a warning; both precinct and central scanners will warn on blank ballots.
Totally Blank Ballots: If blank ballots are not immediately processed, there must be a provision to recognize and accept them	YES	Blank ballots are flagged. These ballots can be manually examined and then be scanned and accepted as blank; or precinct voter can override and accept.
Totally Blank Ballots: If operators can access a blank ballot, there must be a provision for resolution.	YES	Operators can examine a blank ballot, re-mark if needed and allowed, and then re-scan it.
<b>Networking</b>		
Wide Area Network – Use of Modems	NO	
Wide Area Network – Use of Wireless	NO	

Feature/Characteristic	Yes/No	Comment
Local Area Network – Use of TCP/IP	YES	Client/server only
Local Area Network – Use of Infrared	NO	
Local Area Network – Use of Wireless	NO	
FIPS 140-2 validated cryptographic module	YES	
Used as (if applicable):		
Precinct counting device	YES	ImageCast Precinct
Central counting device	YES	ImageCast Central

## Baseline Certification Engineering Change Orders (ECO)

ECO #	Component	Description
100503	ICP PCOS-320C & ICP PCOS-320A	Adding a COTS collapsible ballot box to AVL for use with the ICP
100521	Servers and Workstations	Added DELL P2419H monitor as a display device.
100527	EMS Workstations.	Added DELL Latitude 3490 computer with updated i3-8130U processor (Dual Core, 4MB Cache, 2.2GHz) to DVS PN 190-000061 (a client workstation).
100543	ICC Scanner	Update to the DR-G1130 Scanner LCD Panel User Interface.
100588	ICX Workstation	Added new models of VVPAT printer for use with the D-Suite ICX workstation due to previous model becoming commercially unavailable
100596	EMS Workstation	Added DELL Latitude 3400 computer as a client workstation due to the DELL Latitude 3490 computer becoming commercially unavailable for purchase
100597	EMS Server	Added DELL PowerEdge R640 computer with new processor and RAM as an AVL to the existing R640 server computer configurations
100602	EMS Server and Workstations	Added DELL Precision 3431 computer in an EMS Express Server and EMS Client Workstation configuration due to the DELL Precision 3430 computer becoming commercially unavailable for purchase
100603	ICC Scanner	Added DELL P2418HT monitor as a display device for ICC HiPro scanner workstation configuration due to the Lenovo 10QXPAR1US monitor becoming commercially unavailable for purchase
